Margolis based his reading of Danto on the Artworld and, mainly, on Transfiguration of the Commonplace and finds a 'preposterous' claims there:

Apparently, for Danto, it is only by the rhetorical imputation of certain non-discernible 'attributes' that we are ever justified in treating 'mere real things' (things that are not artworks) as artworks. Nothing really exists as an artwork [...] It does seem preposterous. After all, you are bound to remind me, Danto is an art critic, writes and speaks about artworks all the time²⁸.

From that reading, that artworks do not exist, Margolis concludes that the famous indiscernibility change „never rightly arises!“ and „there is no puzzle of the sort Danto invents“²⁹. In the end, Margolis suggests that Danto was inspired by the famous question about a raising hand proposed by Ludwig Wittgenstein and he supposedly did not accept the answer that there is no difference between 'me raising a hand' and 'my hand raises'. Margolis shares this skepticism expressed in Danto's Analytical Philosophy of Action and does suggest that intention is what makes the distinction.

The same intention that he imposes on Danto to criticize him just a few pages before. No, not exactly, Margolis actually uses the term Intention with a capital I in his other writings as a technical 'umbrella term' to gather all significative human activity. In his book *What, After All, Is a Work of Art?* Margolis suggests that Intentions constitutes the real difference between artworks and 'real things', and that 'Intentional' should be understood as 'cultural' as artworks are just special forms of cultural entities³⁰. And culture is through and through historical, what is yet another common idea for Danto and Margolis.

This, however, does not prevent Margolis from criticizing Danto again, in this book mainly for his 'end of art' thesis. That is quite interesting because it seems to me that Danto's post-historical artistic freedom is quite similar to Margolis idea of cultural relativism. „By 'post-historical' art I mean that there's no longer any historical direction to art, that everything is possible“³¹. But Margolis claims still in 2009 that Danto cannot simultaneously advocated the end of art and the difference between the work of art and mere things³². He accused Danto to "remains silent about persons" and therefore falls into reductionism (of cultural selves into physical objects). But actually the whole 'transfiguration' is taking an physical object into the cultural artworld, and therefore changing it 'meaning'.

The problematic relation between the end of art thesis and the indiscernibility of two objects was discovered by Noel Carroll just after publication of *After the End of Art*:

In Danto's view, the philosophy of art had to await that point in art history when the problem of indiscernibles raised its hydra head. That moment arrived when artists like Warhol presented artworks like Brillo .

Danto moved from a historical definition of art toward an essential definition of art that was based on the embodied meaning and then instead of including the historical relativism inside this definition he combined it with a whole new narration of the end of art. For Danto only our knowledge is historically constructed, but our perception is not. An eye has biological features and cannot be subject to cultural change. In other words, Danto doesn't want interpretations to be hanging in the vacuum, and Margolis doesn't seem to be concerned with the idea of one true meaning supporting all interpretations. This is for him the fatal heritage of Aristotelian logic that still puts a shadow over philosophy. For Danto accepting that would mean that „individuals see the world differently, or even, in the strongest version of the thesis, see different worlds“³⁴. This was accepted by Margolis already in *The Worlds of Art and the World* from 1983.

The main difference is therefore in a very different concept of perception, culture and ontology. In *Embodied Meanings* Danto points out that:

The “real” Brillo box, which actually houses Brillo pads, was designed by an artist, James Harvey, who was a second-generation Abstract Expressionist more or less forced to take up commercial art. It has a very marked style, which situates it perfectly in its own time and in fact there are some very marked connections between it and some of the high art styles of that time. Its style, however, differs sharply from the Warhol's Brillo Box, which has almost no connection to those very high art styles at all. Where Warhol's is cool, it is hot, even urgent, in proclaiming the newness of the product it contains, the speed with which it shines; aluminium, and that its twenty-four packages are GIANT SIZE. [...] In any case, in point of meaning the two could not be more different³⁵

For Danto this is not an aesthetic difference between the two, but an ontological difference in meaning of them being cultural objects. In this Danto moves his theory much closer to Margolis. Both Danto and Margolis tend to think that art should be looked on philosophically rather than aesthetically. Beauty is not the right meaning of art, and should not be abused. In his last book, Danto entangled the meaning of art with an interesting example – with restoration. Since the difference between Danto and Margolis is mostly about interpretation and historicity of it I think that this proves a new opportunity to look on this debate.

I would like to use the example of an architectural reconstruction as it has obvious pragmatic aspects to it. The first question is whether the reconstructed Royal Castle in Warsaw is a work of art or just a forgery and what is its relation to the authentic one. I think Danto's theory, despite its problems and limitations, does provide us with some interesting insights. Especially important is implementation to the meaning of art the narration of “how” and “why” was it created.

The how and why of this (re)making is an important part of the embodied meaning of this architecture and therefore cannot be identified with the old, destroyed castle, that lacks this tragic history³⁶. But in a way today's castle shares the pre-reconstruction identity of the old castle as well. It could not be any different as without it also would have no meaning. Also, the function of the castle is much different now, but this is a common fate of many old residences turned into museums nowadays. Especially in

Europe, this is a very common and a very delicate problem.

Similar case was discussed by Danto in the second chapter of his last book, *What Art Is*, where he writes about his experience of visiting the Sistine Chapel after the restoration of Michelangelo's masterpiece. In "Restoration and Meaning," as he called this chapter, he claims that getting rid of the dust is irrelevant to the meaning of this art. For Danto, the true meaning depends on knowing the intention of the artist who created it³⁷. But with the reconstruction, it refers to the creator or recreator. In the end, it seems that intentions are best explained in a narration-like story and therefore the meaning of the work of art does require in some cases to tell also the story of reconstruction. That makes a strong argument for at least temporal realism of the meanings of art. That brings us back to the very practical decisions and movements of artworld, that would constantly challenge our understanding of art like it has done in the last hundred years.

Some 'hard cases' are still present in every aspect of human artistic activity and I suggest that such a complex quarrel, like the one between Danto and Margolis, helps us to understand not only how to approach them, but also why they are so challenging. That is why art is embedded inside our rich history and culture, and every definition depends on the set of assumptions that usually include such topics as the nature of perception, interpretation and reality itself. For that, it is still important to revisit this discussion. Russell Pryba goes so far as to suggest that:

*The importance of the Danto/Margolis debate is not localized to the narrow question of the essence or definition of art. Rather, the debate points us to an understanding of the nature and power of culturally enriched human selves that make both art, and philosophy of art possible.*³⁸

DANTO'S HEGEL: THE PHILOSOPHICAL SOURCES OF DANTO' END OF ART THESIS

Abstract | In this paper I will consider Arthur C. Danto's idea about the end of art. This thesis is often identified with Hegel's reflection on art as a thing of the past presented in his *Aesthetics. Lectures on Fine Art*. Although Danto mentions Hegel quite frequently, I shall argue against this view that a philosophical source of his thesis is the philosophy of history. Moreover, I believe that the philosophy of history serves as the source of the thesis in two ways. On the one hand, Danto's terminology is based on his own account of the philosophy of history introduced in his eponymous *Analytical Philosophy of History*. On the other hand, the end-of-art thesis makes sense only with respect to a particular interpretation of general history, in Danto's essay represented by philosophies of the end of history. In the first part of my presentation, I will consider Danto's *Analytical Philosophy of History*. Although Danto aimed to offer an alternative account to Carl Hempel's idea on explanation in history in this book, he developed key terms 'narrative' and 'narrative sentence' here both of which Danto uses when thinking about the end of art or end of art history. In the second part of the presentation, I will examine the end-of-art thesis as proposed in Danto's 'The End of Art' as well as in texts which further develop it. I will pay attention especially to the Framework in which the thesis makes sense, i.e. to historical accounts of the end of history as interpreted by Danto. Even though Danto associates this vision of history with Marx and Hegel, my aim is to demonstrate that his interpretation of the end of history is based on further reading, specifically on Alexandre Kojève's commentary on Hegel and on Josiah Royce's interpretation of Hegel *Phenomenology* in terms of *Bildungsroman*. I will claim that these philosophers shaped Danto's idea on the end of art, even though Danto's interpretation of their position differs from their original. I believe that these two steps enable to prove that the philosophical source of Danto's end-of-art thesis is not Hegel's *Aesthetics* but rather a philosophy of history. Not only makes this interpretation the correct understanding of Danto's position possible but it also explains the difference between Danto's and Hegel's notion of the end of art.

Index terms | *Arthur Danto; end of art; Hegel; narrative; philosophy of history;*

INTRODUCTION

Arthur C. Danto introduced his idea of art coming to its end in his eponymous article „The End of Art.“¹ Although it has been more than thirty years since the article was published, the thesis has recently become a subject of philosophical scrutiny again. Contemporary interpreters, however, do not pay closer attention to the question of the origin of the thesis, and therefore it is still understood in the light of Hegel’s statement that „[art]in its highest vocation, is and remains for us a thing of the past.“² Nevertheless, the question of the origin of the thesis is a more complicated issue. As Stephen Snyder rightly observed: „ the influence of Hegel in Danto’s work is often overstated, and that of Nietzsche or Sartre is as often overlooked.“³ But, as I am going to show, yet other intellectual influences shaped the form of Danto’s argument. I aim to demonstrate that Danto’s thesis is rooted in his philosophy of history. By this, I mean that Danto found his inspiration in the philosophy of the end of history as well as in his writings on the philosophy of history.

It is a well-known fact that Danto paid systematic attention to the question of the end of art. In this paper, however, what is required for presenting my point is just a summary of Danto’s position. In his book *After the End of Art*, Danto provides us with a useful overview of his position and notes that he „was writing about a certain narrative that had, [he] thought, been objectively realized in the history of art, and it was that narrative, it seemed to [him], that had come to the end.“⁴ This formulation needs further explanation.

Narratives and the Philosophy of History

For this reason, I think it necessary to address the book *Analytical Philosophy of History*, in which Danto introduced the term „narrative.“ The narrative is a kind of historical explanation which significantly differs from a chronicle. Whereas chronicle only records events in the chronological order without interpreting them, a narrative serves as an explanation of a certain kind. Danto characterizes its function as follows:

They [narratives] are used to explain changes, and, most characteristically, large-scale changes taking place, sometimes, over periods of time vast in relationship to single human lives. It is the job of history to reveal to us these changes, to organize the past into temporal wholes, and to explain these changes at the same time as they tell what happened – albeit with the aid of the sort of temporal perspective linguistically reflected in narrative sentences.⁵

Using the distinction between narratives and chronicles Danto emphasizes the importance of meaning in the historical discourse. According to Danto, events have a particular meaning only with reference to a certain temporal whole,⁶ and therefore the history is open to new interpretations because future events can shed new light on the (always temporary) historical truth. Although Danto focuses on history in general in his book, his findings are significant for art history as well. An art historian or art philosopher has to fulfill the same task, i.e., she or he has to provide us with an explanation of events that occurred in the artworld and to propose a narrative which would be able to clarify them.

The character of history admits that there would be competing narratives, but when speaking about the end of art, Danto has in mind a narrative with a particular structure. So the argument that art came to an end has meaning if and only if the narrative in

question meets specific demands. In the first essay on this topic, Danto asserts that the question about the end of art arises only when we are working with a model of art history that is *progressive*, and that is based on a sufficiently general definition of art. Danto finds such a narrative in the realm of philosophies of the end of history. This thought is rooted in the theories of Alexandre Kojève, Karl Marx and George Wilhelm Friedrich Hegel, who in Danto's opinion, understood history in terms of agony.⁷ For Danto, the end of history arrives through this agony and at the same time, the end of history brings the end of this agony and therefore a state of freedom. By the term agony, Danto describes the last stage of developmental history. Kojève, according to Danto, proposed the most convincing summary of this situation in his commentary on Hegel's *Phenomenology of Spirit*. Danto discusses the characterization of a happy life and connects this commentary with Hegel. In Danto's words:

The End of History coincides, and is indeed identical, with what Hegel speaks of as the advent of Absolute Knowledge. Knowledge is absolute, when there is no gap between knowledge and its object, or knowledge is its own object, hence subject and object at once. The closing paragraph of *Phenomenology* suitably characterizes the philosophical closure of the subject it treats of, by saying that it „consists in perfectly knowing itself, in knowing what it is.“⁸

The role knowledge plays in Hegel's narrative of the end of history was enlightening, according to Danto, of the situation in the world of art found itself in at that time. From this point of view, the most crucial event in the contemporary history of art was Andy Warhol's exhibition of *Brillo Boxes* which took place in 1964. And this event set art free because Warhol raised a question about the essence of art in a new and genuinely philosophical way. Instead of asking what art is, Warhol forced philosophers to explain the difference between two perceptually indiscernible objects. In consequence, art gained its philosophical character. A diagnosis of the reflexive nature of art returned Danto to Hegel and his *Phenomenology* interpreted in terms of *Bildungsroman*. Danto comments on this interpretation as follows:

The great philosophical work which has this form is Hegel's astonishing *Phenomenology of Spirit*, a work whose hero is the spirit of the world – whom Hegel names *Geist* – the stages of whose development toward self-knowledge, and toward self-realization through self-knowledge, Hegel traces dialectically. Art is one of these stages – indeed, one of the nearly final stages of spirit's return to spirit through spirit – but it is a stage which must be gone through in the painful ascent toward the final redeeming cognition.⁹

In respect to this formulation, it is possible to interpret Warhol's *Brillo Boxes* as a proof of self-realization through self-knowledge. And in consequence, it enables Danto to conclude: „The historical stage of art is done with when it is known what art is and means.“¹⁰

The Origin of the Thesis

In the introduction, I have claimed that Danto's thesis of the end of art is rooted in the philosophy of history. By this, I mean that considerations on this topic inspired Danto in two ways. At first, he observed the situation in the artworld of his time that

made him look for an explanation of its specific character – and he found a suitable model of explication in the philosophy of the end of history. At second, his approach to art based on narrative thinking origins in his writings on the philosophy of history. When introducing the explicative role of narratives in historiography, I have already addressed Danto's *Analytical Philosophy of History*, which I believe is one of the sources of Danto's thesis. Even though the importance of this book for his philosophy of art has been already familiar, it has not been, however, analyzed in depth. The distinctive structure of the narrative, i.e., its ability to embrace crucial events and their changes which can be described only in retrospect also determines Danto's thinking about the history of art. According to Danto, 20th century represented a certain milestone in interpreting art history. The century began with a boom of new art forms and isms, and therefore artworld went through a dynamic change which it had not experienced before. In Danto's opinion, each of these movements made a claim to the dominance, and concerning this, those movements competed with each other and moved artworld further. However, in the 1980s, the situation changed significantly – the rivalry of different movements was replaced with plurality, i.e., particular movements coexisted rather than competed. And this, for Danto, the crucial change, demanded an explanation. Of course, when speaking about explanation, I have in mind this kind of explanative narrative which Danto defined in his *Analytical Philosophy of History*. In other words, the argument about the end of art aimed to explain the structural changes in the history of art. Therefore the end of art thesis is the kind of explanative narrative Danto introduced in his writings on the philosophy of history.

Similarly, in the opening paragraphs, I have already touched upon the question of the relevance of Hegel's *Aesthetics*. Concerning the end of art, Danto's notes on Hegel are especially confusing. In *After the End of Art*, Danto characterizes his thesis as Hegelian¹¹, but more detailed analysis of Danto's texts reveals that Hegel's impact on Danto's formulation of the end of art thesis is smaller than it is usually thought. In the introduction of the essay, Danto claims:

Such indeed was a thesis of Hegel, certain of whose views have inspired the present essay, for Hegel said quite unequivocally that art as such, or at least at its highest vocation, is quite finished with as a historical moment, though he did not commit himself to the prediction that there would be no more works of art.¹²

This formulation led readers to the conclusion that Danto followed Hegel's opinions from his *Aesthetics*. In his article „Narratives of the End of Art,“ Danto outlined his understanding of Hegel's statement about the end of art as the highest vocation of Spirit and related it with the situation in the artworld in Hegel's time. In Danto's opinion, art started to thematize its inner processes and so becoming its own subject in the 19th century.¹³ This statement goes hand in hand with the self-reflective character, which Hegel, according to Danto, attributed to philosophy. In this context, Danto connects the consideration about the self-reflection with the end of history, especially with the idea of freedom which consists in the realization of art's own processes. With this statement, Danto gets back to his essay „The End of Art“ and his treatment of *Brillo Boxes* by which Andy Warhol raised a question about the essence of art in a new way. This Warhol's gesture changed the character of art in that that art became philosophical. However, concerning Hegel, I think it necessary to focus on Danto's formulation in more detail. In the context of presenting the idea of freedom and overcoming subject-object opposition, Danto does not talk about *Aesthetics* but about *The Phenomenology of Spirit* and furthermore, he does not approach it directly but

through interpretations of other readers.

The most apparent impact on Danto's understanding of Hegel had Alexandre Kojève whose book *Introduction à la lecture de Hegel* Danto quotes. This fact observes, for example, Katharina Bahlmann who refers to an interview of Fred Rush and Dieter Heinrich with Danto, in which Danto admits his limited knowledge of idealist philosophy.¹⁴ In „The End of Art,“ Danto pays more attention to Kojève's conception of the end of history than to Hegel's; the reason probably being that Kojève's formulation met Danto's requirements for a background theory better than Hegel's. And for this reason, he felt no need to compare it with the original. But there was, in my opinion, one more philosopher who determined Danto's understanding of Hegel's philosophy: Josiah Royce. Danto's interpretation of the *Phenomenology* in terms of *Bildungsroman* is not Danto's own but he took it over from Royce's book *Lectures on Modern Idealism*.¹⁵ In this book, Royce describes *Phenomenology* as a biography of the world spirit. Chapters of this biography deal with individual stages or phases of the life of the spirit or more precisely with his progress on the path for consciousness realized through its specific forms (Gestalten des Bewusstseins).¹⁶ Royce distinguishes following its forms: mere consciousness, self-consciousness, reason and Geist which the Spirit has to go through in order to gain its consciousness.¹⁷ Although Danto takes over the notion of *Bildungsroman*, he relates it not to forms of consciousness but to the forms of *expression* of consciousness, i.e., with art, religion, and philosophy. And in consequence, Danto changed or at least limited the path of the Spirit and attributed art character which Royce did not take into consideration.

In this paper, my goal was to reveal the origin of Danto's thesis and dispell conviction that Danto followed the path of Hegel's *Aesthetics*. I sought to demonstrate that the formulation of the thesis was influenced by Kojève, Royce and Hegel's *Phenomenology of Spirit*. However, the most important impulse found Danto in the contemporary state of the art world. This conclusion, in fact, confirms, Danto's statements scattered throughout the replies to Danto's critics in the book *Library of Living Philosophers. The Philosophy of Arthur C. Danto*. The following expression is especially pertinent: „But I am hegelian only when my tongue is in my cheek. I think I can honestly say that my philosophy of art would have been what it is had he not existed.“¹⁸

Mgr. Sarka Lojdova is a PhD. student at the Department of Aesthetics at Charles University in Prague, Czech Republic. In her research, she focuses on analytical aesthetics, especially on the question of the ontology of art. She deals with Arthur C. Danto's philosophy of art in her PhD. thesis. During her studies she made two fellowships at the University of Sussex in 2016 and at Paris- IV Université Sorbonne in 2012. Currently, she is working on a translation of Danto's *Art after the End of Art* in cooperation with the Institute of Art History of Czech Academy of Sciences.

A STUDY ON COGNITIVE VALUES OF FICTIONAL NARRATIVE ART : FOCUSING ON DISCUSSIONS IN ANGLO-AMERICAN AESTHETICS.

Abstract | The purpose of this paper is to critically review current studies on cognitive values of art (especially fictional narrative art) in Anglo-American aesthetics and propose a new way to conceive the cognitive values of art. From Aristotle to the present day, the cognitive value of art has been the main subject in the philosophy of art. What stands out in debates in Anglo-American aesthetics is that they concentrate on specifying the kind of cognitive benefit and how artwork can give us these cognitive benefits. Initial debates tried to figure out how art can be a source of propositional knowledge of the real world, but current debates see non-propositional knowledge as a more promising option.

But, does cognitive values makes an artwork more valuable as art? It is commonly accepted that artwork has value qua art, in other words, artistic value. And it is widely held that artistic value should not be determined by accidental value such as decorative value or monetary value. Therefore, it requires special care in arguing that cognitive values contribute to artistic value and be artistically relevant. Current debates recognize this issue and try to set arguments that cognitive benefit is not an accidental effect but closely related to the proper appreciation of art. But it is questionable what consist of proper appreciation of art and how this can lead people to cognitive benefit. To clarify this point, I will divide current debates by the kinds of knowledge they argue for; knowing how and knowing what it is like. Also, there are debates explaining cognitive value without knowledge. They argue that art mobilizes what we already know and deepens understanding on it.

I argue that given the conditions for acquiring non-propositional knowledge, acquiring this knowledge is not closely related to the proper appreciation of art. And, I sympathetically agree to the idea that art 'deepens the understanding on what we already know', but this does not give a satisfying answer to questions regarding nature of deepened understanding and its artistic relevance.

Then, what kind of cognitive benefits can be gained through proper appreciation of art? I suggest that knowledge about artwork deserve more focus. Art does not only give knowledge about fictional world and character but knowledge about the way an artwork directs our mind, subtly modulates our attention and prescribes attitudes and knowledge about what it is like to be exposed to the deliberately designed world.

Index terms | *cognitive values of art; artistic value; knowing how; knowing what it is like; understanding*

INTRODUCTION

In Anglo-American Aesthetics, there are two questions concerning cognitive values of art, especially fictional narrative art. First one is about how art is cognitively valuable. Many philosophers in Anglo-American Aesthetics have tried to explain the cognitive value of fictional narrative art in terms of cognitive achievement such as gaining knowledge and understanding of the world we live in. The second question is about the relevancy of cognitive value to artistic value.¹ Most people who appreciate and criticize artwork thought that artworks have the value of their own and this value is irrelevant to other values that artwork might have. Decorative value and economic value are typical examples of the values irrelevant to artistic value. But what about cognitive value? Since there are many cases where the cognitive value of art is irrelevant to artistic value, we have to be careful in arguing that cognitive value is relevant to artistic value. For example, one can acquire true beliefs about British monarchs through reading of Shakespeare's play but this is not the reason why we value Shakespeare's work highly as artwork.²

Cognitivists are philosophers who answer yes to the above questions and present philosophically valid explanations of why they think so. Since the acquisition of propositional knowledge and its artistic relevancy was criticized for various reasons, many philosophers currently rely on non-propositional knowledge and understanding to explain cognitive values of art. This article aims to examine the arguments of cognitivism in terms of non-propositional knowledge and understanding. I'd like to start with arguments on non-propositional knowledge.

FICTIONAL NARRATIVE ART AND NON-PROPOSITIONAL KNOWLEDGE

Gaining non-propositional knowledge from fictional narrative art.

Arguments on non-propositional knowledge focus on imaginative engagement on fictional narrative artwork. Since imaginative engagement is central to our experience of it as art, many philosophers considered imaginative engagement as a key factor in explaining artistic relevance.³

Novitz argues that imaginative engagement guided by fictional narrative art enable people to get a comprehensive picture of the described situation so that they can come up with the practical strategies to deal with the similar situation in the real world.⁴ According to Novitz, people emotionally engage in artwork, questioning how characters feel in such a situation and think about the properness of a character's way of dealing with problems.⁵ If people think a character's strategy for dealing with problems would also work for themselves, they will accept the strategy as a viable option. But if people think that character's strategy is inappropriate for various reasons, such as possible bad consequences and personal inability to do like characters, then they will devise their own strategy by taking their dispositions into consideration.

Novitz's arguments about acquiring knowledge-how through fictional narrative artworks are connected with the argument concerning knowledge-what it is like. Novitz said people can get "empathic belief" through imagining and emotionally engage with the perplexities of a fictional character.⁶ Gaut made a similar point by presenting the concept of "experiential imagination." According to Gaut, artworks are filled with descriptions on phenomenal and sensory aspects of an imagined situation, so the imagination guided by artwork can be similar to an experience of the real world.⁷ Their explanations seem plausible but the relationship between imagination and non-propositional knowledge need to be put under scrutiny from an epistemological point

of view.

Critiques on the arguments on non-propositional knowledge

First, Knowledge-how is considered as non-propositional knowledge because its acquisition requires gaining mental state different from propositional knowledge such as abilities. According to anti-intellectualism, if X know how to V (an activity that people can embark on intentionally), then X has an ability to V.⁸ And it's widely held that acquisition of this kind of ability requires sufficient practices. Then it is doubtful that one intense and vivid imagination through artwork amount to knowledge-how to deal with a real-world situation. But Novitz said that people devise "plans of action appropriate to" imagined situation.⁹ So his explanation might be more plausible under intellectualists' position on knowledge-how because intellectualists analyze knowledge-how into knowing a belief about the right way.¹⁰ But intellectualists' position can't give shelter to Novitz. Stanley and Williamson emphasize not just the belief about the method, but a practical mode of presentations of that method.¹¹ There are some quarrels about the ontology of this mode.¹² But what is obvious is that they don't consider people who only thought and have an image on method as having knowledge-how.¹³

Second, Knowledge-what it is like is analyzed as having certain kinds of abilities. According to Lewis, if X knows what it is like seeing red, X has abilities to remember, imagine, and recognize the experience of seeing red.¹⁴ These abilities are acquired through the proper color experience. So when X know what it is like to fall in love, X have abilities to remember, imagine, and recognize the experience of falling in love. But if we accept Lewis's explanation, we can raise a similar doubt that one intense and vivid imagination on falling in love might not be enough for these abilities. Also, we can raise doubt on whether the experience of imagining love affair by appreciating artwork is an experience of falling in love. People imagine the character's love affairs and wondering how he or she feels in that situation and this is not an experience of falling in love. Some might think this distinction is ill-advised and oppose that we don't strictly divide them in the ordinary sense. But I think this distinction does exist in ordinary people's mind and explains why people sometimes hesitate to say that they get knowledge of what it is like to undergo events which they never experienced by reading novel.¹⁵

FICTIONAL NARRATIVE ART AND UNDERSTANDING

So far, I criticized the arguments that fictional narrative art is a source of non-propositional knowledge on the world we live in by considering epistemological explanation on non-propositional knowledge. But a group of philosophers called 'neo-cognitivist' focus on another kind of cognitive achievement which is different from gaining knowledge. Though it is not certain whether they mean the same cognitive development by 'understanding', Mikkonen said that neo-cognitivists hold the idea that "a reader (or viewer) needs to employ his or her concepts in order to comprehend an artwork and that precisely this conceptual rehearsal leaves its trace on the reader's (or viewer's) conceptual apparatus."¹⁶ I find the idea that artworks leave a *trace* on people very interesting. But, neo-cognitivists need extra explanation on *what* kinds of trace artwork leave on people and *why* this trace is counted as a case of understanding because a trace itself is cognitively neutral. In this section, I will summarize two views on this matter and critically examine each of them.¹⁷

Graham's argument and its problem

According to Graham, fictional narrative artworks "direct people's the mind" and create images on character, scenes, events, ideas.¹⁸ These images "illuminates" people's everyday experience, be a paradigm for people's conduct and thought, thereby "enhance" our understanding of human condition.¹⁹ For Graham, images on character

and scene might be a trace left by appreciating the artwork.

But, Graham's explanation on why this trace is a case of understanding is not satisfying because Graham doesn't explain why the image can be a case of understanding on the human condition in epistemological point of view.²⁰ Graham separates getting understanding from getting a piece of true information. but don't explain much on the nature of understanding itself.²¹ If understanding is a kind of cognitive achievement like knowledge, there might be conditions for getting understanding or advanced understanding than before. And cognitivists who propose another epistemic concept such as understanding as a preferable option must explain how artworks contribute to people's understanding, not relying on the commonly accepted metaphors.

Elgin's argument and its problem.

Elgin explains how fictional narrative art contributes to people's understanding by relying on exemplification. A fictional character and situation exemplify a property of the world or a theoretical commitment and people have to interpret the artwork to figure out what this situation or character exemplify.²²Elgin also explains the nature of understanding. The type of understanding she deals with is objectual understanding. According to Elgin, objectual understanding is not just about proposition but about a topic or subject matter. For example, "I understand the New York subway system" is a case of objectual understanding. Objectual understanding is holistic in the sense that to get a right understanding of certain topic, one has to grasp a complex network of central items or commitments which constitute that topic.²³

But I think Elgin's explanation has problems. First, the exemplification of art is different from the standard case of exemplification. Some fictional character's inner life can be interpreted as exemplifying anxiety about the future, we have to connect complex inner life with a proper concept to understand a character. But described inner life is so particular that it is hard to find one in the real world. Therefore, it is epistemically not proper to conclude that someone gets anxiety on the future mostly have a similar inner life with a fictional character. However, a paint sample allows people to conclude that the objects covered with that paint mostly have the very shade of a paint sample. If this is so, we have to be more careful in saying that artwork exemplifies philosophical commitments or a property of the world and therefore contributes to our understanding on the world just like the other case of exemplification.

Second, interpretation is essentially an activity to get an understanding of artwork, then an advancement of understanding on a property or philosophical commitment seems to be incidental in interpretation on an artwork. Fictional character interpreted as exemplify the anxiety on the future surely leads people to an understanding of the character, people can mobilize their previous knowledge of the anxiety about the future in interpreting the character. But whether this cognitive work connected to an advanced understanding of anxiety about the future itself is another matter. During an interpretation, people could add new commitments/items to their understanding and forming the connection between them.²⁴However new connections or commitments must be considered as proper under some epistemic standard and we need further justification to confirm what I add or connect is epistemically proper.

CONCLUSION: A NEW PERSPECTIVE

Thus far, I briefly present the arguments of cognitivists focusing on cognitive achievement other than non-propositional knowledge and understanding. They focus on the imagination guided by artwork and interpretation on artwork as the source of non-propositional knowledge and understanding of the world we live in. But I show that contrary to intuition, it is difficult to explain that people get a cognitive achievement on

the world they live in from fictional narrative art and it is artistically relevant. Maybe we need a new perspective in dealing with the problem of cognitive values of art.

In Anglo-American Aesthetics, the cognitive value of art commonly understood as an artwork's capacity to provide knowledge or understanding of the world. This is the same cognitive value when we think about the cognitive value of newspaper, non-fiction books or articles. Cognitivists think it is possible that people can get the same insights about life from fictional narrative art and non-fiction book. But what is characteristic to fictional narrative art is the way it imbues its insights to people's experience on an artwork.²⁵ I think if the way is *characteristic* to artwork, we have to focus much more on the way artworks modulate people's attention and induces certain responses by using various artistic methods. The narrative structure and a mode of presentation which engages people's cognitive and emotional capacities are precisely the artwork's achievement. And by focusing on the way artworks directs our mind, people can get knowledge and understanding of how the fictional world is deliberately designed to take a certain attitude towards a character and how they themselves respond to those artistic details. It is not about the knowledge of the world and human life, but this is distinctively artistic and about our aesthetic nature.

A STUDY ON THE “PURPOSE” OR “NON-PURPOSE” AND THEIR AESTHETIC SIGNIFICANCE

Abstract | “Purpose” and “Non-purpose” are two classical Chinese aesthetic categories, which are not yet fully studied. As a medium, “Purpose” is derived from the “Doing something” and “Doing nothing”, which belongs to the Taoist philosophical categories of Laozi and Zhuangzi. “The Tao Emulates Nature” requires “Doing something” must be sublimated to level of the “Doing nothing”, during which the qualitative change is the symptom state of “last resort”. Qin Guan’s thesis of “Non-purposive writing” and “Purposive writing” symbolize the birth of “Purpose” and “Non-purpose” as a group aesthetic category at the same time. It takes the literary independence as the boundary of “Non-purposive writing” and “Purposive writing”, triggering “the distinction of high or low quality between ancient and modern literature” and then the formation of a wealth of theories on literary creation elements. “The distinction of high or low quality between ancient and modern literature” is not only a correction of the traditional logos centrism tendency of classical literary theories, but also an important supplement to the simplistic, mysterious and one-sided cognition of literary creation. The Theories of literary creation elements, which deliver a theoretical appeal for the categories of “Purpose” and “Non-purpose”, present in the deductive way of scattered points. There are many literary conceptions that focus on the aesthetic creation and aesthetic criticism, such as “Writing without purposive pursuing”, “The literature created out of expectation”, “The poems created without purposive writing”, “Perfect without purposive seeking”, “Accordance without purposive refining”. All of above conceptions present inductively the connotative conformity of “Purpose” and “Non-purpose”. Through the medium of these integrated categories, such as “Perfect without purposive seeking” and “The literature created out of expectation”, “Purpose” and “Non-purpose” are merged into the category of “Beauty” in the name of optimum of writing and eventually become the Chinese version of Kant’s aesthetic judgment, i.e., “Beauty is purposiveness without any definite purpose”. The studies on the categories of “Purpose” and “Non-purpose” have a complete pedigree and a clear history, which fully highlight the characteristics and theoretical development of Chinese classical literary theories and aesthetic thoughts. It not only promotes and expands the existing studies of categories on aesthetic and literary theory, but also proves again the development of world aesthetics must attach great importance to the rich connotation and unique contribution of Chinese classical aesthetics.

Index terms | *Beauty; Kant; Nonpurpose; The Tao Emulates Nature; Perfect without purposive seeking; Purpose; Writing without purposive pursuing*

The study of aesthetic category is an important part of the study of aesthetic thoughts and its history of development. "Purpose" and "Non-purpose" as an aesthetic category that did exist in Chinese classical aesthetics, which should be attached great importance to by academic circles. This paper focuses on the "Purpose" and "Non-purpose" aesthetic categories with Chinese characteristics and their derivative category pedigree, summarizes the unique expression of "the characteristics of beauty" in Chinese classical aesthetics, and enriches and completes the existing Chinese aesthetic category system. Then it reveals their significance and value in the history of aesthetics.

"Purpose" and "Non-purpose", as an independent aesthetic category, entered the researchers' field of vision since the beginning of the 21st century.

As a pair of relationship category in the history of philosophy, "Being" and "Not-being" derived from Lao Tzu^①Lao Tzu was an ancient Chinese philosopher and writer. He is the reputed author of the Tao Te Ching, the founder of philosophical Taoism, and a deity in religious Taoism and traditional Chinese religions. There are two categories, which are "Doing something" or "Doing nothing" and "Purpose" or "Non-purpose", influenced each other with the motivation of "Going". "Non-purpose", as one of the premises of "Doing nothing", clarified the logical relationship between "Doing something" or "Doing nothing" and "Purpose" or "Non-purpose". Namely, The behavior with "Purpose" is "Doing something", while the behavior with "Non-purpose" is the premise of "Doing nothing". "Non-purpose" doesn't equal to "Doing nothing" and "Being natural". Only the purpose out of "Non-purpose" can realize that of "Purpose". "Getting without purposive pursuing" and "Success without purposive doing" is the true connotation of "Doing nothing" and "Being natural".

The philosophy of Laozi and Zhuangzi also reveals the influence of Taoist philosophical categories, i.e. "Doing something" and "Doing nothing", on the "Purpose" and "Non-purpose" from horizontal and vertical dimensions respectively. As far as vertical dimension is concerned, "Doing something" must be transformed into the entity of "Doing nothing". Only by "Doing nothing" can we achieve perfection, which are "Doing anything by doing nothing" and "Being natural". As far as vertical dimension is concerned, the opportunity of "Doing something" transformed into the entity of is a special symptom of "Having no alternative", which reveals the trick of "Taoism and nature as well as the provides guide for the actual operation of "Tao". The key to transforming "Doing something" and "Doing nothing" into "Doing anything by doing nothing" is following the principle of "Having no alternative".

"Purpose" and "Non-purpose" originate from the philosophy of Laozi and Zhuangzi. There is also a problem of transformation in the nature of this category. Through the Wei Jin and six dynasties, the vague and unconscious aesthetic category of "Purpose" and "Non-purpose" was obviously improved its state until Tang Dynasty. In the Song Dynasty, when Su Xun^①drew an analogy between the pattern of heaven and earth and the literary creation again, he began to use the word "Non-purpose" which refers

to unintentional. From then on, "Purpose" and "Non-purpose" appeared explicitly as two independent categories. Qin Gua^② was the first scholar who uses "Purpose" and "Non-purpose" in a group to carry out literary criticism. His advocacy that "Writing without Purpose" and "Writing On Purpose" symbolizes the birth of "Purpose" and "Non-purpose" as a group of aesthetic category, and its connotation and denotation are used for reference and absorbed by literary critics in later ages, which obviously shows that "Purpose" and "Non-purpose" occupied an important position in ancient

Chinese literary criticism and literary aesthetics.

Due to the demarcation of Literature before and after its independence, the consciousness of literature broke the cultural chaos. The tremendous historical potential from syncretism of culture and doctrines has exerted an incalculable impact on the tendency of literary criticism. Therefore, it triggered an extremely active ideological trend of “the distinction of high or low quality between ancient and modern literature” in the history of ancient Chinese literary criticism, which the main purpose is as follows: It is the ideal stage of “Writing without purpose” for the sages who syncretize the culture and doctrines during the period of pre-literary independence; while there is the crisis stage of “Writing with purpose” after the independence of literature, which leads to the division of culture and doctrines and the decline of literature daily, showing the obvious tendency of esteem the ancient times and suppress the present.

With the gradual independence of literature from the field of ideology and culture, the literary creation became self-conscious and entered the register of “Purposeful writing”. In the process of concentrating on literary creation after its independence, it is inevitable to touch upon many problems related to literary creation. Finally, it converges and condenses into a very rich and interesting theory of literary creation elements in Chinese classical literary theory, especially that of the Qing Dynasty.

The significance of the concentrated emergence of various theories of literary elements lies in the following aspects: First, It is a correction of the opposing views such as “Tao (learning, vitality, virtue, knowledge) and Affection”, “Inspiration and Force”, “Affection (meaning) and Diction”, “Purpose and Non-purpose” and so on, which are widely existed in the history of literary criticism. It opposes the logos centrism tendency in the tradition of Chinese classical literary theory from emphasizing one element to paying equal attention to a variety of them. Second, paying too much emphasis on the irrationality of Non-purpose will inevitably lead to the biased cognition of literary creation, which is simplistic, mystical and one-sided, while the theory of the elements of literary creation is an important complement to this. Third, it is also the concretization of connotation for the group category, such as “Purpose”, “Nonpurpose” and “Last resort”.

What the concrete connotation of “Purpose” is the external material category from the perspective of creation motives and purposes, such as the fame and fortune, which is the condition that the creative subject must be eliminated before putting into the creation, so as to prepare the aesthetic mind. It means that writing regardless of or in violation of the laws in literature from the perspective of overall evaluation of creative behaviors. It implies that the writer blindly puts emphasis on the material aspects of the “craftsmen”, such as words, rhymes, grammar and so on, rather than other creative elements from the perspective of the details of the creative process. It refers that the creative behavior under the guidance of clear motive and purpose, which is opposite to the “Non-purpose” writing before the independence of literature and the state of inspiration from the perspective of the nature of the creative behaviors.

Taoist philosophical categories of Laozi and Zhuangzi integrates the two opposite categories of “Doing something” and “Doing nothing” with “Doing nothing” and “Doing anything by doing nothing”, and marks it as the ideal of “The Tao Emulates Nature”. In the same way, “Purpose” and “Non-purpose” as two opposite categories, which are two display forms of integrations: one is to focus on aesthetic creation. The integration of “Purpose” and “Non-purpose” embodied in the following aspects, such as “Writing without purposeful pursuing”, “The literature created out of expectation”, “The poems created without purposeful writing”, which refers to the practice of literary creation

with the nature of “Purpose” manifested in the results of creation with the nature of “Non-purpose”. However, there are different insights into transformation between the practice and the results. The other is to focus on aesthetic criticism, the integration of “Purpose” and “Non-purpose” embodied in the following aspects, “Accordance created without refining”, “Perfect without purposive seeking”, “Accordance created out of expectation”, which refers to the high evaluation of the overall aesthetic effect on many elements with the nature of “Purpose” during the process of literary creation. Whether it is the aesthetic creation level of “Writing without purposive pursuing” or aesthetic criticism level of “Perfect without purposive seeking”, they as the integrated category derived from the unity of opposites between “Purpose” and “Non-purpose”. They have become the ideal of literary creation and literary criticism, and the embodiment and the highest standard of “beauty” and “nature”. Thus, these three categories, such as “Beauty” and “Nature”, “Perfect without purposive seeking”, “Purpose” and “Non-purpose”, reveal us a special set of relations: the dialectical unity of “Purpose” and “Non-purpose” or the nature of “Writing without purposive pursuing”, “Perfect without purposive seeking” and “Accordance created without refining” is also the core connotation of “Beauty” or “Beauty lies in nature”.

It goes without saying that “Perfect without purposive seeking” or “Purpose” and “Non-purpose” is all intertwined with distinct nature of purposiveness and aimlessness. This reminds us of Kant, who is the ancestor of modern aesthetics, holds the viewpoint that one of Kant’s provisions on “the characteristics of Beauty”, i.e., “Beauty is purposiveness without any definite purpose”.^① It is an amazing coincidence that Kant just uses the very concept of “Purpose” and “Non-purpose” to express the interpretation of artistic purposiveness or “ purposiveness without any definite purpose ”, namely, although the purposiveness of a beautiful work of art is purposeful, but it does not seem to be so. That is to say, the beautiful art must look like nature, although people realize that it is art. The Characteristics of Kant’s so-called “Beauty is purposiveness without any definite purpose” is such categories as “Perfect without purposive seeking”, which is mentioned in this paper as a category of integration. A series of categories have been developed, focusing on the set of category “Purpose” and “Non-purpose”, which constitute a complete Chinese theoretical discourse system with the characteristics of “Beauty is purposiveness without any definite purpose”. Dates back to its history, the integration of “Purpose” and “Non-purpose” began in the middle of the Tang Dynasty, the category of integration has been basically stereotyped in the middle of the Northern Song Dynasty. Compared to Kant, we were almost a thousand years earlier!

AESTHETIC TRANSMUTATION OF URBAN IMAGE IN THE ERA OF ECOLOGICAL CIVILIZATION

Abstract | There are two criteria in regard to evaluation of the emerging city image in era of ecological civilization. The first is civilization, which has to be established on the basis of industrial civilization in modern times that equipped with high technology. The second is ecology, or ecological balance, which means to benefit human and natural ecology at the same time. There are five important characteristics in cities in the era of ecological civilization. First, the superiority of the whole urban ecological system asks for great drainage capacity, and the capacity to resist ecological catastrophe to some degree; in which condition the citizens must have high qualities of ecological civilization, and the ecology of life taste can be manifested. Second, urban environment should be made more like landscape and be more available to people, only in this way can it be real urban garden. Third, a certain amount of the wild which maintained as original ecological nature should be preserved, excessive artificial beautification must be prevented. Fourth, a certain degree of agriculture must be reserved, to be significant components of urban ecological system. Fifth, a certain degree of architecture from different historical periods, as well as natural elements, must be reserved in urban environment, they can express the history of urban development. The process of shaping urban image in ecological civilization, is also the process of cultivating new aesthetics. Aesthetics in the era of ecological civilization has more tolerance and freedom than before. The outstanding features of its aesthetics are, to respect and be friendly to ecology, to take ecological happy life as highest ideal of life, as well as to take ecological harmony as aesthetic principles. Eco-civilized city is the only path to the future of development of industrial civilization of the city.

Index terms | *Ecological civilization; City image; Aesthetics; Environmental aesthetics; Landscape garden city; Historical and cultural city*

INTRODUCTION

City is the essence of human civilization. Civilization has both contemporaneity and historicity. There are not only the contemporaneity of civilization but the historicity of it in urban image which is created by different civilizations. The ongoing construction of ecological civilization has been already under the way on the existing foundation. At present, it's a guesswork basically about how the future urban image of ecological civilization will be. According to the author's understanding of ecological civilization, there are five important features in these cities in the era of ecological civilization.

1. Five important features of cities in the era of ecological civilization

The first is that the appearance of the concept of living city makes the ecological nature of the urban lifestyle highlighted. There is life in city. However people often firstly attached importance to profits involving the aspects of economics, politics and others rather than life before the era of ecological civilization. Nowadays, it's more of the best environment for high-quality life. There are five features about high-quality life, including higher life freedom, higher life comfort, higher life culture, higher life art and higher life harmonious degree. All in all, the life which more fits in with humanity and has ecological nature is known as ecological happy life by me.

The second is that the appearance of the concept of gardening makes urban environment to be more available to people. Garden is the ideal living environment for people. The city in the era of ecological civilization should be garden as a whole. The biggest difficulty about this project is protection of ecology. What city fears most is not only impractical landscape but also impractical landscape engineering. It seems to respect nature, but actually it damages the ecosystem. I advocate urban gardening, and oppose landscaping excessively. Gardening has both landscape and ecology, while landscaping has only landscape not ecology.

The third is preserving a certain amount of the wild in the urban environment. Wild is undeveloped natural place, the importance of which is original ecology. Only original ecology is the true ecology. In terms of ecological value, artificial ecology such as virescence can by no means be compared with original ecology. People generally regard the wild as their development object. At present, barely any wild can be found in China. The value of wild lies not only in ecology, but also in aesthetics. It is of unique aesthetic value if looking at wild in a different aesthetic standard.

The forth is reserving a certain degree of agriculture in city. There is no civilization in which people have done better than agriculture in terms of the unity of ecology and civilization. There is a certain degree of agriculture around the city due to the ambiguous boundary between cities and villages in the era of agricultural civilization. The agriculture is swept out of the city of industrial civilization based on the benefit of economy and the aesthetic standard of these cities. However, from the demands

of ecological civilization construction ,there should be some ecological agriculture building in cities. The urban ecological agriculture has lots of benefits. Firstly is ecological benefit, which plays positive role in ecosystem such as cleaning up pollution and optimizing the city environment. Secondly is life benefit. The product of ecological agriculture is mainly fruit and vegetable or livestock. It serves citizens directly and meets the demands of markets. Citizens will not build the sense of trust to the food, as well develop rapport even the sense of beauty of crops entirely. Meanwhile, urban agriculture can be a place of sightseeing for citizens' relaxation. What's more, it's an important educational base of agriculture for middle and primary school.

The fifth is reserving a certain degree of architecture from different historical periods and natural elements in urban environment. Artificial architectures includes houses as well as municipal engineerings. Houses reflect the nature of the times in artificial architectures. During the 40-year reform and opening-up, we should select some old houses which embody times features to be reserved.

Ecology is the existence of both the space and time. It as time existing shows the process of the life extensive and development. Natural ecology do so, so do the artificial ecology. The history of city is extremely important, as the synthesis of natural and artificial ecology. History needs to be marked. What really counts as a marker is artificial and natural architecture because the word is only used to be recorded. Therefore, Protecting historical mark has a significant meanings,including some ruins in city.

The nature of beauty is grace as spatial existence, and sublime as historical existence. The time shapes space and the sublime shapes grace. If the grace shows the beauty of life, the sublime shows the hardship of life.

The ecological civilization is not only the criticism of industrial civilization but the inheritance of that. Complex city image in the era of ecological civilization has the the characteristics of the era of ecological civilization and retains traces of city image in the era of industrial civilization. The process of shaping urban image in the era of ecological civilization is the process of cultivating new aesthetics.

2. Cultivating new aesthetics

First, unity with nature means integration of ecology and civilization.

There are different explanations for Chinese traditional aesthetic theory that man being integral part of nature in different eras. The most common explanation for that in industrial civilization is that the unity of man and nature. The unity can be divided into two levels. One is cognitive level. People must be able to achieve a certain degree of understanding through scientific experiment. When the spiritual recognition of nature orient to practice, the unity of man and nature will leap to second level as practice. Man's practice of nature can achieve success to a certain

extent due to basis of scientific knowledge. On one hand, the achievement brings benefit to human beings. But on the other hand, it brings certain destruction to ecology. People also need to carry out the practice of unity of heaven and man, which highlights the unity of ecology and civilization in the ecological civilization time. The theme is unity of ecology and civilization in the ecological civilization times. The aesthetic object in this era is the beauty of ecological civilization which is the beauty of the unity of ecology and civilization.

Secondly is the combination harmony and contract harmony.

Beauty emphasis on the harmony which has lots of forms. We need this harmony in the era of ecological civilization. In terms of relationships between ecology and civilization, the ideal state is combination harmony which belongs not only to ecology but to civilization.

It's a ideal at least for modern people about the harmony of ecology and civilization, which is worth mentioning. The present level of human productivity and science and technology can't achieve a true unity of ecology and civilization strategically. Another contract harmony appears under the background. It doesn't pursue the mutual feeling of both to create a new quality, but highly prevent the harm of both to ensure the realistic state of their interests. It is not bound by contract to harm each other. Its essence is demarcation to divide the equity between the two. The relationship between ecology and civilization is tense in the era of industrial civilization. The reason for the tension is that there is no contract between man and nature. People obtained too much from nature without constraints for their own interests, thus causing serious damage to the natural ecology. The severely injured nature, in turn, retaliates human seriously. Human behaviors should be restrained in the era of ecological civilization. The constraint is contract.

The contract harmony doesn't create a new quality, but it protects the interests of both civilization and ecology from excessive harm. It's also a harmony due to its positive meanings.

The realization of contract harmony is mainly reflected in the protection of wild, local plants and wild animals in process of shaping urban image. In this regard, it is necessary to legislate and educate citizens on ecological ethics. ecological ethics. It's not only a symbol of civilization but also a prominent embodiment of the new aesthetic to cherish local plants and wild animals.

Thirdly is simplicity and thrift.

Simplicity is a philosophical concept in ancient times. Chinese ancient philosopher Lao-tzu summarize his philosophical concept in simplicity¹. The philosophy of Lao-tzu emphasizes respecting the essence while guarding noumenon. Essence and noumenon is nature. Nature is a state. When it rise to the theoretical height, it's Tao. Lao-tzu emphasizes expressing simplicity and embracing the original nature.

1 Chen Guying, *Annotation and Comments on Lao Tzu*(Beijing: Zhonghua Book Company, 2015), 128.

Simplicity is also a moral concept according to Confucius. Confucianists cherish resources of people². For this reason, they advocate plain living. The frugality of Confucianism merges with the simplicity of Taoism on the moral level. Thrift is the principle of simplicity. The thrift of Taoism focuses on saving people's desires and materials. Its purpose is to cultivate one's morality. While Confucius focuses on saving resources of the people and waste. Its purpose is to reduce confrontation between government and people and maintain social stability.

We should advocate plain lifestyle and establish aesthetic that regard simplicity as the beauty in the era of ecological civilization. The lifestyle also emphasizes thrift, the key point of which is resource. Excessive consumption of resources not only affects sustainable development, but also damages the environment. Both of them are the opposite of ecological civilization.

Simplicity is related to aesthetic appreciation directly. In fact, It is not only a philosophy and moral character but an aesthetic way. It is worth noting that there are similarities and differences between the beauty of simplicity advocated now and that of simplicity in ancient times. The similarities are mainly manifested in simplicity. The views of ancient and modern are consistent whether it is to save human resources or resources or not. Only for the purpose of simplicity, the ancient emphasized on reducing social incompatibility, while the construction of ecological civilization is focused on in the modern times. The differences are mainly manifested in form. The simplicity in ancient paid more attention to simple forms instead of magnificence. However, now the content is stressed out. As long as the resources don't be wasted, gorgeous forms can be done. The gorgeous forms and simple content aren't contradictory now.

In some sense, the urban aesthetics in the era of ecological civilization focuses the essence of all human civilizations. It has the most strict ecological single-dimension, and has diversity of culture and personal interests at the same time.

Ecological single-dimension is to say that people's aesthetics in the era of ecological civilization must be transferred to a good ecological basis. Good ecology refers to the harmony between human and ecology firstly. The meaning of mentioned harmony is mutually positive. Ecology plays a dominant role in ecological harmony. It doesn't need to affirm people, while people should affirm it. Only with the affirmation of human beings and benefit to human ecology is it possible to enter the field of civilization, which is the major premise.

According to the aesthetic habits formed by industrial civilization, people like to make contemporary landscape projects neat, for instance afforestation likes to arrange trees in a row. People also like the colorful landscape. As a result, the most enjoyable plants which may be not necessarily native species are the first choice, whose cultivation should be paid the most expensive price naturally.

2 Yang Bojun, *Annotation and Notes on The Analects of Confucius*(Changsha: Yuelu Press, 2009), 3.

3.Conclusion

Aesthetics in the ecological civilization times has maximum tolerance and freedom in the premise of ecological single-dimension. There are not only one model but multiple models in ecological civilization city. All the urban models in the era of ecological civilization is under the construction and being implemented. Although we can't say that it has a presupposed model, it has a presupposed direction which is the unity of ecology and civilization. The unity is never complete, but only be continuous.

Chen Wangheng is a professor in School of Philosophy of Wuhan University in China, a member of International Association for Aesthetics, and also, a foreign member of American Society for Aesthetics since 1989. He has published more than sixty books and hundreds of papers, his representative English books are Chinese Environmental Aesthetics and Chinese Bronze Arts, and his representative Chinese books are History of Ancient Chinese Aesthetics, Environmental Aesthetics and The Civilization Before Civilization, etc. He has been awarded social sciences award by Chinese government many times. He is an excellent scholar who has obtained the Governmental Special Allowance of the State Council of China.

Chen Xinyu, an undergraduate in College of Urban and Environmental Sciences, Hunan University of Technology. She is a junior student, majoring in architecture. She has published a paper in journal as far. She has translated and published some papers, such as Re-enchantment of Wilderness And Urban Aesthetics.

CHINESE AESTHETICS: ONENESS WITH NATURE, ATMOSPHERE OF THE VISIBLE, AND SPACES OF MA YANSONG AND OLAFER ELIASSON

Abstract | Chinese aestheticians and artists are working to describe the individual beholder's aesthetic awareness of oneness with the natural environment. Zhuangzi's account of subject-object melding is used to convey this awareness. Advocates claim this melding is modeled by *shanshui* paintings that produce *qiyunshengdong* ("spirit resonance, engendering vitality"), a feeling of oneness. This *shanshuic* cultivation of "the ideals, charm, and atmosphere of life as a whole" (Li Zehou) is being globalized. Ma Yansong uses it to build holistic urban habitats; Chen Wangheng and Cheng Xiangzhan use it to explain how living in happiness depends on environmental protection. Pragmatist and analytic philosophers have objections. First, Bertrand Russell rejects the idea of *oneness* with nature as malicious; he believes it is supported *not* by the senses but only by feeling or rational intuition. Second, some reject *aesthetic* appreciation because they think it imposes an *aesthetic attitude of disinterestedness* that prevents the beholder from appreciating nature on its own terms (Allen Carlson, Arnold Berleant, Noel Carroll). Both require rebuttal; because Ma Yansong does say the *shanshui* worldview is based on emotion, and Zhuangzi suspends interest in perceptions of physical objects.

I claim Chinese aesthetics dissolves both objections. The idea of oneness is supported by a sensible element in the sense of sight that is played up by downplaying perception. Jing Hao's interpretation of *qiyunshengdong* confirms this: the artist produces the feeling of spirit resonance with nature by making a formless image of *zhi*, a display of visible surface (Jonathan Hay) belonging to the beholder's interior life (Stephen Owen). Formless images, never images of form, authentically represent a hidden truth of the vitality of nature: the eye presents an animating texture and atmosphere of space that is visible and private. Even Russell grants this: "the real space is public, the apparent space is private to the percipient."

The *shanshui* worldview holds up: aesthetic appreciation of oneness with nature. The programs for architecture and environmental protection do too. Euro-American philosophers will accept this idea supported by sight. Paradigm change is possible. *Shanshui* aesthetics explains how Olafer Ellison's *The Weather Project* (2003) and *Feelings Are Facts* (2010), with Ma Yansong, convey feelings of oneness with nature. They emphasize uniqueness of place and the aura of existence (Zhoufei Wang); this uniqueness is the envelope of private visible space in the sense of sight. It is noted when perceptual understanding of time and public space (or facts) stops.

Chinese philosophers are now using traditional Chinese aesthetics to describe how each human beholder can appreciate by looking that an existing natural landscape and one's own uniqueness are one and indistinguishable. Chen Wangheng uses this core idea to advance an environmental aesthetic that guides each human being to protect the natural environment. Ma Yansong uses this same idea of oneness with nature to create spaces of gaps and voids that reduce alienation and lead human beholders in Beijing and Rome to feel as if they are in a natural landscape. Traditional Chinese aesthetics is now used confidently in environmental ethics and urban design. It is an approach to aesthetics accepted as a live option in the global community of philosophers.

Given this accelerating globalization of traditional Chinese aesthetics, what follows logically for the history of philosophy and for assessing contemporary environmental art and architectural designs?

My answer comes in a cascade of five sections and five conclusions. In section one, I find five core claims in Chen Wangheng's account of traditional Chinese aesthetics. These include the ideas of an *aesthetic attitude*; noticing by eye the *private* and *cognitively ineffable* character of a natural landscape, an idea of *oneness with nature*, and *the unity of art and nature appreciation*. Chen finds the origin of these principles in Zhuangzi and in the first principle of painting advanced by Xie He and reiterated by Jing Hao just before the Northern Song Dynasty. I conclude that (1) Chinese aesthetics instructs the painter as follows: *produce an idea and feeling of oneness with nature by adding an image of visible surface that leads the beholder to recall having looked by eye at a lively and cognitively ineffable visible-surface that supports an idea of oneness with the natural environment*.

In section two, I note that the history of Euro-American philosophy is filled with cases where influential writers resist or discard the aesthetic attitude, language for what is cognitively ineffable, the idea that art is about what is private, and the idea of oneness with nature. From these premises, I conclude that (2) *the language of traditional Chinese aesthetics and its five core ideas is incommensurable with the disciplinary languages favored by Kant, William James, Bertrand Russell of 1912, Wittgenstein, and Arthur Danto*.

Section three poses the question of how this incommensurability is to be resolved. I use Thomas Kuhn's procedure for resolving communication breakdowns.¹ Does traditional Chinese aesthetics *supplant* pragmatist and analytic philosophies? Or is it *anomalous due to error or madness*? I find that many late-modern Euro-American philosophers who decline to accept one or more of the five core ideas do themselves refer, if fleetingly, to a non-cognitive uniqueness displayed by eye. They usually discard it as uninteresting, because it is not an object of knowledge. To give one example, Russell himself states that "the real space is public, the apparent space is private to the percipient."² So although he discards this private space as uninteresting, he has direct acquaintance with the uniqueness of private apparent space (before perception of space-time) that would enable him to discover what Zhuangzi says about oneness with nature, or what Chen Wangheng means when he describes looking at the private character of the natural environment (or at "my environment"). I conclude that (3) *traditional Chinese aesthetics describes a paradigm for contact with nature that does supplant the language of analytic philosophy*. Chinese aesthetics is a better representation of what nature is really like *in the eye and sense of sight of the human being*; life in nature is not equivalent to cognitive understanding about it.

Fourth, given that the language of Chinese aesthetics is better at accommodating the language for the uniqueness of visible surface or private apparent space, it follows that (4) the *globalization of traditional Chinese aesthetics is a sign of crossing a tipping point— a crossing of 60 or 100 years in the making – to a new cultural period in the histories of philosophy, art and art criticism.*

Finally, in the fifth section, I ask if there is evidence that global culture is crossing over into a new period. If there is no such shift, then traditional Chinese aesthetics is not better at accommodating the language of contemporary artists, designers and art critics than the cognitive theories of art belonging to analytic philosophy. Is it better? Yes. For support, I discuss the language that Ma Yansong uses to describe his projects, including *Feelings are Facts* (2010), with Olafer Eliassen, and *Via Boncompagni Housing* (2010-2016).

1. Five Core Ideas of Traditional Chinese Aesthetics

Traditional Chinese aesthetics consists of at least five core ideas: (a) *oneness with nature*, (b) *aesthetic attitude*, (c) *a concrete image ineffable as a natural object*, (d) *the private character or uniqueness of the natural environment*, and (e) *the unity of art and nature appreciation*. Chen Wangheng, for example, writes that the traditional principle “nature and the human are one” (天人合一 *tianren he yi*) is supported by Zhuangzi and Daoist texts that describe how the human beholder looks at nature and acquires an aesthetic appreciation of the melding of subject and object and of the natural environment as having a “private character” or as “my environment.” As the painter and Buddhist scholar Zong Bing (375-443) states, this same principle of oneness arises as an authentic meaning or original idea (真意 *zhenyi*), when the human individual cultivates aesthetic appreciation of a landscape for its manifest concreteness as an *image* (象 *xiang*) that words cannot describe. Thus, an *aesthetic attitude* stops the continuous transition of perceptual experiences of natural objects long enough for the concreteness of the image of a landscape to be savored as an intersection or fusion of interiority and exteriority. Chen Wangheng adds that the principle of the oneness of the human individual and nature is given in Xie He’s first principle of aesthetics, *qiyunshengdong* (氣韻生動). Victor Mair interprets and translates this as “spiritual nature is (conveyed by) instilling vitality”³ After Jing Hao adds advice, it becomes the standard for making good mountain and water (山水 *shanshui*) paintings.⁴

What do Xie He and Jing Hao mean by *qiyunshengdong*? Xie He does not describe the vitality that needs to be instilled to produce spiritual nature or the feeling of oneness with nature. He does not explain how to paint it. But Jing Hao does. The *shanshui* painter needs to make forms that resemble mountains, of course; but it is only after adding formless images of *qi* (氣 spirit, energy) and *zhi* (質 substance) that a painting represents the vitality of nature displayed by looking at a natural environment.⁵ What is *zhi*? Ming-Qing decorative artists describe playing down form and structure in order to play up *zhi* and sensuous surface, so an image of *zhi* may be interpreted as a display of a formless visible surface.⁶ This thought of producing the feeling of oneness by playing up formless visible surface can be connected with Zong Bing’s remarks. This is to say that clearing away perceptual experience leads to looking at a natural landscape as an image, not as a web of interrelated objects in human experience. Gathering these results, I conclude that the feeling of oneness with nature is produced by a formless image of visible surface that resembles a formless, non-cognitive, image of visible surface displayed whenever the human being looks at a landscape without any interest

in experiencing objects.

2. Incommensurability

It follows that the language of traditional Chinese aesthetics with its five ideas is incommensurate with most modern Euro-American philosophies. Kant affirms an aesthetic attitude marked by disinterest in concepts of real things. But he holds that this attitude never provides access to support within the senses for an idea of what is absolutely good or of one's own existence in nature. Some philosophers of the natural environment reject the idea that an *aesthetic* attitude can promote nature appreciation; they think it pulls the human beholder away from sympathy for nature as it is (Allen Carlson, Noël Carroll).⁷ Bertrand Russell holds that the idea of oneness is not supported by the senses but only by mood or abstract reason; so he concludes that it is malicious to science since beliefs about existence need support by the senses.⁸

3. Paradigm Shift: Art and the Aesthetics of Morals

These familiar reasons for resisting the ideas of traditional Chinese aesthetics do not work. Aesthetic appreciation of private apparent space – or the private character of the visible surface displayed in one's own look at a landscape – is a reason to think that an aesthetic attitude can bring the human beholder closer to direct acquaintance with nature than the concepts of cognitive understanding. Given his remarks on private apparent space, Russell has available support in the senses for the idea of oneness with nature; he can notice that the uniqueness of his own sense of sight is indistinguishable from the visible context that supports his own experiences of natural objects. Danto declines to include display of a primitive, irreducible uniqueness as part of what art is about; but his reason for declining is not entirely satisfying: a cognitive response to art is more characteristic of the experience of artworks.⁹ But this is to miss part of what Chinese ink paintings are about: the use of voids to represent the private visible surface of the sense of sight that reminds the beholder that each of us is inseparable from our own respective, utterly unique displays of a particular natural environment.

4. New Period: Art for an Aesthetics of Morals

The *shanshui* idea of aesthetic appreciation of oneness with nature holds for each human being; each of us can presume that the other possesses a similar self-existence supported by the stable visible surface displayed the sense of sight. The uniqueness of the visible surface displayed privately in the sense of sight is an advantage: it is not subject to the variations that occur in perception.

5. Ma Yansong and Shanshui City

Is there evidence of a shift by artists or philosophers to use of the five ideas of traditional Chinese aesthetics? I suggest that a shift to a new period is evident, because designers such as Ma Yansong are now explicitly using the terms of traditional Chinese aesthetics to describe how their designs are about non-cognitive direct acquaintance with the natural environment.

Consider the language that Ma Yansong uses to describe *Feelings Are Facts* (2010), made with for Olafer Eliassen, and also the gaps and voids of space in his own *Via Boncompagni Housing* (2010-2016). In regard to *Feelings are Facts*, Ma Yansong states that his aim is to create a space that opens up the senses. But speaking about the atmospheric space of this installation, he adds that “in the end, it's empty, there is

nothing actually, no object.”¹⁰Regarding his own program, MaYansong describes how gaps and voids enable human beings to notice “their intimate connection to individual life and emotion;” for the ancients, these were “the spaces where the relationship between humankind and nature was nourished.”¹¹Continuing, he describes one technique: entire courtyard neighborhoods are stacked to create structures perforated by three-dimensional gaps and voids “that allow for the continuous merging of interior and exterior space in all dimensions.”¹²So it can be argued that Ma Yansong constructs space that is not bound by definite edges; he produces visible spaces that enable the beholder to notice that existing physical structures are in the very same place as the uniqueness of private apparent space in the beholder’s own sense of sight.

Some philosophers are describing contemporary art in ways suggesting a shift to terms similar to those of traditional Chinese aesthetics. For example, as part of an innovative interpretation for Olafer Eliassen’s *The Weather Report* (2003), Wang Zuofei introduces language that Walter Benjamin uses in 1935 to describe the aura of an art work. For Benjamin, the aura of an art work or natural object consists of its “unique existence at the place where it happens to be.”¹³Although Benjamin writes in 1935 that the uniqueness of place is defined by its presence in time and space, he suggests five years later that a shock of tension can lead to a stopping of objective time. This leads the human being to encounter the place of existence as a monad in the uniqueness of a present that is outside knowledge of objective time and conditions. Benjamin’s texts imply a non-objective place of existence witnessed by eye that supports for an idea of oneness: one’s own existence as a free being intersects with the natural environment where actions change history.

Olafer Eliassen also emphasizes that he begins by looking at an environment without at first seeing objects of perception in it: “I begin by developing the idea. But actually, before the idea arrives, there is something. Let’s call it a space ...It is indeterminate, unstructured, open...Because the space is pre-verbal – it isn’t constituted by words – we tend to underestimate it.”¹⁴In some ways, this language fits the words of Zong Bing who suggests that the individual human cultivates a valuable idea about actual life by clearing away perceptual experiences and looking at an atmosphere or natural landscape as an image of what Eliassen calls “atmospheric density” – or as the visible surface of private apparent space within the sense of sight.

6. Summary

Traditional Chinese aesthetics supports the idea of oneness with nature with the animating uniqueness of the visible surface displayed in the individual human being’s own sense of sight. It is a contributing factor now in a momentous crossing to a new period of global culture. It supplants modern thinking – both the idea that ethics is based on metaphysics of pure reason entirely separate from nature, as well as the idea that human beings are closer to actual life when they abandon aesthetics and rely exclusively on systems of scientific knowledge to answer all questions about the roots of existence.

ARTIST BOOK IN CHINA- FROM TRADITION TO DIGITAL AGE

Abstract | The object of study of this paper is about the artist book in China. As the art of book has a long history in China, it is not only the instrument for culture communication, also the media of art creation. nowadays, with the evolution of internet, rise of young artist, complete system of the collection and exhibition, as well as the more attention by the art world, the artist book in China has a new development. The article hope that through the research on the current situation and future possibility of the artist book in China, summarize the current development and tendency of this kind of art form. The research based on following points. first of all is the traditional book art and design in China, and it is the source of the book art in China. Secondly, the development of Chinese society and contemporary art provide the soil for book art. Last but not least, the creation of artist book in China also influenced by the digital age and electronic reading,so there are more diversified forms of it. This article also takes the works of several Chinese artists and designers as examples to analyze the creation of artistic book in China nowadays,and meanwhile make an expectation for the future.

Index terms | *artist book; art creation; book art;contemporary art; digital age; electronic reading*

As a unique form of art, artist book was born from the traditional book art which forms unique artistic languages gradually during its development. Compared with the design of traditional books and different kinds of contemporary arts, artist book has its exclusive, irreplaceable artistic languages. Unlike the publications, artist book has the form of the book but it was the artworks of the artists who create the art by themselves. According to their own styles and thoughts, the artists can use art freely and design various methods to create imaginative work. Instead by taking artist book as a book, it is more like a well-designed artwork.

Because of these unique languages, artist book attracts more attention than other forms of arts. It is distinct and shines new vitality all the time. Artist book originated from Europe. According to historical materials, its model can be traced back to the independent work of William Blake. However, in fact, many artists including Pablo Picasso, Andy Warhol and Kiki Smith, also used the form of artist book to create artwork and left many excellent works. In the last ten years, with the vigorous development of Chinese contemporary art and the deepening communications with other countries, this form of art came to China. Today, artist book has the opportunities to develop in China and its features as showed below:

Firstly, although artist book is a new concept in China, book itself has thousands year of history. This art form roots in Chinese culture and has a special Chinese art feature. Books have a long history in China, for example, the peak of Chinese classical book art - Edition Book of Song Dynasty. Beautiful paper and binding, skilled engraving, various styles of fonts, delicate and elegant layouts are all the Chinese symbols that follow up the past and usher in the future. They all show unique literature and artist values and are the model of world book art. ¹During the exploration of creating book, how to transform traditional material culture effectively is not only staying in protecting current culture heritage, but also a critical question that artists and designers should think about. Many people try constantly to apply Chinese traditional binding methods, type setting and unique art languages to artists' creations and carry them forward to show advanced vitality in the new historical background.

Secondly, the rapid development of Chinese society gives artist book full-development nutrient. As a constant changing society, Chinese contemporary art as an important component of contemporary art, artist book is also constantly making new innovation. With the improvement of aesthetic concept, it also has concept and criticism. For example, artist Xu Bing apply all kinds of logos, icons and emojis and so on to work *the Book from Ground*. It's from more and more symbols and emoji around people and to make a book without language barriers to trigger people's reflection on this phenomena. Finally, people's new reading methods and habits also have a profound impact on the development of artist book. Artist book has a big change because of the new historical background. Digital books and digital reading are changing our reading methods and customs and impact the paper books deeply. Especially in China, people are more willing to accept new things and affected than other countries. For example, the volume of Chinese mobile payments is the first in the world. ²Under this background, including artist book, any kind of art form need new changes to adapt to the changes of society and aesthetic concepts. This requires artists and designers to create more innovative, more imaginative, more experimental and more pioneering works.

Artist work is a new concept across China. Although its development time is not long, its impact is expanding constantly. In the aspect of promotion and exhibition, "*Diamond Leaves—Artist Book from around the World*" exhibits in three-year form to show the work of the artist from all over the world, especially the work of Chinese artist. The first and second sessions were held in the art museum of Central Academy of Fine

Arts in 2012 and 2015. We could see lots of Chinese artists and designers, especially the work of young people. The quality of the works meet certain professional levels. For example, in the second session, more than sixty percent works are from China. *Art book in China* held in Shanghai and Beijing also has big influences. Its exhibition method imitates European and American artist-book exhibition, not only exhibition site, but also providing the opportunities of communications and sales. The exhibition attracts artists and fans all over the world to visit. Except for Beijing and Shanghai, some other cities also have some similar small-scale activities. Meantime, artist book grows mature constantly in Chinese art education system. According to the statement of China “*National Chinese Core Journal*” *Art and Design* dated in 2018, Number 5, taking Guangzhou Academy of Fine Arts of China as an example, this school opens some artist-book courses for book binding major. After the first three-year comprehensive training about art and designing, in the fourth year, students can choose some artist-book courses and finish work creation under the guidance of professors. Some of the students will do this type of creation after their graduation. These guarantees this type of art form - artist book has a constant working group and makes more artists and designers to participate in this form of art creation.³

Books have a long history, from traditional handwritten books to block printing, printing press, from book printing to the current digital reading. The development of time, culture and technology and the challenges from new things not only not make the value of books to disappear, but also let people embrace the carrier of human civilization genes. The development of artist book also experiences from traditional to digital times. In digital time, the reading and living methods of people change a lot, especially in today’s China, 5G network is now going to cover all over the China, digital reading has become one of the mainstream customs and reading methods for people. According to a survey, the digital reading in China is up to 68.2%.⁴ Meantime, the purchasing rate for paper book is also increasing. The proportion of people to read in China is increasing a lot. With the rapid development of digital media technology in China, more and more artist apply digital information to the work. The intervention of video image technology and digital media technology challenges, deliberates and made possible changes to the content and the form of artist book. These also give the form of artist book a constantly growing soil and allow the artist to have a more broader creative space. We then have the right reason to looking forward to the future of Chinese artist book.

THE PHYSICAL PROBLEMS OF CHINESE AESTHETICS

Abstract | The rise of body aesthetics in China is one of the academic hotspots in the new century; but about the physical problems becoming the core concern of Chinese aesthetics, there is a cultural clue that extends for thousands of years. In the cultural context of classical China, the body is always a presence. From the perspective of primitive Confucianism and Taoism, Laozi's philosophy regards the body as the starting point of thinking, aiming at realizing the return of "Tao" by virtue of the body; what the Confucianists strive to shape is a body of rites and music, with the aim of realizing a unified Confucian politics. However, with the change of history, the body gradually stepped out of the original Confucian and Taoist ideology and became a characteristic expression of Chinese aesthetic spirit. Under the view of nature, we can get rid of the imprisonment of philosophy and politics, regain the vitality of life, and display a lively aesthetic characteristics. Starting from "body" and returning to "body" is a red line running through Chinese aesthetics. Body has become one of the most centripetal core categories in Chinese cultural tradition. Therefore, thinking about the body problem of Chinese aesthetics can not only stimulate us to explore the value of life, but also help us to reinvent Chinese aesthetics.

Index terms | *Body; From Body to Body; Body of Rites and Music; Chinese Aesthetics*

The rise of body aesthetics in China is one of the academic hotspots in the new century; but about the physical problems becoming the core concern of Chinese aesthetics, there is a cultural clue that extends for thousands of years. In 2002, the publication of the Chinese translation of *Pragmatism Aesthetics*, written by the American philosopher Richard Schusterman, especially the idea of establishing “body aesthetics”, aroused considerable theoretical excitement and disciplinary imagination in academic circles. But the source of this excitement is not because it has contributed the latest version of “western theory”, but mainly to inspire us to re-examine the posture and significance of the body in Chinese philosophy and aesthetics, and awaken the imagination of a kind of humanism in the cross-cultural context. Actually in the cultural context of classical China, whether the metaphysical talk of Zhuangzi and Laozi, or the Confucian system, the body is always a presence.

Body is the starting point of Laozi’s philosophical thinking. “Why I am worried is because I have a body, if I don’t have it, then what else do I have to worry about”, the judgment in the Book of *Tao De Jing* is clearly viewed body as a container of human suffering. But this is not a denial of the body’s feeling traits and existential values. Since “Tao gives birth to one, one to two, two to three, three to everything”, then, as the end of all things, “body” also has its own meaning of existence. “Nobility takes body as the world if relying on it, and love takes body as the world if placing on it”, which not only emphasizes the need to cherish the body as a whole, but also highlights the hidden connection between the “body” and the “world”. In fact this attitude toward the body reflects precisely the paradoxical nature of Taoism: through the relationship with the body, to realize the return of the Tao which lives in infinite time and space.

Laozi was one of the first philosophers to talk about “self-cultivation”. But his emphasis on “self-cultivation” has its own unique path and goals. “Cultivating yourself the morality is true; cultivating your home the morality is enough to spare; cultivating your town the morality is long; cultivating your country the morality is abundant; cultivating the world the morality is popular”, obviously which is very different from Mengzi’s “the great qi”. On the basis of this, *Tao De Jing* also finds out the unique world perspective from “body” to “world”: “observing the body with the body, observing the home with the home, observing the town with the town, observing the country with the country, observing the world with the world”. In this case, the so-called “body view” means that when observing a person, one should take the path of self-cultivation without seeking out. Compared with the Confucian ethical philosophy, this orientation highlights a kind of ideological posture that delimits the boundaries of oneself. But in the book *Qi Wu Lun* Zhuangzi, with the praise of forgetting things and myself, further push the attitude of eliminating differences and transcending right and wrong to the extreme. “I don’t know if Zhou dreams of butterflies, or the butterflies dreams of Zhou? There must be different between Zhou and the butterflies”, which is implying that what we achieve through “materialization” is not only the naturalization of the body, but also the ecological beauty of the world.

What Confucian efforts to shape is etiquette and music-cultivated body. However, in this complex field of thought, etiquette and music is not so much an artistic expression as a way to realize political civilization. As we all know, Confucius usually starts from the body when he thinks about the moral cultivation of human beings. The so-called “the 60 years old men are obedient” (*LunYU·Wei Zheng*), is to describe the situation of life from the state of the body organs; “to see brightly, hear clearly, expression softly, manner politely, talk faithfully” from “nine thoughts of a gentleman” (*LunYU·Ji Shi*), also measures the degree of accomplishment from the point of the function of the body

organ. It can be seen that the importance of self-cultivation highlights not only a sense of physical presence, but also a self-discipline effort. Mencius, from the angle of caring for the world, further combed out a ladder to the society: "people always says that: 'the world is the state', the essence of the world lies in the state, the essence of the state lies in home, the essence of home lies in oneself." (*Mengzi-Li Lou Shang*)

The body under the vision of Confucianism is also directly related to the hermeneutics of poetics. "Zixia questioned: 'smiling prettily with beautiful and bright eyes, taking plain as gorgeous.' Why? Confucius answered: 'painting on a white background.' Questioned: 'Isn't it true that etiquette is a late thing?' Confucius answered: 'you are a real inspiration to me, now we can talk about *Shi Jing*.'" This case in *LunYu-Ba Xi* cut off the sentence "plain as gorgeous," emphasizing that artificial carving and painting are not as beautiful as the original color, thus Zixia began to think that the etiquette of literature followed the benevolence of nature. It is the pan-moral & ethical orientation in Zixia's thought that is closely related to his teacher, who takes him as his colleague. It can be seen from this that the role of "body" here is no longer the "battlefield" of profound literature, but a yardstick for measuring beauty and ugliness, which is intrinsically related to the great tradition of poetics. In fact, in Dong Zhongshu's time, this analogy, which is taking the body as mirror, goes far beyond poetics in the general sense, and tries to make a full argument about the anthropomorphism of the universe.

Obviously, with the change of history, the body has gone beyond the original scope of Confucianism and Taoism, and has become a characteristic expression of Chinese aesthetic spirit. There is a comparison in *Huai Nan Zi-Jing Shen Xun*, "the day has wind, rain, cold and heat, people also have taking, giving, joy and anger. So the gallbladder is the cloud, the lung is the qi, the liver is the wind, the kidney is the rain, the spleen is the thunder, comparing with heaven and earth, but the heart is the master. So the ear and eye is the sun and moon; the blood and qi is the wind and rain", in which the idea of simulating the world with a body is vividly described on the paper. Dong Zhongshu pushed this theory of the match between man and nature to the extreme, and tried to give a philosophical explanation of the nature and body: "the appearance of heaven and earth takes waist as belt. Above the neck is spirited and respectful like heaven; below the neck is abundant and humble like the earth; walking around, like the shape of earth.....coincident with heaven and earth, and followed with yin and yang, always staying with the body, the body is like heaven, and the number is related to it, so the life is linked to it." On this basis, the organic world of life shows aesthetic in the mirror of the body, and the body also highlights the long-lost spirituality under the eyes of nature.

Therefore, the physical problems of Chinese aesthetics are embodied in the following triple meaning. First of all, in the name of the body, to explore the value of life. The body in Chinese classical aesthetics, on the one hand, presents a solid body color, on the other hand, it is a synthesis of human self-cognition. As some scholars have pointed out, "the unity of the body and the world makes understanding the human body a convenient way to understand the world, and making it possible to reconstruct the beauty of nature and art with the body as the paradigm." (*Body and its Image in Chinese Classical Aesthetics*, Liu Chengji, *Literature and Art Research* 2007-4) In the process of reconstructing this paradigm, the physical image, nature and mind are unified in the sense of body. Through the integrated function of the body, it enlightens us, the aesthetic world of the kite flying & fish jumping, the unity of spirit and flesh, is not an inaccessible utopia, but in the living world in which you, I, and it live together. Only with the help of the body practice of nature and art can the inquiry, exploration and insight into the meaning of life be realized.

Secondly, in the name of the body, fulfilling the beauty of heaven and earth. Although the presence of subjectivity is the basis of human beings, that is, people have to resort to the five perceptual abilities of sight, hearing, smell, taste and touch to accept and judge the world, it does not mean that we have the legitimacy of “legislating for heaven and earth”, neither it is necessary for human beings to call themselves “the spiritual growth of all things”. In fact, the process of our cognition of nature is often accompanied by a deep understanding of human finiteness and difference. Only on the basis of equality can we realize the transformation from “the death of things” to “the life of things”, make the aesthetic discipline complete the return to materiality, obtain the stability of existence, and truly touch the peak experience of “beauty of the original world”. If Chinese aesthetics pays more attention to the usefulness and uselessness of beauty, regarding the unity of beauty and goodness as the highest ideal; while the western aesthetics focuses on distinguishing whether beauty should be true to nature or man’s heart, and regards beauty and truth as the highest standard, then “beauty of heaven and earth” is the best node to unite people and things, heart and nature, and truth, goodness and beauty. And with the attention and restoration of the body, we have the opportunity to crack the arrogance of anthropocentrism, restore the sensibility of aesthetics, and experience the fusion of man and the world in the infinite self-liberation.

Finally, Inventing Chinese Aesthetics in the name of body. In the context of modernity, how to creatively transform the ideological resources of classical China has always been the concern of the aesthetic circles. Through the consideration of physical problems, especially through the reduction of body organs and other elements, it is helpful for us to improve our rethinking of Chinese aesthetics. Actually, in the Chinese society marked by agricultural civilization, people’s agricultural experience is actually physical experience. The uniqueness of this experience leads the Chinese to adapt to the body as their highest survival wisdom. This is reflected to some extent in the Confucian tradition of “virtue”, the Taoist attitude of “joyful spirit” or the value choice of “carrying water and cutting wood, nothing but Dao” in Chan Zong. In this sense, “body” has become the most centripetal core category in Chinese cultural tradition. If we say that the development of Chinese classical aesthetics can be described as the transmutation process from the object image, the emotion image to the meaning image, the prospect and the artistic realm, then the starting from “body” and returning to “body” is a red line running through Chinese aesthetics. Compared with the body aesthetics promoted by British and American pragmatism, this obviously has its Chinese characteristics, and its value and significance are worth further exploring and considering.

APART FROM KAWAII: CONTEMPORARY JAPANESE ART, IDENTITY, AND SENSE OF PLACE

Abstract | Contemporary Japanese visual culture is associated strongly in the West with the aesthetics of *kawaii* („cute“) and Super Flat, the *anime*-inspired work of artists like Takashi Murakami. Beyond this popular, flat aesthetic is a wide range of contemporary artists producing three-dimensional work that examines the sense of self, place, and alienation in Japan since World War II. Katsumi Hayakawa and Takahiro Iwasaki create maquettes of landscapes from found materials, challenging familiar concepts of space, while Tatzu Nishi and Tadashi Kawamata build full-size installations around existing cityscapes that are at once playful and disconcerting. The light-sculpture installations of Yui-chi Higashionna and the delicate, webbed environments of Chiharu Shiota transform galleries into spaces of memory, dreams, nostalgia, and anxiety. These works are expressly physical, tangible, and experiential, in stark contrast to the flat, digitized imagery of *manga* and Sanrio. This paper contextualizes such works amongst themes of collectivism, competition *hikikomori* („extreme self-reclusion“), and limited physical space that have influenced Japanese culture throughout history, but particularly so in recent decades.

Index terms | *Contemporary art; Identity; Installation; Japan; Phenomenology*

To the Western mind, the term *Japanese contemporary art* conjures images of *manga* (graphic novels), *Superflat* paintings by artists like Takashi Murakami, and the aggressively cute aesthetic known as *kawaii*. There is a notion of Japanese society as conformist yet quirky, a cluster of islands populated by robotic salary men, punctuated by Harajuku girls in short plaid skirts. While *manga*, *kawaii*, and Harajuku do compose a portion of Japan's visual culture, not all contemporary artists work within this flattened and hyper-pigmented aesthetic. Many artists, not limited to a particular generation, region, or medium, are creating objects and spaces that interrogate the strictures of Japanese society and geography and reflect on what it means to identify as Japanese in the 21st century, both at home and abroad.

Japanese Identity

Historically and geographically insular, Japanese society developed in relative isolation, cross-pollinated by the Chinese, Zen Buddhism, and native Shinto beliefs, and molded by the constraints of rugged mountains and fearsome seas. After opening to trade with the West in the mid-19th century, and rebuilding in the wake of the Second World War, the traditionally refined and introspective culture has endured a series of challenges, from population decline to sarin gas attacks to catastrophic earthquakes and tsunamis.¹ An intense spirit of nationalism endures nonetheless, represented visually to outsiders most often in the form traditional arts, the only medium which, according to Yuriko Saito, was accepted as equivalent in quality to its Western counterparts.² Near the end of the twentieth century, these objects were equaled, if not surpassed, by the proliferation of graphic novels, animation, and the *Superflat* style of art developed by Takashi Murakami, who perhaps ironically was the first person ever to earn a PhD in *nihonga*, neo-traditional Japanese painting.

American audiences in particular have consumed Japanese visual exports like *Speed Racer*, *Pokémon*, and the films of Hayao Miyazaki at an exponential rate.³ From this limited array of specimens, it is inevitable that the Western conception of Japan at the turn of the twenty-first century tends toward a superficial tableau of cute creatures and one-dimensional warriors. Meanwhile, Japanese artists have been steadily producing a variety of art forms as varied as that of any other nation, as critical of their own society's fallibility, of mass culture, materialism, and conformity; as celebratory of the culture's core strengths and values; and as conversant in the global exchange of ideas in a post-technological world.

Koki Tanaka is an installation artist who assembles mundane found objects along with video installations that investigate "the mundane phenomena of daily existence."⁴ Works like *Everything is Everything* (2006) (**Figure 1**) include cheap items that reflect the real experiences of Japanese citizens during the economic recession of the late twentieth century: push-brooms, ice chests, an inflatable mattress. They are arranged on the gallery floor, accompanied by televisions that play a tight loop of videos of Tanaka and his assistants performing repetitive motions on similar objects, coaxing them to their breaking points. This obsessive investigation of such detritus results from what Gabriel Ritter deems a "stymied atmosphere" in which artists of Tanaka's generation have faced limited economic opportunities. Tanaka's selection of cheap household items in garish plastic colors is notably akin to the work of American sculptor Jessica Stockholder, who also assembles vividly mundane found objects in installations that both critique and fetishize mass culture.⁵ (**Figure 2**) He attributes his choice of everyday

objects to the desire to “escape the seriousness involved with the perspective of art history.”⁶

Whereas Tanaka uses familiar objects as a means to critique his own culture, artist MamiKosemura uses unfamiliar objects, photography, and video to explore notions of relative familiarity within cultures. She spent the summer of 2016 working in the Chelsea townhouse-gallery Dillon + Lee in New York. Acting as a quasi-archaeologist of American culture, she collected objects from the city’s thrift stores and streets that were wholly unfamiliar to her, and yet would be unremarkable to an American viewer. Her experiment recalled the work of Yuji Agematsu, a Japanese artist born in 1956, who moved to New York in 1980. Since 1997, Agematsu has taken daily walks through the city, during which he collects pieces of debris from the street, wraps them in cellophane “mini-vitrines,” and photographs them in annual groups.⁷ (**Figure 3**) But while Agematsu’s series is a study in rhythm and repetition, Kosemura’s was a focused meditation on otherness. She arranged the assortment of glass canisters, bits of coral, a brass horn, a wooden top, and several rocks on linen-draped tables with stark backgrounds, a sort of neo-*vanitas* setting, and photographed them in a series called *Objects – New York*.⁸ (**Figure 4(a)** and **Figure 4(b)**) These images re-framed the items as alien artifacts, curiosities examined by a visitor rather than the incriminating flotsam of shortcomings back home, or the unremarked souvenirs of ritual.

Suchan Kinoshita is another artist who uses mundane materials to devise installations, but rather than material culture, they engage human interaction. Her work in the late 1990s involved rudimentary constructions inside gallery spaces (**Figure 5(a)**) that guided viewers through “a mystifying network of plywood cabins, look-out posts and constructed confines” that evoked “the poetic mechanisms of human relationships.”⁹ Since 2012, she has been creating spaces in collaboration with other artists – none Japanese – that explore the areas of commonality in artistic practices. (**Figure 5(b)**) These works are based on the concept of a *tokonoma*, a “built-in recessed space in a traditional Japanese room in which items are displayed for artistic appreciation.”¹⁰ Kinoshita interweaves cultural tradition with global engagement in the practices of other artists from diverse backgrounds.

Tabaimo is a new media artist also known for creating immersive environments that explore themes of relationships and technology, and critique Japanese society. She represented Japan at the 54th Venice Biennale in 2011 with an installation called *teleco-soup* (**Figure 6(a)**), which used the inverted imagery of sky and sea to connote “Galapagos Syndrome,” a term that once connoted the “incompatibility between Japanese technology and international markets,” but which is “now applicable to multiple facets of Japanese society in the age of globalization.”¹¹ Her 2016-2018 set of video installations, *Utsushi* (**Figure 6(b)**) both critiques contemporary Japanese society and reveres its history via references to well-known works of Japanese art, such as Kano school paintings and the *ukiyo-e* prints of Hiroshige and Hokusai. Tabaimo considers *Utsushi*, a concept referring to a copy that “simultaneously captures the essentialness and spirit of an existing work but avoids exact reproduction,” to be a “binding agent” that creates connections between Japanese artists of the present and past, a practice she has come to embrace despite initial reluctance.¹²

While Tabaimo often incorporates traditional Japanese artworks into her contemporary installations, Tatzu Nishi involves entire public monuments. He has constructed temporary domestic spaces around pre-existing statues in places like Singapore,

Helsinki, and New York (**Figures 7(a) and 7(b)**), resulting in “humorous, symbolic admixtures” that allow the viewer to “critically intervene in the... urban fabric.”¹³ His large-scale installations don’t just reference historic works; they literally surround them, recontextualizing them in domestic environments and allowing the viewer an intimate, even comical, encounter with a public monument.

Industrialization and Globalization Japan since the mid-twentieth century has developed in relation to global technical advancements, many of which it has contributed, and an urbanizing population pressed ever closer together in limited space. Because so much of the country is mountainous, the cities can only spread so far; by the early twenty-first century, the average size of an apartment in Tokyo was only about 40 square meters.¹⁴ Andrew Juniper suggests that the lack of space has been a significant influence on the “Japanese aesthetic,” maximizing impact by “keeping artistic expression to an absolute minimum.”¹⁵ While this is evident in the traditional and “decorative” arts of Japan, a similar sensibility also emerges in the avant-garde.

Katsumi Hayakawa creates three-dimensional paper landscapes that “explore the notion of urban density.”¹⁶ (**Figure 8(a)**) Ethereal and abstract, the pieces “maintain the delicate nature of the material at hand” even as they “examine the impression of architectural density.” Through a painstaking, even obsessive process, the artist constructs suspended cityscapes that offer a means to understand the press of urban creep while also controlling and lightening its visual impact. Nearly ten feet long, *Fata Morgana* (2014) (**Figure 8(b)**) is a composition of inkjet paper and glitter suspended from the gallery ceiling. Through Hayakawa’s deft use of negative space and materials, it appears nearly weightless, liberated from the traffic and smog and noise that would permeate its terrestrial counterpart.

Similarly delicate and meticulous are the works of Takahiro Iwasaki, a Hiroshima native who represented Japan at the 57th Venice Biennale in 2017 (**Figure 9(a)**). He creates landscapes, model buildings, and skylines from everyday materials like toothbrushes and bookmarks that Daniel Lippitsch suggests are evidence of “a desire for an aesthetic simplicity” common in Japanese contemporary art.¹⁷ Economic limitations also influenced his style, which developed due to a lack of access to traditional materials as a young artist. A small-scale model of Coney Island (**Figure 9(b)**) becomes a surrealistic dreamscape through the masterful inclusion of a colorful beach towel, and he creates a topographical universe on the surface of a roll of duct tape. Like Hayakawa, Iwasaki channels a limitation of Japanese life into an austere aesthetic experience that is at once traditional and contemporary.

In the exhibition catalogue *Bye Bye Kitty!!!: Between Heaven and Hell in Contemporary Japanese Art* (2011), David Elliott and Tetsuya Ozaki suggest several other factors that have shaped the culture of the Heisei Period (8 January 1989 – 30 April 2019). Elliott cites urbanization and the concurrent “depopulation of the countryside,” along with the “long hours and pressures of a hierarchical workplace,” as factors in the sense of isolation and aimlessness experienced by the artists in the *Bye Bye Kitty!!!* show, and attributes the culture’s growing affinity for all things escapist, cute, or deviant to a “collective dread of an apocalyptic future” in the wake of the nuclear age.¹⁸ Ozaki lists “fierce competition in school entrance exams..., *hikikomori* (extreme self-reclusion, a form of agoraphobia), bullying, domestic violence..., sexual harassment, social discrimination, cults, and unscrupulous business practices” as effects of a “system that ‘doesn’t make people happy,’” perpetuating a cycle of cause and effect that

characterized the “Lost Decade” of 1993-2002.¹⁹

Chiharu Shiota addresses aimlessness in *Uncertain Journey* (**Figure 10**), one of several room-filling cocoon installations she has created by intertwining webs of yarn. These designed environments may encompass any of a number of evocative objects, from a wedding dress to a burnt-out piano, that express themes such as “remembrance and oblivion, dreaming and sleeping, traces of the past and childhood, and dealing with anxieties.”²⁰ She explains that “[o]ur lives are like a journey without a destination; even though we don’t know where we are heading, we cannot stop,” and her work emphasizes the “feeling of travelling with nowhere to go whil[e] alluding to a search for a sense of belonging.”²¹

These and other installations do not represent the work of a cohesive school of artists in Japan. Though all Japanese-born, some now work in Europe or America. Their sensibilities span from critical to therapeutic, and their aesthetics can be orderly, chaotic, digital, or analogue. Together they demonstrate that visual arts of contemporary Japan are not limited to anime and Superflat, nor are they entirely insular or ethnocentric. Japanese artists today are dealing with a range of subjects and styles, rooted in tradition but refined by exposure to the global art scene. The works discussed above compose a body of work that deals with the complexities of Japanese life since World War II, the stresses of urbanization and technology, and the timeless challenges of human interaction. They manage to be distinctively Japanese and yet transcend any nationality or creed; they are, in short, contemporary.

VELOCITY AND THE CREATIVE IMAGINATION IN CHINA- CONTEMPORARY ART IN A TIME OF SPEED, GLOBALIZATION AND RAPID URBANIZATION

Abstract | It has been remarked that speed offers a way into the entirety of the world and offers a key for reading it. Speed can be understood as a tool for cultural analysis. Nowhere in the world has ever modernized as fast as China today, how has this unique cultural transformation affected creativity and contemporary art in China? China is able to universalize local distinctiveness, Cultural heritage, aesthetic sensibility, attitudes and values, achieving this through making their locality accessible. The locality constantly changes through the urban transformation of Chinese cities. It is reasonable to consider that the intellectual awakening is partly embodied within the complex involvement of artists in the production and dissemination of a new form of Chinese identity. The engagement by artists with this urbanization and globalization offers itself as a major contributor to the production of this new perceived Chinese identity. It can be argued that the rapid urbanization's results and effects in China remain its uniqueness and cannot be borrowed from anywhere else. This research argues that there is an unique opportunity here to see how the very speed of change has affected contemporary art and artists in China – as well as acknowledging how older ideas of Chinese art still inveigle themselves and reappear transformed in new ways. Despite the fast changing speed in China, little in-depth research has been conducted on this theme in the context of contemporary art. This lack of research have led artists and researchers to ignore the significant role that velocity has been played in the field of Chinese contemporary art. My research situates velocity as a key point in the developing of Chinese contemporary art since 1985. To do this, I will examine how speed, globalisation and urbanization influence the developing of contemporary art in China and how Chinese contemporary artists enable with the theme of speed, modernization and urbanization in their works in the field of Chinese contemporary art history. By doing so, I will define the distinctive new relationship between velocity and Chinese contemporary art. The research includes three sections: Speed, “information explosion” in the 1980s and experimental art (shiyan yihshu) in China; speed of urbanization and contemporary art in China; Speed of technologies, and online/offline community-based art in China.

Index terms | *Speed; Urbanization; Globalization; Chinese contemporary art; Expiemntal art (shiyan yishu)*

The study initially grew from my observations as an artist, which situate velocity as a key point in the development of Chinese contemporary art since 1978. China went from a peasant society with no telephones to mobiles and the Internet in 40 years. Clearly, progress like this has affected the imaginations of artists and how they think. This paper argues that there is now a unique opportunity to see how the very speed of change has affected contemporary art and artists in China – as well as acknowledging how the older ideas of Chinese art still transform themselves and reappear transformed in new ways. Despite the incredible speed of change in China, little in-depth research has been conducted on this theme in the context of contemporary art. This lack of research has led artists and researchers to ignore the significant role that the velocity of change has been played in the field of Chinese contemporary art.

China is the first country since the end of the Cold War to occupy a global central stage and present progress with economic growth and political stability; it also represents a new world order that has readdressed the balance of power globally and gained exposure that has shaped the world in its image. Mark Leonard in his book *What does China think* suggests that the story of China's intellectual awakening is much less well documented than the now familiar tale of China's economic revival. It is reasonable to consider that the intellectual awakening is partly embodied by the complex involvement of artists and designers in the production and dissemination of a new form of Chinese identity. The engagement by artists with this urbanization and globalization is a major contributor to this new perceived Chinese identity.

Deng's launching of Opening and Reform policies in 1978 has been widely seen as the catalyst which began to integrate China into the global system that was focused on industrialization, privatization and economic growth. All types of Western cultural productions that had been forbidden during the Cultural Revolution were introduced to China through reproductions and exhibitions in a short span of time. Hundreds of theoretical works, including those by Jacques Derrida and Heinrich Wölfflin, were introduced through translations, as were artists including Robert Rauschenberg and Antoni Tàpies.

The input of information is closely related to the development of Chinese art, and this "information explosion" sometimes acts as a catalyst. The artists Hu Jieming, Sui Jianguo, Zhang Xiaogang, Wang Yin and Song Dong have confirmed that images and texts that were introduced during the 1980s greatly inspired their work. Song Dong said, "The 1980s was a very special era, when all kinds of things came in at the door." He called the "information explosion" as "the fresh air of that era" (Zhu 2016). However, some artists, like one of representatives of "Xiamen Dada", Huang Yong Ping, stated that "it's just a matter of time before everything comes to China, which will bring about a more complete confusion". In 1995, one artist advised another, "always distrust authority, be suspicious of centralist theories, doubt your alleged cultural influences." (Ai 2010)

Huang Yong Ping's work *The History of Chinese Painting and the History of Modern Western Art Washed in the Washing Machine for Two Machines* (1987) demonstrated his confusion. He placed a classical Chinese art history book and a Western art book into a washing machine, washed and mixed them in a two-minute washing cycle, which resulted in a pile of unreadable pulp. It is not a replacement of one tradition with another, but rather an overlapping without any method, concept or ethics. The use of the washing machine here demonstrates "speed results in confusion" precisely. The

peripatetic artist Chen Zhen called artists living who lived between multiple realities, cultural systems, and temporalities a “transexperience”. This kind of experience was also reflected in Cai Guoqiang’s work *Borrowing Your Enemy’s Arrows* (1998) and *Cultural Melting Bath: Projects for the 20th century* (1997). Artists experience a period of imitation after confusion. Also, in Huang Yong Ping’s *World Theater* (1993), there is almost an enlarged version of the transparent dome which fulfilled with hundreds of insects and reptiles. Geckos, locusts, crickets, crickets, crickets - eroding each other under dim chandeliers. This work captures the theme of the exhibition in a unusual way: China is a self-contained world, always evolving, forming a new order, and the 18th century prison structure hanging above the dome - one-way glass only allows observation from the outside to the inside - also reflects the suppression and monitoring that artists feel when they create. Wu Hung stated that some artists generated more antagonism and nihilism toward society and fit the Western notion of the avant-garde more closely; some artists simply focused on stylistic or technical matters with newly introduced Western art forms.

Hui stated that globalization and modernization have caused disorientation. This is not just a loss of direction, but often our oriental roots and history have been smothered and hidden far beneath. From my perspective, the questioning of disorientation can also be discussed in the context of contemporary art in China. I have interviewed several artists who experienced the 1980s “information explosion”, and most of them confirmed they subsequently experienced a period of confusion and imitation. Wu Hung stated that “styles, and theories that had long become past history to a Western art critic were regarded as ‘contemporary’ by Chinese artists and used as their models. In other words, the meaning of these ‘westernized’ Chinese works was located not in the original historical significance of their styles, but in the transference of these styles to a different time and space.”

Because of this experience, contemporary Chinese experimental art cannot be interpreted according to a ready-made western model. Based on Wu Hung’s argument, it can be argued that it is speed which results in the confusion. Furthermore, it is speed that places Chinese artists in a unique position, one which cannot be seen in any other nation in modern history. So how do Chinese artists self-position and reposition under a changing society? Did Chinese artists lose their direction and roots?

To avoid the Western humanist avant-garde ideals that guided the 1985 New Wave, artists approached “contemporary art” as a new “other” space, outside the Western and Chinese art worlds. Munroe stated that, although it is a confusing predicament for art, artists and culture, artists have decided to think beyond China’s own ideological fray in their own way. This gives artists the freedom to gain insights into the juxtaposition and integration of Chinese history, Western modernism and the forces of neoliberal economics. As Huang said in his interview in 2000, his creative methodology and direction were primarily formed in China, so his artistic ideas derived from a juxtaposition of the study of Chinese traditional culture and contemporary western philosophers. The acceleration leads artists to a diversified exploration of politics, society and culture that constitute today’s global pattern. Various concepts and methods from different heterogeneous cultures, different ideas, and lifestyles are fully expressed and displayed on a new platform, which stimulates distinct forms of dialogue between artists and audiences.

The East Asia region, and in particular China, has undergone in recent years a

profound and unprecedentedly swift economic and cultural development, embracing aspects of modernity and modernization, while engaging and participating in, as well as responding to, globalization. This has generated challenging socio-economic conditions, truly testing the nation's ability to respond to social and economic parity. The paradox that is emerging here for artists is considerable and unpredictable; on one hand the situation provides a fertile environment for creative energy in a dynamic and stimulating environment, while on the other, artists often feel a sense of belonging to the production of identity and therefore there's always at the core a sense of loyalty to the traditions and culture of the nation to which they belong.

The very first SEZs - Shenzhen, Zhuhai, Shantou in Guangdong Province and Xiamen in Fujian Province - were renamed by the CPC Central Committee and State Council in 1980. (Xiaoping 1993) They became known as the "Pearl River Delta" Economic zone and economic community later. Guangzhou, which is adjacent to Hong Kong, has become a city centered on consumer entertainment, while cities in north China were not ready for market economy in the 1990s. Artists who lived in north China were surrounded by a cultural atmosphere full of socialism; for instance, Wang Guangyi and Fang Lijun used ideological political symbols to resist consumerism at that time. Artists who lived in the Guangdong area concentrated their perceptions on its high-speed urbanization and globalization processes. The "Pearl River Delta" economic community influenced the appearance of the art group "Big Tail Elephant", founded by Lin Yinlin, Liang Juhui and Chen Shaoxiong in 1991. A characteristic of their working routines is that they always start from local daily life related to urbanization. Their works are based on local materials and are inspired by the phenomena around them. These characteristics can be seen in Lin Yilin's work *Safely Maneuvering across Lin He Road* (1995) and *House Hold Goods I* (1992), Liang Juhui's *One Hour Game* (1996) and *Paradise I* (1994), Chen Shaoxiong's *72.5 Hours of Electricity Consumption* (1992) and Xu Tan's *Uniform Velocity, Variant Velocity No.1* (1992). Artists from The process of urban modernization is often accompanied by the phenomenon of the demolition of old buildings. *Big Tail Elephant* create artworks with buildings construction waste and repair materials visible on the street. Its creative concept of consumerism is integrated with a real-life environment.

Artists above are mainly based on witnesses, some other artists do not look for evidence in reality in the same way as these artists. Instead, they create works by involving in the urbanized environment and interacting with the environment. They are committed to expressing their own urban imagination and developing their own personal evaluations through their performances and rebuild relationship with the city. The characteristic of social intervention can be declared from the works like *One Hour Game* and *Safely Maneuvering across Lin He Road*. Artists engage themselves in the society to create the works.

Guangzhou artist Liang Juhui's video work *One Hour Game* is a documentation of his performance in 1996. In the video, Liang Juhui, wearing a yellow helmet, is seen sitting in the workers' elevator of a construction skyscraper site for an hour without any facial expressions, staring at a television and playing digital games. His performance disturbs the workers' usual construction routes, and deconstructs the capabilities of the elevator and the process of construction; also, this work is set against China's flurry of daily expansion. His expressionless face can be regarded as metaphoric signifier of people's attitudes towards the high speed changing urban environment.

He engaged himself into workers' working cycle and disturbed it. The "temporary landscape" has drawn the strong curiosity of the workers, dragging them from their tense working conditions. His engaging and disturbing, runs counter to the modern tense urbanization process, can be regarded as his yearning of slowing down. Lin Yilin's video compilation, *Safely Maneuvering across Lin He Road*, is another example of artist's response that engaged themselves within the works. In the video, he builds up a wall with bricks on one side of a busy main street in the new town of Guangzhou. He then takes some bricks down from one end of the wall, and piles them up on the other side of it. He moves the wall from one side of the busy street to the other side by repeating the same gesture for hours. The artist interfered, cutting of the rush of urban traffic and the city's tense pace of movement. In these works, artists engage themselves into the process of urbanization.

Their work shows that urbanization has its complex multi-faceted nature, which is a social process involving many aspects such as social structure, cultural psychology, lifestyle and values. Urbanization is actually full of contradictions. It provides many promises, and it even includes many real difficulties that cannot be avoided. Of course, these photographers and artists may not be consciously tempted to urbanize. However, they have indeed felt some problems caused by urbanization from their own personal experiences, and these problems are exactly what many related parties are intentionally obscured. But in any case, they have expressed their attitudes and opinions on this reality, and from a personal perspective. We can find that one of the main tendencies is that they more or less reject or deny the romantic "modern" imagination of urbanization's wishful thinking, from all angles of irony and reflection at the expense of human dignity and overall social development. They are questioning the meaning of contemporary urban lifestyles and values.

This paper focuses on and critically examines the rapid urbanization of Chinese cities and the effects that this dynamic and constantly moving urbanization has had on shifts and changes in cultural behaviour, visual manifestation, sounds and music, communication and digitization, technological innovation, the economic race and architecture; and above all the social changes that have resulted in extreme poverty on one hand and absolute supreme wealth on the other. Here I argue that it is the speed of change which promotes the development of Chinese contemporary art. This study aims to contribute to the body of knowledge of a gap in Chinese contemporary art history, researching an conceptual and practical analysis of contemporary art in China thorough the lenses of velocity and speed.

Jingjing Shen researches across the fields of photography and moving image, especially in the context of contemporary art and culture in China. As a visual artist, she is interested in producing new form of communication and interaction. Her work spans various media in visual communication, including photography, collage, lighting, and moving image. Considering the latest achievements of contemporary science and technology, she concentrates on the expansion of the human wealth of aesthetic experience. She obtained her BA(Hons) at Glasgow School of Art and received her MA from Royal College of Art. She is currently studying at University for the Creative Arts for her Ph.D. She was a winner of Adobe Design Achievement Award in 2014, she was selected as one of the new talents in 2015 Wallpaper* Graduate Directory. She is now undertaking an artistic project funded by China National Arts Fund.

THE INTENTION OF THE ART WORLD AND THE CONTEXT OF “INTERNATIONAL CONTEMPORANEITY IN 1960s JAPAN: REFERENCING CHANGES IN LARGE- SCALE ART EXHIBITIONS IN JAPAN AFTER WWII

Abstract | This study examines the structure and the intention of the art world in a particular region—Japan—by examining the structural changes in large-scale art exhibitions and the discourses accompanying them in Japan after WWII. In 1949, *The Yomiuri Independent Exhibition* was held under the auspice of the Yomiuri Newspaper Company. This was followed by the first international art exhibition in Japan, organized by the Mainichi Newspaper in 1952—*The Japan International Art Exhibition* (commonly known as the Tokyo Biennale); its sister biennale exhibition, *The Contemporary Art Exhibition of Japan*, was held soon thereafter. These exhibitions had established an important platform for criticism where Japanese critics and artists could debate. However, as a whole, there has been inadequate research on these exhibitions.

Based on the numerous articles and illustrated catalogs on these exhibitions that unavoidably evolved with the trends of the times, I examine their organizational structure and selections, as well as the forms of their shows. In other words, my methodology involves studying and analyzing the history of art exhibitions. Through these analyses, I reveal the intention of art organization in Japan—the judgments and the vector on criticism present in Japan’s contemporary art situation. Particularly, I focus on the relation between “International Contemporaneity,” often mentioned by art criticism in 1960s Japan, and the concept of Japanese originality.

The results of this research show that while the content of these exhibitions evolved from modern to contemporary art, it was intentionally and unconsciously influenced by the institution of “art,” which involved the issues present in the avant-garde’s inherent conservatism and the hierarchy within Japanese art organizations. Furthermore, though these exhibitions had become important platforms for criticism regarding “racial characteristics” in the 1950s and “internationality” and “contemporaneity” in the 1960s, the vector of devoting themselves to the West’s sense of values and to the concept of “art” which stemmed from the West had worked covertly; in part, this situation had been responsible for encouraging artists and critics in Japan to seek “Japanese originality.” Therefore, the context of “international contemporaneity” in the late 1960s inherently involved issues regarding the adoption of the concept of “art.” Thus, Japan has continually involved the issues of “art” as an institution and the Japanese cultural context, since the modern era. The large-scale art exhibitions after WWII also involved these issues.

Index terms | *contemporary art, international art exhibition, international contemporaneity, Japanese art history after WWII, the Tokyo Biennale*

INTRODUCTION

In this paper, I examine large-scale art exhibitions in Japan after WWII, especially those that were held from the 1950s to the 1990s. This study does not adopt traditional theories of artists and artworks, but employs a methodology of analyzing the structures of biennial or continuous art—a study of exhibition making. On the basis of the numerous articles and illustrated catalogs, I examine the intention of the art world in Japan—judgments and the vector on criticism—by analyzing the organizational structure, selections, and value criteria of criticism, as well the forms of their shows, which unavoidably evolved according to the trends of the times.

I focus on “International contemporaneity” (*kokusaiteki dōjisei*), which is often found in 1960s’ Japan art criticism through an analysis of discourses about large-scale art exhibitions in Japan after WWII. At that time, art critics frequently employed the concept of “International contemporaneity” (*kokusaiteki dōjisei*) against “Ideal” (a term widely used at that time) artworks made from various materials and not based on traditional styles by young artists who had grown at *Yomiuri Independent Exhibition*, during the worldwide shift from concrete expression to abstraction that had occurred from the 1950s to the 1960s. I outline the issues of “art” as an institution that stems from the West and the phenomenon of “Japanese originality” that closely relates to clarifying art history after WWII, examining the context of “International contemporaneity” (*kokusaiteki dōjisei*).

1. Analyzing discourses: Changes of large-scale art exhibitions and the intentions of the Japanese art world

Historically avant-garde artists or art groups, such as the Gutai Art Association (*Gutai bijutsu kyōkai*), were focused on the criticism and study of art history in Japan after WWII. Firstly, the Japanese art world after WWII reinstated and reorganized traditional art circles (*gadan*) and held large-scale art exhibitions under the auspices of major newspaper companies. In 1949, the *Yomiuri Independent Exhibition* that adopted “non-judgement” and “free display” systems was held under the auspice of the Yomiuri Newspaper Company. This was followed by the first international art exhibition in Japan, which was organized by Mainichi Newspaper in 1952: *International Art Exhibition, Japan (Nihon kokusai bijutsu-ten*, commonly known as *Tokyo Biennale*), and its sister biennale exhibition, *Contemporary Art Exhibition of Japan (Gendai nihon bijutsu-ten)*, was held soon after. These exhibitions unavoidably evolved alongside the trends of the times; yet, as a whole, there has been inadequate research on these exhibitions.¹

First, I focus on the consciousness of the artists and critics involved in the *Yomiuri Independent Exhibition* as the steering committee, as well as the newspaper company’s response (Figure 1). Although 1,019 artworks were gathered at the beginning of this exhibition, and this exhibition was the focus of public attention in the Japanese art world, many maestros from established art circles were asked by Yomiuri Newspaper Company to display their artworks and join the steering committee. In the display, the artists themselves as committee members intentionally changed the arrangement of artworks, taking the hierarchy of art groups into consideration. However, young artists severely criticized this situation because this was contrary to the aim of this independent exhibition. The following young artists, referred to as the “Yomiuri Independent Exhibition’s generation,” had been given consideration from the fifth exhibition of 1953 onward: Mōri Takeshirō, Yamaguchi Katsuhiro, Fujimatsu Hiroshi, and Suzuki Motoharu. Thereafter, by the ninth exhibition of 1957, the displays of

“collusion” by the artists from traditional art groups decreased. On the other hand, the movement referred to as “anti-art” (*han-geijutsu*) had appeared gradually and included the following actors: the Gutai Art Association (*Gutai bijutsu kyōkai*), “Kyūshū group” (*Kyūshū-ha*), and the “Neo Dadaïsme Organizers.” The rule of “including a molding work with a wall” was established for the genre of “painting” in the 15th exhibition of 1963, and the change of incorporating the genre of “molding” to “sculpture” was implemented.

Here, I want to carefully investigate the alteration of the genres outlined above. Though the forms of artworks had obviously gone beyond the established framework, the formal dependence upon a genre still remained the case in art exhibition structures. This indicates the value criteria against which an art exhibition was established and examined by organizers, art critics, and artists in 1960s’ Japan, and the conservatism toward institutionalized “art” was consistent even in *Yomiuri Independent Exhibition*, which had a steering committee of young artists. Takiguchi Shūzō, who was one of the eminent art critics in postwar Japan, observed the following about this point:

I hope that though young artists from the Independent exhibition have a new position, they do not sink back into an art museum’s habit and not repeat the same history; this is a problem of the Japanese art world as a whole.²

It is symbolic that he highlights how young artists’ energy also has the dangerous characteristic of settling into one style of the established “display” in an art museum. Thus, the criterion of “anti-art” (*han-geijutsu*) is immanent in the problem of adapting institutionalized “art” in Japan. Then, I investigate the *Contemporary Art Exhibition of Japan (Gendai nihon bijutsu-ten)* which functions as an example of the problem of adopting institutionalized “art” and the trend of power favoring conservatism in the avant-garde genre (Figure 2).

In the *Contemporary Art Exhibition of Japan*, the steering committee in Mainichi Newspaper Company selected Japanese artists, researching art circles comprehensively. “Consciousness as a comprehensiveness,” composed of various styles by masters and middle-rank artists in art circles, was implemented. In the first exhibition of 1954, 315 pieces by 206 artists were displayed, and the sections were Western-style painting, Japanese-style painting, print, and sculpture. However, articles of the time included phrases such as “across-the-board” and “an average display.” So Mainichi organized the selection committee with five art critics from the 5th exhibition of 1962 onward and established an open-call competition section; this was the first time that a large-scale Japanese exhibition was including a competition. The reflection of the Japanese art world was significant. This decision led the exhibition to develop a reputation of being against liberation from the hierarchy of art circles. As a result, 2,925 works were entered in the 5th exhibition, and this Mainichi contemporary art exhibition began to have power in the Japanese art world. During the 9th exhibition of 1969, Mainichi reformatted the exhibition structure, establishing two thematic sections and one open-call competition section, revising the systems of selection, division, and open-call competition. For instance, the second section was the one titled “Frontiers of Contemporary Art.” Mainichi set up a selective exhibition that was aware of “contemporaneity.” In this section, several young artists who did not belong to traditional art groups received awards, such as Ikemizu Keiichi, Wakabayashi Isamu,

Takamatsu Jirō, and Kawara On.

The issue of how the selection and show of “contemporaneity” should be formed has been debated continually following changes like those outlined above in the *Contemporary Art Exhibition of Japan*. Based on this domestic condition, Haryū Ichirō, one of the most influential art critics in postwar Japan, mentioned the distinction between “modern” and “contemporary” and criticized this condition as a domestic synthetic exhibition, describing as follows:

I do not name the latest style “contemporary.” The distance between foreign countries and Japan in art has gone and catching up with new trends is over. First of all I want to attach great importance to the awareness of existing in the reality within international contemporaneity.³

Thus, Haryū used the term of “international contemporaneity” (*kokusaiteki dōjisei*) here. “International contemporaneity” had been frequently used in the art discourses of the late 1960s.

2. Analyzing discourses: “International contemporaneity” (*kokusaiteki dōjisei*) and “Japanese originality”

What intention did the Japanese art world have during the transition from *gadan* to “avant-garde”? I focus on applying the system of an international judging committee in the 9th *International Art Exhibition, Japan (Nihon kokusai bijutsu-ten)* of 1967 to examine the context of “international contemporaneity” I mentioned above (Figure 3).

Mainichi abolished the distinction between domestic and foreign art sections that were considered for the award, introducing an international judging system and invited one judge from France, America, and England.⁴ As a result, Yoshiwara Jirō, Yoshida Minoru, Arakawa Shūsaku, Takamatsu Jirō, Miki Tomio, and Kojima Nobuaki were selected as the winning artists from Japan, and the shift from established art groups to individual artists began. This fact gave them (*gadan*) a great shock. As a result, Mainichi postponed the *International Art Exhibition, Japan* in 1969.

Here exists the problem of “internationality” in the *International Art Exhibition, Japan*. There are problems regarding the transformation of artworks, the established hierarchy, and the relation of “internationality” or “contemporaneity” and institutionalized “art.” In short, “contemporaneity” here was achieved by the criterion of value by the outside of the international judges from America, France and Britain. Then, although Japanese critics focused on domestic artists and explained their characteristics, they focused on them only to highlight that the young artists were not based on traditional art circles, so they could not meet the original criteria of value. They actually used only the terms of “neo dada” and “action painting.” In brief, the “contemporaneity” (*dōjisei*) of “international contemporaneity” (*kokusaiteki dōjisei*) is inherent in the structural problem within the institution of “art” that stemmed from the West and relates to the problem of Japanese originality. Moreover, “Japanese-style painting” was withdrawn from display under the “international contemporaneity,” as well as from the display in an international exhibition overseas.

Conclusion: Changes of large-sale art exhibitions in Japan and “art” as an institution

In this paper, I elaborate upon the art movements in postwar Japan around the structural change of large-scale art exhibitions. This viewpoint shows that the problems of adopting “art” as an institution and the inclusion of “Japanese characteristics” relate to the intention of the Japanese art world following the war: the value criterion and vector of criticism involved with organization, display, and artwork.

Though Japanese art organization always had the intention of expressing nationalism—“Japanese characteristics”—they tended to keep the focus on modernism, that is, the strong conservatism toward the institutionalized “art.” Thus, in the “international contemporaneity” of the 1960s onward, the vulnerability toward powerfully outputting the originality from Japanese inside arises intentionally or unconsciously. In Japan, the structure of getting out of established art circles (*gadan*) was equal to “contemporaneity” that was formed unavoidably, so that the intention of exploring and outputting Japanese originality is equal to “contemporaneity” does not work sufficiently. This “international contemporaneity” without mutual traffic relates to the structural problem of the Japanese art world lasting since the modern era, and this condition has a great impact on the making of Japanese art history in the postwar era.

This problem of adopting the system of “art” in Japan may connect to another intention of “from art exhibition in ‘White Cube’ to the open-air exhibition” that arose in 1960s’ Japan: the development of open-air sculptural exhibitions. Open-air sculptural exhibitions in Japan involve the same structural problems as large-scale art exhibitions. On the other hand, by way of open-air art exhibitions in the 1980s onward, the intention of deviation from institutionalized “art” stemming from the West, that is, the elements of culture and festival peculiar to each region arose in the structure of the large-sale art exhibitions and art festivals in the open-air of the 2000s.⁵ We can regard this change of an art exhibition as the postmodern transformation of an art exhibition in Japan.

History of Independent Exhibitions			
Organizer	Yomiuri Newspaper Company	Period	From February to March (annually)
Venue	Tokyo Metropolitan Art Museum	System	Non-judgement, free display
Year	1949, 1950, 1951, 1952, 1953, 1954, 1955, 1956, 1957, 1958, 1959, 1960, 1961, 1962, 1963. * Discontinues in 1964 (total) 15 times		
Notes	1953 (the 5th): (Nakahara Yūsuke) The appearance of the first generation ----- 1955 (the seventh): The display by Gutai Art Association ----- 1958 (the tenth): The joint display by Kyūshū-ku (Nakahara Yūsuke) The appearance of the second generation ----- 1960 (the twelfth): (Nakahara Yūsuke) The place for action / The display by “New Dalarnomi Organizers” ----- * Dec. 1962: Announced six items as “the standard of an artwork for display” (Minimoru shikakuin shikaku kijō) for regulating works that may have a final order or be too dirty to display		

Contemporary Art Exhibition of Japan	
Organizer	Mainichi Newspaper Company
Period	In May, for 20 days (Tokyo Metropolitan Art Museum) In June, for 12 days (Kyoto Municipal Museum of Art)
Year	1954, 1956, 1959, 1960, 1962, 1964, 1966, 1968, 1969, 1971, 1973, 1975, 1977, 1979, 1981, 1983, 1985, 1987, 1989, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000 Total 29 times * "the * 0" was not applied in 1973
Venue	Tokyo Metropolitan Art Museum, Kyoto Municipal Museum of Art * (the first - the 10th, 14th, 19th, 21st, 22nd, 25th) Exhibition tours of some regions
System	1954 (the first) to 1960 (the fourth) : Invitation system 1954 (the first) to 1968 (the eighth) : Displays based on genres 1962 (the fifth) : The section for competition was also attached. * For this exhibition was only an invitation section in 1973. 1969 (the ninth) : Three sections. The theme of the second section was "Frontiers of Contemporary Art" 1973 (the eleventh) : The transition from established genres to "plane and three-dimensional object".
Notes	1962 (the fifth) : The system in which art critics selected artists for the exhibition was applied. 1966 (the seventh) : The artists of Kansai Independent Exhibition received prizes. 1971 (the tenth) : Miki Tarom and Hayashi Shiro selected artists in the invitation section. The theme was "Human and Nature" and four sections were set up. 1992 (the twenty-first) : The solo exhibition by the artist who received a grand prix in the preceding year was held in the invitation section.

International Art Exhibition, Japan (commonly called Bizen Biennale)	
Organizer	Mainichi Newspaper Company
Period	In May, for 20 days (Tokyo Metropolitan Art Museum) In June, for 15 days (Kyoto Municipal Museum of Art)
Venue	Tokyo Metropolitan Art Museum, Kyoto Municipal Museum of Art * (the 1st to the 10th) Exhibition tours of some regions
Year	1952, 1953, 1973, 1975, 1979, 1981, 1982, 1983, 1987, 1970, 1974, 1979, 1980, 1982, 1984, 1986, 1988, 1990. Total 18 times
System	1952 (the first) to 1967 (the ninth) : The nation-by-nation presentation, invitation system 1970 (the tenth) : Commissioned system (Nishikubo Yuzo) * The subject "human and nature" 1974 (the eleventh) : The section of foreign countries and a domestic one. (Competition) 1978 (the twelfth) to 1990 (the eighteenth) : The system of inviting one overseas country and a domestic section. (Competition)
Notes	(The domestic selection) Five art critics had conducted since the 6th exhibition of 1961. 1967 (the ninth) : Introduction of international judging system. 1970 (the tenth) : Many artists were in residence for making artworks. 1974 (the eleventh) : The display based on a theme. (Foreign section) America : "New Realism Paintings in America" Britain : "Hyper Realism Paintings in Europe" (Domestic section) The theme of "Realism in the Age of Reproduction and Reflection". 1978 (the twelfth) : The genre itself changed into the section of "plane and three-dimensional object."

Notes

1. The Mainichi Newspaper Company held the *Art Organizations` Joint Exhibition (Bijutsu dantai rengō-ten)* as the synthetic presentation of major art groups in 1947 and brought *Salon de mai* from Paris to Japan in 1951. The Yomiuri Newspaper Company held the 1st*Occident Masterpieces Exhibition (Taisei meiga-ten)* in 1947 and the 1st*Japan Independent Exhibition* mentioned in this paper (formally called the *Yomiuri Independent Exhibition* from the 8th exhibition onward.) The Asahi Newspaper Company also held *The West Masterpieces Exhibition (Seiyō bijutsu meisaku-ten)* and *The Contemporary Art Exhibition in the World (Sekai konnichi no bijutsu-ten)* which was known for bringing an “informal whirlwind” to Japan.
 2. Takiguchi Shūzō: “Artwork`s Crisis and Responsibility: *Yomiuri Independent Exhibition*” (Sakuhin no kiki to sekinin: *Yomiuri andependan-ten kara*), *Yomiuri evening newspaper*, (March 16 1962).
 3. Haryū Ichirō: “*Contemporary Art Exhibition of Japan Has Reached a Turning Point*”, *Mizuwye*, No.737 (June 1966), 11.
 4. The following judges were from other countries: Michel Ragon (France), Jasia Reichardt (England), and Maurice Tuchman (America). The Japanese judges were Imaizumi Atsuo, Tōno Yoshiaki, Haryū Ichirō, and Hijikata Teiichi.
- 5 *Tsumari Art Triennale* was established in the Echigo-Tsumari area of Niigata Prefecture in 2000. After, large-sale art exhibitions have appeared in many regions including Yokohama, Kobe, Aichi, and the Seto Inland Sea.

Kohei Yamashita received his PhD at Kyoto City University of Art, Japan in 2016. He is an art historian who specializes in Japanese art history after WWII. In his study of Japanese art history after WWII, he examines the structure and intension of art world itself in Japan by analyzing art exhibitions and their discourses. In 2017, He published “*International Art Exhibition, Japan*” and *Art History after World War II: Decoding the Changes in and the System of “Art”* from SOGENSHA. His publications includes “Reconsidering “The Japan International Art Exhibition (Tokyo Biennial)” : The Intentions of International Art Exhibitions in Japan After WWII” (*Aesthetics web*, The Japanese Society for Aesthetics, vol.22, 2018.) He is currently an adjunct lecturer at Kyoto City University of Art and other universities in Japan.

DEPOLITICIZATION OR REPOLITICIZATION- PURIFICATION ART MOVEMENT OF CHINA IN THE 1980s

Abstract | Emerging in the late 1970s, Chinese contemporary art presented two trends in 1980s: the Purification Art Movement and the Avant-garde Art Movement. In the west, the avant-garde emerges in the conflict between aesthetic autonomy seeking individual creative freedom and capitalist bourgeois materialist values (Gao Minglu). However, it comes the different way in China.

Avant-garde art due to its radical social and political criticality, is undeniable and obviously political and considered to play a very important role in the process of social transformation in China. The purification art movement pursuing formalism and “art for art’s sake”, on the other hand, seemed to go another way that’s called “Depoliticization”. However, the purification art movement is not actually depoliticized in China and it’s only political in a relatively hidden way. In this essay I’ll discuss the link between the purification art movement and politics, and then its historic role in reference to modernity.

If it were the case that the influence of the Purification Movement in Western art had long since diminished in 1980s, the opposite was true in China where it had indeed flourished during that period. “Formalism” “Autonomy” were frequently discussed since artist Wu Guanzhong had published an article named “Formal Beauty of Painting” in one of the most important magazines “Art”. This article brought formalism, which was considered a political exclusion zone because it challenged prevailing aesthetics principle “forms obey contents” in Socialist Realism, into discussion, and then started up an ideological trend concerning with the relationship between contents and forms. The Purification Movement contained not only ideological trend but also art practice. Abstract painting in the early 1980s and conceptual art in the late are representative practices. I’ll focus on Wu Guanzhong as representative artist at the early stage and Xu Bing as the late. The two artists were both exploring art forms: Wu through abstract painting and Xu through conceptual art such as “Book from the Sky”. Although they didn’t originally intend to be political, their composition showed political factors subverting the socialist ideology that were consistent with modernization process, which can be regarded as Depoliticization.

By discussing paradox of depoliticization and repoliticization of Purification Art Movement of China in the 1980s, we can see the specialty of modernity in China, which is a kind of “total modernity” (Gao Minglu).

Index terms | *Gao Minglu, Total Modernity and the Avant-garde in Twentieth Century Art (Cambridge, MA: MIT Press, 2011), 2*

In the late 1970s, with the end of the Cultural Revolution, Chinese history entered a new era. On May 27, 1978, the third full-committee meeting of CHINA FEDERATION OF LITERARY AND ART CIRCLES "CFLAC"¹ was held announcing the resumption of the work of the committee. The "new era of literature and art" first appeared in the resolution of the General Assembly, and the history of Chinese literature and art entered a "new era". In the fifth issue of "Art" magazine in 1979, Wu Guanzhong's article "The Beauty of the Form of Painting" was published in which the slogan "Painting should focus on the beauty of form" was proposed. After that, Wu Guanzhong published several articles in succession discussing problems of abstract as well as content and form relationship. Wu Guanzhong's series of actions triggered a nationwide discussion on the form which lasted for almost five years. Wu's view about the importance of abstract and form in painting seemed not new from a worldwide perspective and even conservative as formalism had lost its dominant position in the west and esthetician tended to pay more attention on heteronomy theory such as "institution" "atmosphere" "art worlds" "regime"², etcetera.

The problem is why this "conservative" view challenged the art and aesthetic conception in China at that time and caused a fierce, nationwide argument? How "conservative" in the west became avant-garde in China?

To understand these issues, a perspective of "Eventualization" inspired by Michel Foucault is needed. Foucault believes that historians have lost interest in the study of events, thus making their principles of historical understanding non-event, which he calls de-eventualization. What's inspiring from Foucault is any event is historical, so it should be used to evaluate an event from the historical context, instead of the opposite³. Therefore, in order to deeply explore issues thereof, we should place them in the historical and cultural context, that is to say, returning to historical scene of China's early reform and opening up from late 1970s to early 1980s so as to reveal its essence and meaning in the intersection points of social, historical, and cultural texts.

HISTORICAL CONTEXT

The most important context in the late 1970s and early 1980s was the liquidation of the "Cultural Revolution" and Chinese art world was trying to bring order out of chaos with the whole society. On October 30, 1979, the Fourth Literary Conference⁴ was opened, and Deng Xiaoping⁵ issued one of the most significant speeches for the art world. This speech released two important signals. Firstly, Bringing literature and art work into the Four Modernization Projects. Secondly, adjusting literary and artistic policies, criticizing the previous literary and art policy which regarded them as political tools, and respecting the laws of literature and art. These propositions have given the literary and art circles the possibility to debate which was impossible during the Cultural Revolution. In such a context, the art purification movement blew the first horn of the new era.

The art purification movement has both a gentle side and a fierce side. It focuses on form and abstract beauty that seems to have nothing to do with politics, which made it gentle and moderate. However, in China the problem of formal has been discussed for almost a hundred years and is not limited in art but also in politics. Especially after the founding of People's Republic of China, as art gradually became a tool of class struggle, the theory "content decides form" is not only an absolutely correct idea in art, but also the only correct route in politics. "Formalism" is synonymous with class enemies. If an artist is called "formalism", it basically means the end of his artistic life.

Therefore, Wu Guanzhong⁶ raising formal questions at the time, and even vigorously advocating “formal beauty” and “abstract beauty” actually touched the “taboo” of “formalism” and defied the long-term dominance of content determinism and its representative art criticism discourse: political standards first and art standard second. Formal problem has been the epitome of ideological conflict in China for a long time. In this sense, it is not difficult for us to understand why Jiang Feng⁷, who is one of the most important founders of People’s Republic of China’s fine arts, fiercely criticized Wu Guanzhong’s views. Jiang Feng believes that Wu Guanzhong actually advocates the form to decide the content. This is a departure from the materialistic reflection theory. The fundamental intention is that the future of art is to imitate Europe and the United States, to follow the art path of European and American modernism, and to depart art from life, society, and most seriously, from class struggle. Jiang’s critique of Wu’s formal determinism at the level of ideology is more tangible than other theorists and critics at the academic level. The relationship between content and form is not the focus of this paper. My focus in this paper is the transformation of discourse paradigm that Wu Guanzhong seeks through the formal determinism of his loophole and inconsistency theory. Behind the transformation of the discourse paradigm – as Jiang Feng realized – led the transformation of ideology.

GENERATION OF CONSENSUS IN MODERN CHINESE ART HISTORY

The reason why Wu Guanzhong’s issue of the form and abstract beauty of art can cause widespread controversy is that it breaks the “consensus” model of the “perceptual distribution mechanism” of the Chinese art world and creates a “dissensus”, thus allowing formal that used to be an invisible part becomes visible and sensible and further more a topic that can be explored. In the discussion of this section, the aesthetic theory of Rancière will be introduced. The concepts of “sensible distribution mechanism”, “consensus” and “dissensus” are all from Rancière. In the early days of reform and opening up, the issue of Chinese art purification movement involves a game between two different mechanisms, political and aesthetic. Therefore, compared with the usual aesthetic-political dualism analysis method, Rancière tries to establish a research method that links politics with aesthetics, which may bring a new perspective to the study of the above problems.

In Rancière’s aesthetic theory, “dissensus” is a combination of politics and aesthetics, and a theoretical stage for thinking about politics and aesthetics. Dissensus is the core concept of the theory of the aesthetic system of Rancière. In a literal sense, this concept refers to dissent — a certain kind of “difference” and “conflict”. Specifically, dissensus refers to “a conflict between sense and sense” “between a sensory presentation and a way of making sense of it” or “between several sensory regimes and /or bodies”⁸. Rancière believes that under the aesthetic system of art, the emergence of “dissensus” breaks the harmonious state between different perceptions, between the presentation mechanism of perception and meaning and between different sensory presentation mechanisms that he calls consensus. In short, what Rancière thinks of “dissensus” is to put heterogeneous logic on the same stage, in the same world, and thus making incommensurable things commensurable. The controversy triggered by Wu Guanzhong’s article on formal beauty and abstract beauty generated “dissensus”, so that heterogeneous logic such as “formalism” and “realism”, “abstract” and “realism” were placed on the same stage. On the “stage” of Chinese art, issues such as “formalism” “abstract” and theory related to them has not been included in the sensory distribution mechanism until then.

To understand the generation of dissenting, we must know how the consensus is constructed. The process of constructing consensus in modern Chinese art is actually the contradiction and struggle of heteronomy aesthetics (theory that advocates art should act as instrument) and autonomy aesthetics (theory that stands for art for art sake) around whether aesthetics obeys utilitarianism or not. Nie Zhenbin calls this struggle “the basic contradiction of modern Chinese aesthetics”⁹. Compared with Nie Zhenbin’s neutral point of view, Li Yu is more inclined. Li summarizes the struggle process of “basic contradiction” as “A history of Chinese art is a history of conflicts between realism and non-realism and realism has finally won” “Realism must defeat formalism which is just like the fact that socialism in the West must defeat capitalism.”¹⁰

As an academic judgment, Li’s statement is obviously not rigorous. But analyzing it as a text will reveal rich implications. The interpretation of binary opposition like “formalism representing western capitalism versus realism representing socialism” is not everlasting in the Chinese art history while its formation was achieved through long struggles and multiple turning points.

1. Wandering and Debating: From Late Qing Dynasty to The 1930s

From the late Qing Dynasty to the 1930s, before the outbreak of the Anti-Japanese War, it was a period of wandering and debating. Chinese art world of this period tried to find a way out for the transformation of Chinese art and society. There are two ways ahead of them: autonomy based on aesthetic purpose, that is to say insisting on “art for art’s sake”, and heteronomy based on utilitarianism. The founder of aesthetic autonomy is Wang Guowei who advocates the preservation of the sacredness of philosophy and art. The heteronomy theory originated from Liang Qichao advocates art for life and society. Whether to choose to go back to the ivory tower or go to the cross street is the hottest topic of discussion in artistic world at that time.

After Wang Guowei and Liang Qichao, the different interpretations about the “art revolution” around the year of 1918 were the first positive confrontation between aesthetic utilitarianism and instrumentalism. The topic was initiated by the esthetician Lu Cheng who used study in Japan researching aesthetics and art. Therefore, when the issue of “art revolution” was first proposed by Lu, he put forward the idea that art needs change due to scholar concerns. On January 15, 1918, “New Youth” magazine published the newsletter written by Lu Cheng to Chen Duxiu under the heading “Art Revolution”. Although the “revolution” is a utilitarian vocabulary, the art revolution he advocates is a radical reform of the art within the art. Lu’s point is to conduct an ontological analysis and a review of art history. Different from Lu, Chen Duxiu is a radical intellectual and politician. His literary and artistic proposition is mostly out of the political purpose of serving the reality of Chinese society. After receiving Lu Wei’s newsletter, Chen Duxiu quickly responded to Lu Wei and also published the same issue of “Art Revolution” in the same issue of “New Youth” magazine. Although the formulation is the same, in addition to the term “art revolution”, Chen Duxiu almost put aside all the problems of art history, art genre, and other subjects within art world. Chen’s focus is revolutionizing Chinese painting. He slams Inheritance tradition in Chinese art as a model of feudal superstition and believes painters must use realism to be able to play his own genius, draw his own paintings, and not fall into the shackles of the ancients.

Similar to Chen Duxiu and Liang Qichao's views, Cai Yuanpei and Xu Beihong are also representatives of heteronomy Aesthetic concept.

2. Consensus Formation : From the 1930s to the Reform and Opening Up

During the decade of the 20s and 30s, the art world was in the midst of a big debate about "art for art" and "art for society." Moreover, the conflict of autonomy and heteronomy in this period was no longer a dialogue and contention within art, but is given more political significance. With the deepening of the national crisis, the left-wing art practice led by the Communist Party of China is becoming increasingly influential. With the establishment of the "Left Wing Art Artists Alliance", art practice and party political practice began to have a closer connection, and art gradually became part of the revolutionary work, serving the overall goal of the revolution. Although the left-wing art movement advocates realism, western modernism is still widely adopted. For example, in the woodcut movement led by Lu Xun, expressionism reflects a strong vitality. An important turning point is Mao Zedong's speech at the Yan'an Forum on Literature and Art in the year of 1942. After the speech, "modernism" "formalism" and "abstract" regarded as representation of western capitalism have gradually become forbidden zones, and became invisible, insensible parts in the sensible distribution mechanism of Chinese art. After that, heteronomy obtained authorization and developed to an extreme degree during the Cultural Revolution. Socialist realism becomes the only legal art form.

GENERATION OF DISSENSUS: ARGUMENT ABOUT FORM AFTER REFORM AND OPENING UP

Wu Guanzhong's objection to the "content determination form" proposed in the debate has two meanings. The first is opposition to rigid creative techniques, socialist realism, which is its artistic and direct purpose. The second is what it represents—ideology. The ideology of class struggle, is a more essential meaning. The contending of formal problems broke the situation that realism and modernism are completely opposite, letting modernism and form problems out of the "forbidden zone". The contend for formal issues represents a new ideology represented by modernization and humanitarianism in the new historical period, trying to replace the ideology of class struggle and seeking for authorization.

This contend did not form any conclusions. However, we cannot devalue its meaning because the "no conclusion" means the biggest rebellion against the long-standing consensus model of the past decades. It completed the politicization appeal in a depoliticized form, and that's why it is avant-garde. It is neither the avant-garde in the sense of Greenberg (the renewal of the art style), nor the historical avant-garde in the sense of Burger (critique of the art system). It is more about the rebellion of the ultra-leftist trend and the rigid art system, realizing their avant-garde thinking in a "depoliticized" way.

1 CHINA FEDERATION OF LITERARY AND ART CIRCLES "CFLAC" is a national literary and art association led by the Communist Party of China. It was founded in July, 1949 and had played an important role in organizing and managing national art work until the Cultural Revolution (1966-1976) during which its work is completely stopped. More information see its official website, http://www.cflac.org.cn/wdh/7wendaihui/dbdh_a4_09.htm

MODERN INFLUENCE OF LAOZI'S AESTHETICS THOUGHTS ON ARTIFICIAL INTELLIGENCE AESTHETICS

Abstract | The emergence of artificial intelligence has influenced people's understanding of art. Although artificial intelligence is high technical way to make arts' production which can provide us with aesthetic experiences and aesthetic feelings, its' production is not equal to art works and cannot replace the later one in the sense of art's nature. The deconstruction of art which has brought by artificial intelligence could be dispelled by Laozi's aesthetic thoughts. Let's following Laozi's way of explaining things, try to consider things as themselves. Art, whose realization depends on technology is human experience physically and mentally as well, is a free play of symbol. Firstly, art works cannot be the transformation of things; even it is made by strong artificial intelligence. Art works which reveal themselves are not art production; they are created for the showing of things' nature. It means that the creation of art is the way and the aim at the same time. In Laozi's opinion, human being's practice and things ' developing should follow the principle of nature. The most exquisite and useful artifact presents itself as it is used to be that way, and it should not be sheer man-made one. Furthermore, art is explanation of human being's affection and needs, or it is the reflection of human desire both in mind and body. Then merely collection of human experiences cannot illuminate the complexity of human desire; even affective computing cannot truly modify human being's affection and its expression, otherwise it turns out to be the satisfaction of desire for high technology or desire for the desire for art. Laozi emphasized that let things take their own courses; then no desire goes beyond its way. Finally, art is the truth revealing process which involves with human being, things and technology. Aesthetic computing is high technical thoughts and methods which deal with art, so art and affection could be stylized. Then the meaning of art works is set and the aesthetic feelings are predicable. Art, which is used to be the way human being relies on technology to reveal the nature of things and themselves as well, turns out to be the technical reflection of human experiences based on collection and computing. As a result, Laozi called for viewing things by heart, so human being's experience could directly connect with things themselves, and then both human being and things could follow their way.

Index terms | *affection; artificial intelligence aesthetics; desire; intentionality ; Laozi's aesthetics thoughts; nature*

INTRODUCTION

FOR the ambiguity of the concept of artificial intelligence (AI)¹ and the potential extension of human beings' feelings, we may ignore the nature of artificial intelligence and overlook the influence of technology on us. While Lao Zi's thoughts on aesthetics suggest us just let things to be themselves, and weak those negative influence. This paper states this view: Modern influence of Lao Zi's aesthetics thoughts on artificial Intelligence aesthetics raises the question concerning the relationships among art, technology, desire and Dao.

Although the definition of art varies from different times and the type of art is multiple, there are some features beyond the development of changes that keep art as art. Both in western thoughts and traditional Chinese thought, art originated from skills which were closely connected with knowledge.

Although the experience of art is physically and mentally as well, the arts' practices are considered as the practices of symbol for the emphasis of mental movement in art, not merely as the process of production (Fuchun Peng,2010:137).

Nowadays, arts' creation relies on skills, technology and AI that share different concepts and features, while they also have something in common that they are extension of human beings' abilities. Skills mainly depends on human beings physically and mentally that people should keep on improve their abilities so they could do things better and faster; the technology releases human being from inefficiency, low precision, repeat works by tools or machines; and the AI solves intelligent problems and practices for us by computer language. Even the development of high technology could not change this fact, machines are controlled by human beings, and artificial life is produced by human beings, even its smartness is beyond the reach of human intelligence.

We may get the conclusion that technology replaces most of the corporal experience of human beings, while it only imitates, reflects and presents our spiritual experience. Later studies show that evaluation of human experience or affection could not ensure the originality of artworks. That discussion seems to suggest that the spirit of the human being is a unique feature of art. This paper tries to explain the relationship between AI and art this way: The most controversial rationality on the aesthetic of AI is human beings' affection and intentionality which actually can be included in human beings' desire. Either as a tool or as a way, the AI fulfills our desires for arts or the living world. Directing our desire for technology by Dao, we may get rid of the harmful impact on technicism.

LAO ZI'S AESTHETIC THOUGHTS ON DAO

Dao was the origination of things and the developing principles of things. It followed its own way and let things to be themselves. In Lao Zi's opinion, the greatest artwork was created by the direction of Dao.

Lao Zi insisted that distinguishes among things were artificial, and were based on the standards of whether they were useful for the human being or not. The human being named things and learned to discriminate varieties things that they ignored the nature of things. To be worse, technology carried forward the process of this classification, and people's desires to make things to be usefully motivated the development of

technology. Only by following the principle of Dao that everything should exist as themselves, then their usage never exhausted. Skills or technology were the way to change things' shapes, features even contents, while arts' practices were the process of uncovering of the nature of things. People shaped things or rearranged the structure of things for a certain purpose or we say for desires, while art creation was aesthetic disinterestedness.

In Lao Zi's opinion, the greatest beauty was the beauty of Dao, the most superb artists' action obeyed the principles of Dao. The greatest artwork was the work showed us with thing itself. Taking music for example, the most beautiful music provides people litter voices or no voices, for the limitation of artificial voices could not lead music to the aesthetic experience of infinity. With the direction of Dao, the greatest music released their nature and uncovered their own, then everything showed themselves as a whole.

That was to say artificial skills or technology which followed the nature of things that things showed their own purposes in the process of being shaped and fulfilled the needs of the human being at the same time. Artificial skills or technology in general or extend in the meaning of wits would be harmful to people when it was out of the proper principle of things' development.

How to avoid negative effects to skills or technology which were out the control of Dao? Lao Zi offered us three ways: firstly, following the principle of Dao that people would not merely pay attention to their own interests; secondly, let things to be themselves without diversity of usage; thirdly, did everything under the direction of Dao, not under the desires of needs. In conclusion, people should follow the direction of Dao instead of their desire.

MODERN INFLUENCES OF LAO ZI'S AESTHETIC THOUGHTS ON ARTIFICIAL INTELLIGENCE AESTHETICS

Lao Zi illuminated his thoughts on desire from two aspects: For the need of the individual, Lao Zi emphasized that people could meet their physical instinctive desires in the level of following the guide of Dao. For the relationship between human beings and the universe, people should obey the movement of nature which also following the principle of Dao. That was to say, the human being did not enjoy priority in the universe, and he was just equal to all the other creatures because the universe did not treat creatures in a special way. The movement of all creatures was a circle from the flourishing to vanishing of them, which means that all the creatures would go back to its beginning in the end. So people should respect this natural rule, and pursued the desires which could be pursued under the guidance of Dao.

The developing of AI is the fulfillment of human being's desire for technology and the desire for the desire of technology as well. AI, as a tool which helps people with intellect problems, is considered as a replacement of human beings brain's function, not as the replacement of intelligence. AI as a desire which is the desire of human being's desire for technology may never stop sparking human being's curiosity for the extreme of the developing of AI, then high artificial intelligence may be the governor of the human being in some days.

As we had discussed current researches on how AI put the impact on art did not change the core feature of art that the spirit of the human being was considered as a specific

feature which made art to be itself, and it points out that human being creates art in purpose. Human beings showed their worship for the unknown power of nature; they imitated the image of plants for recording; they gathered together, danced and sang for pleasure; they wrote poems to present their grief; they mixed pigments to reflect what color they saw by heart, not by eyes; they put man-made productions in certain places just like museum; they even use emojis to write stories. The object of art varied from the material, substantial things to metaphysical, imagined symbols. The technology developed from tools for normal life to artificial intelligence. The purpose of creating art changed from survival to pleasure, even for pain. One thing never changes from time to time, it is human beings' desire for art. Or we could say people create art on purpose. And the purpose is our desire for art.

To be worse, unlike technology in industrial age produces machines, AI in modern times makes language directly to reality (Fuchun Peng, 2018:147-150). That is to say, human beings lost his or her control for AI releases human beings from intellect activities that the motives of AI's production can be its own creation without human being's order. On the one hand, AI's development relies on the culture history, AI is the extension of human being's brain; on the other hand, the human being is no longer subject to the living world, like things, technology, human being is the object which could be set. AI makes it come true. The relationship between art and truth also has been changed in that sense, then whether art releases itself in the process of creation should be in doubt here.

When we talk about the aesthetics of artificial intelligence, we actually ask two questions. One of them is whether AI can be considered as an artist? The other is whether AI can provide us aesthetic experience or not. For the former one, we were used to setting artist as a human being. Some people may say Nature or God is a creator, while only human beings can create artworks in the sense of culture. Some people may say everyone is an artist, while only talented ones make artworks. Some people may say there are not artworks, but the text now day; while that is the relation between art and truth turns out to be art and language in the modern world. In fact, artist acts as a part of play of art creating process that artist should be considered as a part of art's play, and who is artist relies on its role in the art's play. As a result, we could ask for the nature of art to solve our questions on all the problems of art.

For the later one, it seems more obviously to say whether AI raises our affection or not. Aesthetic experience is not experience to get knowledge but experience to experience human beings' affection. There no recognition, collection, diversity, definition, but experience feeling from feelings. So it is the inner interrelation of feelings themselves. Artworks show themselves as a whole that they are no longer merely man-made production, they are abstract symbols which turn objective features into subjective feelings. Then AI could produce art production to stimulate emotion.

When we illuminate our views on AI, two misunderstandings may make us ignore the nature of art. We are readily receptive to the statement that AI is inferior to human beings, special to our brain. Or art production of AI is superior to artworks. As a matter of fact, a robot which cleans the floor or a software which can write poems may not clever enough to create art. Artificial life could follow the development of society and culture succession, and even could be someone if enough data are provided. While the aesthetic experience offered by AI could release the nature of a thing or not is a question, for the sorts of data which were collected by the principle of useful, so as the

date themselves.

CONCLUSION

Artificial intelligence aesthetics do provide us with art production and aesthetic feelings, while art is not created for man-made things without wisdom inside. Art creation process is an experience which is involved with things, tools, artist and our living world. It is a free play of symbol that things themselves, technology and the desire of human being show themselves as themselves here, for everything works under the direction of Dao. That is to say, no matter how the technology develop and no matter how clever the artificial intelligence is, Dao which releases the nature of art should be the setting for them, then everything develops on its own way.

Notes

1. It is too complicated to offer a generally acknowledged concept that there are some concepts, methods and questions can be used to discuss here: such as machine likes compute; software likes Aaron (A software, which was designed by American artist H. Cohen, could produce painting in a specific way); Expert Database and Machine Learning; affective computing and aesthetic evaluation; Intentionality and Automated Fitness Functions Based on Performance Goals; strong artificial intelligence and artificial life.

“LOCALISM” OF THE MODERNISM PAINTINGS IN OKINAWA

Abstract | This paper discusses about the aesthetics of the Okinawan artists in the postwar era. After the World War II, the artists (mostly oil painters) in Okinawa managed to merge the concept of “modern art” learnt from the movements in Japan or overseas into the cultural climate of their homeland.

Okinawa is situated in the southeast part of Japan and was once independent as Ryukyu Kingdom. In 1879, Okinawa was forced to obey the Japanese government, nevertheless in 1945, had turned into burnt ground in the Pacific War. After that, the United States Forces became their governor, until 1972. Therefore, the postwar recovery of art began from some interchanges between the soldiers of the U.S. and the Okinawan artists who had drawn the postcards or the portraits for sale. Their arena was called “Nishimui Artist Village,” which was formed in c. 1948. It could be said that every following artistic movement in Okinawa, such as *Okiten* (Okinawa Art Exhibition, 1949-), had been born from Nishimui.

Through these activities of the artists, it was the most important aesthetic concern what the identity of their paintings was. In preceding studies, there were two artists’ groups about this problem; one was a realist group who had been active before the WWII, the other was an abstractionist group who had become professional painters after the war. The latter is seen as the modernist painters in Okinawa.

However, the real situation was more confused. The author had researched the archives about the artists of postwar Okinawa: their works of art, their critiques about Okinawan aesthetics and the records of the artists’ interviews. Following this survey, Adaniya Masayoshi (1921-1967), who has been considered as the one of the modernist and semi-abstractionist painters, had tried to build “new tradition.” In other words, his aesthetics of activities was made of the modernism as universal aesthetics and the localism as the new tradition of Okinawa.

Therefore, the axis of the controversy between the previous two groups was not whether realism or abstractionism, but how to treat localism in their paintings.

Furthermore, the artists who were affected by modernist paintings were interested how they could express the cultural climate of Okinawa in their paintings.

Consequently, imported “modernism” is made into their own modernism only after the paintings caught the localism. That is a form of modernism in the small island among the strong political and cultural power.

INTRODUCTION

In 1995 and 1996, two associated exhibitions were held in Okinawa, Japan. While both of them were titled “Exhibition of Contemporary Okinawan Artists,” their subtitles were contrasting. The subtitle of the first one was “the genealogy of modernism,” but the second was “the care to inherency.” In this perspective, the history of art in postwar Okinawa divided into modernism and localism.

However, this classification contains an ambiguity: what does the modernism in Okinawan art mean?; in Okinawa, does the modernism confront the localism?

The previous studies about the Okinawan art claim that the modernism in Okinawa began in 1950s and it had developed by the activity of an artist, Adaniya Masayoshi (1921-1967).[1] Adaniya studied design in the Tokyo Fine Arts School (present Tokyo University of the Arts), but he was called up for the military before his graduation. Thus, his artistic career began after the war as a member of the “Nishimui Artist Village.” He had organized two groups of artists: “Five Artists Show” and “Sōtokai.” These groups, the previous research says, claimed to stand for the modernism in Okinawan art.

In this paper, I first arrange the position of Adaniya and his followers in the Okinawan art world, second, examine the character of him as a modernist painter, and third, observe that through his artistic theory the modernism in Okinawa was related to the localism who search for the cultural identity of Okinawa clearly marked off from that of Japan.

TWO TIDES OF MODERN PAINTINGS IN POSTWAR OKINAWA

Dawning of the post-war art in Okinawa

After the end of the Battle of Okinawa in the World War II, the US military force had administered Okinawa until 1972. Though most of the land was burned in the war and taken over for the base of the U.S. force, the activities of the artists in Okinawa began to recover just after the war’s end. The reason why is that the U.S. and Okinawa Civilian Administration[2] employed the artists as public workers[3] and made them draw the postcards, the posters or the portraits.

At this time, the central position of these artists was occupied by those who were well-known in Okinawa before the war: Yabu Ken (1894-1952), Nadoyama Aijun (1906-1970), Ohmine Seikan (1910-1987). They organized “Okinawa Bijutsuka Kyōkai (Society for the Okinawan Artists,)” which was the first group of the artists in Okinawa after the war.

Nishimui Artist Village

On April 1948, as the Ministry of Culture was decided to dissolve, the artists who had worked there lost the official support and the salary. Accordingly, under the initiative of Okinawa Bijutsuka Kyōkai, they decided to create the artists’ community at Nishimui near Shuri.[4] It is now called “Nishimui Artist Village.” By the summer of that year, the removal of the artists finished; the residents of Nishimui were Yabu, Nadoyama, Gushiken Itoku, Yamamoto Keiichi, Ashimine Kanemasa, Ohshiro Kōya, Tamanaha Seikichi and Adaniya Masayoshi.

In Nishimui, the artists sold the postcards and the portraits to the soldiers of the US Army. However, because they could not satisfy these works, they held “Okinawa

Art Exhibition” (hereinafter, this is called “Okiten”[5]) in 1949 collaborated with the Okinawa Times.

“Okiten” and “Five Artists Show”

After the first Okiten exhibition, some members of Nishimui formed a new group of artists. It was “Five Artists Show”; its members were Adaniya, Ashimine, Tamanaha, Gushiken and Kinjō Yasutarō. This group was previously regarded as the opposition against Okiten. They say that these members were dissatisfied about the screening standards of Okiten, which took a serious view of academic style.

Academism of the oil painting was imported to Okinawa from mainland Japan about 1920s.[6] Thus, the painters who grew up that time attached importance to the academism (in other words, realistic expression) in painting. Because the judges of Okiten (Nadoyama, Ohshiro and so on) also were these kind of artists, the younger members (Adaniya and others) might feel stuffy and tried to find genuine new aesthetic values which they should obey, to organize Five Artists Show.

I claim that this explanation about Five Artists Show exemplifies only one side of the truth. Certainly, there was a generation gap between the leaders of early Okiten and the members of Five Artists Show, but the younger was not antagonistic to the elders at the beginning of the group.

It is because that the members of Five Artists Show did not have the concrete aesthetic values against the elders when the group was formed, and moreover, their ambiguous ideas for making their own works were not necessarily shared with each other. The Okinawa Times of those days pointed out that the members of Five Artists Show did not agree their aesthetics or attitudes to artworks with each other.[7] There is also the comment by someone of the group: “individual ideas of us do not correspond but we need the occasion for coming out with our artworks.”[8] The mission of Five Artists Show was to get the opportunity to exhibit their works freed from the existing framework (i.e. Okiten or its academic realism.) They did not have a common ideology of art at that time.

Therefore, Five Artists Show was not the opposite against the authority of Okiten. It has been just the experimental arena for the young artists.

ADANIYA MASAYOSHI AS A MODERNIST PAINTER

Transition of Adaniya’s works

798

In the previous section, I argued the imperfection of aesthetic ideology of Five Artists Show. However, through the exhibitions, the members had established their own ideas for art. Adaniya especially changed his style of work changed after the breakup of Five Artists Show in 1954.

His career of oil painting started after the war. At first, he made realistic painting following the elders in Nishimui (figure 1, 2). *View of Shuri (I)* (figure 3, 1951) is also a pure landscape painting. However, *Funerary Urn (White)* (figure 4), which is a work in 1954, the last year of Five Artists Show, illustrates his analytical sense to capture the object and the tendency to abstraction. The most important work of Adaniya, *Tower* (figure 5, 1958), shows the abstractionist composition by horizontal lines and vertical line. His motives of painting were originated in the view of Okinawa (e.g. the

landscapes, the urns or the bases of the US), while he transformed those motives to his own abstractionist expression. In other words, he was not satisfied the style of realism to describe the contemporary Okinawan culture. In consequence, he found out abstractionism as the way to express modernity in Okinawa. Through the experiences in Five Artists Show, Adaniya tried to find a new way for Okinawan modernist painting.

The term “modernism” in this context means the reexamination of the system of painting, or art, itself. This reconsideration of painting itself brought the connection between art and the contemporaneous society.[9] Hence, this modernism does not mean abstract expressionism in the US nor the imitated style of the Western modern paintings since the Impressionism. Of course, it is not deniable that the West had had a large impact on the East during the modernization, but this modernism shows the originality of each local who goes on to the modernity.

Thus, modernism in the paintings of Adaniya is seen from his integration the new style of painting in the local context which he took up as his motives. In that sense, he has been regarded as a modernist painter in Okinawa.

As the organizer of “Sōtokai”

After the breakup of Five Artists Show, in 1958, Adaniya made a new group of artists, Sōtokai. While the original members of that group are Adaniya, Ashimine, Tamanaha and Ashitomi Chōshō (the pupil of Adaniya in Ryukyu University), they organized the research society as a branch of Sōtokai, which was the group to grow up the next generation. By doing so, the ideology of Sōtokai to create and nurture the Okinawan local art spread widely.[10] This activity of Sōtokai shows Adaniya as a pedagogical leader of the upcoming artists.

While Sōtokai continued after the death of Adaniya, 1967, a lot of avant-garde groups of artists were born from Sōtokai. They tried to get over both the realism in early Okiten and the “eclectic” modernism such like Adaniya and their works of art showed pure abstraction. In their works, the local context in Okinawa, which Adaniya had used as the subject of painting, internalized, rather it might be hidden behind.

Thus, Sōtokai and Adaniya were the origins of modernism in Okinawan art.

MODERNISM IN OKINAWA BASED ON LOCALISM

Two types of localism in Okinawan art

We discussed about the career of Adaniya Masayoshi as a modernist painter, meanwhile he was always aware of the problem what the localism of Okinawa is.

The term “localism” has a few meanings in Okinawan art, but the most popular meaning is similar to “local color.” In the era of the empire Japan, Japanese art world wanted to the colonies for each local color.[11] Okinawan artists were also required that they reflected the local color in their works, not only in the postwar era, but also after the war, to be accepted for the exhibition of the Japanese mainland. It is because that the leaders of Nishimui and early Okiten such like Nadoyama painted the products, the landscapes or the portraits of Okinawa. It was necessary for them to depict realistically to express the local color of Okinawa. Therefore, the localism that the realist painters thought was based on the local color such that the Others (mainly, the painters in

Japan) could feel the climate of Okinawa.

On the contrary, Adaniya and the followers did not make the paintings illustrating the objects in Okinawa directly. It certainly shows that they tried to oppose to the aesthetics regulated by Japan, but I proved above that Adaniya chose the Okinawan local objects as the theme of his painting. In other words, Adaniya also had his own idea of localism of art.

“Based on the local, establishing a new style”

In Adaniya’s writings to mention about the fruit of Five Artists Show, he claimed that the direction of the group came to be “based on the local, establishing a new style.”[12] At the same time, to the pamphlet of 8th Five Artists Show, he argued that “realism is never old style. Abstraction is also never new. What both of them coexist is modern.”[13] In these texts, Adaniya emphasized the importance of combination realism and abstraction, to build up modernist painting in Okinawa. Thus, for him, the idea of localism was not contradictory to that of modernism.

However, why did Adaniya insist on localism? What made him go beyond being just a pure modernist? Of course, because he studied in Tokyo and followed the realism of the elders in Nishimui at the beginning, the influence of them might remain in the ideology of him. Furthermore, it was an undeniable that Adaniya had intended to receive a decoration in the exhibition of Japan, to make the pieces that was easy for the people to evaluate. Consequently, the award at the exhibition in the mainland Japan enhanced his reputation in Okinawa.

Meanwhile, what should not be overlooked is the political situation of Okinawa of those days. As mentioned above, from 1945 to 1972, the US Forces had administrated Okinawa, while the Japanese government remained the potential sovereignty. As the Korean War began, the importance of Okinawa had increased as “the keystone of the Pacific” and the administration of the US became forcible. After that, the residents of Okinawa organized the movement for reversion to the mainland. Whereas, the US carried out the cultural policy in which the identity of Okinawan differentiated from Japanese, to govern more easily. In fact, the culture of Okinawa is far from that of the mainland. Thus, the identity of Okinawan faced a crisis of division: as Okinawan and as Japanese. In other words, the residents had a problem of what their own culture is.

Okinawan artists also confronted this situation. Above all, the artists who sought modern expression could not help standing face to face with the local culture of Okinawa. Therefore, regardless of realist or abstractionist, the painters in post-war Okinawa were more or less the investigators for localism. Adaniya wrote, “it is the guardian of the tradition who has a spirit to go his own way.”[14] He pointed out here that the seeker of localism should not depend on the tradition but arise new style from the tradition.

CONCLUSION

In this paper, I discussed about the modernist painting in post-war Okinawa. Adaniya Masayoshi, an oil painter in Okinawa, was abstractionist and localist as well. The concept of modernism is clearly imported from the West, but it was paraphrased to adapt to the context of Okinawa. Adaniya can be regarded as a modernist painter in the sense that he worked hard on this rewriting modernism, and moreover, as the

earliest modernist painter because he led the followers.

The modernist paintings in Okinawa did not just come from the imitation of the Western paintings, but also from the pursuit for another way to reflect the climate of Okinawa. In short, Okinawan modernism has been based on localism.

Rei Kagitani was received M.A. in cultural studies from the Department of Interdisciplinary Cultural Studies, the University of Tokyo, Japan, in 2017. He is now a Ph.D. student in the University of Tokyo. He is majoring in the history of contemporary Asian art, especially the movement of modernism in East Asia after World War II. His current research project is concerned with the history of Okinawan art in the post-war era. The interest of his paper for this congress is the modernist paintings in Okinawa, which had a relationship with desire for Okinawan identity, "localism." His related publication to this paper is "Modernism of Postwar Okinawan Art in 'Nishimui Art Colony,'" an oral presentation in Japanese, in The 69th annual conference of the Japanese Society for Aesthetics, 2018.

THE CURRENT STATE OF ARCHITECTURE IN VIETNAM

Abstract | In the last century Vietnam has survived political upheaval and a long series of wars, followed by further economic and social turmoil. Considering all of these issues, it is unlikely the nation would today be pegged as a center of ambitious design. However in the last thirty five years, the nation has witnessed tremendous growth and development. Such transformations are especially noticeable in the field of architecture. Complex architectural problems find eloquent solutions despite the number of seemingly insurmountable issues faced in Vietnam, displaying the nation's leadership in innovative and interdisciplinary design.

Architectural design in the southeast asian country faces a plethora of issues to consider: historic preservation, environmental concerns, and rapid urbanization. Incorporating diverse historic influences from China, France, America, and the Soviet Union is a daunting task. Simultaneously, Vietnam is a country at high risk for devastation due to climate change. Another facet to environmental design in Vietnam is a close cultural connection between the Vietnamese people and the environment, influencing aesthetic preferences. Both preservation and environmental design are only further complicated by rapid population growth. Urbanization forces the country to quickly grow and adapt in an attempt to serve huge urban populations. This paper analyzes how these diverse problems are approached. Solutions taking on interconnected issues are discussed, such as the Koi Cafe in Hanoi. These examples are used as evidence to how the complexities of architecture in Vietnam are facilitating stronger design work.

Architecture in Vietnam skillfully addresses diverse issues. Solutions to multifaceted architectural problems are thoroughly analyzed from various viewpoints, allowing final results to be more nuanced and comprehensive. Instead of being burdened by the multitude of problems faced, Vietnamese design thrives and displays a comprehensive understanding of effective design. Vietnam has become a lively canvas for artists and designers, transforming the field of architecture. As globalization increases, connecting the world more than ever, issues become more interdependent. Moving forward the realm of architecture around the world will have to take on these more complex design issues. Vietnam is establishing itself as a valuable leader in approaching such complicated design problems.

Index terms | *Architecture, Design, Environmental Design, Historic Preservation, Multifaceted Design, Urbanization, Vietnam*

Vietnam has often been considered by the outside world as a developing nation riddled by war, transformed into a rising economic power. While emphasis is still placed on problems that Vietnam faces, such as environmental problems, widespread corruption, and uncontrolled growth, Vietnam has slowly garnered attention for fresh and impressive designs and developments. In examining the many topics Vietnam has to consider in relation to architectural development- debates of historic preservation, rapid urbanization, and environmental considerations- it can be seen how Vietnamese architecture is able to thrive *because* of all these pressures. While necessitating many issues be balanced complicates the design process, this situation has also produced multifaceted designing. Preservation is an ongoing debate in Vietnam as a complex architectural history is faced with demands and desires for modernity. Urbanization places a large demand on design to maximize efficiency. Lastly, Vietnam's close relationship to nature and the resulting impact on architectural development has encouraged creative experiments in green design. Overall, the architectural environment of Vietnam has facilitated innovation due to the variety and complexity of issues being faced.

Through years of colonization and warfare Vietnam preserved a layered architectural history. Traditional Asian styles can be seen in historic pagodas around the country. Later French colonization brought an abundance of projects utilizing French colonial style. Villas turned government buildings, the Saigon post office, and the Continental Hotel have become iconic images of architecture in Vietnam. During the war period and subsequent years of Socialist ideology, Soviet and Eastern European architecture was utilized in new projects. These buildings, especially housing blocks, encouraged personalized adaption by Vietnamese residents. Through re-adaption of spaces, "a modification and resignification in culturally meaningful and economically beneficial ways"¹ transformed these accommodations. By remodeling apartments to suit Vietnamese living principles (so that the living space entrance did not face the bathroom entrance) and using balcony spaces to raise farm animals, the Vietnamese personalized otherwise sterilized Soviet designs.² This is evocative of the ability of a distinct Vietnamese voice to prevail through imposed foreign styles. Since Doi Moi reforms and entering into the global economy there has been an influx of modern architecture. Asian traditional styles are dispersed within a predominantly French colonial style but today are also dotted with hyper-modern projects that contrast with the vestiges of brutalized and industrial Soviet design. Clearly, Vietnamese architectural history is heavily layered and present day architects have numerous influences to consider in newer designs.

Historic preservation is a complex debate all over the world. Many people value preserving relics of the past in order to keep a society grounded through accomplishments and prior obstacles. Simultaneously, historic preservation is expensive and time consuming, requiring substantial space preventing development of denser neighborhoods to provide housing for more people. Architecture is designed to be used and lived in, "so when a building becomes useless at the task it was designed for, it needs to be changed or will rot away."³ Tension between practical

and emotional desires of mankind results in debates around the world. Vietnam, in the midst of its impressive economic development since the Doi Moi reforms, has found itself entangled in a fight between modernization and preservation. Desire for modernization in Vietnam puts historic buildings at risk. Ho Chi Minh City (HCMC) has especially been accused of a narrow “progress focused mindset [that] could cause Ho Chi Minh City to lose its cultural identity.”⁴ Hanoi in comparison has been praised for its efforts to maintain historic areas like (Old Quarter) in the center and segregate modern projects to city outskirts. Centuries of various architectural influences is part of what makes Vietnamese visual history and culture so distinct. Good design connects with the surroundings, thus effective architectural projects can only be produced after internalizing this multifaceted architectural context. Resulting projects will then be able to represent the unique culture of Vietnam and suit the spirit of Vietnamese lifestyles.

The debate of preservation versus modernization has given rise to a fascinating dynamic between new and old that simultaneously collaborates and conflicts. Globalization is an essential partner and facilitator of modernization. While bringing positive aspects, globalization also obliterates traditions considered archaic and inefficient. On the alternate side, a cooperation between modernity and preservation encourages fascinating modes of preservation. This is seen in the use of technology as a tool for preservation. For example, the Heritage Observatory opened a website for the public to call attention to threatened historic buildings. The information is then shared with civil and political groups who can work to maintain the historic site. Software developer of the site, Daniel Caune, has simultaneously been creating an app that prompts users to take pictures of historic sites, and using geolocation, provides information about the site.⁵ Such an idea probes the concept of using artificial reality in preserving certain historic sites digitally. Globalization also opens up Vietnam to modernized theories of development. For example Hung-Trung Mai, a Vietnamese born, French educated architecture student utilizes a combination of development of underutilized land and reconnection of urban and rural in his proposed urban strategy “& Lang.” The project proposal is an effort to combine urban development with preservation of rural and traditional spaces.⁶ These examples of simultaneous conflict and coalition of modern and traditional exhibits a necessary balance still being found in Vietnam. An alliance of conservation with modernization will produce the best results of moving Vietnam forward without sabotaging the past.

Vietnam is currently experiencing rapid urbanization. This is encouraged by the government because of a global acknowledgement that urbanization, when managed well, can contribute significantly to a nation’s growth and productivity.⁷ But in Vietnam urbanization problems of insufficient and unsuitable housing, traffic problems, pollution, and urban sprawl are not sufficiently addressed. Issues that are not comprehensively faced by urban planning, such as lack of greenery, traffic, and crowding influence an architect’s decisions. If an area is extremely crowded and loud, a building will be designed to combat this issue and create an oasis inside the building. For example, a HCMC townhouse’s design accounted for the unappealing aspects of city life such as pollution and dense living, so the “72 sqm house blends

together the serenity of nature with the compactness urban living.”⁸ Through greenery and thoughtful design the building intends to make the small building feel spacious and peaceful.

Urbanization also contributes to environmental concerns. For example, water treatment and solid waste collection are incomprehensive due to drainage facilities being too small, dilapidated, or unfinished.⁹ Most tap water in urban areas is still considered unsafe for drinking.¹⁰ The growth of urban areas without thoughtful redesign will also result in continued growth of traffic, contributing to the already terrible air quality. Urban growth without involvement of greenspaces can also lead to urban heating, encouraging excessive air conditioning and energy consumption. Many environmental concerns are involved in the expansion of cities and must be faced, making awareness of environmental issues noticeable in urban areas. This leads to individual building designs combatting these problems. Large urban population growth is an important topic considered in designing spaces and facilities to effectively serve a city. A balance must be established between livable space and efficient design. This balance is complicated by a large range of issues weighing in. A vacancy of comprehensive urban planning has instead encouraged individual architectural projects to take on issues of pollution and dense living spaces. While these projects may not be wholehearted solutions, they showcase impressive individual innovation in the face of systemic problems and make an effort toward balancing livable spaces with urban demands.

Warm and humid weather in Vietnam historically manifested as open spaces with plenty of greenery. Rising Vietnamese “starchitect” Vo Trong Nghia voices his desire “not only to make beautiful architecture. Architecture should be a device to connect people to nature”.¹¹ Even today in Vietnamese urban spaces, greenery is a motif from frequent small parks to overflowing potted plants on balconies. A trend of locally sourced materials and involvement of greenery in design is thus not surprising. Featured architectural Vietnamese design projects usually involve the use of sustainable and/or local materials including bamboo, thatch, mesh screens, and second-hand timber.¹² This trend in Vietnamese architecture has contributed to plenty of Vietnamese architectural projects finding themselves the subject of praise due to a global popularization of re-humanizing urban spaces through the use of greenery. Many projects have been featured for emphasis on environmental awareness. For example, Koi Cafe in Hanoi’s design of a self-sustaining eco-system uses a decorative waterfall system to oxygenate the koi carp ponds. Koi fish waste is then pumped into a planter where bacteria rich soil converts the ammonia into nitrates to grow decorative trees and vegetables harvested for dishes. A mesh roof provides plenty of natural light for the plants, simultaneously giving the café a warm environment.¹³ This project and similar ones display an inclination in Vietnamese design to involve greenery. Openness in Vietnamese culture to greenery has led to interesting proposed solutions

to urbanization problems. A common area experimented with are the Vietnamese tube houses (also referred to as shopfront houses, these buildings are narrow and long but not particularly tall). These buildings are common in the Vietnamese architectural landscape, even being consciously preserved in Hanoi's Old Quarter. But they are not conducive to air flow, leading to hot and humid indoor environments. Even worse, this environment can accelerate mold and fungus growth. Various engineers and designers are combatting this by experimenting with the inner building layout to increase airflow. Architect Kazuhiro Kojima introduced the concept of 'space block' for future tube house construction (any future construction in Old Quarter is expected to respect the existing architecture of the area). The design is intended to maximize ventilation and shade by "using some basic space blocks (BSBs) as constitutive elements, which form a porous structure...The porous structure creates wind corridors connecting several inner void spaces or courtyards, which encourages natural ventilation and is effective in reducing energy consumption."¹⁴ Environmental constraints and goals are often a great design facilitator. For example, the development of a new typology for the river's edge in the Mekong Delta by ASRO and Hanoi University involves elevated housing blocks above predicted water-level rise. The design attempts a balance of legitimate threats and maintaining current life styles.¹⁵ Actual implementation of the riverside design is still yet to be seen.¹⁶ Overall there is an impressive development of environmental design in Vietnam, likely stemming from a deep relationship between Vietnamese culture and the environment. This characteristic of Vietnamese architecture has allowed it to bloom into prominence in international architecture because of its suitability to modern architectural emphasis on green design.

As a discipline of art, aesthetics in architecture is an important topic. Beauty without deeper value results in unimpressive projects. Because of the multitude of concerns in Vietnam aesthetic concerns are well addressed by considering the visuals of historic architecture. Buildings are then developed even further through demands of urbanization and environmentalism. The final product of these influences are often visually enjoyable and experientially satisfying. Good design is becoming a Vietnamese experience. For example, a three family house in Chau Doc's redesign reflected a preservation of traditional style and environmental concern. Corrugated metal was employed as traditionally seen in rural areas but in a modernized method of a moveable façade. The open plan interior using local materials maintained regional living styles while also making sense for natural cooling of the house.¹⁷ Design of a sleek "townhouse" in Vinh still respected the existing trend of narrow Vietnamese houses but involved intelligent design to ventilate the building and make it feel more spacious through greenery and double height spaces.¹⁸ In Vietnam many of the projects recognized internationally are smaller projects such as cafes and homes. The impressive architecture of Vietnam represents the Vietnamese people and their aesthetic.

Discussions in Vietnam display a comprehensive understanding of the nuances of effective design. Research and development director of MoMA, Paola Antonelli,

explained, “Good design is a renaissance attitude that combines technology, cognitive science, human need, and beauty to produce something that the world didn’t know it was missing.” The state of design in Vietnam reflects this idea. With so many topics clashing, the output of problem solving design enterprises are admirable. Excellent design cannot exist in a vacuum, the more push there is on a solution the more finessed it becomes. All of the factors discussed- historic preservation, urbanization, and environmentalism- push projects in Vietnam further. Layering of historic styles gives Vietnamese designers a breadth in their styles. Diverse influences make designs less ideologically limited. New buildings pull from various influences, from minimal modernism to ornamental oriental. Necessity for problem solving in dense urban development and openness to improving the quality of life through environmental influence in congruence with global trends. The planet is simultaneously becoming overpopulated and environmentally strained. Vietnam has a deep connection to these issues, putting them at the forefront of discussions of architectural solutions. The ubiquity of interesting and beautifully designed buildings speaks to the general character of architecture in Vietnam. A unique dynamic of Vietnamese style and history has tackled technical design problems well and will likely continue to. Analysis of Vietnamese architecture and the elements impacting it today show Vietnam to be a lively canvas for contemporary architects and designers.

ON THE BEAUTY OF ROUGH NATURE OF HEZHE MINORITY

Abstract | Ethnic minority in Northeast China gallops in the wild land, travels around the world, fights north and south. Most of them possess the gallant, vigorous and bold aesthetic taste. However, Hezhe people who are famous for fishing owns the violent, unrestrained wild rugged beauty. This kind of beauty is different from the beauty of a fine delicacy and harmony. It is a kind of beauty that full of “strength” and “spirits” and also is a synonym of “masculinity” which embodies the essence of grand, magnificent and vigorous and has a very rich regional culture characteristics. The rough beauty of Hezhe is concentrate in Hezhe’s hero, nature worship and their living practice ,namely, clothing, food, housing, transportation and so on.

Index terms | *Hezhe minority, Rough, The beauty of nature*

“Under boundless sky, on vast plains, fishing boats can be seen in the wind.” The people of all ethnic groups living in the north and northeast of China are more likely to live the nomadic life of grass and horses. They are racing to make a living in the mountains and wilderness, or to ride on the vast rivers and seas. The arduous and dangerous living environment and the mobile life style make the northeastern people strong and brave, bold and unrestrained style and solemn and desolate mood, which are quite different from the southern weak and lingering style. The northeastern ethnic minorities are riddled with wilderness, traveled to the rivers and seas, and the south rushed to the north. Most of them have the aesthetic taste of bravery and boldness. However, the Hezhe ethnic minority known for their “fishing and hunting” have a rough and rude beauty.

The word “roughness” is a derogatory term. Crude, roughness, refers to the inferior. In *Shuowen Jiezi*, “Coarse means sparse,^{[14] 972} “Kuang, refers to fierce and inaccessibility,”^{[14] 1350} Kuang was later extended to mean brutal and vicious”. Roughness is a concentrated expression of the emotional and stylistic characteristics of rudeness, boldness, unconstraint, and so on. It straightly shows the essence of the most authentic and natural things in life, demonstrating to people in the most direct form of elements, so that people gain the most realistic visual effects. The Hezhe ethnic minority, the people of the far northeast frontier, which has a small population and a slow development of productivity, is known as “savage” because of its small population and slow development of productive forces. However, the art of this nationality still exists. The German art historian Grosser once said: “There is on nation without art... Even the roughest and poorest tribes devote much of their time and energy to art.”^{[4] 76} The rough beauty Hezhe ethnic minority is actually a kind of beauty different from the beauty of a fine delicacy and harmony, which is rich in “strength” and “vigor”. In the traditional Chinese aesthetic paradigm, it is synonymous with the “beauty of masculinity”, pursuing the internal spirits of grandness, magnificence, bold and unrestrained, which has quite rich regional cultural characteristics. The rough beauty of Hezhe ethnic minority is concentrate in the worship of hero, nature and their living practice, namely, clothing, food, housing, transportation and so on.

1. Force: The Root of Rugged Beauty

Shuowen Jiezi records: “Strength, also Tendons, which like human’s tendon. Tender means the strength of meat. Tendon is the ontology, the fundamental, that is the external performance of force.”^{[14] 1350}. The origin of the word “Li” first refers to the effectiveness of animal muscles: this can be extended to refer to the effectiveness of body organs, such as: sight, brain power, or the efficiency of everything, such as: persuasion, productivity. In physics, the interaction between objects is called force. Force has three elements, namely strength, direction and point of action. “Li” also refers to the ability of a person, such as *Historical Records Huaiyin Hou Biography* described that: “There are many elite soldiers in the world, armed with knives and guns, who want to do what his Majesty does, but they cannot do it.”^{[10] 537} “Intense” refers to a person, referring to the person’s “strong temperament”. For example, Cao Zhi wrote in the book *Endowment*: “Liang Jinde is supplemented by the strong personality of chastity and virginity.”^{[2] 151} In the ninth round of the “The Story of the

Stone”, it evaluates Si Qi who was suicided in despair of emotions: “No wonder that those things are coming out of the day, he has nothing in his heart, dare to be such a strong child.!” “Strength” and “Intense” are two excellent personalities that reside in the historical spirit of the Hezhe ethnic minority nationality. Hence, it became the origin of Hezhe ethnic minority’s pursuit of aesthetic spirit.

1.1. Skill and endurance are the forces generated by the tempering of fishery life.

The national history of the Hezhe ethnic minority determines their unique national identity., and their unique national personality determines their unique aesthetic artistic interest. Throughout history, the Hezhe ethnic minority can be described as a vicissitudes of fishing and hunting people. They have not only been ruled by the Han nationality, but have even been oppressed by other ethnic groups. He was once extinct and is still one of the fewest ethnic groups in China. The Hezhe ethnic minority always adhere to the roots of their own nation in the blending of the nation, so that they can continue The strength of the Hezhe ethnic minority and their worship of power are derived from their fishing and hunting life, and because they are particularly fond of fishery production activities, the Hezhe’s pursuit of power is different from other ethnic minorities living in the northeast. The power they admire is more practical and ingenious. At the same time, the “power” of the Hezhe ethnic minority also contains a kind of endurance stemming from their national character, and in order to survive. they adjust their behavioral habits at any time.

The Hezhe ethnic minority admire the power. In the Hezhe ethnic minority epic *Imakan* each hero “Možgen” is “the expert of fishing and hunting.” Instance, in *Xiangfu Možgen* there is a text like this: “The next morning, ten Mozhgen took the bow and arrow, then went up the mountain together... played for three days... have a hundreds flowers, a hundred deer, a hundred scorpions, a hundred pheasants, and a hundred wild boars.”^{[7] 205} Another story, it was recorded that Agri Mozhgen goes into the mountains every day to hunt and shoot the arrows very accurately. To some extent he is a rare hunting expert.^{[7]376} But compared to the brute force in hunting and fighting the Hezhe ethnic minority are more interested in a “skillful power” that can adapt to the environment and seek vitality., There is a custom of “competing the enemy” in the wedding customs of the Hezhe ethnic minority. The contest mentioned here is the meaning of competition. It is not the skill described by Jin Yong in the novel, but it is a skill that is closely related to the life of Hezhe, such as fork fishing, boating, fish cutting, carp skinning, weaving fishing nets, etc. The Hezhe ethnic minority emphasize the practical wisdom. factor compared with the simple military fighting competition. In *Yimakan*, there are a lot of texts describing the situation of recruiting relatives. When Mozhgen proposes to Germany, the woman proposes a series of test conditions and asks him to catch the millennium squid in the river, to slap the golden carp in the waters of the southeast, to capture the unicorn that is hidden in the deep spring, to hunt down the deer on the southwest slopes, etc. These tests are not simply achieved by brute force. But they also require the wisdom of the tested heroes.

The power contained in the original national character of the Hezhe ethnic minority is more inclined to a kind of perseverance and the ability to adapt to the behavioral habits at any time to survive. The survival mode of the Hezhe ethnic minority in the period of Su Shen and Sui was Hunting-based and fishing is supplemented, according to the *History of the Late Han-Dynasty* (Hou Han Shu) During the Qin and Han Dynasties, the ancestors of the Hezhe ethnic minority mainly lived in the northern part of Heilongjiang

to the eastern part of the outer Baikal Lake. It is the birthplace of the Lena River and the Heilongjiang River. The mountains and rivers are covered with virgin forests. The rare birds and animals that live there are Hezhe. The original hunting activities provide a wealth of natural conditions. However, the Hezhe ethnic minority who lived a primitive hunting life did not have a fixed residence, and their hunting tools were primitive and backward. Therefore, hunting alone has been difficult to meet the survival needs of the Hezhe. In order to find a more suitable living environment and way, in the 10th century, a large number of Hezhe ethnic minority moved southward to the Sanjiang River basin where Heilongjiang, Songhua and Wusuli rivers meet. During their migration, they mingled with Chiller, Feyaka and a small part of the shrimp and barbarians, and then mixed with Nantonggu, so that the present Hezhe ethnic minority community was formed. At the same time, the wide waters, the river veins and the numerous lakes in the Sanjiang area ensure the fishery production of the Hezhe ethnic group to be rich in fish resources. Therefore, the production and life style of the Hezhe ethnic group changed from "Hunting-based, fishing is supplemented" to "Fishing-based, hunting is the supplemented", and settled down in a large area after the migration. ^{[5] 153-157} The Hezhe ethnic minority were suffered from the torture of nature and politics with such a strong spirit of life, and they survived to this day.

1.2. Physical strength and intelligence are the aesthetic evaluation standards of the Hezhe ethnic minority.

The first developed ethnic groups were those who lived along rivers in the production relations of the feudal society in China. They had unique climate and land resources, and had a long harvest cycle to deal with unexpected natural disasters, so as to obtain relatively guaranteed labor output value. While there is no such survival guarantee in the nomadic people. The Han also have a saying: "Fishing in the sea is more dangerous than hunting in the mountains", which can be reflected the hardships and dangers of fishing and hunting national life in the eyes of the Han. The Wusuli River area has four distinct seasons and a long winter. Under the influence of various internal and external forces, the Hezhe ethnic minority admire the strong physical beauty and advocate the healthy and powerful people.

In the history of Western art, the ancient Greek sculptures featuring marine culture are mostly strong and plump human figures, emphasizing the texture and strength of the muscles, as well as the shape of the woman. In today's view, Venus of the broken arm lacks a delicate state and still needs to consider losing weight. In the aesthetic consciousness of the Hezhe ethnic minority, it reflects such an aesthetic standard that originated in the early human society. This is evident in the standards for Hezhe ethnic minority women. In the legend of the Hezhe ethnic minority, women are not only men's companions, but also men's helpful assistants in the war, that is, "broad-minded". In daily life and work, men go hunting and fishing, and women operate daily affairs at home cooperating men with common family life. Health, diligence, intelligence and fertility are important criteria for evaluating women in the eyes of Hezhe ethnic minority.

For men, the excellent Hezhe ethnic minority man should be a strong man with strength and a master of hunting with clever skills, as described in *Shangse Morgan*: "The next morning, ten Mozhen took the bow and arrow, then went up the mountain together... played for three days... have a hundreds flowers, a hundred deer, a hundred scorpions, a hundred pheasants, and a hundred wild boars." ^{[7]205} As, in the marriage customs of

the Hezhe ethnic minority, in the folk songs of the Hezhe ethnic minority, there is a time when the old man marries his daughter and asks the future son-in-law to try to go hunting and water fishing. So that the winner can win the beauty. On the contrary, men who do not have such heroic temperament are not favored. For example, a woman sings the regrets of her own non-personality in a song of The which is the Hezhe ethnic minority folk songs.

The Hezhe ethnic minority's Song of *Disgusting Husband* uses the "bunny-like jump" and the "turtle-like crawling and climbing" image to expression express primitively and plainly their contempt for the cunning, four-body lazy and trivial man. Therefore, we know that the aesthetic evaluation criteria of Hezhe ethnic minority pay more attention to physical and intellectual.

2. Extension and Wildness: Characteristic of Rough Beauty

According to Zhu Guangqian, nature is originally opposed to people. Since the day when people engaged in labor production and became a social person, nature has become the object of human practice and understanding, the object of conquest and transformation. and production materials and living materials of serving people. ^{[15] 316}. In such a process, art was created. The "race, time and environment" of a nation, Dana believes, which determine what kind of objects the national artists choose to imitate and how to depict them, and determine the artists' emotional attitude toward the objects of artistic observation, ^{[3]5} plays a key role in the formation and development of this national art. The Hezhe ethnic minority takes "fishing as the mainstay and hunting as the supplement" as their production mode, and their culture fully embodies the aesthetic characteristics of fishing and hunting, especially the architecture of the Hezhe ethnic minority fully displays the aesthetic ideology of extension and wildness nature of the nationality.

Architecture is an artistic style produced by the cultural accumulation of the national popular culture and cultural creativity, is an organic fusion of natural beauty and artificial beauty, and a handicraft that embodies "a beauty integrates nature with artificial production".^{[9] 374} In the Sanjiang Plain, the Hezhe people who live on fish and live by water, form three communities along and along the three rivers. At the same

time, Hezhe people have two kinds of fixed and temporary residences to adapt to their fishing and hunting production habits. In order to prevent floods, Hezhe people build their houses on the highlands along the river. At the door of the houses, there are wooden shelves and auxiliary buildings for drying fish. “Tucker” is a kind of auxiliary building, and it is made of wooden boards. It is a simple wooden building with good ventilation and rain-proof function. The tucker is mainly used to store grain, dry meat products, and stack tools and sundries. In hot summer, people can also cool down in Tucker, which is also a building that can represent Hezhe people’s culture of fishing and hunting, it can protect people from the invasion of wild animals and the destruction of unfavorable weather.

As Cao Tingjie observes, in Qing Dynasty, the names of Hezhe people’s temporary residences are complicated: “Ankou”, being made of birch skin, it is used in winter and summer for hunting; “Zhuluo Ankou”, as well as called “Zhuluo”, it is built for fishing, and their construction methods and structures are very similar; “Aoge” is built for sleeping at night when walking in winter evening; birch skin was used to build “Humona” in a small round shed for fishing in summer; and “Dao jia a ji rang mang” set up by fish on the shore at night on the way to the boat...^{[1] 2284} In general, temporary dwellings vary from time to time, from place to place, and most of them are small-sized and “shack-style” buildings built with birch, bark, and grass, which are easy to build and move. During the fishing season, in order to facilitate fishing, Hezhe people have to go to the fishery along the river for a few months to form a net beach settlement. The cellar is also one kind of Hezhe people’s hunting residences in the winter. Hezhe people’s cellar is a kind of cave-dwelling building. When it is constructed, a rectangular pit with a depth of 70 cm to 1 m should be excavated underground, and then a column foot with a height of 70 cm to 1 m on both sides of the wall. Purlins are erected between the column foot and two rafters are built on both sides of the purlin and on the edge of the pit to form a herringbone-shaped house. The shelves are covered with animal skins and thatch. The origin of Hezhe people’s cellar is very primitive, and it is an ancient way of their living. At the same time, it is also an architectural style that utilizes natural landforms to develop and make the organic combination of nature and human beings. The Hezhe people’s discovery of the cellars not only follows the objective laws of the natural environment, but also is a clever way of natural survival, which embodies the characteristics of Hezhe people’s fishing and hunting life.

In short, the Hezhe people’s residence, which should be built according to the fishing and hunting habits and the geographical environment of Sanjiang region, originates from the Hezhe people’s life needs and plays a supporting role in their fishing process. Their residence has exuded the aesthetic characteristics of the ethnic “fishing taste” from the building materials and appearance.

3. Wilderness and Sublimity: the Uniqueness of Rough Beauty

The spirit of “wilderness” is closely related to Chinese “magnificence” and the western “sublimity”. Chinese traditional magnificent aesthetic category originates from Chinese traditional philosophical thought and has the extension space on the spiritual and moral level. In Confucianism, “magnificence” refers to the sense of the heart when facing the magnificent natural scenery, thus achieving the perfection of the moral level; in Taoism, the phrase “Highest excellence as water” indicates that Taoist expects to achieve the spiritual realm of “nothing to wait for and nothing to seek” through the observation of the magnificent beauty of nature, so as to obtain unlimited strength. Linked with

the spirit of “magnificence” is the traditional Chinese spirit of “sadness and beauty”. Literally speaking, one is “sadness” and the other is “magnificence”, “magnificence” emphasizes that the spirit of the aesthetic subject is shocked when facing things, so that the spirit obtains the spiritual experience of “purification and sublimation”; while “sadness and beauty” refers to the feeling of the day after day, of the change of the day and night, the change of the four seasons, and the feeling of the youth is fleeting, Out of the instinct of life, a sense of “impermanence” appears and feels beautiful when feeling sad.

“Sublimity” is an aesthetic category originating from the western traditional aesthetic spirit. This concept was first proposed by Longinus, emphasizing the different rebellious and martyrdom spirits of Christians. In Kant’s definition, sublimity can be divided into “sublime of number” and “sublimity of force”. In the “sublimity of number”, sublimity is “everything that is more than it is smaller than it”; In terms of “sublimity of force”, it arises from the potential energy of natural forces: “As for nature as a force, it is a skill superior to the obstacles of gods. It is called a power, if it’s strong enough to resist itself, it’s also superior.”^{[8] 100} Sense of sublimity “experienced a momentary block of vitality, and immediately followed by vitality, thus a more intense jet.”^{[8] 84} Being similar to “magnificence”, sublimity emphasizes the perception of the subject’s life in the face of grand natural things. Unlike “magnificence”, the sublimity spirit emphasizes the vigor and publicity of the subject’s vitality.

3.1 Wilderness and Sublimity: the Spiritual Core of Rough Beauty

After a long and difficult ethnic migration, Hezhe people “lived to the fish” and found their own living environment and lifestyle. This process makes the Hezhe people’s rough aesthetic sense show tragic and sublime spiritual color. The difference between this spirit and the “magnificence” lies in the fact that the wilderness spirit displayed by Hezhe people emphasizes more on the publicity of vitality and lacks spiritual reflection. But it is still different from the sublimity in the category of western aesthetics. Individuals of Hezhe ethnic minority and nature show a kind of interrelationship of peaceful coexistence, rather than a competitive relationship of conquest and control. Therefore, it also shows the “sadness and beauty” of “compassion for heaven and people”.

When the ancestor of Hezhe ethnic minority, who was a fast-paced and tough-tempered hunter, saw his companions fighting against foreign oppressors and dying in battle, the children and women of the tribe were starving, and on the tough wooden face of the man, it was inevitable to show the sad look that made him abhorrent and painful in the ordinary days. He understood that in order to achieve racial development, they had to abandon their long-lived homes and go to the wilderness to find new life. The “wilderness” here is different from the “wasteland” theme described by T. S. Eliot: in front of the “wasteland” is barren and there is no trace of hope; while the “wilderness” contains infinite vitality, provides numerous battlefields and killings for challengers, but also rewarded them with prey and glory. As Jack London’s *The Call of the Wild* (also translated as *The Call of the Wild*), calls for the beloved hero to say goodbye to his comfortable living environment, to evolve and metamorphose through war, confrontation and sacrifice, and thus to become a strong man in nature.

The ancestors of the Hezhe people left their homes, looking for and fighting in the wilderness, and his long song sang a tragic tune:

herile herilenani herigige

赫力勒 赫力勒那尼 赫力格衣格

osi katen seun

哪个 厉害 神,

bikini mini seun mei etekini

有时 我的 神 把 胜了

mi ni gujukuli jonalei ilianki

我 的 美丽 家园地方 占上了

bi tianhelemi ilan tauen ba olimi huli ei bale

我 愿意 三 百 里 绕着 走 这 地方

de emergimi eheleusu gelter sten

也 回来 到 坏处 找 不

mene jo na i berti tidu bui

我 的 家 园 把 永 远 他 给

a rang.....

啊 啞.....^[11]

The mournful ballad sings the mighty spirit of the Hezhe ethnic minority. After experiencing the two-way choice between man and nature, the ancestors of the Hezhe people migrated from the northern region of Heilongjiang and the eastern region of Lake Baikal to the Sanjiang basin where Heilongjiang, Songhua River and Wusuli River meet. In order to further adapt to the environment, the Hezhe ethnic minority adjusted their production patterns and lifestyle. Their main business changed from hunting to fishing and their sideline from to fishing to hunting. Even though the Sanjiang Plain is rich in natural resources, the Hezhe people have to face many survival challenges. For example, winter is very long and the area is infested with beasts are infested. During the process of the Hezhe people's migration, faced with the howling wind; snow all over the sky; the precipitous mountains and fast-flowing rivers, they are never afraid to step back, which shapes their bold and unconstrained nature.

In the political environment, when a large number of the Hezhe people migrated to the south, they lived with other nationalities, which leads to the formation of today's Hezhe community. In this process, the Hezhe people have to face the danger of being conquered, being assimilated and even extinct all the time. At the same time, the Hezhe people are not only under the jurisdiction of the Han people, but also subject to the control of the Manchu governments, When it comes to the strength and toughness of ethnic minorities, the Hezhe people are not as quiet, weak and resigned as the Mongolians and Nuzhen people living in the northern region, nor have they had the glorious experience of holding their heads high, uniting China and being the heads

of all nationalities as the Mongolians and Manchus. Their existential situation makes people feel so aggrieved. In the whole process of national development, the Hezhe people accept new things, change their production patterns, learn new way lifestyles, incorporate new patterns into their clothing and improve their artistic skills. They constantly deny themselves and at the same time rebuild themselves. Up to now, the Hezhe ethnic minority is still one of the smallest ethnic minorities in China, but he has always retained the vitality of his own nation and adhered to the root of his own nation in national integration, which makes this nation to continue.

3.2 Survival or death: the individual's pessimism towards nature.

In the genesis mythology of the Hezhe ethnic minority, it is said that the Hezhe people are descendants of fish. This kind of stories about the ancestor has been widely spread among the Hezhe people until now. However, it is well known that the Hezhe people are "fish skin tribes" who eat raw fish and wear fish skin. In many ethnic groups, ancestor-related creatures will become taboos for later generations, such as Manchus will not eat dogs because dogs saved their ancestors in their mythology. For the same reason, the Hui don't eat pork. There is no similar taboo in Hezhe ethnic minority, which shows unique view of life of this nation.

The shaping of Hezhe people's spirit is sustained through constant denial of themselves, while at the same time rebuilding themselves. The spirit of abandonment of one's own life in order to obtain rebirth is reflected in the legend of the Hezhe people. The human soul can be attached to the body of a human being, it can also attach to the body of any animal in the same way and become a deer, a horse, a fish, or some other animal. For example: in Marto Morrigan, Miyat becomes a bee to help Marto defeat his enemies. Another example, Shamans worships eagle very much. The excellent Hezhe women who helps men to make achievements as Kuoli is the embodiment of an eagle. At the same time, according to archaeological discoveries, there are many complementary aspects among the sculptures of women and eagles in ancient times. *Yimakan's Andersen Mergen* tells a story about a woman becomes an eagle to rescue a man's soul. In this type of stories, the human spirit is not limited by the body, the soul can attach to any bodies and human and animals can interact with each other. The advantages of this setting are as follows. First, the characters can puzzle the enemy to protect themselves and defeat the enemy unexpectedly by changing different forms. Second, the character can help themselves achieve their aspiration by a completely new form of themselves. In this way, human have more possibilities and more abilities to realize their aspiration.

The Hezhe people caught fish, ate them and wore their skins, but they were also in awe of fish and considered them beautiful in their aesthetic taste. Therefore, the behavior of eating fish can be seen as the deconstruction of the image of fish in their opinion. In the history of western philosophy, it was Heidegger who first put forward the idea of "deconstruction". He believed that deconstruction was "the critical demolition of the concept that are inherited and necessarily applied first"... Philosophical construction must be deconstruction, that is, the demolition of the inherited things in the process of returning to traditional historiography. Its meaning is not to deny or criticize the tradition, on the contrary, it is a practical inheritance of tradition.^{[6] 26-27} They eat fish, which is the symbol of their nostalgia for their ancestors in their national subconscious. They believe that they can gain energy from their ancestors and never forget themselves. If they eat their ancestors(the fish), they can give the ancestors a new life.

3.3 The desire for supernatural power: willpower to realize the ideal of life

The Hezhe people worship nature, fear gods and ghosts, and believe that all things in the world are dominated by gods. They believe that the immortal soul can talk to God. Moreover, a sage with a shamanistic temperament can even become a form of sacred things in order to obtain help from the divine power of nature.

In addition, the wildness will of the Hezhe people is embodied in their desire to “control and transcend the natural force”. In the epic of Hezhe nationality – *Yimakan’s Andersen Mergen*, Mergen Prayed during his expedition:

herile herilenani herigeige

赫力勒 赫力勒那尼 赫力格衣格

geren seun aiji dolidibuso

各位 神灵 好好听着吧

edu aiji jo we etenacie bi

在这好好家 把 保佑 我

yadu de mangge bakeki geren

哪儿 在 厉害 得到 各位

seun mine we belecian

神灵 我 把 帮助去

doledihen ecihen arna

听着 记住了吗 啊那.....^{[12] 26-27}

This reflects the desire of the Hezhe people to have outstanding qualities so that they can be blessed by the gods. At the same time, in *Yimakan*, the hero’s name “Mergen” is the symbol of “wisdom”. In the *Qingwen Collection*, the hero explained that “A wise man is one who has the best shooting skills, catches the most prey and stands out in a crowd”. The heroes in *Yimakan* are all named “Mergen” such as *Imakan’s Sharon Mergen; Andersen Mergen; Muduri Mergen; Xiangsou Mergen; Agdi Mergen; Muzhulin Mergen* and so on. They are all ideal figures shaped by the people of the Hezhe ethnic minority in their perception of real life, and the character are endowed with all kinds of preeminent “power” by the Hezhe people. For example, “Muzhulin Mergen” refers to a hero who possesses the cleanliness of “Muzhulin” god, who stays away from womanizing; “Duhiri Mergen” refers to a hero who walks as if on wings; “Hilda Mergen” refers to a hero who possesses the pioneering spirit; “Agdi Mergen” refers to a hero who has a temperament as bold as lighting... In this way, Mergen was able to help his people realize their aspirations. It shows the Hezhe people’s thoughts and emotional tendencies.

This worship of power is also placed on women. The Hezhen ethnic minority spreads a legend with the theme of “chasing the soul after death and returning to life after death”: Agdi Mergen fell in love with the Black Jin, a female Shaman who is endowed

with both beauty and talent. Agdi Mergen's proposal to Black Jin was opposed by Jin's parents. As a result, the depressed Agdi Mergen died of lovesickness. When Heijin heard the news, she split Agdi's coffin and used her magic to protect Agdi's body from decaying. Black Jin commanded the god Sajka protect Agdi's body day and night, while she flew to the hell to chase Agdi's soul back, which gave a rebirth to Agdi. In the end, the reborn Agdi Mergen tied the knot with Black Jin and lived a happy life.

In a word, both the worship of natural force and the worship of supernatural force show that the Hezhe ethnic minority, as a fishing and hunting nationality with a long history, is a kind of primitive power for survival, which interprets the beauty of the Hezhe nationality's rough nature and is the unity of the Hezhe people spiritual freedom and natural essence. Therefore, this kind of beauty also inevitably surpasses the external form of things and exists in the essence of the national spirit. Our grasp of the essence of a nation's aesthetics should not only rest on sensory experience, but on the spiritual level, and finally achieve a perfect fit with the essence of nature.

THE DIALOGUE BETWEEN THE FLOWER AND THE ARRANGER: INTERPRETING THE *IKEBANA* THEORY OF SOFU TESHIGAHARA

Abstract | The *ikebana* artist Sofu Teshigahara, the founder of Sogetsu School of flower arrangement, remarked that *ikebana* is the union of the flower and the arranger. How is it possible? This is the question this paper aims to answer by interpreting his writings. My first approach is a comparison of Sofu with the two leading schools of *ikebana*. The Ikenobo school has the cosmos at large as their goal in their *rikka* or standing up flowers, their most characteristic method of arranging individual flowers. In the Ohara School, the arranger pursues to symbolize visible scenes in their *moribana* or heaping flowers in a shallow container. Both agree in regarding nature as their prototype. Sofu's view is, on the other hand, that we express our own grasp of the flowers in arranging them. We must not gaze at their appearance or *natura naturata*, but into their nature or *natura naturans*. Where he goes so far as to say he hates nature, he is emphasizing our commitment such as making changes in the shape of flowers by painting or breaking branches, cutting leaves, etc. This means to give an original life to flowers, unlike the ideas of the other two schools, in which the arranger aims to revive them. In my opinion, a dialogue enables us to achieve this purpose. The flower wants to turn, bloom and fall according to its nature (it is not a mere material but a living thing). This is the first voice of the flower. The arranger wants to apply his design to the flower by determining its length in proportion with the vessel, cutting it, placing it appropriately, etc. This is the first voice of the arranger. But the flower does not always follow his voice. Then, the arranger asks it a question by changing its length, cutting its leaves, etc. The flower may answer it in the affirmative by staying as it has been arranged or in the negative by turning another way, falling, etc. This is the second voice of the flower. In this way, a genuine dialogue exists through which he develops his idea of the flower step by step. Through this dialogue, the flower recognizes for the first time its nature by following or refusing the arranger. Also the arranger realizes what he really wants to express by listening to the voice of the flower.

INTRODUCTION

What is *ikebana*? It is the act of arranging the flower in Japan, comparable to flower arrangement. In my opinion, there are two differences between them. First, the *ikebana* arranger usually uses branches, while the flower arranger does not. Second, the former frames the space with branches, the latter fills the space. But recently the border is disappearing, because both have adopted characteristics of the other.

What is the present situation of *ikebana*? One of the major problems is that it lacks critical language and theory, with the result that people who have not experienced arranging *ikebana* do not know how to appreciate it. The issue is all the graver, in my opinion, because first, *ikebana* has expanded all over the world after WWII and second, its boundaries with other kinds of art have become unclear. Even people who have experienced *ikebana* cannot discuss it at large. The cause of this is that it has a lot of schools and almost all of them have their secret of arranging, which they are reluctant to disclose to an outsider. So the knowledge of the way of arranging it does not spread. In addition, the accumulation of the study is poor. Though there are studies of discussing *ikebana*'s relation to contemporary art and its history based on the literature on it, few researches have been done on the process of arranging *ikebana*. As far as I know, only Ryuho Sasaoka, who is *iemoto*, that is the head of a school, of Misho School Sasaoka, has the following opinion.

The flower for the arranger is not a means of expressing himself. He arranges it because he does not force his individuality on it, but brings out its characteristic beauty. So the flower plays the leading role, and the arranger the supporting role.¹

It is true that he shows an exact understanding of traditional *ikebana*. But his theory is not entirely appropriate to contemporary *ikebana*. This paper aims to reveal a new aspect of the process of arranging *ikebana* by interpreting the theory of Sofu Teshigahara (1900-1979) also in the light of my own experience.

According to Sofu, the founder of Sogetsu School of *ikebana*, "*ikebana* is the union of the flower and the arranger"². How is it possible?

1. Gazing into the nature of flowers, making changes in their shape through the dialogue with them, and reviving them

Some people take the remark of Sen no Rikyu, "arranged flowers should look as if being in the field" to mean "we should not make changes in the shape

1 Ryuho Sasaoka, *Ikebana: Beauty of Japan Loving by Intellect* (Tokyo: Shinchosha, 2011), p. 27.

2 Sofu Teshigahara, *Sofu Teshigahara's the Flowering Spirit* (Tokyo: Sogetsu Press, 2004(1979)), p. 66

of flowers in arranging them". This interpretation means that arranged flowers are beautiful when the arranger leaves them untouched without making changes in their shape. But this has two difficulties. First, it focuses on the appearance of nature or *natura naturata*. Second, it forgets the fact that the flower we arrange is dead, because it was cut from nature. Thus the arranger must revive it through the dialogue with it. Let us now consider the theory of Sofu.

His view is that the arranger expresses his own grasp of flowers in arranging them. He must not gaze at their appearance or *natura naturata*, but into their nature or *natura naturans*. Sofu also emphasizes that the arranger must make changes in the shape of flowers by painting or breaking branches, or cutting leaves. What is the relation between *natura naturata* and *natura naturans*? The former is the means and the latter is the end. Since the former disappears when the latter is arrived at, the former is not beautiful and important for Sofu. Therefore, when he has seized the nature of flowers by gazing into them, he makes changes in their shape to express his own grasp and thus make them more beautiful.

In my opinion, a dialogue enables us to achieve this purpose. Let us take an example. The flower wants to turn, bloom and fall according to its own nature. The flower is not a mere material but a living thing. This is the first voice of the flower. The arranger wants to apply his design to the flower by determining its length in proportion with the vessel, cutting it, placing it appropriately. This is the first voice of the arranger. But the flower does not always follow his voice. Then, the arranger asks it a question by changing its length, cutting its leaves. The flower may answer it in the affirmative by staying as it has been arranged or in the negative by turning another way or falling. This is the second voice of the flower. In this way, a genuine dialogue exists through which he develops his idea of the flower step by step.

Through this dialogue, the flower recognizes for the first time its nature by following or refusing the arranger. Also the arranger realizes what he really wants to express by listening to the voice of the flower. This means to revive it; and accordingly he must do three things when he arranges it. First he must gaze into the nature of it, second he must make changes in the shape of it through the dialogue with it, and third he must revive it.

2. Regarding flowers as a mirror, expressing the arranger's own grasp of them, and uniting them with him

But the arranger's reviving of flowers is only one side of the story. Since in Sofu's view, the arranger must give an original life to them by expressing his own grasp, we must consider what he expresses then. My first approach is a comparison of Sofu with the two leading schools of *ikebana*. The Ikenobo School has the cosmos at large as their goal in their *rikka* or standing up flowers, their most characteristic method of arranging individual flowers. In the Ohara School, the arranger pursues to symbolize visible scenes in their *moribana* or heaping flowers in a shallow container. Both agree in regarding nature as their prototype.

Sofu has a different opinion. He remarks "I always want to start from hating

nature”³. This means that he does not regard nature as their prototype. What the arranger expresses is not nature but his own grasp. What does it mean? In the light of Sofu’s view, this can be explained by the idea of a mirror. The arranger must regard flowers as a mirror when he arranges them. In the mirror, the subject who sees is the object who is seen. He sees himself through the mirror without its being seen in itself. This applies to the act of arranging flowers. In the flower as the mirror, the arranger as the subject of arranging recognizes himself as the object of arranging. His grasp is expressed in this way. This is how he gives an original life to flowers, unlike the other two schools, in which he only aims to revive them, so that he completes uniting with them. Therefore, he must do three things when he arranges it. First he must regard flowers as a mirror, second he must express his own grasp of them, and third he must unite with them.

CONCLUSION

In the theory of Sofu, the flower is the partner to the arranger in expressing himself. He arranges it to discover and express himself in bringing out its characteristic beauty. So both the arranger and the flower play the leading role, thus making up *ikebana* together.

THE HYBRIDITY AND FUZZINESS OF PSEUDO- MODERN SOCIETY AND ITS AESTHETIC CHARACTERISTICS

Abstract | Due to the inconsistent progress in the development of human society, the process of modernization is not synchronized. When the United States and Europe enter the post-modern society, some countries in the world are in a state of modern, pre-modern, post-modern entanglement, and their social forms are heterozygous, leading to the ambiguity of their social and historical development stages. This kind of miscellaneous and fuzzy often obscures the authenticity of its social form and historical stage, and has pseudo-modern characteristics. Pseudo-modernism is the interweaving of feudalism, socialism, and capitalism, but it is often the rise of feudal factors, the decline of modern factors of capitalism, but it is deceptive by the name of socialism. I call this pseudo modernity the Bie-modern, a doubtful modernity. Bie-modern is different from post-socialism in the Soviet Union and Eastern European countries. The latter has completed the transition from socialism to capitalism. The former has become a quadruple because of the hodgepodge of feudalism, capitalism, and socialism. Bie-modernism has been discussed in the United States and Europe, and American professors have established the Center for Chinese Bie-modern Studies (CCBMS) at Southwestern State University in Georgia.

In the Bie-modern era, China's aesthetic form is characterized by Embarrassing Drama, Anti-Japanese Oratorio, Wonderful Architecture or Exotic Buildings, and Cold Humor. The Embarrassing Drama is famous for the famous film director Xu Zhen's Embarrassing series, which expresses the difficulties and embarrassment in life in a comedy and cold humor way, and finally ends with a happiness. The Anti-Japanese Oratorio mainly deified the positive characters by distorting the plot of history and the exaggeration of comedy, creating a feast of ecstasy of defeating Japanese army. Wonderful Architecture, also known as bi-onic buildings or ugly buildings, use the architectural expression of pre-modern concepts and fetishism, ridiculously singular, or stimulating appetite. Cold Humor is different from Western black humor, and it is a kind of cynicism. Although the aesthetic characteristics of realism in China are still continuing, they have been mixed with Bie-modern art techniques, showing a holistic ambiguity. Bie-modernism aesthetic forms not only show the ugliness of social, human and artificial products, but also have a spirit of reflection and criticism, which constitutes the complexity and exploratory characteristics of Chinese contemporary art. Pseudo-modern or Bie-modern, in addition to China, has existed in varying degrees in developing countries such as Iran, Turkey, India, etc., and its art form and aesthetic form have modern, pre-modern and post-modern mixed features. It is not for developed countries. Understanding this situation will directly help the development of aesthetics with national characteristics in countries with different histories, geographies and cultural backgrounds.

Index terms | *pseudo-modernity; Bie-modern; Bie-modernism; hybridity; social form characteristics; aesthetic form characteristics*

“Bie-modern” is a theory that I put forward in 2014 to study the development stage of social morphology and social history. It refers to a kind of mixed, paradoxical modernity or pseudo-modernity. The historical starting point of the Bie-modern is China’s reform and opening up which implanted capitalist system into the socialist system, with feudal consciousness and system still deeply rooted. Bie-modernism aims at distinguishing between true and false modernity, establishing real modernity, and realizing a different kind of modernization on this basis. Therefore, Bie-modern theory includes two parts: the current Bie-modern situation and Bie-modernism. Bie-modernism is a reflection and criticism of the current Bie-modern situation, and therefore has the function of complex sentences, which indicates different relationships such as juxtaposition between Bie-modern era and Bie-modernism; causality which means Bie-modernism is to distinguish between the true and false since it is hard to distinguish between them in the Bie-modern era; and adversative relation that is, though the Bie-modern is a mixture of truth and falsehood, Bie-modernism does not agree with this mixture and disguise, instead it aims to distinguish between true and false modernity and establish real modernity. The form and internal tension of Bie-modern’s complexity come from the philosophy of “Bie” in ancient China. This philosophy includes such philosophical categories as difference, distinction and speciality, so it is easy to become an ideological space.¹

Bie-modern theory originated from the study of the current situation of Chinese society, but in the course of its development, it was found to be of more general significance. Mr. Huang Haicheng, a Chinese aesthetician, said that the significance of Bie-modern theory goes beyond aesthetics and theory of literature and art. Professor Ernest Zenko also believes that Bie-modern theory has global significance. For this reason, the difference between the Center for Chinese Bie-modern Studies (CCBMS) in the U.S. and the Bie-modern Research Center of Slovenia has been reasonably explained. The CCBMS in the U.S. is based on the Bie-modern theory and the Bie-modern art in China while the Bie-modern Research Center in Slovenia focuses on the global Bie-modern phenomenon. But both of them research and discuss the Bie-modern theory.²³⁴⁵

I. The study of aesthetic form inseparable from that of social form

Thomas Munro put forward the concept of “aesthetic morphology” in his book *Form and Style in the Arts: An Introduction to Aesthetic Morphology*. It holds that aesthetic morphology is a theory about art form and classification. Although this statement conforms to the history and present situation of western aesthetic forms, it does not accord with the history of ancient Chinese aesthetic forms. It seems logical to classify aesthetic forms according to artistic standards in the West, and western aesthetic forms such as tragedy, comedy, sublime and absurdity basically belong to art genres or categories. However, Chinese aesthetic forms such as wonder, neutrality, rhythm, artistic conception, femininity and masculinity are scattered in philosophical, artistic

4 The CCBMS or Center for Chinese Bie-modern Studies in the United States was established by Georgia Southwestern State University in 2017.

5 Slovenia’s CBMS or Center for Bie-Modern Studies) was established by the University of Primosca in Slovenia in 2018.

and cultural forms. Nevertheless, through morphological study of aesthetics and art, it is easy to approach the actual situation of their existence and development. In contemporary Chinese aesthetic textbooks, the concept of “aesthetic form” is a very vague concept, which is often mixed with “aesthetic category”, “aesthetic classification”, and “aesthetic types”. Until the beginning of this century, there was a clear boundary. The main manifestation is that Chinese aesthetic textbooks begin to distinguish between Chinese aesthetic form and Western aesthetic form, instead of simply covering Chinese aesthetic form with Western theory, or simply applying Western aesthetic form and category to explain Chinese aesthetic form, but juxtaposing Chinese and Western aesthetic form for respective discussion. However, Chinese and Western theories, when dealing with Chinese aesthetic form, are both separated from the social form of current china’s existence. Since no new aesthetic form has been found in China, it is impossible to explain the current aesthetic form. Therefore, it may provide a unique perspective and a theoretical intervention for the study of global aesthetics to show the new aesthetic form that has been shaped in China and to construct its theory. The incision is small, but it is the entrance to find and solve problems, and also the port of international dialogue.⁶

In order to make the existing theories of aesthetic form in the West contain and explain the aesthetic forms of China and the East including India and Japan, I once gave a definition of aesthetic form different from that of Thomas Munro. Aesthetic form is the emotional cohesion and logical classification of life style, aesthetic realm, aesthetic interest, aesthetic style and literary genre. Thus, it has certain theoretical coverage for integrating the western theory that aesthetic form belongs to form or genre with the more ambiguous but inclusive one of China which contain social, cultural, artistic, philosophical and other factors. At the same time, it is more related to the aesthetic activities of life and social forms.⁷

Social form refers to a social model consisting of social economic foundation, superstructure and social activities, or marked by capitalism and socialism, or with modernity and modernization as symbols; or “socialist modernization” and both. Because of the shelving of the issue of “capitalism vs. socialism” and the continuation of the modern and post-modern disputes between the 1970s and 1980s in the West by the Chinese academic circles since the end of the last century, the discussion of social formation in the philosophical, aesthetic, literary and artistic circles has basically focused on the issue of modernity. Similar to the Western “New Modernity”, the terms such as “Complex Modernity”, “Mixed Modernity” and “Alternative Modernity” in China’s National Social Science Fund project achievements and art exhibition reviews have always affirmed and modified the so-called “Chinese Modernity” with “characteristics”. However, Bie-modern theory which has emerged in recent years and exerted international influence holds that modernity does not belong to the concept of chronicle, but to that of attribute. The concept of attribute is based on the analysis of the proportion of social components. Just as gold is identified by 24K and 18k, and gold less than 18k is alloy, modernity may not be established because of the large proportion of the pre-modern. China is a society intertwined with the modern, pre-modern and post-modern in which true and false modernity coexist. Therefore, Bie-modernism advocates the distinction between true and false modernity and the establishment of real modernity. Only on the basis of distinguishing between true and false modernity can we establish distinctive modernity.

6 Thomas Munro, *Toward Science in Aesthetics*, Chinese Federation Publishing Company, 1985, P. 274.

7 Wang Jianjiang, *New Exploration of Aesthetic Form*, Gansu Social Sciences, No. 4, 2007.

In terms of social morphology theory, the post-socialist theory of Aleš Erjavec, a famous aesthetician, philosopher and former president of the International Association for Aesthetics, deserves attention. This study calls the disintegrated and undissolved socialist countries post socialism, and reveals the common social and aesthetic characteristics of the post-socialist countries. At the same time, in recent years, western economic circles have called China crony capitalism. But both of them are inconsistent with the fact that China still retains the socialist system and meanwhile socialism, capitalism and feudalism are mixed in ideology, behavior and aesthetic form.⁸

Different from Terry Eagleton's theory that literature and art are attributes of "aesthetic ideology", aesthetic form is the aggregation and logical classification of genre, style, interest, realm and life style in the sense of morphology rather than ideology. However, the history of aesthetics has proved that there is a natural relationship between aesthetic form and social form, and the study of aesthetic form cannot be separated from the study of social form. In Europe, tragedies and comedies as aesthetic forms emerged in pre-modern society, sublime and comic aesthetic forms appeared in early capitalism, while absurd and ugly aesthetic forms emerged in late capitalism. In the pre-modern society of China, neutralization, wonder, rhythm and artistic conception emerged. In the historical stage of reform and opening-up, some doubtful aesthetic forms have appeared, such as "Jiong" films, "strange" architecture and "cold" humor. The so-called "doubtful" means that the characteristics of aesthetic form have been obvious, but it still needs time to test. However, for a long time, the theoretical research of Chinese aesthetic form has been basically based on the categories of tragedy, comedy, sublime, grace, absurd and ugliness listed in the western textbooks, neglecting the theoretical research of the local aesthetic form, thus failing to generalize the category of Chinese aesthetic form which has both identification marks and universal applicability, and naturally failing to attract the attention of international academic circles. Therefore, it is necessary and meaningful to study the relationship between social form and aesthetic form. Its direct effect is to investigate the characteristics of aesthetic form in accordance with the reality from the perspective of social form, and to construct an aesthetic theory with universal adaptability and national cultural characteristics, instead of becoming the mouthpiece of western aesthetic form theory.⁹

Aesthetic form plays a central role in the aesthetic system, and it is also the starting point and theoretical foothold of aesthetics. There are many categories in the aesthetic system, such as those from aesthetic disciplines, aesthetic occurrence and development, aesthetic noumenon, aesthetic form, aesthetic creation, aesthetic appreciation as well as aesthetic criticism. However, as one of them, the category of aesthetic form can concretely show what aesthetics is, so it has an introductory position. In fact, nothing can better illustrate what is aesthetic than tragedy or comedy, rhythm or artistic conception. At the same time, aesthetic theory should be applied to the interpretation of specific aesthetic forms, rather than following the course from abstraction to abstraction. Therefore, the generalization and interpretation of aesthetic forms is the place where aesthetic theories come into being. If an aesthetic theory wants to break through and develop, it has to pay attention to the study of aesthetic form. In fact, from Aristotle to Longinus, to Burke, to Kant, Hegel, Schiller, to Nietzsche and Lyotard in the West, and from Zhong Rong, Liu Xie, to Sikongtu, Yan Yu and Wang Guowei in China, great philosophers, aestheticians and literary critics all study aesthetic forms. The category of aesthetic form constitutes the basic category of aesthetics as well as the pivotal category. Without the category of aesthetic form, aesthetic theory is not

8 Ales Erjavec, *Postmodernism And the Postsocialist Condition: Politicized Art Under Late Socialism*. The Regents of the University of California, 2003, pp.1-2.

9 Terry Eagleton, *Criticism and Ideology*, Verso 1976, pl66.

only highly abstract, difficult to get to learn or to confirm, but also loses the ability to generalize the characteristics of different aesthetic forms produced under different cultural backgrounds. If we do not study the characteristics of Chinese aesthetic form, how can the so-called Chinese aesthetics be embodied? How can we understand the characteristics of Indian aesthetics and Japanese aesthetics without studying the specific aesthetic forms of India and Japan?

Since 2000, the study of Chinese aesthetic form has made some progress, which is shown in writing the category of ancient Chinese aesthetic form in the unified national textbooks. However, there are still some shortcomings. Firstly, the theoretical study of the category of modern and contemporary Chinese aesthetic forms is far from enough, and a theoretical system has not yet been formed. Secondly, it lacks the historical dimension of the extension, interruption, continuation and generation of Chinese aesthetic form in the pre-modern, modern and post-modern history. Therefore, it is difficult to understand the difference between Chinese aesthetic form and Western aesthetic form, to rise to the theoretical level, or to apply the theory of aesthetic form to realistic aesthetic life and cultural creativity. In view of this, it is necessary and urgent to start the study of contemporary Chinese aesthetic form.

In the past, the research on the relationship between social form and aesthetic form was confined to their respective professional fields, and failed to combine the two organically, nor to put the issue under the background of globalization, so the growing point of aesthetic form theory could not be found in the changing social form. Therefore, the study of aesthetic form should first be placed in the category of the relationship between social form and aesthetic form, seek the connection point between them, find out the problems, and then solve them, with a view to achieving new results in the study of social form, aesthetic form and their inner relationship.

Bie-modern theory means that the social form and aesthetic form are different from those of the past. Therefore, how to fully and deeply understand and grasp the characteristics of the times especially the relationship between social form and aesthetic form, has become a topic of contemporary aesthetics. Because understanding and grasping the relationship between social form and aesthetic form can not only discover the relationship between social morphology and aesthetic theory, but also provide the support of aesthetic morphology theory for satisfying the needs of a better life and developing literary and artistic undertakings. Any style positioning and literary criticism of a better life, such as atmosphere and realm, joy and leisure, etherealness and solidity, naturalness and awkwardness, sublime and absurdity, solemnity and tenderness, beauty and ugliness, comedy and decency, irony and humor, chic and absurdity, and even the “urban skyline” and “face project” in life and art, cannot be separated from macro or micro-examination of aesthetic morphology. Therefore, the relationship between social form and aesthetic form is not only an object for professional research, but also an indispensable and important subject related to people’s good life and prosperity of literature and art.

The theoretical research of aesthetic form is not a simple study of form and style, let alone a single genre, but a systematic study of form, style, genre, realm, life style and social form. In fact, the history of the emergence, popularity, prosperity and decline of a certain aesthetic form is also that of the change of a particular social form. Absurdity and ugliness which occurred in the late period of capitalism could not have come into being in the ancient Greek marked by “quiet greatness” and “sublime simplicity”. Similarly, doubtful aesthetic forms such as “Jiong” films, strange architecture and cold humor cannot be produced in the historical period before the reform and opening up.

Therefore, in different social and historical stages, what are the nature, characteristics and development rules of its social form, what are the characteristics and generation ways of its aesthetic form, and what is the relationship between Bie-modern's social form and aesthetic form, become theoretical and practical questions that need to be answered urgently. The reply to the questions is directly related to the examination and judgment of social aesthetic atmosphere, aesthetic taste, artistic style and aesthetic trend of thought, and it also involves the aesthetic orientation of a better life.

The research on the relationship between Bie-modern's social form and aesthetic form should consult the general theory of morphology, the theory of relational category and the function theory of aesthetic form. The general theory of morphology studies the general methodological significance and disciplinary paradigm innovation of morphology in the study of social form and aesthetic form. The theory of relational category researches the specific categories of social form and aesthetic form, establishes many connections between them, and seeks the growth point of theoretical innovation. The function theory of aesthetic form studies the specific influence of social form and aesthetic form on aesthetic practice and artistic creation of a better life. Through a series of cases, it finds that the study of social form and aesthetic form plays a supplementary and regulating role in solving the main social contradictions.

The basic idea of studying the relationship between Bie-modern social form and aesthetic form is to start from their own and grasp their relationship, dissect their structure and study their functions by using the methods of morphology and system theory; explore the nature, characteristics and development rules of Bie-modern social form, and find out the characteristics, functions and value of Bie-modern aesthetic form; and create aesthetic morphology close to life and artistic practice by linking with literary and artistic creation and beautiful life.

II. Aesthetic Morphological Characteristics of Bie-modern Period

The beginning of Chinese modern aesthetics is related to the study of aesthetic form. In his works, Wang Guowei touches on more than ten categories of aesthetic forms among which the most nationally characterized are quaintness, dazzle and realm. Different from western aesthetic forms and arts including genres of literature and art (such as tragedy, comedy and absurd drama which are both aesthetic forms and genres), Chinese traditional aesthetic forms with style and realm as symbols, span all kinds of literature, art and lifestyles, and form aesthetic forms such as artistic conception, rhythm, neutrality, wonder, etherealness, elegance, femininity and masculinity. And before the spread of Western learning to the East, they were not related to each other. After Wang Guowei, the western aesthetic form gradually entered the field of Chinese aesthetics and art and began to dominate the theory of Chinese aesthetic form, thus forming the interruption of the theory of Chinese traditional aesthetic form. In the field of aesthetics, the categories of tragedy, comedy, grace and sublime aesthetic forms in the West are generally accepted by Chinese aesthetics. It was not until 2000 that a series of categories of Chinese aesthetic forms equivalent to the category of western aesthetic forms appeared in aesthetic textbooks. In the field of literature and art, Cao Yu's *Thunderstorm* and *Sunrise*, and Guo Moruo's new series of historical dramas in the 1930s are successful transplants of western aesthetic forms of tragedy and sublime. In the 1990s, Wei Minglun's absurd drama was also a transplantation of western modern drama with the same name and modern aesthetic form. With the implantation of Western modernity factors, Chinese aesthetic form has always been a mixture of Chinese and Western elements. On the one hand, the Chinese traditional neutrality, wonder, rhythm, artistic conception, etherealness, elegance, femininity and

masculinity are enduring, and penetrating into calligraphy, painting, music, poetry, gardens, landscapes, dramas, films and square arts. On the other hand, the sublime, tragedy and absurd drama of the West are also flourishing in China. And Chinese and Western aesthetic forms are often intertwined. However, in the 21st century, with the further deepening of China's reform and opening up, new doubtful aesthetic forms have emerged in China, such as "Jiong" films and "Jiong" culture, strange architecture, cold humor, ridiculous drama, Bie-modernist art and other aesthetic forms with art as the carrier.

1. The Aesthetic Form with the Chinese and Western hybridity

The traditional Chinese aesthetic form continues to this day. The category of Chinese aesthetic form includes wonder, neutrality, rhythm, elegance and etherealness, femininity and masculinity, which permeate all aspects of literary and artistic works, human landscape and social life, indicating their continuity and extensiveness. Continuity is the concept of time and extensiveness is the concept of space. It proves that our definition of aesthetic form is not only continuous, but also universally applicable.¹⁰¹¹

Western aesthetic forms merged into China. Western aesthetic categories include tragedy, comedy, sublime, absurdity, ugliness, etc. Since Wang Guowei published the Commentary on Dream of Red Mansions in 1904, China has accepted western aesthetic categories in theory. Artistically, the aesthetic forms of tragedy and sublime are enlarged through Cao Yu's tragedy, Guo Moruo's new historical play and revolutionary novel in the 1930s. The absurdity of the West was transplanted by Wei Minglun in the process of reform and opening up. The aesthetic form of ugliness in the West has become a universal aesthetic form in China through the New Tide in 1985. For a long time, the category of western aesthetic form occupied the space of Chinese aesthetic form, while the traditional aesthetic form of China only permeated the traditional art forms of lyre-playing, chess, calligraphy and painting, and remained in the cultural relics and scenic spots, but failed to occupy the art stage of novels, movies and dramas. The revival or rebirth of Chinese traditional aesthetic form is a matter after the reform and opening up. With the hit swordsman film Shaolin Temple and popularity of Jin Yong's swordsman fictions, there appeared a mixed state of Chinese and Western aesthetic forms. This is the mixture and hybridity of Chinese wonder, artistic conception, etherealness, elegance with western tragedy and sublime.

Although the hybridity of Chinese aesthetic form is closely related to the change of China's international status in the process of globalization and social form, it still maintains its relative independence when the change of aesthetic form is related to the change of social form. This relative independence is often related to the ideological influence of others. In fact, even though China's national power is unprecedentedly strong, the right of academic discourse is still in the West, and its academic norms and academic system are still disciplining and restricting us, resulting in the long-term underdevelopment of China's aesthetic morphology theory. As for the category of aesthetic morphology generated and developed in aesthetic practice, it cannot be separated from the Western restrictions of ideology. The contemporary Chinese aesthetic form mixed with the West is the witness of the influence and restriction of Western modernity and post-modernity on contemporary Chinese aesthetic form.

10 This paper synthesizes Zhu Liyuan's Aesthetics, Ye Lang's Aesthetics Principles and Wang Jianjiang's Aesthetics Course on "Chinese Aesthetic Form".

11 Wang Jianjiang, New Explorations of Aesthetic Form, Gansu Social Sciences, No. 4, 2007, and Aesthetics, Reprinted Periodicals of RUC, No. 10, 2007.

2. The Emerging Aesthetic Form

Since the reform and opening up, Chinese traditional aesthetic form has been fully revived, and its category has begun to step into the aesthetic textbooks, showing a mixture of Chinese and Western factors. But the real progress of China's aesthetic form lies in the emergence of new categories of doubtful aesthetic form, such as "Jiong" films, strange architecture and cold humor, etc.

(1) "Jiong" films

"Jiong" films are famous for the success of Xu Zheng's self-directed and acted trilogy series, that is, *Lost on Journey*, *Lost in Thailand*, and *Lost in HongKong*. However, as a cultural phenomenon consisting of network language, spoken language, commercial advertisement words and "Jiong" character exercises, "Jiong" has exerted a great influence at home and abroad. Both "Jiong" culture and "Jiong" films use the embarrassment and brightness, two different meanings of the word "Jiong" to express the embarrassment of "difficult road" and the complex psychology and narrative logic of looking forward to a bright future. They produce many artistic expressions with comic effects and become hot words or buzzwords in life and art at the same time. In particular, "Jiong" films earned an unprecedented box office with its popular joy and cold humor. "Jiong" is a true portrayal of people's living situation and spiritual outlook in Bie-modern period, but it is full of laughable jokes, which show the difficulties and embarrassment in life by comic exaggeration, and has full releasing and entertaining functions. The endings of "jiong" films are not incomplete, and in the vulgar bright endings, there is no lack of good consolation.¹²

"Jiong" films come from "Jiong" culture, which is composed of network language, spoken language, commercial advertisement words and "Jiong" character exercises. But it summarizes the dual characteristics of "Jiong", which shows a strong sense of humor and criticism. It tears up human weaknesses and spiritual loss, wakes up people in laughter and promises a bright prospect in the time of suffering. Although it is not elegant, it is enjoyable. "Jiong" films, with its unique way of expression and narrative logic, shows its unique aesthetic effect and has obvious aesthetic characteristics, thus becoming a contemporary emerging aesthetic form.

Although "jiong" films have a modern background and characters in the process of modernization, most of their ideas remain in the harmony and conflicts of pre-modern feudal superstition, succession of offsprings, the difference between men and women and modern commercial competition as well as modern love concepts; combined with the methods of deconstruction and collage of post-modern art, which have some mixed and symbiotic characteristics that is Bie-modern.

It is worth mentioning that "cool", "dazzling", "beautiful" and other hot words, have not become the category of aesthetic form like "Jiong". The reason is that, besides the time length of popularity and the extent of widespread use, "Jiong" has become an aesthetic form with the help of "Jiong" films. This aesthetic form transcends life and art and has the characteristics of the times while other hot words, merely used as adjectives, are easy to pass quickly as catchwords.

(2) Strange Architecture

Strange architecture is also called odd or ugly buildings. Since the beginning of this century, strange buildings have appeared in many cities in China. In Beijing alone, there are Big Pants (the nickname for the headquarters of China Central Television), Bird's Nest Stadium and so on. Some like Bird's Nest have won praises, while some are

12 Wang Jianjiang, The Aesthetic Formation of "Jiong" in the Bie-modern Period, Southern Cultural Forum, No. 5, 2016.

criticized by people, such as the scornful name of Big Pants. Although the activities of “Ugly Buildings of the Year” network Award are “lively” and “colorful” every year, it has not prevented the frequent appearance of ugly buildings. On the contrary, they have sprung up like mushrooms.

Strange architecture is mostly related to bionics. For example, the “Tianzi (son of heaven) Grand Hotel” in Hebei is modeled after the image of longevity star, fortune star and wealth star. The headquarters of Wuliangye distillery is built in imitation of Wuliangye bottle, and the Hebei Baiyangdian stadium is modeled on the big tortoise. The Taihu aquafarm in Suzhou is built in the shape of the big crab. Most of them have bionic objects to satisfy their desire or appetite, and are ridiculed by many netizens.

There are also self-moulding golden bodies in strange buildings. For example, the chairman of a corporation group in Luoyang, Henan Province was portrayed as Maitreya Buddha, expressing the pre-modern salvation thought and personal worship, which are inseparable from the domination of modern commercial purposes. There is also the consciousness of household protection and flourishing as well as authoritarian consciousness, etc., which permeate into such bionic buildings and form the Bie-modern landscape of distinctive aesthetics.

Strange architecture embodies a mixture of pre-modern concept of fortune and longevity, people’s idea of taking food as the heaven and modern commercial consciousness, and also a mixture of desirable and edible objects under the influence of post-modern collage techniques. Most of these strange buildings do not have much aesthetic value, but they can attract people’s attention and achieve commercial purposes by their strange ways. They are the harmonious conspiracy of modern commercial consciousness, pre-modern catering culture and hedonic culture as well as post-modern parody, deconstruction and collage. However, this ubiquitous strange architecture is also a manifestation of the aesthetic form of Bie-modern period.

Because these buildings have a function of forcibly implanting into humans’ visual field, their influence on social aesthetic mentality and taste cannot be neglected. As an aesthetic form that tends to appreciate ugliness, strange architecture reflects the mixed reality of social form in Bie-modern period in architectural art, and is poor Bie-modern artistic collage and parody.

(3) Cold humor

Cold humor is a very popular way of humor nowadays. Although it is also a kind of humor, cold humor is different from hot humor which is easy to understand. For cold humor, laughter is usually produced after thorough understanding, and this kind of laughter always makes people feel cold reality because of the seriousness of the content. For example, people mistake the Yangtze River as Yellow River in the dialogue of *Lost on Journey*, which makes people realize the serious pollution of the Yangtze River and feel “penetrating coolness” while laughing. Again, in a humorous sketch, when the reporter asked a farmer’s idea about the significance of the launching of Shenzhou X spaceship, he answered: “That is to say, medical problems, education and employment are more difficult than launching of a spaceship?” After laughter there arise heavy and cold senses.

Cold humor is different from black humor in the West. Black humor always ends in laughing at other’s misfortune, but cold humor cannot be finished after a laugh, instead it evokes a sense of heaviness and coldness.

Cold humor is the product of the times, which comes from the difficulty of positive expression and the danger of direct criticism. Therefore, it hides the heavy problems and strong appeals in funny rhetoric and plays an allegorical role in laughter.

Cold humor has something to do with the Chinese tradition that “civil officials should admonish the emperor at the cost of life, and military officers should fight to death to win the war”, and it is also related to the implicit restraint of the Chinese people. But admonition in the shadow of death is the matter of ministers after all, and fighting to death in the battlefield is the matter of military officers, which is far from reach for ordinary people. Therefore, only through cold humor can they implicitly express dissatisfaction and irony. The jokes with connotation fly around in Wechat era, which is apparently a reflection of reality. Cold humor, for this purpose and to serve it, is likely to create the splendor of the aesthetic form of this era.

3. The Formation of Bie-modern Aesthetic Form

It is directly related to the need for emotional expression. For example, people’s economic status has rapidly changed since the reform and opening-up, from the initial desire for wealth, the disillusionment of the dream of making a fortune later, to the anxiety caused by the fear of unpredictable paths, they all need to be socially released through cultural awakening and aesthetic appreciation of literature and art. The longing for bright prospects leads to the illusion of entering the bright situation from embarrassment, which leads to the emergence of aesthetic form of “Jiong” and “Jiong” films. The combination of Jiong(窘, embarrassment or emotional and spiritual loss) and Jiong(窘, brightness), that is, predicament and hope, has contributed to an aesthetic form of “Jiong” films with multiple expressions and integration of sadness and happiness.

The worship for fortune, wealth and longevity and desire for gourmet food led to the popularity of bionic and strange architecture. The direct result of economic reform is the expansion of private desire, the prevalence of the concept of material enjoyment, and the increasingly materialized expression of human nature liberated from the “Cultural Revolution” and “self-criticism”. On the one hand, it promotes the rapid development of material production and consumption; on the other hand, it fully releases the selfish desire and evil of human nature. The strange architecture almost all over the country with the shapes of wine set, tea cup, tortoise or crab are the firm manifestations of material pursuit and appetite desire, which are in connotation far from the post-modern trend of thought reflecting on modernity. But borrowing post-modern parody, deconstruction and collage, as well as the harmonious conspiracy of pre-modern concepts and modern commodity consciousness, they have come to the opposite of the post-modern and achieved Bie-modern strange art.

With depressed emotions which means being dissatisfied with the present situation but dare not speak out openly, they seek tortuous and implicit paths, and often resort to cold humor to launch irony and criticism. Because this kind of satire and criticism is different from black humor which aims to take pleasure in other’s misfortune, or hot humor which shows clear and explicit meaning, it has profound implication and needs rational understanding, and then produces a thought-provoking cold effect after laughing. Cold humor is only an aesthetic form, not an appendage of political standpoint, so it depends on the position and attitude of users and understanders. However, as a new aesthetic form, cold humor prevails in Bie-modern period, probably because of the reality of various contradictions and conflicts in this stage, and the choice of tortuous expression of this reality.

From the uniqueness of western aesthetic forms in the last century to the mixture of Chinese and Western aesthetic forms in martial arts after the reform and opening-up, then to *Crouching Tiger, Hidden Dragon* directed by Ang Lee in 2000 and the opening ceremony of the 2008 Olympic Games directed by Zhang Yimou, the aesthetic forms

of neutrality, wonder, rhythm, femininity and masculinity, artistic conception, elegance and etherealness in Chinese aesthetic forms have been magnified and independently highlighted, thus enabling traditional Chinese aesthetic forms to finally return to the center of the art stage. But with the appearance of “jiong” films, cold humor, strange architecture and other doubtful aesthetic forms, the creative contemporary Chinese aesthetic morphology is coming into being. It can be said that the development of Chinese aesthetic form has gone through such a process: Since the 20th century, there has been a prolonged and declining period, a mixed period between China and the West since the reform and opening up, an independent period for self expression after 2000, and finally a period of independent creation of new aesthetic forms. This is naturally related to the fact that the awakening of the consciousness of Chinese aesthetic form did not happen until the spread of Western learning to the East. It also involves the long-term domination of Western discourse, and the re-activated creativity of aesthetic form since the reform and opening up. Without the creativity of aesthetic form, it is impossible to expect a new category of aesthetic form.

III. Structural Characteristics of Bie-modern Aesthetic Form

After the reform and opening up, capitalist economy entered China and changed the original single mode of state-owned economy. Accordingly, state-owned economy, private economy, foreign-funded enterprises and joint ventures coexist in China. With China’s accession to the WTO, further opening up has been expected and encouraged by foreign investment. This change in the composition of ownership has a profound impact on China’s social formation. Especially, the entry and acceptance of Western ideology is beyond the scope of “infiltration”. The result is the loss of China’s academic discourse power, the Westernization of aesthetic taste, the mixture with Western aesthetic forms, and the dominance of Western aesthetic ideas. It was only in 2000 that Chinese aesthetic forms such as neutrality, rhythm and artistic conception appeared in textbooks. However, as far as contemporary Chinese aesthetic forms are concerned, they still seem to be blank. But realistic aesthetics and artistic creation always go ahead of the theoretical summary. Before the category of traditional Chinese aesthetic forms was accepted by Chinese aesthetic textbooks, the aesthetic forms in Chinese real life and literary creation had risen quietly. The aforementioned “jiong” films, strange architecture, and cold humor etc. are all achievements since the reform and opening up.

The Bie-modern originated from the existence of capitalist factors in socialist China, so it is a mixture of socialism, capitalism and feudalism, and a harmonious conspiracy of the modern, pre-modern and post-modern. This is related to the fact that China has not yet achieved modernization. Modernization includes material modernization, system modernization and ideological modernization. China is still in the process of poverty alleviation and the reform has entered a “deep water zone”. The backward pre-modern ideas still restrict people’s thinking and affect the progress of society. The present situation of this social form provides a structural basis for the aesthetic form. This is the intersection and entanglement of the modern, pre-modern, post-modern.

It is worth noting that the disintegrated Soviet Union and Eastern Europe are called post-socialist countries, and their aesthetics is called post-socialist aesthetics. This is because from the perspective of social composition, post-socialist countries have transferred to capitalist countries, and private economy has formed the basis of state dominance. Its social system has also been democratized by capitalist constitutionalism. And its mainstream ideology has been completely capitalized. This kind of post-socialist “change of heaven” is quite different from the hybridity of current China which still

adheres to the socialist road but fails to completely eradicate the feudal factors.¹³

Compared with the pre-modern aesthetic form, the Bie-modern aesthetic form has made progress in that it has accepted the concepts of freedom, democracy, development, social welfare and human community generally accepted by human beings in terms of ideological content. In art, especially in avant-garde art, it has exposed and criticized the pre-modern patriarchal ideology, feudal authoritarian ideology, feudal superstition, and the concept of hierarchy, etc., which means it will not blindly recognize the pre-modern system and concepts. From the artistic point of view, Bie-modern art has adopted the western modern and post-modern methods and forms. It has surpassed the materials and techniques of landscape freehand brushwork and meticulous description. It has boldly imitated and explored in the artistic form, made great efforts to express new feelings, new ideas, communicate the western context, and has been accepted by the western literary and artistic circles. In the words of Western scholars, Chinese contemporary visual art has reached the leading position in the world. As far as avant-garde visual art is concerned, its mixture of the modern, pre-modern and post-modern is also shown vividly. But Bie-modernist visual art is characterized by reflection and criticism of the reality. For example, Meng Yan's oil painting Crisis Series (pictures) shows the spiritual crisis of humans and the separation of their soul and body. Wang Wangwang's Money Hills and Meat Hills (pictures) express the decadent and luxurious life and the degeneration of humanity with landscape freehand brushwork. Zuo Yilin's "THAAD Missile" (pictured) expresses his expectation for peace and mocks the inability of religion on war. As for Zhang Xiaogang's Big Family Series (pictures), Yue Minjun's Iconic Laughing Image Series (pictures), Fang Lijun's Bald head Series (pictures), Wang Guangyi's Great Criticism Series (pictures), Zeng Fanzhi's Mask Series (pictures), they have made use of post-modern miscellaneous techniques and modern Pop reproduction techniques to reflect and criticize the reality and history, and thus achieved the unprecedented achievements of avant-garde art. These achievements of Bie-modernist art are undoubtedly the revolution of art and aesthetics as compared with pre-modern art.¹⁴

Compared with modern period, Bie-modern aesthetic form also has obvious progress. Formally speaking, the greatest feature of Bie-modern art is that it absorbs both modern and post-modern creative techniques. Compared with modern art, Bie-modern has more parody, deconstruction, collage and other artistic techniques, thus increasing its artistic expression ability. At the same time, Bie-modern art has not forgotten the pre-modern materials and techniques, so it has more local characteristics than western modern art. Xu Bing and Gu Wenda's art of wrong Chinese characters has the Chinese character endowed by the unique performance of Chinese characters' pictograms. In terms of the content of art, Bie-modern art in its ideas still contains the pre-modern patriarchal ideology, feudal authoritarian ideology, feudal superstition ideology, the idea that connections are greater than law, as well as the inertial waiting as a form of hidden rules, etc. In this regard, strange architecture is particularly prominent. The traces of pre-modern ideology has hidden the pioneering character of Bie-modernist art and lost its modernity.

Compared with the post-modern aesthetic form, the Bie-modern aesthetic form has made progress in that, in terms of content, although it borrowed the post-modern method, it embodied the Chinese implication. This implication comes from the

13 Ales Erjavec, *Postmodernism And the Postsocialist Condition: Politicized Art Under Late Socialism*. The Regents of the University of California, 2003. pp.1-2.

14 Ales Erjavec, *Trivial Truths: Related to Further Comments on the Absence of Zhuy, Exploration and Free Views*, No. 5, 2018.

understanding, grasping and handling of the harmony and conflict between the modern and pre-modern. Zhang Xiaogang's Tian'anmen Series is a description of pre-modern architecture with pre-modern woodcut, which highlights the conflict between pre-modern symbols and the awakening of modern consciousness. It has gone beyond the transcendence of post-modern art to modern art and the reflection on modernity. Because of the great differences of modernization among countries in the world, post-modernity in developed countries is a reflection and criticism of modernity, while in developing countries modernity is still the core element of modernization that they want to pursue. Therefore, there is a natural distance between Bie-modern aesthetic form and post-modern aesthetic form.¹⁵

As far as cultural inheritance and innovation are concerned, the hybridity and intertwined feature of Bie-modern aesthetic form are also structural characteristics.

Pre-modern aesthetic forms are not only related to the concept of harmony between man and nature in agricultural society, generating artistic conception and other forms, but also to Confucianism, Taoism and Buddhism, resulting in neutrality, elegance and etherealness, while wonder, femininity and masculinity, and rhythm are the results of metaphysical thinking. Compared with the Western pre-modern aesthetic forms such as tragedy and comedy, the Chinese pre-modern aesthetic forms are indistinguishable and hard to be analyzed because they do not have the latter's genre characteristics, but are integrated with philosophy, nature, social life, art and so on. They are indistinguishable, indecisive, persistent and intertwined. As for the category of artistic conception, which is an aesthetic form, in fact intersects with etherealness and elegance, and it is difficult to have an accurate boundary. Furthermore, the artistic conception is compatible with the femininity and masculinity, rhythmic vitality, neutrality and wonder. The result of this compatibility is ambiguous boundaries. This characteristic has been continuing to the mixture and hybridity of the modern, pre-modern and post-modern aesthetic forms.

In the Chinese aesthetic textbooks published before 2000, there seems to be a break in the pre-modern aesthetic form, that is, the absence of the category of Chinese aesthetic form in almost all the aesthetic textbooks. But this is not a reflection of the normal structure. On the contrary, it is the neglect of the category of Chinese aesthetic form caused by the hegemony of Western discourse. It results from the absence of the study of aesthetic form in the theoretical study of Chinese aesthetics, rather than the autonomous cutting and breaking of Chinese aesthetic study itself. Therefore, when the category of Chinese aesthetic form revived after 2000, its intrinsic integral feature remained unchanged. In terms of "jiong" films, strange architecture and cold humor, they are also closely related to aesthetic forms such as neutrality, wonder, as well as related categories such as joy and satire. They do not form a cut between modern western aesthetic forms such as sublime, absurdity and pre-modern aesthetic forms such as tragedy and comedy, but are an incompact continuum, especially adapted to the survival in the Bie-modern context.

The aesthetic form and social form in Bie-modern period have the characteristics of homogeneity and isomorphism, which embodies the mixture of the ancient and modern and that of China and the West. But it is not a "double-headed monster" of the modern and post-modern, but a "three-headed monster" combined with the modern, pre-modern and post-modern. This three-headed monster is actually a cultural and aesthetic structure based on a certain social form. From the structural characteristics, no matter which country or nationality, as long as the Bie-modern trinity is possessed,

15 Keaton Wynn, Differing Modernisms: Similar Art, Different Meaning Zhuyi for a Bie-modern Age, Northwest Normal University Journal, No. 5, 2017.

it can be called Bie-modern aesthetic form. According to Dr. Zhou's research, Iranian films have typical Bie-modern aesthetic features. The same is true of some movies in Turkey. This conclusion is basically consistent with the fact that both have religious tradition and modern democratic social formation. Religious beliefs originated in pre-modern times and may be integrated into modernity as in European and American countries. They may also stand up against modernity and form a contest and struggle between modern democratic system and the system of integration of politics and religion. That is to say, harmony and collusion plus confrontation show a much more complex Bie-modern situation than simple modern and post-modern ones.¹⁶¹⁷

From the perspective of completion structure, especially when it comes to the Bie-modern aesthetic form involving many countries and nationalities, there is a need for an inclusive concept in addition to subdivision in order to express the common characteristic of cross-time and cross-region. In a word, this feature can be summarized as follows: Bie-modern - hybridity and fuzziness.

MAP AS ART- MAP AS THE WAY OF CREATION IN CONTEMPORARY ART

Abstract | Map is a tool to understand the world for human beings, also a visual representation of the world in ideas and imagination. Humans began to draw maps from thousands of years ago to now, leaving many maps of great scientific and artistic value.

In contemporary art, map has also become an important form of artist creation. The main reasons are as follows: First of all, maps are important tools for human beings to understand nature and the world, as well as visual representations of ideas in politics, culture, and religion. Secondly, historically, the map is the image of science and technology, also a creation of art, and it is the perfect combination of science and technology and art. Finally, the use of new media and materials has made the current maps more artistically possible.

This article takes the works of several artists, including Chinese artists, as an example to analyze the way of artistic creation and to study the significance and value of map as a visual image language in contemporary social, scientific and artistic contexts.

Index terms | *map; contemporary art; way of creation; science and art; concept and image*

China has a long history of cartography; numerous masterpieces have emerged. The *Dunhuang Star Map* which was made in 649-684 A.D. is considered to be the oldest and most completely preserved star map so far.¹ In the Song Dynasty Stone Carved Map *Yuji Map*, China's borders, especially the coastline, were depicted with surprising accuracy, and even a grid for representing the scale appeared.

Currently, the development of maps has been changing with each passing day. New remote sensing and computer technology make maps more accurate, and get everyone intuitively complete the understanding of geography and route planning on mobile phones. In the long development of the concept of maps, people are increasingly not satisfied with the geographical images and nouns that only show the objective world in the picture. They add the human imagination and artistic expression to the map drawing. In this long process, the map also developed an unique aesthetic system.

A typical example is *Map of Wutai Mountain* in cave No.61 of the thousand-buddha cave mural in Dunhuang, China, which is an aerial view of the Wutai Mountain area, drawn in the Five Dynasties Period of China. The painting depicts in detail the landscape from Taiyuan in Shanxi province through Wutai Mountain to Zhenzhou in Hebei province within a range of more than 800 miles, including small and large villages and towns, temple, tower and so on. There are more than 200 buildings, in which there are believers' visits, famous historic sites and various spiritual beauty and so on. With its large scale, precise conception, rich content and appropriate layout, the map is a rich Buddhist historic painting, a visual historical map, and what's more it's a spectacular landscape and figure painting. The green mountains and waters in this painting also reflects the artistic achievements of the Five Dynasties in China.² In Europe, there are many well-drawn maps with high artistic level. Fra Mauro's *Fra Mauro's World Map* is regarded as one of the most beautiful and important works in the history of European cartography in the Middle Ages. The work was made in about 1450, with a huge size (2.4MX2.4M). It is extremely exquisite and consumes a lot of good kraft paper, gold and pigments. The details of the works are quite rich, with accurate textual research, and even many places have reached a very high level in painting.³

The aesthetic value and system of maps are manifested in the following aspects: Firstly, maps originate from the objective world, but because of the limitations of people's understanding, many maps are full of imagination. For example, in many medieval maps, because of the lack of geographical discovery, people would use their imagination to depict the mysterious East. These images are full of imagination and fantastic ideas. Secondly, painting not only integrates the aesthetic factors of painting, but also has the rigor of scientific and technological mapping, which can be called the perfect combination of art and technology. For example, *Map of Wutai Mountain* accurately depicts the geographical features of Shanxi province, and the description of green mountains and waters has reached the peak of that era. Thirdly, the aesthetic system of maps also contains conceptual elements, such as the devotion to Buddhism shown in *Map of Wutai Mountain* and the strong Christian theology in *Map of Fra Mauro World*. These concepts have a profound impact on the map drawing and the final

presentation. Finally, most of the maps are drawn from the “God’s Angle” overlooking. Compared with the general landscape paintings, they are not only more magnificent in size and sense, but also have many details, which make people sigh at the great nature, and stop to watch for a long time.

On the basis of traditional art and modernist art, post-modern art and contemporary art pay more attention to the interaction between art and human society, emphasizing reflection, deconstruction and reconstruction. Many artists turn their eyes to maps and choose them as carriers of their own artistic and conceptual expressions.

Black Scalpel City by British artist Damien Hirst, presents 14 representative cities overlooks around the world, such as Paris, San Francisco, Baghdad, Washington and so on. When it is viewed from a distance, viewers can distinguish these cities according to the presentation of the images. But if you look closely, you will find that all the buildings in the cities presented in this work are artistic creation by using metal blades, pins and other comprehensive materials to combine with together. Here, the artist shows the connotation of the work with the conflict of chaos and order, showing the crisis behind the prosperity of the city and people’s uneasiness about it.⁴ *Hot Spot* by British installation artist Mona Hatoum presents a small globe. The longitude and latitude of the globe are connected by a metal line. Red neon lights delineate the continental plates of the world. Intentionally amplified electric sound cooperates with the flashing image of neon, implies dangerous heat and dialectical relationship between part and whole, showing the crisis and challenge of the current world and triggering new thinking.⁵

There are lots of artists using maps as a means of artistic expression in China. The artist Ai Weiwei’s *Map of China* is composed of nagkassar from the demolished temples of the Qing Dynasty, and a map of the whole territory of China which is made by mortise and tenon way in ancient times. It has evolved from the old things carrying history to the works of art which exist in the form of ready-made products. With the change of the form of things, it metaphors the gradual disappearance and transformation of Chinese traditional culture.⁶ This is not his only work in the form of maps. In 2013, he built a 10-metre wide and 8-metre high map of China with 1,800 cans of milk powder of seven different brands and colors to metaphorically reflect the various social hot spots and problems behind China’s rapid development. In Ai Weiwei’s works, Chinese map is not only a geographical concept, but also a cultural reflection. Qiu Zhijie, an artist, creates art by hand. His *World Map Project* draws a series of virtual maps in the form of Chinese ink painting. The geographical concepts in the maps are replaced by nouns, which correspond to the content implied by the theme of the works. In the works of artists, maps break away from the function of presenting the objective world, and become the means for artists to create freely. The carefully drawn geographical landscapes such as mountains, rivers, forests and roads in maps become the connection of artists’ thought clues. In fact, these maps are like mind maps full of rationality.

Based on the above, it is reflected that contemporary artists have already paid more attention to the extension of maps on the conceptual level than the beautification of

maps in art works. The maps in their works are marked by distinct personal artistic style, and also have different connotations, so that viewers can initiate new thought after aesthetic observation.

As a researcher and practitioner of contemporary art, I am conducting art research as well as artistic creation. And map is one of the topics that I am extremely interested in. *The Internal of City* is a series of works that I have been working on since 2014. The works use multi-layer paper carvings to show the urban features of different cities, and such different urban features and textures create a unique urban culture and the personality and thinking mode of people living in the city. I try to present this feature in an artistic way in a more intuitive way, similar to the human body structure, to arouse people's thought on this topic. In the latest work, *Jianghu City*, I combine dynamic images with city maps made of metal materials to show the unique urban features of Chongqing, a city where the two rivers meet, and also to show my understanding of Chongqing, a city with typical geographical features.

What is the cause that there are so many artists deeply attracted to this theme? This is mainly due to the complex concepts of maps after geographical presentation. Map is an important tool for people to explore and understand the world. It presents not only geography and landform, but also deep and complex phenomena such as culture, religion, history, power and so on. It is the visual presentation of people's concepts and thoughts. At the same time, as the most important means for people to know and understand the world, the drawing and expression way of maps have been constantly changing with the continuous progress of human society and science and technology. And the combination of art and technology is also an extremely important trend of contemporary art. It is worth noting that the maps drawn by ancient people based on observation and imagination, or by high-tech means, are not completely real world in fact. All the maps are more or less influenced by geography, culture, religion and ideology, with a personal impression. For example, in the Map of the Fra Mauro World, the way the images are presented reflects the special identity of the cartographer himself as a clergyman. The artist's artistic expression is actually the external expression of the image of the outside world in the artist's heart, which is a personal expression with personal style. Therefore, the map can also be perfectly combined with the artist's personal expression of ideas.

Under the new social and historical background, the concept of map has also undergone new changes in artistic expression. The way maps are presented and the way we understand them are undergoing profound changes. Nowadays, people are more willing to use apps such as GOOGLE EARTH in mobile phones to view maps. New technologies and algorithms make the original three-dimensional and multi-dimensional maps more intuitive, distance and time seem to be flat here, which also affects the way we view and understand the world. At the same time, it also gives artists more space and possibilities in artistic expression. Artists can use painting, sculpture, installation art and video to create art. They can also use scientific and technological means to create and present art directly on mobile terminals such as mobile phones. This is not only more in line with the aesthetic habits of modern people, but also allows the dissemination of works of art in a wider group. It can be predicted that more works of art with maps as carriers will appear in front of us, and the aesthetic value and conceptual significance of maps will be further extended in the future.

NOTES OF ART MUSEUM- THE GENERATE AND CHANGE OF SOCIAL AESTHETIC QUALITY IN PUBLIC SPACE

Abstract | In today's China, public and private art museums are emerging in cities, showcasing the prosperity and diversity of social culture. They present collections from art museums from all around the world, thanks to fast and safe logistics worldwide. To view artistic treasures of foreign art museums, more artists also travel to other countries and regions.

Thanks to the public space of art museums, audiences have more access to art work by artists of different nations and ages. The investment in social culture, therefore, is rewarded in art museums. Aesthetic taste and quality of the era is also gradually shaped through the public space of art museums.

Art museums create multiple artistic presentations, tending to define a special space of life in the context of social culture. Curators curate exhibitions in different types of visual presentation, reflecting the thoughts of artists on history, the Nature and the *status quo* of life. Audiences have their visual desire and belief modified, perfected or changed in the specific space of art museums. Thus, the cultural meaning in present society is perfected through visual means of art museums..

This paper, from the perspective of the author's own thoughts and experience in artistic career, explores the new mode and the social aesthetic meanings of art museums in the context of the above-mentioned functional transformation of art museums..

Index terms | *art museum; art form; curator; diversity; living status*

The gallery maybe the only public space where people show their creating visual images. When the public walks into the gallery, they become the audience who perceives the existence of society in the form of images with their eyes.

Walking around the city, public and private galleries occupy very good blocks, parks and campuses. The number is increasing and the quality is commendable. Rich cultural format is presented. This space defines the cultural qualities of the visual senses in social life, and visualizes the individual desires and social processes in a quiet way.

The number of people is counted by the counter every day at the entrance of the gallery. The enthusiasm of the public is measured, and the reasons for the change of the statistical data value are figured out. Any visitor who enters the gallery can stand in front of the work and experience the short-term aesthetics equally, expecting to see the works he wants to see.

On the one hand, public galleries are making a big splash, on the other hand, private galleries are boosting the tide, relying on commercially valuable projects to develop and optimize the quality of galleries, and the assets activate the urban culture in the form of public welfare. The evaluation mechanism of competent departments and the generosity tendency of annual investment ensure the stability of the functions of public cultural service institutions.

Logistics industry is fast and efficient. Under the compact annual arrangement of galleries, works of art collected in various places are transported back and forth for exhibition. After the hammer falling at the auction, the works of art are crowned with the word "treasure" and awe people. Unnamed shape, color and material change in space, completing its often new combination.

It is pleasure to enjoy collections and exhibits in galleries. The lighting is high-quality, the security is tight, the environment is quiet, and even loud speaking would be considered rude. As long as it's not closed, it's up to you to appreciate works of art. Thinking about the collection that is not easy to show in the private house of the collectors, which is like the award for you to see and to be constantly implied the ownership of the collection.

Artists are like stars shining far away. Usually you can not see where the reflected light source comes from. It seems that only when take it back to the gallery, we can see clearly the original uneven face.

The gallery should lead the audience to gradually understand the connotation of the works in appreciation. The critics appear. They come from all over the world. Their profession is to enrich the audience's understanding of the works of art by writing. They can delineate the uncertain potential of works and guide the public to appreciate them beyond their personal preferences. They encourage them to adopt a variety of perspectives in appreciation and cherish their visual perception.

Their words of rational analysis and guidance are sometimes made public earlier than the works of art, and there is a necessary delay in public response, which undoubtedly tests the patience of critics. They constantly describe, interpret and judge works of art so that the audience knows what is understandable, what is appropriate and acceptable, and that aesthetic standards should not be formatted.

Most artists are not special people in imagination. Their works concentrate the world in their eyes through some medium or medium into what audiences of this era want to see. They are very concerned about whether the audience in the exhibition hall will go to see it. They can't bear to see the work hard created in the exhibition hall in the face of the figure dangling to praise and criticize casually.

The galleries strive to exert their functions to meet everyone's needs with different types of exhibitions and enhance the interaction of visual art exchanges. Meanwhile, they have also contributed to a social multi-cultural ecology of popularizing art education in a region.

The galleries release people's innate nature and activate the public space of the city. The children line up to spread out their boards in the gallery and paint by hand, which restored the real intention of visual art education. The adult question sounded more like a child.

The boundary of visual art becomes more and more wide and a fuzzy. Its form has been eager to expand to almost all human creation of the goods, micro-macro and even nature. When you see familiar objects placed in the galleries as works of art, visual art has begun to challenge the audience's fragile but inherent aesthetic concept. At this moment, do you and I in the exhibition hall feel uncomfortable that we are being watched and displayed?

Going to a gallery is like going to a restaurant. You can be as picky as you like. But if there is not a dish you like, it must be something wrong with your stomach. In the exhibition hall, there are both classic images repeatedly studied by experts and contemporary images that the audience has not been used to forming experience, which gradually merge into the tolerance and tension of visual art in the overlapping.

At the same time, the curator, who is also a critic takes pains to present the artist's visual thinking on the living environment and living state through different theme types of exhibitions. In the exhibition space, he insists on leading the artistic values, expands and sorts out the new orientation of exhibition design. They do their best to make a peace between the quality of the era and the public imagination.

In the public society, there is no space like the galleries, where the space and works can absorb each other's energy, which can not only make the decent social contact add elegant charm, but also make people fantasize due to the visual experience. The viewer's preconceived visual preconceptions can be unexpectedly changed by viewing the work. Shouldn't exhibitions give us more freedom of visual choice?

The audience entering the gallery will form a temporary visual belief and judgment. The uneven visual preferences and tastes of the appreciators inhibit the social function of obtaining higher virtue, which reflects the cultural intention of unified aesthetic standards. We are used to viewing history by pictures, taking love, kindness and hatred as moral standards, conducting the function of education, and changing the meaning into the unique. Compared with rational reasoning, visual image perception is slow but stubborn, far duller than our developed and sensitive sense of taste.

When we use images to spread ideas, we consciously use the principle of collectivism. But when we examine and think, we can not control the will and preferences of individuals. It is easy to neglect the aesthetic function of the image itself on the vision, and also weakens the public's understanding of the function of the gallery.

The refinement of the aesthetic concept in daily life and the content of life and life in personal emotions and feelings have become an indispensable landscape of the times. The gallery is like a stage, which scenes the author's life consciousness and brings the audience a real visual experience and life feeling.

Thankfully, it's unusual to see a new generation in the gallery from 1990 onwards, because it's hard-won for them to go to the gallery and look directly at the original work when the Internet Terminal bring them unimaginable temptation. By the way, there is some advice for the media that to give them more pictures in future interviews

and not to fill the camera with people of several social identities all the time.

Appreciation and taste belong to the individual and are also from the exhibition hall established cultural identity. The audience's reaction is often intercepted by the sensitive art market outside the exhibition hall. The categorical needs of different audiences for visual appreciation are shown and their attribution in social culture is confirmed through the operation of different art institutions.

If aesthetics still needs to be popularized, then the chip of future knowledge can be put into the brain completely without time and effort. If aesthetics relies on emotions acting on physical and mental activities, people's consciousness may even exist in the future without the body itself. It is a little challenge to human dignity. How do you think about it when you are in the gallery?

It is difficult to meet people's visual more diverse needs by paper media transmission mode. The Internet has broken the spatial barriers of the galleries, and the visual desire is obtained "presence" in more and more virtual spaces. APP social reading has become a powerful force, even if only fragments of information and pictures browsing, it is enough to release people's emotions without restraint. The tiny graphics on the display screen objectively reduce the cost of visiting the exhibition and make up for the lack of understanding caused by the lack of illustrations in many art books, thus expanding the potential audience.

Exhibitions of classical themes carefully planned by the galleries sometimes fail to achieve the desired results. The exhibits that are carefully considered, even when some overreactions are taken into account, are surprisingly impressive. The audience's comments on the message book often show unexplained praise and derogation excitement, which is unexpected. The change of aesthetic and moral evaluation in the memory of the times and expectations of the times, the aesthetic evaluation of the public influenced by the process of cultural development, and the exclusion and attraction of taste among different audiences attract more attention from public opinion. impact on the setting mode of the inherent functions of today's galleries and activate the ideas of exhibition planning.

It is clear to artists and critics that unlike commodities, which can be consumed in the process of appreciation, works of art continue to act on the public's feelings with their own connotations, which are amplified into social and cultural visions through the vision of the future.

The visual blood supply from the galleries constitutes a cultural nutrient base, accelerating the potential visual integration of different social bodies of history, reality and ideals. It has broadened its own existence space both consciously and unconsciously. It injects fresh blood into the city's cultural character, and even to build a luxury phenomenon. This is certainly a good thing. One scholar said that the retina and eardrum membranes of residents in big cities like Paris are created by a generation of architects, musicians and painters.

Is visual experience not yet possible realized in another environment of social space? In the future, will the galleries be the only place to display objects called art in urban space? It is believed that there will be more public spaces with different functions, accompanied by changes in the way of digital acquisition of human visual information. They intercept images from different cultural backgrounds and act on the expression in different spaces to cultivate the audience's visual quality of the times.

Once you hear about the number of collections in the gallery (which are equivalent to hard currency in the capital market), it's inevitable that there will be worries about when it will be seen around the world again. This is also the precise psychological activity of

the enthusiastic audience. How to use all possible ways to stimulate the vitality of the galleries, attract the public to maintain a sustained interest in the appreciation of the original works of art in modern life, and maximize the utilization rate of public visual resources should be included in the budget of contributing to culture - this is the social significance of the existence of the galleries.

Artists and critics conspire to use real and virtual forms to make everything possible, and then playback the possible processes to prove why it is possible. People of all identities gathered in the gallery are in different ways. It is impossible and unnecessary for either party to fully agree with the other party's views. This actually reflects the non-stop competition between demanding and giving of different roles in the contemporary social division of labor.

Nobody wants the space of the gallery as an artificial structure to become a barrier between artists, critics, the public and the media. This shared space loaded with social functions still has the freedom to think and acquire new knowledge. It brings us more opportunity to understand and respect each other-- no matter it's for the gallery, the critics, the enthusiastic audience, the authorities, or the self-effacing or pretentious artist.

While performing their duties, public and private art galleries have enthusiastically embraced a lot of social obligations to take on the responsibility, archiving the cultural process in a visual way and leaving the topic of social value evaluation to the public. Although it is impossible to consume in its space, taste and enthusiasm can be transformed into the anticipated demand for art consumption. The function of the gallery space endowed by the times is still being reconfigured.

The cost of artists and social cultural investment is slowly showing returns in art galleries.

Looking at the favorite works is that any viewer walking into the gallery hoping for, you can absolutely enjoy the visual payment of public cultural welfare in good faith.

MUSIC AESTHETICS IN HARUKI MURAKAMI'S *NORWEGIAN WOOD*

Abstract | Haruki Murakami is an emotional writer who is good at using music to convey loneliness and sadness. His novel *Norwegian Wood* emerges a number of music songs and a few artists's name. In the novel, most of characters love music, especially western music, and the title was also taken from a popular western song of that time—"Norwegian Wood". Not only the melody is beautiful and clear, but the lyrics reveal the expectation of love and the yearning for freedom. He internalizes the song as a part of novel, leading to many implications. Murakami is good at representing innocent love between young men and women in a subtle way. So music has become a aesthetic symbol of love in the novel, the novel *Norwegian Wood* is as famous as its song, which is a sad and silent song. As if sending out the cherry blossom withered like the faint melancholy. In the novel, main roles also use their youth and life to resist the faint of loneliness and sinking of reality, playing a piece of eternal love, noble and free era music. Since its publication, the works have been rapidly sought after and favored by readers. It not only depicts the youth memories of a generation, but also symbolizes the general state of social depression and national depression in postwar Japan. The island had a lingering shadow. Throughout the novel, the tone is sad, lonely and full of death. In the novel, Mu Yue, Naoko and Chamei all commit suicide in this long and lonely life journey. Kimoko and Naoko were lovers in the past. Mu Yue's sudden suicide, directly caused his girlfriend Naoko into an emotional breakdown, she was full of grief and sadness all day. However, Naoko more and more closed psychology, will keep Watanabe out of the way, who is accompanying her side all the time.

Index terms | *Norwegian Wood*; *The metaphor of music*; *Loneliness and redemption*

Throughout the novel, the tone is sad, lonely and full of death. In the novel, Kizuki, Naoko and Hatsumi all commit suicide in this long and lonely life journey. Kizuki and Naoko were lovers in the past. Kizuki's sudden suicide, directly caused his girlfriend Naoko into an emotional breakdown, who was full of grief and sadness all day. However, Naoko more and more closed psychology, will keep Toru out of the way, who is accompany her side all the time. When Toru sent a song *Norwegian wood*, he hoped to appease her. But it didn't work out, as soon as Naoko heard it, she was very sad and sorrowful. She felt that she had lost her way in a thick forest, alone, dark and cold, with no one could save her. The death of Kizuki hit his girlfriend and his friend, at the same time, also let them embrace each other in the dark. On the night of Naoko's twentieth birthday, they fell in love with each other. But Kizuki's death is the gap they can not cross, Naoko and Toru more contact, more and more guilt and pain, so she chose to escape, Toru continued to pursue. Naoko for Toru, always made him teary ending, as if an elusive forest. Where the air was calm, the lake clear, the white moon shining on the earth, hiding her deepest secret. And Toru has always been unable to reach the heart of Naoko's forest, finally she followed former lovers, leaving the bitter Toru. Later, Midori Green's appearance, bleaking Toru's dark world into a bright sunshine, giving him enthusiasm, taking him to escape. Midori Green's cheerful living and bold confession, let Toru put down to Naoko's obsession, choose Midori Green as his life partner, because she is the redeemer of his life. Music, is the ghost song of the dead in the novel, and the Gospel of the living out of sadness and loneliness.

Music metaphor one: Memory

A sad song *Norwegian wood* at Hamburg airport, reminding of Toru's youth experience at twenty years: shy and sentimental Naoko is the girl he falls in love with. The lingering sickness, the tenderness like water, even after she had been dead, still haunted him. Cheerful and lively Midori Green is the lover he met by chance. The charming vitality, bold confession, even when his pledge eternal love had been decided, also felt her hard to resist. Vicissitudes of life, like clear string, like sad song, covered by a lingering sound. In Haruki Murakami's literary world, music, especially western music, sets the emotional tone for the appearance of characters and the development of stories. The names of many songs and artists in his works, like the scenery or atmosphere of a particular era, are instantly reproduced, so that people are moved to tears. The frequent use of music in Murakami's works proves that it has already become an aesthetic symbol. He takes music as the background of the characters in the book, which indicates the idea of literature, has strong personal color and era characteristics.

The author deliberately takes the melody of *Norwegian Wood* as a tone and entry point of the novel, aiming to recall the youth memory related to this song. The song itself is a sad and silent love song. *I want you always to remember me. Will you remember that I existed, and that I stood next to you here like this?*¹ This is Naoko left to Toru's last words, but also Toru to Naoko's commitment. It is now 18 years since Murakami created this work, and many beautiful and sad memories of that year are fading away. This novel has an autobiographical nature, the main figure of the novel, more or less has the shadow of Murakami. The author clearly stated in the postscript, *Norwegian wood* is a very personal novel, dedicated to the friends who dead and living. In order

1 Haruki Murakami, *Norwegian Wood*, translated by Jay Rubin. London: The Harvill Press. 2001. p12.

to keep his promise to Naoko, the author had to pick up the memory fragments which had been blurred and were still blurred at every moment, and remember his lost youth with novel. The Beatles' song Norwegian wood, once a hugely popular music, recording a generation's youth. So the song, a metaphor for a generation's search for love and freedom, including Murakami, symbolizes author's raw and troubled memories of youth. At the end of the story, Toru arranged a music funeral for Naoko. At the music funeral, Reiko played fifty songs. The theme song Norwegian wood appeared twice among those songs, and as the closing song of the music funeral. Begin and end with the song, which echoes the beginning of the novel, allowing lonesome and sentimental tone to run through the novel.

Music metaphor two: Loneliness

Norwegian wood was a song by the Beatles in the 1960s, the poignant and profound lyrics constitute a symbol of loneliness and emptiness, reflect the most prominent personal feelings of that era. At the beginning of the novel, I sit alone in the cabin, the destination is Hamburg, Germany, but there is not my final destination, life is like duckweed general adrift, the lonely time and space stage from then on. Loneliness is the theme of the novel, and it is also the reflection of Haruki Murakami's soul. Haruki Murakami writes at the beginning of the novel: *For many fates*.² For those who wander from the real world, every day in the past is a memorial day of life. Loneliness is the essence of the festival, but also the ghost of the modern city. The loneliness that erodes people's hearts is composed by Murakami into a tear-jerking story, every reader who is involved in it will read a self-sense that is different from others. Norwegian wood makes everyone's life flow out a painful tone, that pale music vortex is the aria of fate. Loneliness is the product of a sick society. The loneliness or helplessness of the protagonist of the novel, is the symbol of the plight of human existence. Naoko couldn't endure loneliness, but would sink into madness and despair in extreme loneliness. She tangled feelings into a mess, all could do is just expressing pain. Naoko's loneliness is heartbreaking, her life is like a leaf in the bleakly autumn wind. Deeply loneliness, she had no choice to be strong and fight, immersed for a long time, and eventually led to suicide. Toru is like a cable of Naoko's life, although he was able to help, he was numb. He could have given the mentally aggravated Naoko more warmth and care, but only went to the nursing home to visit her for two or three times. Later, his affair with Midori Green became public, which was a fatal blow to Naoko.

The modern society has created loneliness, and loneliness is the killer. Norwegian wood is nothing less than a dismal forest, full of despair and decadence, and characters in it are hopelessly alone. No matter what lifestyle the characters choose in the novel, they cannot get rid of the shackle of social rules. In Norwegian wood, Haruki Murakami reflects his attitude towards social rules from the side. The loneliness of society caused the suicide of Kizuki, Naoko and Hatsumi. Toru, the protagonist of the novel, wants to break the loneliness, listening to music, going to bar and looking for a girl, but he can't get rid of loneliness at all. Nagasawa also wants to break the loneliness. He is quick-witted, smart, persistent and ambitious, and knows how to make use of social rules and unspoken rules. He racked his brains, arrogance, selfish paranoia, unscrupulous, and lost the very essence of human compassion. Hatsumi committed suicide because of him, Toru

2 Haruki Murakami, *Norwegian Wood*, translated by Jay Rubin. London: The Harvill Press. 2001.

broke with him forever. Although Nagasawa felt just like a fish got water in the alienated world, seemingly breaking the loneliness, actually he is a lone priest and victim. He was sadder than those who killed themselves, lonely and empty. In particular, the character Nagasawa makes readers feel the loneliness created by society and make use of the cruel reality of loneliness.

In real life, loneliness buried individuality. Haruki Murakami can make loneliness changed into different tastes, like bitter. Toru can't find Midori Green and feel lonely, Midori Green was also sunk in lonely vortex. Compared with Kizuki, Naoko and Hatsumi, Midori Green seems to be cheerful and lovely. In fact, she experienced more loneliness than someone who committed suicide. She lost family member one after another at a young age, and her only sister was not around all the year round. She was unaccompanied, but had to laugh at life. In the whole novel, suicide shows loneliness, seeking friends shows loneliness, shouting out loneliness, cancelling sound traps loneliness, drilling into loneliness. The lonely pilot and implication of the novel, are described with light brushwork and came out with soft breath. The more leisurely the author, the more emotional the reader.

The dead who commit suicide are brave loners, and the living who stay behind are wandering or cowardly loners. Haruki Murakami is careful to write about the former, such as Naoko and Hatsumi, and also about the lonely wanderers, such as Toru and Nagasawa, and residual loners, such as the Storm Trooper. Storm Trooper is a comic figure in the novel, he is not observant and opportunistic as Nagasawa, nor reserved as Toru. He did not make use of social rules, thought pedantic, life is rigorous and inflexible. He studied geography hard, and his biggest dream was to enter the institute of land and geography to draw maps. Haruki Murakami describes a typical detail that Storm Trooper can do a set of broadcast gymnastics for ten years. For such a cynical figure, the author called *Storm Trooper*. The irony of Storm Trooper is that it refers to one person, not a team. The funny thing about Storm Trooper is that he didn't dare to die, pedantry is that he cannot think. Storm Trooper is a joke that Toru and Naoko, Midori Green talked about. He strictly abided by social rules, only to be dropped out. He left his beloved school, his circle of friends and classmates, his abiding social rules, and returned to loneliness. Although three factors caused loneliness are personality, fate and society, but the biggest factor is still society. The occurrence of tragedy, rather than blame personality and fate, as to investigate the evil society, only the society is real perpetrators of turning people into ghosts.

Norwegian wood described loneliness so deeply. Loneliness is poison enough to eat life away. It makes good people die slowly in silence, let the evil people in madness speed up destruction. Loneliness is also the spiritual trap that society has dug for everyone. The unfolding of an individual life is like digging a hole in the open earth, and its end result, as Naoko puts it, leads to a hopeless *deep well*. which makes one feel like dying in despair. Toru recalled Naoko's first memory, putting the reader into Naoko's position, which is a kind of helpless loneliness and a kind of spiritual portrayal of a lover who is close at hand but seems to be separated by two worlds. If the novel's love story of the lonely life is a show crooning interpretation, then the scattered death narration can be said to be ups and downs of the rest. Norwegian wood has several suicides. Haruki Murakami intends to tell people the terrible loneliness and reveal the crisis consciousness that loneliness will lead to a tragedy of life. A series of suicides project the novel in sombre tones. In essence, suicide is the most helpless and last choice for people, which contains freedom, resistance, cowardice and liberation. These young

people in the novel are all dolls of fate in that particular society. Fate is the mastermind of loneliness, playing tricks on each poor people who are bound to live and die in the loneliness. Kizuki, Naoko, Toru, Midori Green, Hatsumi, Nagasawa, Storm Trooper... the weak life of modern urban forest, comes in a hurry and goes away in a hurry, but none deserves a better fate.

Conclusion

Modern society advocates justice and fair all the time, this also shows that modern society lacks justice and fair from reverse. Modern society infuses humanity and love, but the convergence of fame and fortune downplays human nature. In modern society, urbanization and industrialization are the greatest achievement, but they are separated from nature and stripped of their simplicity, what followed are melodramatic, porn and unfeeling. Modern society is keen on promoting freedom and democracy, but the rules of reality teach people to give up their ideals, be clever and normative. Modern society asks people to respect knowledge, talent and truth, but life reality proves them have value only when convert into money, power, fame and gain. Modern society flaunted citizens, people, residents and other people-oriented thoughts, but in the real world, these concepts can only be used in advertising slogans and announcement texts. Haruki Murakami is well aware of the society, he didn't debate with the false world, but narrated and expressed with literary works. Norwegian wood shows us not only a group of young people lost in the modern forest, but also a kind of loneliness, a desperately ill society.

WHY DO CHINESE PREFER JADE

Abstract | As we all know, the value of gold is recognized by all countries in the world. In the East, there is such a country that has a special liking for a stone. This country is China. And this stone that is especially liked by China is jade. As a very important civilization in Asia, Chinese civilization is why it loves jade. We have carried out a series of studies on this. Mainly includes:

First, through the jade artifacts unearthed from many Chinese relics, they are classified and summarized according to their style and usage, and look for the commonalities of these jade articles.

Second, look at the role of jade in the entire historical process from a practical perspective. Exploring why prehistoric civilizations who lack material resources love jade, why do they love jade alone during feudal rituals, and why they prefer jade in the period of civilization development.

Third, research is based on the traditional Chinese culture and the nature of jade. Look for the role that jade plays in the development of Chinese civilization.

In the end, we found that the reason why jade is most loved by Chinese people still returns to the beauty of jade. It is this most primitive beauty that may be the most essential reason for Chinese love jade.

Index terms | *beauty of jade; Chinese culture; Feudal ritual; historical; value*

“Gold is valuable, jade is priceless”, which has always been the common view of most Chinese. Most people think that jade is more valuable than gold. Throughout the rest of the world but the situation is not the case. Although they are also very fond of jade, but in comparison, the value of gold is recognized by many countries. We can see that in many countries in Southeast Asia, wearing gold and silver is very common, but there are very few wearing jade. Even Myanmar, a country of origin as a jade, wears gold and silver more than jade. On the contrary, in China, wearing jade is recognized by more people. Wearing bracelets and jade rings is very common. On the contrary, precious metals such as gold are worn much less. What is the cause of this? Why do Chinese people prefer jade to other countries?

The most common view on this issue is the impact of Confucianism on China. Confucianism compares the virtues of gentlemen

In Xunzi's *Fa Xing*, he wrote: “A man of jade, a gentleman is better than a man of virtue.” Warm and lustrous, benevolent; chestnut and reason, knowledge; firm and unyielding, righteous; honest and unyielding, line; flexibility and perseverance, courage; flaws and appropriate, love; and “Poetry” said: “Speaking of gentlemen, warm as jade.”

For the general view is the influence of Confucianism on China, Confucianism uses jade to describe the virtue of a gentleman. Confucianism compares the virtue of jade to the virtue of a gentleman. People value jade because they value the character of a gentleman.

This is true, but Confucianism originated in the Eastern Zhou Dynasty, more than 2000 years ago. However, according to underground archaeology, as early as the Neolithic Age, which lasted from 4000 to 10000 years ago, the Chinese people loved jade very much. Jade ware has been discovered in the prehistoric Xinglongwa culture from about 8000 to 7000 years ago. In addition, jade daggers were also unearthed at M117 site in Xinglongwa. Xinglongwa Cultural Site is located in Aohan Banner, Chifeng City, Inner Mongolia. Hongshan Culture, which is about two thousand years later than Xinglongwa Culture, is also in this area. The most brilliant jade culture in prehistory has been found in Hongshan Culture. Jade is very rich in types, not only decorative jades, but also the emergence of ritual jades that may be mainly used for sacrificial purposes. The famous jades are Sanxingtalong unearthed in Wengniut Banner, Chifeng City, Inner Mongolia, which is similar to the shape of the dragon of the civilized era. The Huaxia Bank takes this dragon as a symbol. In addition, there is also a jade pig dragon. This dragon is found in many ruins of Hongshan culture, especially in the shape of pigs. Jade ware has also been found at prehistoric sites in southern China during the same period. The prehistoric culture of Lingjiatan in Hanshan County of Anhui Province is also six thousand years ago. A large number of prehistoric jades have been unearthed here, including jade dragons, jade eagles, and jade editions carved with mysterious patterns. The most precious one is the appearance of jade sculptures with two postures: sitting and standing. Liangzhu Culture in Zhejiang Province, which was about 1,000 to 2,000 years later than Lingjiatan Culture, pushed Chinese prehistoric jade culture to its peak. A large number of exquisite jades have been unearthed here, among which there are many kinds of ritual jades, and the most noteworthy one is the jade cone. A jade cone unearthed at the Anti-mountain Site, with a height of 8.9, a longitude of 17.1-17.6 on the top, 16.5-17.5 on the bottom, 5 on the outside and 3.8 centimeters on the inside, is the largest one ever discovered, known as the King of Jade cones. The jade

articles of Liangzhu obviously have the meaning of monarchy symbols. Compared with Lingjiatan culture of Hongshan culture, the degree of civilization of the jade articles of Liangzhu culture has a higher development. The prehistoric cultural sites of Shijiahe in Tianmen area of Hubei Province in the same period of Liangzhu culture seem to have inheritance relationship with Lingjiatan culture. The sacrificial ceremonies of Yulong and Yuren have also been unearthed. What deserves special attention is that they were unearthed. Jade phoenix of Shang Dynasty is the first Phoenix in China.

The exquisite and rich prehistoric jade culture makes us have reason to doubt the conclusion that the Chinese nation loves jade because it is a symbol of gentleman's moral character.

Professor Chen Wangheng put forward another viewpoint on the Chinese nation's love of jade in his "Civilization before Civilization" (People's Publishing House 2017 edition). That's beauty. He said: "Jade has a common feature, that is, beauty."

This view is valid. In prehistoric times, people's production capacity was low and material was very scarce. In this case, people should like sharper stones as tools, because these stones are very practical and can be used for hunting and meat cutting. Compared with jade, its practicability is much worse. Some of them are nephrite and can not be used as tools at all. At this level, it is obviously not a good tool. The only explanation is that it can indeed be used as a "beautiful" aesthetic object. From this we can infer that in the primitive civilization period, people had a beautiful yearning and pursuit for "beauty", where "beauty" is purer and more real than "beauty" today. We can find that people did not yearn for jade because of its "utilitarianism", but simply because of its "beauty", and this kind of love and yearning surpassed the general utilitarianism.

Human childhood and individual childhood have a certain sense of consistency. Give the child a beautiful flower and a biscuit. We can find that many children do not grab the biscuit but choose the beautiful flowers. This kind of liking is the purest from the heart. People are born with aesthetic, and instinctive yearning for beautiful things. At the seminar of Chen Wangheng's new book "Civilization Before Civilization", Zhao Tingyang, a researcher of the Chinese Academy of Social Sciences, also said that aesthetics is congenital, original and primary, and that aesthetics can have nothing to do with utilitarianism.

However, a question arises: prehistoric human existence is extremely difficult, can we pay attention to the beauty that has nothing to do with survival? The answer is yes. Scientists have found ornamental pebbles, shells, animal teeth, and some centers are perforated and stained with hematite powder in the cave dwellers' living areas more than 20,000 years ago. What is this for? Decoration. Aesthetics is human nature, born. Chen Wangheng said, "Aesthetic consciousness is a kind of human original consciousness".

Primitive consciousness can be traced back to animals. What is the nature of love of beauty as a kind of primitive consciousness? Chen Wangheng said that it can be traced back to animal courtship and sex. Yes, when an animal courts, it publicizes the beauty of its body in order to get the other person's favor. In this respect, there is no difference between human and animal. Are people exactly the same as animals in terms of sex? Chen Wangheng said, not the same. "The main difference between people is that beauty can be related to and separated from sex."

Thus, the beauty is actually divided into two levels:

First, the beauty of nature, such as human and animal sex. This is natural. Second, cultural beauty, animals do not, people do. Animals like objects only in their physical beauty - the beauty of perceptual form, while people like objects not only in their physical beauty, but also in their ideological, moral, intellectual beauty and overall temperament beauty. Here, we use the concept of "beauty" broadly. Many estheticians believe that the animals have only the beauty of perceptual form, not beauty, which is related to the needs of nature, and that the beauty of Ideological and moral knowledge is not considered beauty.

When it comes to jade, its beauty can also be divided into two levels:

1. The beauty of the physical nature of the jade is the same as the natural beauty mentioned above. Chen Wangheng said that as a stone, jade is a beautiful stone. First of all, in terms of physical properties, it gives jade five kinds of aesthetic properties: delicate texture, mild, slippery like gelatin, translucency, pleasant color and so on.

Second, the beauty of the cultural nature of jade. This is related to the processing of jade, the processing of jade involves its use, decoration is the most basic, followed by entertainment. When the jade became the object of appreciation, it was gradually promoted to the symbol of sacrifice and power. Both Shenyu and Wang Yu appeared.

On this point, Chen Wangheng has a penetrating exposition:

Some properties of jade, such as delicate texture and transparency, are physical, because people's love for it has become an aesthetic nature. By borrowing the idiom "point stone into gold", the physical nature of jade is "stone", and the discovery of man is "point". Without "stone", of course, it is impossible to "become gold"; however, without "point", this "stone" can not become "gold". So, in essence, although nature creates jade, it is the common role of nature and people that creates the beauty of jade. The discovery of the beauty of jade means that jade is reborn from stone. It can no longer be regarded as stone, but as jade. Stone is in the natural state, while jade must be in the cultural state.

When the jade becomes the jade culture, the taste of beauty will be improved qualitatively. People's feelings for jade are also sublimated: from simple love to awe. With people's love for jade becoming a kind of awe, the technology of jade cutting is also getting higher and higher. In tribes, only skilled people can engage in this cause. They stopped doing other things and became full-time jade craftsmen. The development of jade has promoted the social differentiation and the development of civilization.

Today, China still loves jade very much. Jade still has a certain divinity, but it is no longer a special gift for rulers, not a divine jade, nor Wang Yu. It returns to people's daily aesthetic life: to become ornaments and ornaments for ordinary people.

A STUDY OF IMAGERY BEYOND IMAGERY IN THE CREATIVE CONCEPTION OF IDEO-IMAGERY

Abstract | Imagery beyond imagery (IBI) is a result of blending subjective affects and physical objects or actual events during aesthetic activities in which subjects perceive those objects or events through imagination-ignited aesthetic experiences. IBI is derived from the contemplation of physical images. Therefore, it is a subjective mental creation as well as an expansion of space and time. IBI both depends on and transforms physical images, and is characterized by “nothingness and thingness growing out of one another” to such an extent that the resulting event exceeds the imagery itself (i.e., the combination of the mental and physical images) to an infinite degree. Since it is bound by particular aesthetic experiences, IBI influences the subject’s way of perceiving physical objects and actual events and helps present their similarity in spirit. The formal freedom of these experiences enables abundant expressiveness. Artistic ideo-imagery includes both the real image and the artist’s imagination-evoked IBI. On this basis, the audience is able to create individualized IBI through imaginative processes. An artist often employs IBI as a means to enhance the imagery’s communicative power of ideas, which provides the audience with sufficient space for re-creation.

During aesthetic activities, the subject perceives and judges external physical objects, actual events, and artistic images through affect. Through the process of imagination-triggered imagery beyond imagery (IBI), the subject senses the intimate integration of ideas and imagery. Thus, the creation of ideo-imagery is possible. During the creative conception of ideo-imagery, the subject always aspires to achieve harmony between their own affects and aesthetic ideals, and physical objects or actual events, thus achieving ideal harmony between real images and ideo-imagery. In aesthetic practice, the images of things or events provoke the subject's aesthetic experience through his or her imagination, thus creatively bridging the gap between the self and the elements via IBI. As such, IBI not only becomes an integral part of ideo-imagery, but also effectively expands its expressiveness. Therefore, aesthetic ideo-imagery consists of not only objective elements concerning the imagery of things, events, and their contexts, but also the subject's imagination-centered IBI.

1. What is imagery beyond imagery (IBI)?

IBI involves the further blending of the subjective affect and the physical object or actual event in an aesthetic activity in which the subject perceives the object. Inspired by affect, the subject imagines and meditates as they explore their developing thoughts. Thus, the result of the imagined imagery that emanates from the imagery of things and events (among other actual images) is IBI. Based on actual images, IBI of this kind is bound by the subject's aesthetic experience and ideals. It is also inspired by simultaneous subjective affect and aesthetic perception, and creates ethereal and transcendental ideo-imagery.

During aesthetic activities, IBI results in harmony between the self and the elements and enables the conception of ideo-imagery. There is a certain degree of distance between reality, or the external objects, and the ideal; this describes the concept of subjective affect. IBI aids in the realization of better harmony between the self and the elements. Triggered by scenery or tangible images in sight, the subject creates IBI through association-driven thought exploration. Hence, the unity of actual images and the images in the subject's imagination arises, thus achieving the harmony of subjective affect.

During aesthetic activities, the imagery of things and events mingle with the subjective affect due to IBI. The creative conception of IBI is then provoked by the imagery of things and events, through which the subject's emotions are aroused. IBI features the blending and harmony of the self and the elements. Therefore, IBI is reliant on and dominated by the subject's affects and emotions as well as their interests and tastes. IBI is subtle; it bears the subject's ideals and is rich in implication. The subject, with all the uniqueness and constantly changing emotions, is faced with relatively stable physical imagery during the creative conception of ideo-imagery.

IBI is the result of contemplation based on physical images, which enables the mental integration of physical imagery. IBI is attached to physical imagery. It is therefore not only the brainchild of the subject, but also an instant imagination-triggered expansion and extension of physical imagery. It is through imagination that a subject creatively conceives ideo-imagery by transforming tangible images into IBI.

IBI is also a type of individualized mental creation. Although IBI relies on the imagery of things or events in sight, it is generated in the subject's mind. The term "beyond

imagery”(*xiangwai*, 相外) implies that there is detachment from physical imagery that transcends the limitations of the physical world.

Besides being a subjective mental creation, IBI is also a kind of expansion of space and time. Visually and acoustically, this process mainly involves the integration of space and extension of time to help elevate ideo-imagery to an exalted mental and creative state. Hence, Liu Yuxi 刘宇锡 1972-842 argues that “the realm of ideo-imagery is evoked beyond imagery”¹. In his poem *Battle of Red Cliff* 念奴娇·赤壁怀古 苏轼 1037-1101 “thought back to those old days of Zhou Yu 周瑜 175-210”² in his revisiting of the Red Cliff. In these cases, among others, scenes of the past are emotionally integrated into experiences of real scenes in real time.

In short, IBI is aimed at integrating tangible physical imagery with the subject’s emotion. It aspires to infinite representation and unifies the finite and the infinite. Thus, IBI demonstrates the transcendence of life in its pursuit of infinity and is created in the process of purging the mind in order to contemplate *Tao* 道, which is known as “surpassing the imagery to obtain the essence”³.

2. The relationship between IBI and the physical image

In the creative conception of ideo-imagery, physical imagery (such as the imagery of things and events) serves as the foundation. From this foundation, IBI emerges and evolves. IBI harmonizes with physical imagery and blends with the affects of the subject, from which point they collectively form an organic whole.

First, with physical imagery as its foundation, IBI cannot exist independently of physical imagery. Rather, the physical imagery is the basis of IBI. As imaginary imagery, IBI generally relies on physical imagery, which in turn restricts the former. Physical imagery puts certain limits on IBI, which is caused by imagination. In *Annotations to the Book of Change: Volume 1* 周易注疏 卷一, Kong Yingda 孔颖达 574-648 divides imagery into “physical imagery” 物理 and “false imagery” 虚理. The creativeness and uniqueness of IBI are laid on the basis of physical imagery. IBI aids in the reconstruction of physical imagery and places it into new situations.

Second, IBI involves certain degrees of breakthrough and transformation of physical imagery rather than over-reliance on it. IBI is derived from physical imagery, but exceeds its limitations. IBI aids in the subject’s ability to convey the intrinsic implications of physical imagery. On one hand, it relies on physical imagery. On the other, it fits in with the affect of the subject. The interpretation of physical imagery based on affect and thoughts is not sufficient by itself, and thus needs to be supplemented and perfected by IBI.

Third, IBI characterizes a circumstance in which nihility and existence are complementary. Here, the experience is formed by a combination of IBI and physical imagery and becomes integrated into the intangible affect, which is expressed by the former. Within the creative conception of ideo-imagery, imaginary IBI is based

1 Liu Yuxi 刘宇锡, and Tuiyuan Qu 逄源, *Liu Yuxi Ji Jianzheng* 刘宇锡集笺证 (Commentary on Selected Works of Liu Yuxi) (Shanghai: Shanghai Ancient Books Publishing House, 1984), 517.

2 Su Shi 苏轼, and Shuizhao Wang 水藻王, *Su Shi Ji Xuan* 苏轼集选 (Selected Works of Su Shi) (Shanghai: Shanghai Ancient Books Publishing House, 1984), 291.

3 Quoted from Sikong Tu, *Commentaries on Selected Poems*, 163.

on concrete (i.e., physical) imagery. It blends with the imagery of things, physical imagery, and the backgrounds of both to form whole imagery that combines with the subject's affect. As Fan Xiwen (2002) describes this circumstance in *Night Words to the Bed* (Duichuang Yeyu) (2002), "the tangible should be transformed into the intangible and scenery into affect"⁴. Therefore, the combination of both mental and physical IBI and physical imagery make the entire ideo-imagery more ethereal.

Fourth, the creative conception of the subject's ideo-imagery is not limited to the imagery of things themselves during an aesthetic experience, which is a combination of mental and physical images, and enables infinite interpretation. IBI unifies the imagery within and the imagery beyond. As with the imagery of things or events, physical imagery is concrete and finite, while IBI is vague, rich, ethereal, "near but not superficial and far but endless"⁵. In particular, affect is not limited to physical imagery. Therefore, IBI is defined by an experience in which the subject moves toward the conception of intangible imagery on the basis of physical imagery in order to make ideo-imagery more ethereal, but which is still restricted by the mind, finally enters a realm of great *Tao*, and thus "obtains the essence."

3. The Basic Characteristics of IBI

During an aesthetic activity, the subject uses imagination to creatively conceive the imagery of events and things. In the creative conception of ideo-imagery, the imagination of the subject is fully activated. On this basis, the nascent IBI undercurrents the entire process of the aesthetic activity. This begins with the subject's perception of the object and capturing of imagery. During this process, ideo-imagery is created and the subject's creative desire is also satisfied.

First, IBI affects the way in which the subject perceives the imagery of things and events during their dynamic creation. In perceiving and choosing the imagery of things, events, and artistry, the subject has already modified and supplemented them, and has thus projected an IBI. Physical imagery becomes ethereal and transcendental after it is experienced, perceived, and selected by the subject.

Second, the IBI is dependent on the aesthetic experience of the subject. During aesthetic activities, the subject's creative conception of ideo-imagery is based on a value judgment of the aesthetic experience. IBI originates from the sensory elements of the aesthetic experience and becomes integrated with the promotion of the subject's emotions. The subject enhances the technique of creatively conceiving the ideo-imagery by using IBI through the aesthetic experience.

Third, IBI helps to reveal the resemblance in spirit between the imagery of things and events. In aesthetic activities, IBI works in conjunction with physical imagery to convey spirituality and ideas. Wang Fuzhi's (1619-1692) remark in *Ming Poetry Selection* (Ming Shi Pingxuan) (i.e., that the imagery within or beyond imagery can be obtained depending on the mind⁶) can be interpreted in this sense. During aesthetic activities, the subject should not be confined to physical imagery. Rather, the

4 .Fan, Xiwen, et al. *Duichuang Yeyu, Juan Er* (Night Words to the Bed, Volume II) (Beijing: Zhonghua Book Company, 1983), 421.

5 Quoted from Sikong Tu, *Commentaries on Selected Poems*, 193-194.

6 Wang Fuzhi, *Chuanshan Quan Shu* (The Complete Collection of Wang Fuzhi) (Changsha: Yue Lu Press, 2011), 1430.

subject should allow IBI to help convey their spirit.

Fourth, IBI gains rich expressiveness in its unrestricted form. Whether on the basis of the imagery of things or events (or the subjective affect), IBI is unexceptionally characterized by its free and creative imitation of the external, reflecting the subject's agency and creativeness. At the same time, the ethereality and ambiguity of IBI make ideo-imagery ambiguous and uncertain. This obscurity and ambiguity gains greater expressiveness through symbolism. This kind of IBI becomes abundant and profound with its invisible, inaccessible, and indefinable form, as well as its expression of affect.

4. IBI in artistic imagery

Ideo-imagery that is creatively conceived in artistic works can be called artistic ideo-imagery. Artistic ideo-imagery includes both the real image and the artist's imagined IBI in the artistic process. This is performed on the basis that the viewer creates his or her own IBI through imagination. In artistic creation, IBI is often transmitted by artistic language. Alternately, they can induce and enlighten the imagination of the viewer through physical imagery. Therefore, the IBI that viewers generate is not only constrained to some extent by the artist's artistic imagery, but also has its own free space for imagination.

During a creative process, an artist often identifies idea-driven imagery and then conceives further imagery that follows the affect, thus creating artistic imagery that is distinctively different from common imagery. Artistic ideo-imagery contains some elements of the imagery of things and events, both in life and Nature, but is more of an integration or creation that is achieved through imagination. When artists convey their ideas, they must integrate and graft the imagery of things and create new ideo-imagery. Namely, they must create artistic imagery by using their imagination.

Artistic imagery seeks resemblance in spirit through IBI. Through IBI, the detachment from the form of resemblance is realized in the creation and appreciation of artistic imagery. Artists surpass imagery for the purpose of resemblance in spirit. In art, IBI transcends the limitedness of physical imagery rather than heavily relying on it. Artists detach from the form to obtain resemblance by looking beyond imagery. In artistic creation, this involves the transcendence of specific sensual forms to convey the spirit and gain its resemblance.

In traditional Chinese paintings, artists use *xukong*, which describes void or negative space. This is done to enable sufficient room for the viewers for physical imagery-based imagination. In his *Painting Theory of Xikuzhai* (Xikuzhai Hua Xu), Dai Xi (1801-1860) writes that "the brushstrokes and ink show the physical form of the painting, whereas the space left uncovered by ink conveys the subtlety of its beauty". Artists may employ the strategy of *liubai* (the use of negative space), which literally involves leaving blank spaces in certain areas of a painting. This is meant to provide viewers room for using their imaginations and to make connections.

The perception of artistic imagery is the active process of re-creation, during which the viewers use their imaginations to recreate an image beyond the one that the artist has creatively conceived. Therefore, in addition to the artist's activities, there is also

7 Dai Xi, *Xikuzhai Hua Xu* (Painting Theory of Xikuzhai) (Shanghai: Shanghai Ancient Books Publishing House, 2002), 808.

IBI, which is created by the viewer. To “express ideas by IBI” means that, in the process of art appreciation, we perceive ideas more profoundly through IBI.

To summarize, IBI is based on, but not confined to, physical imagery. It is creatively conceived during the process of perceiving and selecting the imagery of things in the physical world. On one hand, IBI is subject to physical imagery, and on the other, it is predominated by the affect of the subject. It is not bound by the perception of physical images, but is gained from the imagery beyond. This kind of IBI is congruent with the subject’s affect of the present time and also in the aesthetic ideals formed through long-term aesthetic practice. IBI is creatively conceived by the subject through their aesthetic activities, which reflects the subject’s dynamic creation. With its uniqueness, this process intends to allow ideas to flow out of physical imagery. In the meantime, IBI is not hindered by physical imagery. Its transcendence enables it to exceed the imagery itself and to result in the combination of mental and physical images. During artistic creation and appreciation, one can depart and detach from the physical form of the art to obtain resemblance in spirit from beyond imagery, where one sees ideas and conveys the spirit.

Zhirong Zhu, Ph.D., Professor in the department of Chinese Language and Literature, East China Normal University, specialized in Chinese aesthetics and philosophy of Chinese art. Awarded as “Changjiang Scholar Program Distinguished Professor” (2016) by the Chinese Ministry of Education. He is an executive member of the council of Chinese Aesthetics Association, and the vice president of Shanghai Aesthetics Association. He has published over 160 essays on *literary Review*, *Literature & Art Studies* and other core periodicals and published over 10 monographs of *Chinese Art Philosophy*, *Study on Kant’s Aesthetics*, *Chinese Aesthetics Theory*, *Study on Aesthetic Thoughts in Xia, Shang and Zhou Dynasties* and so on. He was the principle investigator of several major/key/general national funded projects in social science and humanities. He has won the sixth Outstanding Achievement Award of Science Research in Higher Institutions and the Award of Philosophy and Social Science in Shanghai.

TOWARDS A PLURAL AESTHETIC IN THE MAGHREBIN AREA

Abstract | The study and interpretation of art of modern and contemporary Maghreb is a developing field, in terms of artistic production, exhibition, marketing and theoretical discourse. In recent years artists of North Africa and Middle East have achieved a great visibility on the international scene, even as they suffer from many lacks, in the structures of art production, and in the critical discourses, and theoretical approaches. But what are the common grounds in arts and culture among the different countries in the Maghreb? This paper aims to analyze and discuss the major historical, conceptual, theoretical and aesthetic issues that inform the region's modern and contemporary art paradigm. The principal aim is to avoid the radar screen of western world and to think the specificity of this region, such as a possible world of contemporary art, taking these artists and artworks out of the cliché image repertoires of terrorism and tourism, Orientalism and clandestine migration that dominate most representations of the Maghreb. We want to explore visual art, and its dynamic, not by describing movements or putting a chronological order, but by guiding many reflections about the relation between theory and practice in this specific geographic area: The paper will address key points about the problems of terminology: the problematic use of such terms as 'Modern Islamic Art' and the frequent application of the terms 'Modern' and 'Contemporary' without sufficient acknowledgement of their contextual connotation. It will examine the recent developments in art practice in the Maghreb and its diaspora and their wider context, analyzing the impact of globalization and other transnational cultural and social links. Pointing to the problem of contextualism and universalism applied to the field of arts and aesthetics. The reflection about present and the will of emancipation. The relation between singularity and identity, noting that Maghrebin art has a plural dimension of art: Arabic, African and Mediterranean. The main elements and ideas of my paper are:

- The problem of concepts.
 - The relationship between art worlds in a plural perspective that is mapping contemporary areas of arts and aesthetics.
 - The reflexivity of culture at the horizon of post-colonial thought.
 - The aesthetic experience and his cosmopolitan dimension (when aesthetics join ethics and points towards an intercultural ethic of solidarity).
- My deep aim is to take "the Maghreb as horizon of thinking" as Khatibi said.

Index terms | *aesthetics (contemporary); art world; cosmopolitan; ethics; identity; Maghreb; singularity.*

Introduction :

The Maghreb (Tunisia-Algeria-Marocco –Mauritania and Lybia) is a region who was shaped by a myriad of cultures .It can be considered as a multicultural area or a transcultural area with a mediterranean dimension , an african dimension and an arab –islamic dimension .The analysis and interpretation of culture should consider the mediterranean dimension as a critic and hermeneutic tool to point the diversity of symbols and the variety of artworks .

For this reason it's necessary to avoid many stereotypes when we try to think condition of arts and aesthetics in this particular area of the world :First we must avoid the screen or mirror of Western that was carried by the colonization and that still live in many occasions : (production of postcards depicting lands ,exotic views , specific architecture , images of berber life , images of woman, etc)

We must point the necessity of mapping artistic practices in the Maghreb (which his modern and contemporary aspects) and tracing the contours of different spaces of creativity . This analyse should consider the relation between global and local , endogenous and exogenous. According to the critic of art and philosopher Rachida Triki ,artists of Maghreb are :“creating in a different way , with a sense of self constancy tha respects their singularity and their committment to the present „¹

The methodology adopted in this article is : the analytical frame of reference is not a narrative of art's development in this region but a reflexion in the conditions of its production and reception or consumption. This approach leads us to think the relation between Maghreb and Middle East , yet it encourages us to go further , to a mapping of diversity in contemporary aesthetics in different continents .

The Maghrebin Artworld :

Neither Middle –Eastern , nor Western , the Maghreb is specific area of production and reception of modern and contemporary art .A plural approach is fecond for all actors of artworld today : No center , no periphery , but a myriad of cultural and artistic expressions that reflect the problems , the situations and the ambitions of every local world art .

In many occasions , Europe based émigrés artists are chosen to represent the art of Maghreb in large internartional exhibitions that would „include“ the periphery, and recognize the other , the stranger .

On the other face , local artists are disfavored , and not recognized , they suffer from a luck of visibility²:Alice Panel showed this contradiction between local artists and artists of diaspora :„we need to move away from „hybridity „ and „globalart „ towards an understanding of artistic production and reception that recognizes multi axial power relations as audiences and artworks attempt to travel between different geographies „

Are these artists representative of the Maghreb ? we must note that their works are anchored whithin European terms of artistic production , where is their „Maghrebinity“

1 Triki (Rachida):“*Aesthetic value, creation and emotion*“ in „Art , Emotion and Value „ 5th Mediterranean Congress of Aesthetics .

2 Panel (Alice):“*Travelling back to ourselves:The Maghreb as an art destination*“ The Higher Atlas , the Marrakech Biennale (4) in context .Sternberg Press,February 2012;

?³This specificity of belonging to Maghreb is not only an origin (far origin) but a feel , a common feel , a singularity, a resistance ⁴

The system of contemporary art is inclusive of different groups , and regions , it 's benefic because it permit to wide the audience of artistic practices , but , the local maghrebin artists suffer from less audience .

The contemporary art is in perpetuall flux , both geographically and theoretically , but this need more visibilty and more mobility for the artists ,,The dialogue between artists is a pont to rely contextual and universal aesthetics and to point to an aesthetic –ethic of solidarity in diverse regions of the world .

We must recognize that geo- political issues is an obstacle that hold weight in the art world , but the horizon of freedom is the plural approach that gives every element his real value .

Maghreb is intrinsiqually plural⁵: in his geograhly, his history , his language, his polititic and economic dimension , but there is a common ground that unify this region .The common history has a great influence in this case , and that permit us to distinguish Maghreb from the Middle East , i think that the history of modern and contemporary artistic experience is different in many aspects from the Maghreb to Middle east .

In the Maghreb , the experience of modernism and contemporaneity was specific , it begans with essays of decolonization , especially in literary essays . We can say that every country of Maghreb had its proper artistic modernity , and the role of historians and critics is to point the differences and to show the similar points between these different experiences of modern art ,

Modern maghrebin art is not a copy of modern ocidental art , it expresses the problems and the aspirations of this région , it has a narrow relation with ethnicity , language , and traditions.

For this reason i think that Middle -East art cannot be lumped with maghrebin art : we should consider the difference of social , political and financial difference between the regions of the wide arabic World.

1: Aesthetics in Maghreb : Theory , History and Critics

It 's necessary – for reseachers and universitarians – to work and construct a maghrebin aesthetic of decolonization , it ' s necessary to show key values of maghrebin artistic experiences , to show the manner how artists make meaning , and the manner that public receive these productions , with the eyes and sensibility of Tunisian , Algerian or Maroccan spectator , in the field of maghrebin everyday life , struggle and conflicts .A thought of hybridity and diversity should rise from different world arts .

3 Artists like Zineb Sedira , Katia Kameli , Bouchra Khalili , Samta ben Yahia , work in Paris , London and New york , these based migrants are frequently chosen to represent the artistic production of the Maghreb in international exhibitions such as « Africa remix » 2004 or « Uneven geographies » 2010

4

5 Khatibi (Abdelkebir) :*Maghreb pluriel* ,Paris Denoel 1983 .

The Magazine 'Souffles'⁶ „ was a famous essay on this way ; but i think that we have an enormous work of Mapping , and writing the history of arts in this region , there's a great luck of history of art in the institutions of education and in the writings of thinkers . Artists in maghrebin area are nowadays producing a transmedial aesthetic , they use different media from painting and sculpture to photography , video , performance and installation , women artists are very active and many of them are well known abroad .

The Maghreb is an area where a art of resistance is raising and developing , where an hybridation of traditional signs and contemporary expressions is rich This production needs to be guided by a critical discourse that points her force and her limits , it needs to be replaced in the historical movement of art globally and locally .In the Maghreb , we have many theorists and critics who are well known in the international scene , they analysed deeply this dimension and pointed to this luck of sufficient writings and institutions for preservation and valorisation of art works :Rachida Triki: philosopher , and critic of art , who has written many articles in the field of maghrebin art and in philosophy of art . She organised many exhibitions in order to encourage local artists and promote an authentic critical discourse ⁷

These exhibitions are a resistance to marginalisation of the Maghrebin art , and the méconnaissance of his political , cultural and social reality , this region is underlooked .

Abdelkebir Khatibi , is also a famous figure of maghrebin thought , and i think that we shall go on his path towards a plural comprehension of art and creation, when we analyse the problem of legitimation Khatibi defended the idea of Maghreb , and wanted to take the Maghreb as an horizon of thought , to discover new directions in maghreb aesthetic studies. The reinvestigation of calligraphy , mosaics and others signs and forms is significant .

That Khatibi call „*bi-pictural* , that signifies a dialog between visual and picural elements Farid Zahi ,⁸ a well known marocco professor and critique , attentive to write the main periods of modern art history in his country .On the same sense ,we can speak about Moulim Laroussi⁹ : a critic who is trying to lie the modern and contemporary art in Maghreb to his deep and past origins , in oredor to put a pont relying past present and furute of arts .

These thinkers , critical arts have pointed the originality of maghrebin experience .They have worked to link differents pratices and to improve the critical reception .They fight for instituional foundation tha can encourage artistic production .Finally , they are working in the sense of a postcolonial aesthetic or a decolonialisation of maghrebin aesthetics .

They have struggled for the favor of local artists , and they still work to reinforce the relation between Maghreb and african arts .

3-Creation/institutions /public sphere

6 *Souffles* , the Magazine Souffles was published from 1966 to 1972) it provided a dialog between intellectual , artistic production of postcolonial period , it was a transdisciplinary review , with artistic reserachs , and interviews .

7 „*Memory , Place and desire :contemporary art of the Maghreb and Maghrebi Diaspora*„ Haverford , PA,Cantor Fitzgerald Gallery 2014.

8 Zahi (Farid):“*D'un regard l'autre , l'art et ses médiations au Maroc* „Editions Marsam 2006.

9 *Laaroussi(Moulim):“les tendances de la peinture contemporaine marocaine* „, Casa-blanca , PM editions , 2002.

The third main problem is the problem of curatorial actors point to the absence of financial support , ,and the lack of art Market;¹⁰The paradox is the following :It 's necessary to do the diagnostic of culture and arts in the Maghreb , to show its limits and its forces, to interpret its dynamism , and to search a cosmopolitan horizon behind these elements.

This work requires a description of artistic scene , an analyse of critical and theoretical discourses about modern and contemporary arts .But all these approaches must be plural , because the Maghreb is arabic , amazigh, greek, roman , andalou, ottoman , french , italian mediterranean etc .

The multidisciplinary approach is fruitful because it consider all these influences and far origins that shapes the Maghrebin identity .I consider that we have a huge responsibility in this case to reconstrct this identity in a dynamic and plural dimension .The opportunity is that the cultural signs and symbols can be easily deconstructed and reconstructed in the artistic practice

In this case , we should be careful to the terminology :the problematic use of terms contemporary and modern without acknowledgement of their contextual connotation .

When we examine the recent developments of arts in the Maghreb and its diaspora we should put this in a wider context analysing the impact of globalisation and other transnational , social and cultural links .

We should search a reflexive dynamic that can transcend the frontiers , and share the experiences in a sense of deep solidarity .I think the theme of this congress encourage us to make an effort in this sense , and to put the slogan „*creating whitout frontiers* „

This wide conception of creation is compatible with the local dimension , it is a step to recognize the other ,to create a symetric relationship that could share the experiences of production , reception , theory and critics about arts .

In this case , the alternative of occidental circuit , is the solidarity and recognition all over the word , it 's the communication crossing the continents , the emancipation f from the Western radar sceern , and from other prejudices . The Maghrebin artist should be free from the conditions of market and the conditions of west reception .

We must also avoid the screen of arab spring), if we should say something about aesthetic revolution we can go to Rancière who said that a revolution : „ rearranges the rules of the game by making two thigns interpedednet firstly , it blurs the boreders between the logic of facts and the logic of fictions , secondly it introduces a new mode of rationality , a new way of thinking about history“¹¹

As Gerad Vilar say:“the artworld today is global and tribal , democratic and snobbisch , universal and singular „¹²

The practices of contemporary art are a weapon for emancipation , and a reflexive tool for the dynamic of culture , but these practices must be anchored into a historical vision , and a critical approach which show the reneweal of culural symbols and signs

10 Therefore there's an increase of number of institutions who promote contemporary art :in Tunisia , the foundation kamel Lazaar , in Marocco , Dar AL Maamun

11 Rancière Jacques : “The politics of aesthetics , the distribution of sensible “ translated by ,Gabriel Rocknill, London & New york , Continuum , 2004, p 10 ;

12 Vilar (Gérard) :“*Deartification, deaestheticization, and politicization in contemporary art* “in „Art , Emotion and Value „ 5th Mediterranean Congress of Aesthetics .

.The first step of resistance is the renewal of the memory , the second is the relexion that gives légitimity to new symbols and shows the dynamic of creativity in the arts as well as in the theory products .

INTERPRETING A PERSIAN MINIATURE WITH DERRIDA'S PARERAGON

Abstract | In the context of sustainable urban development, the challenge of mobility is to activate the potential of walking by giving the walker the means to access the multiple resources of the city, to benefit from the richest experiences. Different fields of research have pointed out the benefits of walking, which is now a particular focus for the promotion of health, environment and urbanity. In the Algerian context, studies shows that motorized travel has increased over decades, while walking has decreased and continues to decline also the urban space is characterized by absence of sidewalks, disrepair of their condition, insecurity, discomfort ... etc. The consideration of walking space has just been developed in the urban planning documents of the strategic plan of Algiers whose application begins to be materialized. Assuming that the streetscape or physical appearance of the mobility space influences the practice of walking, we ask whether this recent awareness of pedestrian mobility requalification of the public outdoor space brings or at least will bring its positive influence on the promotion of walking to people's dailies. The method used for this study is the analysis of the documents of the Master Plan of Architecture and Town Planning that deal with the consideration of soft mobility, notably by the Charter of Public Spaces. A charter of public spaces was added recently in the 2017 PDAU of Algiers. This document emphasizes the importance of public space for the city in its various dimensions through the adoption of the principles of development of soft mobility networks, through the requalification of pedestrian spaces. As well as the observation of interventions already carried out in the framework of the requalification of the outer urban space. This method is justified by the fact that it is the best way to compare the reality on the ground and the prescriptions and expectations of urban planning documents and the scientific literature dealing with the subject of urban ambiances and pedestrian mobility. The importance of this study is justified by the influence of aesthetic of the urban public space, which represents the field of socialization and the common life, on the promotion of the soft pedestrian sustainable mobility in the case of Algeria. From the analysis of the documents of the strategic plan of Algiers, we can say that the pedestrian mobility was quite well taken into account compared to the old documents of urbanism. The field observation shows that the redevelopment of the public outdoor space that is starting to take place in the city-center of Algiers gave the Algerian capital a new face and improved the comfort of the walking for people. In conclusion, we can say that the charter of public spaces in the context of Algiers, as planned, has improved the quality of community life and particularly walking and this initiative is encouraging to be generalized on other Algerian cities.

Index terms | *Persian Painting; Derrida; Parergon; Mohammad Siyah – Qalam;*

Introduction

The lack of perspective, shadow, and signature in Iranian painting led to this forming of a theory that the artist created the picture, relying on the concepts of “example universe”, “manifestation” and “ethereal light”. Based on his view, the artist was trying to achieve perfections with romantic austerity, and he considered his mission, showing the truth and not the appearance of the objects. “The Iranian artist creates the mystical quality through revealing the truth of things, not its apparent nature.” (*Khalaj Amir Hosseini*, 2010).

In contrast, some theorists believe that Iranian painting can not be based on a mystical viewpoint. Due to the similarities between the painting space and the Fantasy world, it is unrealistic to say that which one influenced another, such as water and mirror that due to their reflective Property, can not result that which one effect on the other. (*Abulqasemi*, 1394). Therefore, the world of imagination and the material world are both capable of influencing each other and tolerate their condition exposing to each other, and this Double-sided link, have the perception of the world of imagination through art. Most scholars who believe in the link between mysticism and art, don't have a historical proof for their words. “According to their belief, this link is something non-historical and does not require a historical observation, while non-historical affairs also have a historical appearance.” (*Qayomi Beidhendi*, 2010)”.

Mostly, evaluation of Iranian painting has done with a mystical approach and the results have a common part and similarity, but the analysis of painting on the basis of Deconstruction approach can reveal its hidden layers. In this approach, the work of art as a text related to other texts, does not contain the final and definitive meaning but it carries the possibility of creating different meanings, and understanding the meaning is the responsibility of the audience and the intent of the author is ineffective on it. But in the case of Iranian painting, which is different in nature from postmodern art, the interpretation of the painting based on the Deconstruction approach and special aspect on parergon (one of the deconstruction concepts) has what possibility to create a new and different interpretation of the ancestors for the audience? In this research, we are trying to find a new answer to the old questions about painting.

Parergon

The Parergon word was first used by Kant for the internal and external separation border in aesthetic topics. According to Kant, everything has a boundary that separates its inside and outside. He calls this border, Parergon. A marginal thing that is not a part of beauty, adds to the work and surrounds it, but does not relate to the inside mean of the work. Jacques Derrida, the postmodern philosopher, does not disassociate these two concepts, the “logical taste” and “the taste of aesthetics,” in his book “The Truth of Painting.” “Logical judgment is also a kind of framing, as it has key importance in the art of the frame or Parergon” (*Ahmadi*, 1391: 490).

Derrida speaks about Kant's theory of Parergon in the chapter on artistic Arrays in the book “The Truth in Painting”. Parergon consists of two Greek words, that is, par mesns around and margin and ergon means the effect. (*Adams*, 2008). in the words of Derrida Parergon is both inside and outside, both and none, and this makes it indecisive. *Derrida* says inner and outer elements are an inseparable effect, and there is no clear boundary between art and other areas. (*afarin* 1391). Derrida's framework is full of questions that lead him to the question, and the dreams come up with the questions

and new meanings are apparent. From Derrida's point of view, there are particular relationships between artwork, frameworks, frames, and cadres. He says that, in *Criticism of the power of judgment*, Kant states that art is also a bridge between the mind (inner space) and nature (outer space), but the distance between them will not be eliminated through pure reason (pure wisdom), but rather The aesthetic rules can lessen this gap, and Derrida considers Parragon to be one of the most important tools for bringing the mind and eye closer. (Zamiran, 1386: 90)

Parergon is not specific to literature and art, and encompasses a broad sense of meaning, As far as he considers Parergon the boundaries that exist throughout the universe in various forms, even on everyday, social and political issues. "The issue is not just about for example, the lateral lines in a box or frame of a painting, but is about the boundaries of texts, institutions, and indeed, nations and continents. (Royel, 2009: 37). From Derrida's point of view, Parergon do not only have frame and framework, Rather, every thing associated with the work can be influenced by Pargeron's sentence on its interpretation. In his view, aesthetic philosophy is also a kind of Parergon, and although it is outside the frame, it can illustrate the truth within the frame, while Kant's Parergon remains in and out of the boundaries to keep the works holiness. Hence, any form, and color, and in general the visual factors that are in work, can as Parergon, create a new interpretation of the image for the audience.

The Parergon, this supplement outside the work, must, if it is to have the status of a philosophical quasi-concept, designate a formal and general predicative structure, which one can transport intact or deformed and reformed according to certain rules, into other fields, to submit new contents to it. ...Now what is the Parergon? It is the concept of the remark, of this "General Remark," insofar as it defines what comes to be added to Religion within the Limits of Reason Alone without being a part of it and yet without being absolutely extrinsic to it. (Derrida, 1987: 55)

In his opinion, the painting, like any text, has its own elements and language, culture and structure, which, by means of the reopening of their codes, we can find the implicit meaning of it. In this interpretation, he even uses words to extract the new and fresh meaning of the text, and believes that concepts such as beauty, truth, aesthetic criteria, and ... that come from an area beyond the artistic sphere, affect the art. in his view, Parergon can determine the extent of art, like a frame.

This fact is far from being indifferent or extrinsic, or at least the extrinsic always intervenes, like the Parergon, within the scene. (Derrida, 1987: 271)

Criticism of the "Two Demons" and Parergon

Mohammad Siah Qalam (The famous timury painter) created works in non-workshop spaces and different subjects with his contemporary artists. On a visit with Shahrokh Shah order, he went to China and on the orders of Baisanqar Mirza, he was agent for preparing a Travelogue for him. "It is believed that Ghias al-Din is preparing two travelogues that are now recorded in some of the historical books of this period, such as "*Zobdeh al-Tavarikh with Hafez Abro*" and "*Matla by Sadin Abdul Razagh Samarghandi*" , and another illustrated, which has been scattered today in three Margha of Topqai Saray. "(Ajand, 1389: 322). What distinguishes the Siah ghalam from other artists, in addition to skill and ability in painting and design, is imagination, dynamic and creative minds, and his particular and realistic attitude of life and social relationships. Although

this painter is in the category of artists who have a close relationship with Mysticism and Sufism, he has chosen another drawing method for the creation of his works, which is not compatible with the aesthetic criteria of the time in he lived. He drew the Figures with wide hands and feet, curved back, horns and tail, or with a terrible mask, strange garments and strange decorations.

He drew a painting entitled "Two Demons", which is kept at the Topqai Museum of Istanbul. In that case, there are two demon sitting on the ground that are in the strap and one playing the musical instrument and the other is giving him a cup. (picture)

The perplexity shown in the picture creates different sounds. How do they play and drink when they are in strap? Is there a reason for such a situation? Obviously, these questions can play a role in introducing new meanings. Achieving the answer to each question involves finding the answer to other questions that play a role in the minds of the audience and the viewer of the work. A tool such as chain and shackle on the faces can be one of the voices in the picture and speaks of them as parergon. Whether these are in the reality that he has seen with his eye or with his imagination he portrayed it, it engages the audience mind. In particular, instrument in the right hand of the body, raises more challenge to this. If the painter has painted his work on the journey and based on the work of realism and the writing of a illustrated travelogue for his patron, then his musicians should use the instruments of their own country instrument to play. Why the painter pasinted a fiddle like instrument in the hands of the face? In the past, artists began to create works by the demand and order of their artistic supporters, who were from the wealthy corners of society and, in general, kings and monarchs. Artists had to do their requests because of fear of their authority. Hence, we can say that the painter has put Iranian instrument in the hands of a non-native artist and has shown metaphorically, a strong captivity and pressure by putting up an instrument, such as chains. Because the works of each artist are described as an explanation of his Internal features, and the painter was forced to perform the work in the shortest possible time due to the time consuming, he unconsciously depicted what he thought (the algebra and the pressure) . The history showed that the sovereigns and the sultans has often hurt artists and even killed them for some reason. As master Mohammad Siahghalam did not escape from these abuses, and he escaped from the Amir Ali-Shir Nawai system and took refuge in the court of Sultan Hussein Baighara.

Result

Apart from the mystical viewpoint of the painter, there are other things involved in the creation of the pictures, and this approach can not be generalized to all the images. The deconstruction approach can carry the capability of interpreting painting. By applying this approach, the audience faces multiple and different meanings with the past. From Derrida's point of view, the concept of parergon opens up a new and broad meanings for the audience. Parergon raises many questions in the mind of the viewer of the work, and each question and answer creates other meanings in its inside. As it was in the interpretation of the above illustrations, the selection of the marginal element of the pictogram and the interpretation of the effect from that point of view, the decontamination, and eventually the design of various questions from a new perspective, gave rise to meanings different from the earlier interpretations and rejected the possibility of a fixed meaning. For today's audience who is experiencing a completely different world than the old artist, the deconstruction approach, especially Parergon's conception, allows for the new meaning understanding and the interpretation

Hamideh Rafiee Elizeiee (1967) has Master of Arts from Ferdows Institute of Higher Education, Mashhad, Iran. Her thesis is "An Interpretation of Persian Painting Using the Concept of Derrida's Parergon", which has been defended in 2018. She is interested in research about "Persian Painting" and "Philosophy of Art". Her article, entitled "Interpretation of Persian Painting Using the concept of Derrida's Parergon; Case Study: Two Demons" by Mohamad Siyah-Qalam, is under review for publishing in national scientific and research journals. In addition to her specialty "Painting", she does calligraphy. She is a member of the "Association of Iranian Calligraphist". She has a degree in "Photography and Filming" from "IYCS- Iranian Young Cinema Society" and taught there in both of these areas. She participated in two group paintings exhibitions and has received an award for participation in the Fajr National Festival in the "Structural Volume" section. She tutors painting and calligraphy.

THE ROMANTIC GEMÜT AS SOCIAL FEELINGS IN HEGEL'S AESTHETICS

Abstract | This paper sought to apply Axel Honneth's reading of Hegel's *Philosophy of Rights* and specify the meaning of the comprehensive word *Gemüt*(the heart), which frequently appears in the "romantic form of art ". It is the feeling of suffering such as void, depression, and despondency, experienced by subjects of his times, and it is also the feeling of love embracing possibilities of healing. The history of art in Hegel's *Aesthetics Lectures on Fine Art* has been studied mainly by his speculative method. However, Hegel adhered to the actuality of mind which is achieved not by sheer ideal but with constant interactions with reality. Therefore, each era has its own artistic spirit as results of ceaseless dialectical dialogues between consciousness and social conditions. The romantic form of art extends from the birth of Jesus to early 19th century including the period of *Philosophy of Rights*, and holds Christianity and individualism as the key. However, Hegel described inner subjectivity as the principle of the romantic. The moments of romantic art converge on inner life, in other words *Gemüt*, which is vague and apart from logic. This *Gemüt* holds feelings of Christian love, and also social pain stemmed from introverted immersion of individualism. Hegel found his early philosophy by communicating with the early German Romanticism (Frühromantik), and retained his early thoughts. The critique of individualism in romantic thought and the concept of love that they shared are described as a clue to solve the contradictory thesis saying that all subjects would realize the free will as the basis of ethical life. In Honneth's analyses of *Philosophy of Right* Hegel discerned the possibility and the limitation of individualistic subjectivity. Honneth concluded, "Being by itself in others (Im Anderen bei sich selbst sein)" is the pivotal condition to realize true freedom in Capitalism. In romantic art the feelings of love, holding the principle of realizing the free will, are especially shown as love of Jesus and maternal love of Mary as the romantic ideal, the most successful subject of romantic art. Also, because of consciousness of rights related to private property, and dispersion of individualism which is self-completed inwards, *Gemüt* which is free inward however locked outward conceive daily despondency and depression which especially was described in Shakespeare's tragedy. Finally, if we seek practical philosophical interpretations of Hegel's aesthetics instead of its systemic philosophical interpretations, we can access to the vital discussion heading to an open conclusion to address Hegel's determination of art as "the sensuous appearance of the Idea."

Index terms | feelings; freedom; *Gemüt*; individualism; love; pain; romantic art; subjectivity;

IS ROMANTIC GEMÜT ONLY A PARTICULAR SUBJECTIVITY?

The realization of the Idea of freedom as the essence of mind is crucial in Hegel's philosophy. His whole philosophy, including his philosophy of history, is a description of freedom and struggles for freedom. Because he considered not only subjective mind but also the objective (law, morality, ethical life), we can also consider conscious, social conditions of freedom realization. Thus, Hegel's philosophy provides sources of standpoints to political and practical philosophy for studying modern and contemporary society. Through analyzing *Philosophy of Right*, Axel Honneth investigated conditions for the realization of individual freedom, in a society of excessive subjectivity where everyone enjoys freedom. According to Honneth, Hegel diagnosed social pathology of his time and proposed *the ethical relationship of communicative freedom*¹ as the prescription, and this prescription still holds nowadays that it suggests a foundation of how a subject establishes one's relationship with oneself.

Pain and love as practical contents of inner subjectivity

This paper pays attention to *Hegel's diagnosis and prescription of social pathology*. Hegel mentioned that if a society accomplish a thought thinking that the acquisition of rights or conscientious attitude are the best task to realize the free will of individuals, this totality has not yet been fully developed. In this case, individuals lose their directions and fail to communicate with others because they act according to the impulse of natural desire to acquire the rights or engage in the obligation only to fulfill the obligation according to the categorial imperative. This implies that they have failed to engage in social life and participate in communication with others. In other words, repeatedly experiencing failures to participate in social life, individuals live in solitude and emptiness, and seek breakthroughs to avoid such pain from negativity.² If these are the symptoms, Honneth's idea is that the prescription should be a basis for intersubjective communication, and its principle shall be found in love, the ethical form. This paper aims to show that this painful emotion described by Hegel and the vain efforts to escape from it form the romantic feelings, and that principle of love suggested as treatment may be regarded as the romantic ideal.

In addition, instead of expecting metaphysical logic, this paper intends to read Hegel's aesthetics through practical philosophy based on *Philosophy of Right* and Honneth's interpretation of it.³ The history of romantic art is the process of establishing independent subjectivity by acquiring universality without sinking to individuality.⁴ Thus, many studies have interpreted aesthetics according to the metaphysical principles of the movement of mind and the structure of the philosophical system, which has resulted in repeated arguments about theses such as *das Ende der Kunst* entailed in Hegel's system. Reading on practical philosophy such as *Philosophy of Right*, predicates of the romantic feelings such as inner silence, dark abyss, emptiness and depression reveals itself with its social and ideological meanings, while it is never enough to explain the particular subjectivity as a developmental process of mind. In other words, if the *undetermined pain*⁵, the solitude, emptiness, and despondency in *Philosophy of Right* is the diagnostic result of the ideological dimension of his modern society, these sufferings may have been expressed in the spiritual culture, especially in art, and it would have been described by Hegel as *romantic Gemüt*. Also, seeking communicative prescription for painfully closed/ entrapped Gemüt in ethical relationships and feelings of *love*, the beginning of romantic art is traced back from Christian history such as the love of Jesus and the maternal love of Mary.

Subjective particularity and romantic Gemüt

Hegel defined integrity of classical art in perfect unity with the reality as the ideal beauty, and described that the original function or life of art has ended in classic art.⁶ However, the romantic art bloomed on modern spirituality is mentioned as *higher*⁷, because it expresses inner beauty of the modern spirit and thus is closer to nature of mind. Contrary to classical arts, the basis for the higher art comes from the achievement of the Modern Spirit, which in terms of the development of mind the individual subjectivity is in full bloom, acquiring universality while maintaining the individuality. This accomplishment is the fulfillment of the free Idea that have overcome historical sacrifices such as the Crucifixion, the Reformation, the Renaissance, the Enlightenment and the French Revolution. Therefore, inner beauty of romantic art is mainly expressed through sacrificial pain. In the place where joy of classical art disappears, sufferings and death of Christ, and martyrdom fills Gemüt with infinite loss and pain. Subjectivity through the chivalry brings Gemüt into individual's own subjectivity rather than divine subjectivity, and takes one more step for manifestation of individuality which in modern society finally gets contents of individual particularity in independent form.

Now particular subjectivity has a lively personality, combined directly with his wishes and purposes,⁸ and not with substantive purposes. However, the world of this particularity is limited, so it is presented abstract and contingent.⁹ Individuals do not have the essence of substantive contents, but sustains themselves by their formally unique identity, while being held to the realization of a specific purpose derived from their own desires, or locked in the dark abyss of entrapped Gemüt which will not reach to the developed totality.¹⁰ As such, the romantic Gemüt is stubbornly inward, so it tries to complete its soul in itself without any communication with other people, and drive their catastrophe in one's own destiny in *solitude and emptiness*.¹¹ It is also the purpose of actions itself to sweep away the external situation by violence or to act irrelevant to the actual purpose of the event.¹² Hegel argued that if the claims of one-sided freedom exert enormous influence in the society, and if individuals are not aware of this one-sidedness, subjects are negatively influenced and depressed in practical relations with themselves.¹³ Hegel captured romantic Gemüt of depressed, empty feelings of his times.

Diagnosis: Emptiness Gemüt

The subject who has not yet realized the empty representation of freedom feels emptiness and depression. Members of a society which regards assurance of the acquisition of abstract legal rights as the realization of free will are limited to earning one-sided freedom in their practical relations. Formal rights/laws are institutions in which subjects are engaged with minimal personalities, and only cover as much freedom as is necessary for independent individuals to strategically interact with individual freedom.¹⁴

"If someone is interested only in his formal right, this may be pure stubbornness, such as is often encountered in emotionally limited people [einem beschränkten Herzen und Gemüte]; for uncultured people insist most strongly on their rights."¹⁵

In addition, it is difficult for members of a society where the thoughts are totalized to fully realize the Idea of the good by execution of moral obligation, because it is impossible to communicate among intersubjectivities and to realize the representation of one's own freedom. Hegel pointed out the Kantian ethics and romantic individualism as roots of the pathological symptom in terms of limitation of moral autonomy. While

acknowledging the contribution of Kant's practical philosophy,¹⁶ it was criticized that categorical imperative contains the essence of self-consciousness related only to oneself, therefore, it stays in abstract universality and makes undeterminacy its own determination.¹⁷ Honneth inferred that Hegel considered the Kantian subject following the imperative is *empty* without any sense of directions, so in his perspective the subject is thought to be in a state unable to reconstruct the rational behavior.¹⁸

Hegel's diagnosis of this *emptiness of selflessness without foundation*¹⁹ leads to criticism of the concept of *conscience*. Conscience is manifested in particular subjectivity, such as the subjectivity of romantic art. In other words, it is the determinacy of conscience to be reflected or returned to itself and to establish and determine special contents in the absolute self-assurance of subjectivity. Conscience is thus not restricted to a specific purpose, but it is the deepest self-loneliness and thorough self-confinement,²⁰ in which all constraints have disappeared. Hegel insisted that subjects, on the basis of his abstract self-determination and pure self-assurance, recognized its own freedom as an entity within oneself, thereby rejected all the contents of law, duty, and life, eventually doing or behaving nothing.²¹ Analyzing this, Honneth found the basis of his *Social Pathology* theory. If the moral point of view is completely isolated from the context of the concrete environmental world, all practical action plans will be erased and will eventually go beyond the threshold of social pathology where no action would occur. There are pains of undeterminacy.²² This suffered subjectivity adds not only to the emptiness of all ethical content of laws, obligations, and regulations, but also in this awareness adds to the formal subjective emptiness of knowing oneself as emptiness.²³ The solution to this emptiness and the poverty of action, taken by romantic individualism, was to reemphasize the voice of one's own nature. However, because these efforts to develop inner mood and emotional state must go deeper into the process of infinite self-reflection,²⁴ "a longing may therefore arise for an objective condition, a condition in which the human being gladly debases himself to servitude and total subjection simply in order to escape the tonnent of vacuity and negativity."²⁵

Prescription: Love, the beginning of intersubjective communication

In Honneth's view, Hegel diagnosed the pathological situation of his times and described therapeutic suggestions in chapter of Ethical Life. In short, the prescription is to recognize the representations of the undetermined state and the one-sided freedom in which all subjects have failed to participate in social life in ways of intersubjective communication, and to establish conditions of communication in which each individual can achieve equal autonomy.²⁶ This awareness, by itself, contains clues for the liberation from the suffering. In addition, Honneth analyzed Hegel as suggesting self-realization and inter-recognition in ethical conditions of communicative freedom. Ethical life ensures conditions of equal freedom realization and provides basis for inter-recognition, therefore liberating all members of society from their societal pathology.²⁷ Above all, from the starting line of freedom realization, there is a demand of the Idea of free will that intends and orients to refine the basic impulse system of human beings, and the principle of love is deeply connected. For this love is presented as the model of freedom experience.

"For example in friendship and love. Here, we are not one-sidedly within ourselves, but willingly limit ourselves with reference to an other, even while knowing ourselves in this limitation as ourselves. In this determinacy, the human being should not feel determined; on the contrary, he attains his self-awareness only by regarding the other as other. ... Freedom is to will something determinate, yet to be with oneself [bei sich] in this determinacy and to return once more to the universal."²⁸

Among areas of ethical life²⁹, family as the natural form of ethical life,³⁰ is based on the emotional unification of love and carries out the function of care and protection, and thus plays a social role to fulfill natural basic desires. It is the work by the principle of love in family that intersubjective communication is started and the most basic representation of human being and the inter-relationship with another are formed. So Hegel sets family as the foundation of all ethical life. In family, individuals repeatedly experience satisfactions with natural desires by interaction forms of me unified with others and others unified with me, and in that interaction the foundation of Bildung forms where one learns the attitude toward others in ways of trust and solidarity. Hegel's family is a core sector of ethical life that learns and practices what it means "to see others as irreplaceable individuals"³¹, and the principle of deep feeling of love works in its roots. This is why love in romantic art is a social/ethical feeling as the prescription of pathological symptoms.

The beginning of romantic art is filled with the redemptive history of Christ, its infinite suffering, but it also covers "the spiritual depth of love as feeling of one's life in self in another."³² In this sense, love is the only deeply emotional equivalent to the concept of free spirit that is satisfied internally as the divine love of Christ, and the moments of reconciled return from another to oneself, considered as the romantic ideal. In classical ideals, mediation and reconciliation of one with another are contents, but in case of love, another is not nature but is another subject. When it comes to romantic art, mind is realized in its own possession, itself in its most unique element. Just as *Philosophy of Right* presupposes family's natural love as the basis of ethical life, Mary's maternal love is regarded as the most successful theme of artistic expression as a romantic ideal. It was the achievement of young Hegel and the early German romantic philosophy that extended the form of love beyond the individual's inner feelings to the principle of philosophy. Love is a form of emotion that can not be adequately grasped in the concept of reflection that philosophy requires. After early thoughts, Hegel added ethical meaning to love as a basic principle that constitutes social order as a part of objective spirit, not as an instrument to form a consciousness. Thus Hegel saw society as a rational crystallization based on the uniqueness of human being, their inter-relationship, and their rationality of spirits, and laid out a way to remain with another from the principle of love suggesting it as the basic of objective spirit. Here Honneth excavates Hegel's model of communicative freedom and asserts that its core is "Being by itself in others (Im-Anderen-bei-sich-selbst-sein)".³³

ROMANTIC GEMÜT AS SOCIAL FEELINGS

The modern subject, which creates art and is created through art, enjoys infinite subjectivity but is always close to suffering as it is. Art expresses this pain as tragedy or comedy, and humor that makes itself a source of fun. However, if we grasp the pain, the core material of the romantic art spirit, only as a single criterion derived from logical rules, it is difficult to explain the feelings of modern subjects whom are free from political bondage but experience only one side of freedom realizing limited relation with only oneself. Hegel defined the spirit of his times as "romantic" and read void and depression in formalism or closed mind revealed through the "inner Gemüt" of such romanticism. In this time when introversion or inner subjectivity is universal, conditions to realize free will begin with the "principle of love" inherent in the spirit of all people through Jesus. According to Honneth, Hegel's plan was to diagnose the pathological phenomena of his time and to make political, social, and psychological prescriptions for it, and these thoughts and goal of philosophy is revealed through

Philosophy of art as well as *Philosophy of Right*.³⁴

JACQUES RANCIÈRE'S RELATIONS TO KANT

Abstract | I discuss Jacques Rancière's reading of Kant, the important leaning of his understanding of aesthetics on Kant and some implications, problems and questions that follow from this. I point out the duality of Rancière's aesthetics that is constituted on Kant's two meanings of aesthetic(s), the transcendental aesthetics and the beautiful. Rancière's indebtedness to Kant is twofold in one more sense. His thought is related to Kant through Foucault and his fundamental transformation of Kant's transcendental a priori into a historical one, but he also relies on Kant beyond Foucault's intervention and restores a notion of universality. I expose Rancière's inner paradox between necessity and contingency that follows from this relationship with Kant. While questioning this two points, I primarily focus on the less examined part, which I see as the most original, as well as underdeveloped and problematic: Rancière's reliance on Kant's account of transcendental aesthetics. The idea of a priori forms of sensibility is problematic in the context of Kant's first Critique and reaches back into his precritical philosophy and relates to Baumgarten. While ultimately Kant cannot justify the difference of sensibility from reason, Rancière gives the simultaneousness of their distinction and indistinction a political sense. This ultimately leads to the question of redundancy of Rancière's conception of aesthetics of politics. It also highlights the troubling closeness of politics and aesthetics that imposes the question of their own distinctiveness and of reduction of aesthetics to politics. This specific relationship to Kant results in a quite traditional conception of aesthetics that is linked to the sensible and to art but it is also split. This implies further questions whether contemporary aesthetic thought can be relevant for concurrent artistic and cultural phenomena and innovative and still be derived from Kant.

Index terms | *aesthetics; Kant; Rancière; sensible; transcendental aesthetics;*

INTRODUCTION

I will discuss the leaning of Jacques Rancière's aesthetics on Kant. I will present three problems or implications that are related to this.

There is a duality in Rancière's aesthetics that is constituted on Kant's two meanings of aesthetic(s). In *The politics of aesthetics* Rancière associates his first meaning of aesthetics to Kant's transcendental aesthetics: »... aesthetics can be understood in a Kantian sense – re-examined perhaps by Foucault – as the system of *a priori* forms determining what presents itself to sense experience. It is a delimitation of spaces and times, of the visible and the invisible, of speech and noise, that simultaneously determines the place and the stakes of politics as a form of experience«¹. It is developed in the context of the concept of the distribution of the sensible, the determination of the field of sensible experiences that is connected to what is common to the community, of the social organization and interpersonal relations. Aesthetics is the presupposition of politics, which is also conceptualized in the notion of the aesthetics of politics.

The second meaning of aesthetics is based on the first and concerns the aesthetic regime of art as a specific distribution of the sensible, the discursive and sensible frame of aesthetic practices and experiences and is, in a crucial part, constituted on Kant's notion of the beautiful (aesthetic judgement) as a relationship of harmony between the faculties, especially read through Schiller. It is a revocation of the first aesthetics and it is another distribution of the sensible, which "suspends the ordinary connections not only between appearance and reality, but also between form and matter, activity and passivity, understanding and sensibility"². This means for Rancière that aesthetics has its own politics, the politics of aesthetics. Aesthetics is thus in both senses an apriority or a condition of possibility.

1

Rancière's indebtedness to Kant is twofold in one more sense, through Foucault, which results in an inner paradox between contingency and necessity. This is the first problem of Rancière's relation to Kant. Rancière's conceptions of a priori are partly mediated by Foucault's transformation of Kant's transcendental a priori into a historical one. The distribution of the sensible functions as necessary and universal only in the frame of a particular community or of an intellectual order, where it conditions the arrangement of people that belong to the community, the definition of art or public interests, etc. This ordering can be altered by the advent of politics, which cannot be predicted. The aesthetic regime of art was formed historically by the aesthetic revolution, constituted by the philosophical and literary conceptions of the aesthetic in the late 18th century³. Rancière points out this conceptual closeness: »There is no doubt that the notion of the distribution of the sensible and the classification of the regimes of identification of the arts owe a great deal to the Foucauldian notion of the episteme and the historical a priori. For me and for him, it is a matter of defining conditions of possibility for an experience either of forms of articulation between words and things or between forms of enunciation and modes of sensible presentation of the »objects« these enunciations concern. My way of thinking of the historical emergence of art as a unifying category in its difference with the distribution of the arts is similar to his way of thinking the emergence of life with regard to the tableaux of natural history.«⁴ This is the kind of contingency in Rancière.

But the distribution of the sensible is not merely a rearticulation of Foucault's ideas of the conditions of possibility. Although it is changeable and intersubjective, it is also not strictly historical. He universalizes and dehistoricizes some of Foucault's conceptions

and makes them into abstract and general properties of the distribution of the sensible beyond Foucault's more localized and specific applications. In *Discipline and punish*⁵, for example, Foucault distinguishes two types of power, modelled after historical handlings of leprosy and plague, the former is led by the idea of a pure community and is described in terms of excluding, marking, binary partition, while the latter is a paradigm of a disciplined community, characterized by multiple, diversified separations and distributions. Similar terminology that mixes classifications is continually used by Rancière to define the distribution of the sensible and the police as universal concepts. Rancière understands politics as two opposing forces: the police - which is another derivation from Foucault's view on the police as an all-embracing technique of governing - is the term for social order of hierarchical and power relations, but also the usual and evident organization of experiences and meanings, while politics in the narrow sense is the invalidation of this order with the opposing order, which presupposes equality. Unlike Rancière's binary generalization, Foucault does not think about visibility and invisibility as a simple pair, where the former is related to politics and the latter is a characteristic of the excluded, but form more complex historical dynamics and the breaks of the relations between spatiality and the gaze (in the panopticum paradigm, for instance, visibility is equated with the subjection to surveillance of the invisible power). This troubling connection to Foucault is a problem because he unites what Foucault constituted as an opposition to Kant, namely the refusing of universal concepts and explanations with exactly that again. In this respect Rancière's aesthetics is related to Kant beyond Foucault. Politics and aesthetics come close to universal forms of relations and dynamics, of experiences and communities, differentiated only by the assumption of equality of inequality.

2

The second series of relations and problems concerns Rancière's foundation of the distribution of the sensible on transcendental aesthetics. In the »Transcendental aesthetics«⁶, which is a part of the *Critique of pure reason*, Kant splits sensibility into two parts, the material and the formal. The latter belongs to a singular cognitive faculty with its specific laws or a priori forms of sensibility, space and time that precede perception, facilitate it and determine the appearance of its objects.

Transcendental aesthetics is problematic in the context of Kant's first *Critique*. While the details cannot be discussed here, I want to mention two basic problems that reflect interestingly in Rancière. As is shown systematically by Zdravko Kobe⁷, already in the »Transcendental aesthetics« Kant has troubles distinguishing sensibility from understanding as not just elements or extremes of the same continuum, but as different because of their origin. The clear distinctions of oppositions and correspondence between the pairs of oppositions of passive and active, formal and material, unity and multitude, intuition and concept do not work out.

While ultimately Kant cannot justify the difference of sensibility from reason, Rancière gives the simultaneousness of their distinction and indistinctness a political sense. The sensible is always in a relationship with understanding, as Rancière highlights in »The Aesthetic Dimension« where he refers to the *Critique of Judgement*: the distribution of the sensible has three elements, sensible given and sensibility and understanding, which make sense of this given, it is therefore *a certain relation between the sensible and the intelligible*⁸. He also calls the relationship between the sensible and its intelligible sense the relation between sense and sense⁹, a difference within the same¹⁰. For Rancière the dynamics between distinctions and indistinctions on different levels are the core of the politics: blurring of meanings and oppositions, disidentifications, unfoundedness of

differences. The indistinction and distinction between the sensible and intelligible are one of the aesthetic paradoxes, introduced by the aesthetic revolution that identified the thought with non-thought (*The aesthetic unconscious*). But indistinctions that follow from this on two other crucial levels of his thought are not this promising.

The first of this second set of problems concerns the status of aesthetics. Another issue of Kant's transcendental aesthetics is that after the deduction of categories, a priori forms of sensibility become not only unnecessary, but also inconsistent with it: if we have categories or a priori forms of understanding that apply to all objects of possible experience, sensibility cannot be a priori, but it is already determined by understanding. In the context of Rancière it is unclear, if aesthetics as the distribution of the sensible really is a priori, the law, which distributes, determines, the form that defines what and how it can be seen, that which precedes all experience and determines what will be possible to be perceived and how, or is it predetermined, what is seen, experienced, a passive given, and as such already a product of the distribution.

The second problem in this series is the duality of experience and of the common, the mixing of levels of experience and the political. The distribution of the sensible is not just the form of relation between the sensible and the intelligible, but it conceptualizes the connection between the sensible and the communal. In *Dissensus*, for instance, Rancière defines it as »a generally implicit law that defines the forms of partaking by first defining the modes of perception in which they are inscribed. ... A partition of the sensible refers to the manner in which a relation between a shared common and the distribution of exclusive parts is determined in sensory experience. This latter form of distribution itself presupposes ... a distribution of what is visible and what not, of what can be heard and what cannot.«¹¹ But distribution of the sensible and politics are sometimes defined similarly, so that it is unclear which conditions the other and what is the role of the sensible: »The police is, essentially, the law, generally implicit, that defines a party's share or lack of it. But to define this, you first must define the configuration of the perceptible in which one or the other is inscribed. The police is thus first an order of bodies that defines the allocation of ways of doing, ways of being, and ways of saying, and sees that those bodies are assigned by name to a particular place and task; it is an order of the visible and the sayable that sees that a particular activity is visible and another is not, that this speech is understood as discourse and another as noise.«¹² Besides that politics begins with a different kind of aesthetic perception, but there already has to be a political subject who makes it possible for this new sensible to be perceived. Politics can function without aesthetics, but not aesthetics without politics. The sensible always already has a political sense, it is always inscribed into a police or a political distribution of the sensible. Does aesthetics precede and form politics or vice versa? To say that they are simultaneous is also problematic, because it renders the distribution of the sensible as an a priori obsolete and invalid and makes aesthetics of politics and politics of aesthetics just two aspects of the same phenomenon. This troubling relationship thus highlights a more serious indistinction, between aesthetics and politics and imposes the question of their own distinctiveness and of reduction of aesthetics to politics.

We should ask, why Rancière needs aesthetics to ground his politics. Although over the course of his writings the foundation of politics becomes more sensible, aesthetic, it is in no way obvious why it is necessary. This politics can already be defined by the more rational concepts of counting, distribution, democracy etc. It is clear, from *The hatred of democracy*¹³, for instance, that his politics does not need an aesthetic foundation. Is aesthetics just a dimension of politics? This ultimately leads to the question of

redundancy of Rancière's conception of aesthetics of politics.

3

The third and most serious problem is the inscription of Rancière's aesthetics and politics into Kantian anthropocentrism, their foundation on human capacities. It seems that Rancière has a premise of Schiller's anthropology of human's wholeness. In some of his works he founds equality in the sameness of human intelligence, and claims that inequality presupposes equality (*Emancipated spectator*¹⁴). But equality only applies to people, who have the same kind of intelligence or capacities of understanding, communicating, interpreting, perceiving. There is a distribution of the sensible that precedes this »anyone« who can partake in a political subject: it is questionable whether this definition can include mentally ill persons, people with neurological disorders, developmental disorders and others.

Rancière offers a lot to art and aesthetics that want to be political but this politics leaves out nature that is other than human nature. It precludes environmental aesthetics and the relation of politics to ecology; in our contemporary situation of environmental problems these themes are of political as well as of aesthetic interest and even central to the future of humanity.

There is a certain emancipation in making the sensible a political matter. But Rancière's procedure perpetuates the aesthetic split, which emancipates one part of the sensible at the expense of another and thus continues the denigration of the sensible. He continues Kant's distinction in the sensible: the material is the sensible residue that this anthropocentrism leaves out. A very clear and sharp distribution of the sensible is preserved: between human (defined by his cognitive and communal, political, aesthetic capacities) and non-human or even less human; but also within human: the distinction between sensibility as a capability and sensibility as the bodily, the emotional, etc. The aesthetic experience that follows from this is also impoverished and rationalized. In this view it is a perpetuation of aesthetic distinction, which I think the aesthetic revolution, besides making it possible for anything to be art, failed to resolve and even solidifies it.

(PRACTICAL) DISINTERESTEDNESS AND (AESTHETIC) INVOLVEMENT: KANT'S AESTHETIC THEORY REVISITED

Abstract | This paper reconsiders Kant's disputed doctrine of supposed "aesthetic disinterestedness," arguing that disinterestedness toward beauty is a necessary condition for being "involved in" it. First, I demonstrate that Kant encountered the notion of "disinterestedness" in Alexander Baumgarten's *Metaphysica*, where he avers that, when I "intuit the perfection" (or the "imperfection") of something as "good" (or "evil"), I "am pleased" (or "displeased"). When "I intuit neither its perfection nor its imperfection," I "intuit it as neither good nor evil," and "am neither pleased nor displeased," i.e., "it is indifferent to me" (§ 651). The indifference is, therefore, neither compatible with the pleasure nor the displeasure. Conversely, in the *third Critique*, Kant insists that Baumgarten overlooks the distinction between the good and the beautiful because the beautiful is "indifferent" to me and yet "pleases" me (§ 5). Hence, the notion of disinterestedness enables him to introduce a new kind of pleasure, i.e., pleasure in the beautiful distinguished from other kinds of pleasure (e.g., in the good or the agreeable). Second, I examine the "first moment of the judgment of taste" (§§ 1–5) in the *third Critique* where Kant elaborates his notion of disinterestedness. I argue that disinterestedness is only a negative condition to construct an aesthetic judgment, as Heidegger indicated in *Nietzsche*. Essentially, we have to be first free from the faculty of desire, otherwise our aesthetic judgment might be "partial" (§ 5). Therefore, the expression "*aesthetic* disinterestedness" that never appears in the *third Critique* is misleading and should rather be called "*practical* disinterestedness." Third, I refer to the "third moment of the judgment of taste" (§§ 10–17) where Kant addresses the positive characteristics of aesthetic judgment, arguing that only when we are free from any practical interest can we "*linger over [weilen]* the consideration of the beautiful" (§ 12). Thus, practical disinterestedness is a condition to "involve ourselves in [*sich einlassen*]" a beautiful object (5: 269), an aesthetic involvement that can be called "aesthetic interest." Finally, I briefly indicate that Schopenhauer does not misinterpret Kant's theory of disinterestedness, as Heidegger noted, since he characterizes the "disinterested" apprehension of the beauty as "purely objective interest" (WWR II, xxxi–xxxii).

Index terms | *aesthetic disinterestedness; indifference; aesthetic interest; aesthetic involvement; lingering; Immanuel Kant; Martin Heidegger; Alexander Baumgarten*

INTRODUCTION

This paper reconsiders Kant's disputed doctrine of supposed "aesthetic disinterestedness," arguing that the concept of "aesthetic disinterestedness" that was never used by Kant himself misses the main point of the *Critique of the Power of Judgment* (1790) (hereafter abbreviated as the third *Critique*). First, I address Baumgarten's theory of disinterestedness in his "Metaphysics" (1739, 1757) as a background for understanding Kant's theory of disinterestedness. Second, I show that disinterestedness toward the beautiful is for Kant only a necessary condition for being aesthetically "involved in" it. Thus, I interpret Kant's doctrine of supposed "aesthetic disinterestedness" as composed of practical disinterestedness (as a necessary condition) and aesthetic involvement (as a sufficient condition). Then, in order to verify this interpretation, I refer to Schiller's and Schopenhauer's aesthetic theory. Finally, I address the question of what "aesthetic disinterestedness" can literally mean by taking Duchamp's description of the readymade as an example.

1. BAUMGARTEN'S THEORY OF DISINTERESTEDNESS

In his epoch-making article "On the Origins of 'Aesthetic Disinterestedness'" (1961), Jerome Stolnitz traced the origins of the Kantian idea of disinterestedness to eighteenth-century British philosophy, especially Shaftesbury's and Hutcheson's. Werner Strube's article "Interesselosigkeit. Zur Geschichte eines Grundbegriffs der Ästhetik" (1979) basically shared Stolnitz's opinion. I tend to take into consideration Baumgarten's "Metaphysics," which served as the textbook for Kant's lectures on metaphysics and anthropology; Kant's terminus technicus "indifferent" (in German: "gleichgültig") that is used synonymously with "without interest" and "disinterested" (in German: "ohne Interesse" and "uninteressiert") (Kant 5: 205, 209) obviously originates from Baumgarten.

In "Metaphysics," Baumgarten argues as follows: The power of the soul consists of the powers of cognition and desire. When I "intuit the perfection" (or the "imperfection") of something as "good" (or "evil"), I "am pleased" (or "displeased"), and I "desire" (or "avert") what "pleases" (or "displeases") me. A desire (or an aversion), therefore, results from a cognition. However, when "I intuit neither its perfection as good nor its imperfection as evil," I am "neither pleased nor displeased," i.e., "it is indifferent to me [*mihi indifferens, es ist mir gleichgültig, ich bin dagegen gleichgültig*]." And I "cannot desire those things that are entirely indifferent to me." Neither a desire nor an aversion, therefore, results from a cognition of those things that are entirely indifferent to me (Baumgarten 1757: §§ 651, 664, 666).

In the first moment of the judgment of taste (§§ 1–5), in which beauty is defined according to quality, Kant introduces the idea of "disinterested pleasure [*das uninteressierte Wohlgefallen*]" that does not have any "relation to the faculty of desire" (Kant 5: 205). This idea would be self-contradictory in Baumgarten's view, for what pleases me (so Baumgarten says) cannot be, by definition, indifferent to me. Kant is, however, not entirely opposed to Baumgarten. Both Kant and Baumgarten are of the opinion that what is indifferent to me does not affect (and, at the same time, is not affected by) the power of desire. Kant thus characterizes "disinterested pleasure" as "a free pleasure" in that it is free from the power of desire (5: 210), because it is "indifferent with regard to the existence of an object" (5: 209). This also suggests that the disinterestedness is only a negative (or necessary) condition for aesthetic pleasure. In this respect, I agree with Heidegger, who avers that the disinterested nature of aesthetic pleasure is propounded in a merely "preparatory and path-breaking way" (Heidegger 1979: 110). But when Heidegger continues, "by means of the 'devoid of interest' the essential relation to the object itself comes into play. . . . now for the

first time the object comes to light [*zum Vorschein kommen*] as pure object and that such coming to light is the beautiful. The word 'beautiful [*schön*]' means appearing in the radiance of such coming to light [*das Erscheinen im Schein solchen Vorscheins*]" (Heidegger 1979: 110), his ontological interpretation is not compatible with Kant's theory of the beautiful. I will now move on to the question of how Kant determines the sufficient condition of aesthetic pleasure.

2. DISINTERESTEDNESS AND INVOLVEMENT

It is in the third moment of the judgment of taste (§§ 10–17), in which beauty is defined according to relation, that Kant addresses the sufficient condition of aesthetic pleasure. In section 12, he explains it as follows:

The pleasure [in the beautiful] has a causality in itself, namely that of *maintaining* [*erhalten*] the state of the representation and the occupation of the cognitive powers without any further aim. We *linger* [*weilen*] over the contemplation of the beautiful because this contemplation strengthens and reproduces itself. (Kant 5: 222)

When our minds are aim-oriented, we use an object for the sake of something else. That is, an object is embedded in a means-end relationship and determined by the end. At issue is the end, not the means to the end. An object as a means therefore attracts our attention to it only insofar as how to efficiently attain its end. We should not—and do not have to—linger over an object. But when our minds are indifferent to aims and freed from a purpose-oriented scheme, we are led to linger over an object. And if we are offered by an object "that representation of the imagination which occasions much thinking, but to which no determinate . . . concept can be adequate" (5: 314), we actually linger over it, because our mental powers—i.e., the "imagination" (as the "faculty of intuitions") and the "understanding" (as the "faculty of concepts") (5: 287)—are set into a "play that maintains itself on its own and even strengthens the powers for such play" (5: 313).

Considering all of this, one can argue as follows: While disinterestedness is a necessary condition for aesthetic pleasure in the beautiful, the active, self-maintaining play of one's mental powers is the sufficient condition for it. Kant's doctrine of supposed "aesthetic disinterestedness" is thus a compound of a negative and a positive moment.

The disinterestedness is also attributed to aesthetic pleasure in the sublime as well as to that in the beautiful (5: 247). Also, aesthetic pleasure in the sublime is a compound of a negative and a positive moment. The first, negative moment can be seen in the following quotation:

The sight of [such fearful objects] only becomes all the more attractive the more fearful it is, *as long as we find ourselves in safety*. (5: 261—emphasis by the author)

In order to find something sublime, we have to be free from actual fear caused by danger, being thus indifferent to the existence of an object. For "it is impossible to find pleasure in a terror that we take seriously" (5: 261). But to be free from actual fear is not an effect of aesthetic pleasure; it can cause "gladness" at most (5: 261). So then, what is the second, positive moment?

The astonishment bordering on terror, the horror and the awesome shudder, . . . is—*if the spectator knows that he/she is in safety*—not actual fear, but only a temptation to *get involved in it* [*uns darauf einlassen*] by means of the imagination, in order to

feel the power of that very faculty, . . . (5: 269—emphasis by the author)

To get involved in fear caused by a sublime object in order to feel “the strength of our soul elevated above its usual level” (5: 261) is the second, positive moment for aesthetic pleasure in the sublime.

Having made this distinction, I propose we call the first, negative moment “practical disinterestedness,” and the second, positive moment “aesthetic involvement.” This explains the reason why I regard the expression “aesthetic disinterestedness” as misleading, or even false, for disinterestedness itself does not constitute aesthetic pleasure.

By the way, in the first part of the third *Critique*, the word “indifferent [*gleichgültig*]” appears four times. Its first three uses are in the sense analyzed above; the last use is an exception:

. . . we reproach someone who is indifferent in judging an object in nature that we find beautiful with lack of taste, so we say of someone who remains unmoved by that which we judge to be sublime that he/she has no feeling. (5: 265)

When we make a judgment of taste, we must be “indifferent with regard to the existence of the object” (5: 205), but it does not follow that we can be indifferent in making a judgment of taste. We should rather have much interest in making a judgment of taste, otherwise we would be charged with a lack of taste. Kant is not an advocate of the so-called aesthetics of disinterestedness.

3. ECHOES OF KANT’S THEORY

Once, Heidegger claimed that “Schopenhauer plays the leading role in the preparation and genesis of the misunderstanding of Kantian aesthetics. . . . Kant’s *Critique of the Power of Judgment* . . . has been influential up to now on the basis of misunderstanding. . . . Schiller alone grasped some essentials in relation to Kant’s doctrine of the beautiful” (Heidegger 1979: 107–8). I will now briefly examine his statement.

In Schiller’s essay “On the Aesthetic Education of the Human Being” (1795), we read that “insofar as need for reality and dependence on the actual are merely the results of a deficiency, indifference towards reality [*die Gleichgültigkeit gegen Realität*] and an interest in appearance [*das Interesse am Schein*] represent a real shift for humankind and a decisive step in the direction of culture” (Schiller 5: 656). The “indifference toward reality” corresponds to what I called “practical disinterestedness,” while “an interest in appearance” is equivalent to what I named “aesthetic involvement,” for due to this interest in appearance we are “able to linger over pure appearance [*sich bei dem bloßen Schein verweilen*]” (5: 658). Schiller juxtaposes indifference and interest, thus clearly articulating the negative and positive moments of the judgment of taste.

Next, let us move on to examine whether Schopenhauer misunderstood Kant’s aesthetic theory. In his “World as Will and Representation,” Schopenhauer shares the same opinion as Kant, arguing that “the beauty . . . depends upon disinterestedness of the intuition” (Schopenhauer 4: 444). Twenty pages later, however, he continues as follows: “Every genius is . . . a big child; he/she looks out into the world . . . with purely objective interest. Accordingly, he/she has just as little as the child that dull gravity of ordinary people, who, since they are capable only of subjective interest, always see in things mere motives for their action” (4: 458). Disinterestedness toward practical motives excludes subjective interest, but not objective interest. Ordinary people who

are caught up in subjective interest “do not linger longer over the mere intuition [*bei der bloßen Anschauung lange weilen*]” (1: 242). Objective interest that presupposes disinterestedness of the intuition, on the contrary, makes it possible for us to linger over intuition, which corresponds to what I above called “aesthetic involvement.” Schopenhauer’s theory of beauty certainly conflicts with Kant’s letter—because Kant does not use the word “interest” in this way—but not with Kant’s spirit. Seen in this way, it is Heidegger who misunderstood Schopenhauer.

4. VISUAL INDIFFERENCE AND/OR ENJOYMENT OF LOOKING

Finally, I will address the question of what “aesthetic disinterestedness” can literally mean. This concept reminds me of Marcel Duchamp’s concept of “visual indifference.” In his talk “Apropos of ‘Readymades,’” delivered in 1961, he recalled when he invented readymades, as follows:

In 1913 I had the happy idea to fasten a bicycle wheel to a kitchen stool and watch it turn. It was around that time that the word “Readymade” came to my mind to designate this form of manifestation. A point that I very much want to establish is that the choice of these Readymades was never dictated by an aesthetic delectation. The choice was based on visual indifference—a total absence of good or bad taste—in fact, a complete anesthesia. (Duchamp 1973: 141)

Visual indifference toward readymades, which entails a denial of taste or even an absence of *aisthesis*, is the antipode of Kant’s aesthetic theory. Duchamp’s readymades seem to exemplify “aesthetic disinterestedness” in the literal sense. The case is, however, not quite so simple, as he often “compared” the spinning Bicycle Wheel (1913) to “flames in a fireplace,” underlining the “pleasure of looking at” them (Schwarz 1969: 442). Duchamp was pleased both by looking at the movement of the wheel (and the flames) and by comparing the spinning bicycle wheel to the flames. The pleasure is, therefore, both visual and intellectual. The former pleasure exactly corresponds to the pleasure of imagination that Kant argues, for example, resides in “looking at the changing shapes of a fire in a fireplace” (Kant 5: 243). Duchamp lingered on looking at the wheel. He cannot have been visually indifferent toward the wheel.

One might assume that Duchamp must have been visually indifferent to the urinal he submitted as Fountain under the pseudonym R. Mutt to the exhibition of the Society of Independent Artists in 1917. This case is not quite so simple, either. In the unsigned text entitled “The Richard Mutt Case” that appeared in *The Blind Man*, no. 2 (May 1917) and was attributed to Beatrice Wood (who worked closely with Duchamp), we read the following:

He [Mr. Richard Mutt] took an ordinary article of life, placed it so that its useful significance disappeared under the new title and point of view—created a new thought for that object. (Wood 1917: 5).

There are two points here: first, to remove a urinal from its original practical context and, secondly, to look at it from a new point of view and create a new thought for it. The first point corresponds to what I above called “practical disinterestedness.” What is at issue is, therefore, the second point.

The text “The Richard Mutt Case” was followed on the same page by an article titled “Buddha of the Bathroom,” written by Louise Norton, one of Duchamp’s friends with insider knowledge about the Richard Mutt case. She wrote the following:

. . . to any “innocent” eye how pleasant is its chaste simplicity of line and color! Someone [Stieglitz] said, “Like a lovely Buddha”; someone said, “Like the legs of the ladies by Cezanne”; . . . (Wood 1917: 5–6)

Duchamp circle members were pleased by comparing the visual qualities of the urinal to those of Buddha or the legs of the ladies by Cezanne. The more conspicuous (or even witty) the contrast between the urinal and Buddha or Cezanne’s legs was, the more they were pleased. Their pleasure was certainly intellectual; it was, however, based on visual pleasure. They cannot have been, therefore, visually indifferent toward the urinal.

In the 1960s, Duchamp came to advocate visual indifference, in order to differentiate himself from the Neo-Dadaists, who “found aesthetic beauty” in his readymades (Richter 1965: 208). The idea of visual indifference, however, does not reflect Duchamp’s or his circle members’ attitude toward readymades in the 1910s. This attitude actually consists of practical indifference and aesthetic-intellectual involvement. Seen in this way, Duchamp’s readymades still faintly echo Kant’s aesthetic theory.

KANT'S CLAIM OF THE UNIVERSAL VOICE OF THE JUDGMENT OF TASTE

Abstract | This paper defends Kant's claim on the universality of the judgment of taste in the Analytic of the Beautiful of the *Critique of the Power of Judgment*. This claim, as the key to comprehending Kantian aesthetics, emphasizes on the two respects of the "quantity" of the judgment of taste: firstly, the universality of the judgment is non-conceptual (KU 5:211); secondly, the universality means a universal voice over the subjects who judge rather the objects being judged (KU 5:215). Kant's claim remains controversial and raises enduring debates (Allison 2001:107-9; Guyer 1997: 125). I refer these two respects to the transcendental idealism Kant presents in the *Critique of Pure Reason*. For Kant, the possibility of the aesthetic but subjectively universal judgement of taste belongs to the general problem of transcendental philosophy, namely, the possibility of synthetic a priori judgments (KU 5:289). We must restate this issue which Kant tackles in the first *Critique* and investigate the meaning of a *priori* principles in Kantian philosophy. I consider the judgment of taste to be a component of Kant's transcendental architectonic. For Kant, nothing but cognition and representations belonging to cognition can be universally communicated (KU 5:217), such that there must be some relationship between the universal validity of the judgement of taste and cognition. However, beauty is not an attribute of an object (as in a cognitive judgment) but something we experience when our cognitive powers interact freely and harmoniously in representing an object without cognizing it. In this case, I investigate three respects of the specific relationship between taste and cognition. Firstly, the universality of the aesthetic, reflecting judgment of taste is nevertheless based on the operation of our cognitive powers; secondly, the judgment of taste is analogous to cognition; thirdly, the judgment's universality cannot conflict with cognition. On this basis, I ground the justification of judgment's universality in ideas, which can be either general ideas or transcendental ones. By doing so, I provide a convincing interpretation of Kant's claim on the universal voice of the judgment of taste.

Index terms | *The judgment of taste; Universality; Subjective; Idea; Kant;*

INTRODUCTION

In Kant's planning of his philosophy, the aesthetic field bases on the feeling of pleasure and displeasure, which corresponds to the faculty of the power of judgment. At the same time, according to Kant's *a priori* requirements of his philosophy, the judgment of taste belongs to a subjective principle of purposiveness. The establishment of this transcendental principle opens up new possibilities for traditional aesthetic thoughts. The most important breakthrough is that although beauty itself is a subjective state of mind, it can still require a universal validity of this pleasure. This subjective universality of beauty seems to be a contradiction in itself, and gives a great difficulty to be understood. This paper starts from Kant's own system and tries to give a reasonable interpretation of the universality of taste and beauty.

As the background of interpretation of the judgment of taste, the first part of this paper begins with the synthetic *a priori* judgment and interprets the basic connotation of the transcendental conception established by Kant in *Critique of Pure Reason*. The second part returns to beauty, and analyses the subjective universality of taste. In this part, I investigate three respects of the specific relationship between beauty and cognition, and lay the subjective universal voice of beauty on cognition.

1. The Judgement of Taste and Transcendental Idealism

According to the second moment of the beautiful, Kant claims that the beautiful which pleases universally without any concept (KU 5:219). This claim gives the judgment of taste two basic attributes: firstly, the beautiful is non-concept; secondly, the satisfaction of the beautiful is a universal voice. The so-called non-concept means the beautiful is not directly satisfied through the concept, which makes it distinguished from the cognition; the so-called universally satisfaction, meaning that the state of mind of the beautiful can be communicated for all people at the same time, which makes it distinguished from the agreeable. These two attributes are actually two important characteristics of Kant's transcendental idealism, namely the requirements of subjectivity (ideality) and universality. Kant also respectively explain these two points as the main problem for a deduction of judgment of taste: §32 "The judgment of taste determines its object with regard to satisfaction (as beauty) with a claim to the assent of everyone, as if it were objective." (KU 5:281); §33 "The judgment of taste is not determinable by grounds of proof at all, just as if it were merely subjective." (KU 5:284). When dealing with this problem, Kant did not limit it to the aesthetic field, but to include in under the entire transcendental idealism. That is, how is a judgment of taste possible? This problem "belongs under the general problem of transcendental philosophy: How are synthetic *a priori* judgments possible?" (KU 5:289)

"How are synthetic *a priori* judgments possible?" is raised in *Critique of Pure Reason*. This problem is a basic problem of Kant's epistemology. On the one hand, Kant's basic standpoint in dealing with the skepticism's questioning of the universality of cognition, in response to Hume, as well as rescuing the authority of reason. On the other hand, this problem can be said to be the beginning of Kant's transcendental philosophy, and it also opened the period of German Idealism. His epistemology and transcendental idealism is to explain how such conditions of cognition can be both subjective and objective or objectivating at once (Allison 2004:11). To put it simply, when dealing with cognition, Kant firstly divides cognition into pure cognition and empirical cognition, and at the same time divides the basic form of cognition—judgment, into analytical

judgment and synthetic judgment, only the latter is the basic form of cognition. Kant's epistemology recognizes that "all our cognition commences with experience, yet it does not on that account all arise from experience." (KpV B1). There is such a cognition independent of all experience and even of all impressions of the senses, it is called *priori* cognition—pure with which nothing empirical is intermixed. In Kant's view, *priori* cognition is cognition about cognition, it can establish *priori* principles for cognition, in that case, it response to an important question: how are cognitions possible? By making a basic dissection of the constituent elements of cognition, Kant transforms the question of the possibility of cognition into the possibility of synthetic *priori* judgment.

This problem is an important step of Kant's Copernican turn. Kant starts his philosophy from the so-called Copernican Revolution, which has two fundamental features: firstly, the criterion of cognition turns from the external objective world to our subjective principles; secondly, the criterion of cognition turns from the object of experience to a transcendental one. Therefore, Kant's thoughts present two fundamental characteristics: one is subjectivity and the other is transcendentalism, which makes synthetic *priori* judgments possible.

Kant's transcendental idealism is rested on subjectivity and universality. Although aesthetics has reason to legislate itself as an independent field, it still belongs to the general framework of the transcendental system. That is to say, the universality of aesthetics itself is an inevitable requirement of rational architectonic, and it must be interpreted in the context of transcendental idealism.

2. The Judgment of Taste and Cognition

As mentioned above, although Kant's claim of the universal voice of taste belongs under the general framework of the transcendental idealism, it has its own legislative principles as an independent field. The first thing to be clear here is, in what sense is the aesthetic problem different from cognition? And in what sense do they rely to each other?

Obviously, Kant breaks through the traditional opinions of aesthetics and associates beauty merely with the subject, beauty becomes the sense of beauty here. "Hence he will speak of the beautiful as if beauty were a property of the object and the judgment logical (constituting a cognition of the object through concepts of it), although it is only aesthetic and contains merely a relation of the representation of the object to the subject" (KU 5:211). It should be noted here that Kant uses analogous expression "as if". On the one hand, this expression no doubt emphasizes the beautiful is without any interest or logical concepts, that is, indifferent with objects, but on the other hand, this analogy is actually against another extreme claim that beauty and object are absolutely not related. The judgment that given a given object is beautiful thus has both empirical and a *priori* elements (Guyer 1997:147). These two kinds of meanings must be understood at three different respects.

Firstly, although Kant has attributed the beautiful to the inner state of the subject and broke through the traditional view which takes beauty as an object attribute, he does not pull away the reliability of the experience. The beautiful still needs the support of the empirical object to maintain its validity. There is an analogy between beauty and cognition, which also implies "empirical reality" (A28/B44) of transcendental idealism in aesthetic field. Disagreements at this point often lead to misunderstandings about

Kant. He is considered to be a typical formalist, with only a hollow subjective form out of reality. It is true that Kant's subjective shift in aesthetics makes beauty pure and non-interest, but the key point to note is that Kant has been taken these aesthetic issues on a priori level, which inevitably makes Kant's claim of beauty seem to be inconsistent or even against to real experience. Objects are often in complex relationships in real world, it is impossible to conduct a thorough investigation to these empirical matters, because of this, transcendental principles are indispensable. Putting beauty into a priori level means that beauty can be manifested in this transcendental dissection and focusing, and it is only in this transcendental purity that the possibility of beauty can be explored.

Secondly, although beauty is a purely subjective state of mind, it is not completely isolated from cognition in the transcendental philosophy system. In Kant's view, the universal voice of the judgment of taste is only a subjective requirement, while the universality and subjectivity of beauty can only be untied through the intermediary of cognition and its representation. Kant clearly pointed out that "Nothing, however, can be universally communicated except cognition and representation so far as it belongs to cognition." (KU 5:217) This is to say, only cognition is genuine objective, this declaration has been clarified in the *Critique of Pure Reason*. Kant attaches the universality of beauty to cognition in a certain analogy, in this way beauty and cognition are in a special relationship. Kant's statement basically took over his division of determining power of judgment and reflecting power of judgment. Because two different ways of judging can be distinguished in the cognition of objects, one is on the cognitive matters of objects, which is a way to achieve cognition and knowledge through logical categories and sensitive materials, this is a direct way related to objects. The other one is on the cognitive form of objects, that is, through the reflecting power of judgment to achieve a mind state, this mind state is not directly in contact with objects, but only the harmony of the subject's faculties of cognition, it plays as a certain form to affect activity of cognition itself, not directly on the matter of objects. From this we can find that the universality of the beautiful is very unique, it is not genuine but "as if" the objective universality of cognition. Beauty is related to cognition in such an analogy and reaches a subjective universality.

Thirdly, in the analogy of beauty and cognition, the objective(cognition) side dominates the relationship among the two, the subjective universality of beauty cannot violate the objective universality of cognition, this dependency cannot be reversed. "an objectively universally valid judgment is also always subjectively", "but from a subjectively universal validity, i.e., from aesthetic universal validity, which does not rest on any concept, there cannot be any inference at all to logical universal validity" (KU 5:215). Kant's hierarchy of beauty and cognition is very clear on the issue of universality. On the one hand, the subjective nature of beauty has determined its difference from objective cognition, and limited itself to providing any effective guarantee for the objective universal validity. On the other hand, the universal character of beauty also requires that it must be clearly defined at the subjective dimension. That is to say, the universality of beauty is not a genuine validity about objects. If this is basic situation is misunderstood, then the logical system of cognition will be confusing due to aesthetic intervention, which is not allowed in Kant's transcendental philosophy. Kant defines both the subjective universality of beauty and the objective universality of cognition as an irreversible dependency relationship. This is a further ascertainment of the relationship between beauty and cognition, the universal validity of beauty is restricted in subject dimension,

which further means a universal communicability among all subject who are feeling beauty.

In this relationship between beauty and cognition, Kant ensures the independent status of beauty in a subjective dimension without any matters or interest, while still limiting the validity of beauty with an analogy of cognition. Therefore, the universal voice of judgment of taste is not a fantasy but an expectable idea, this idea makes a profound impact on Kant's aesthetics.

**SLOVENIAN WOMEN VISUAL ARTISTS AND THEIR ROLE THROUGHOUT HISTORY:
A NETWORK ANALYSIS PERSPECTIVE**

Abstract | Can contemporary aesthetics and other art related sciences benefit from computer data and statistical analysis? To answer this question we research the role of women artists in slovene art in the 19th and 20th century. We use the dataset of Slovenska biografija (operated by the Slovenian Academy of Sciences and Arts). With this dataset, which to our knowledge has not been utilized in similar statistical analyses so far, we perform a social network analysis of the centrality of individual artists throughout history with a particular focus on women artists. We then locate the women artist in the network and compare this with the history of Slovenian visual arts in 19th and 20th century and the dynamics of art historical movements. Secondly, we analyze the influence of network centrality on cultural production, specifically addressing women visual artists (following approaches of O'Hagan and Borowiecki, 2010; Borowiecki, 2013; and Grafenauer, Srakar and Vecco, 2016). We use regression methodology and compare the results with the existing art historical research to answer questions such as: Which are the central women artists figures in artistic networks? What are the reasons for specific positions of women in the networks and how does this affect their artistic productivity? What are the gender specifics of visual artists' occupation in Slovenia and can this data be useful for constructing measures to lead to more equality in these terms nowadays? Results show that centrality in the network contributes to artists productivity – social capital is a significant predictor of success in the Slovenian fine art for both men and women. The network centrality is even more significant for woman artists. To our best knowledge this is one of the first studies in general, associating network centrality with artistic productivity. Additional predictors of success for artists are gender, age, birth date, occupation and multiple professional roles. This predictors of success are of different sign, size and significance, when only women visual artists are concerned. The results indicate that women visual artists, when they conquer the obstacles and gain a position in the artistic network, use it more strongly than men. We offer a few theoretical explanations: the better positioned women were the most talented/productive ones; better positions in networks simply provided women with more „boost“ to their productivity; and selective bias: the women, included in the database were the most productive ones per se. We conclude with research/policy implications of the study.

Index terms | *artistic productivity; data analysis; network centrality; visual art; women artists in slovene visual art from 19th to 20th century*

1. Introduction

Slovenian art history has been researched in numerous publications and is one of the fields in Slovenian humanities with the longest tradition. Yet, surprisingly little attention has been provided to the perspective of the network theory and groups of artists throughout history. Are the artists more productive when forming and working in groups? Is there any special influence of the confounding variables, such as gender, age, occupation, income? Are there any spillovers between artistic sectors – do the “transdisciplinary” groups such as Dada and Bauhaus show that not only is connectedness within one art sector important, the key is to connect with artists from as diverse fields as possible. Such questions have been posed and partially and/or fully answered in previous years, within the scientific literature (e.g. O’Hagan and Hellmanzik, 2008; Hellmanzik, 2009a; 2009b; 2010; 2012; O’Hagan and Borowiecki, 2010; Borowiecki, 2013; O’Hagan and Walsh, 2015; Mitchell, 2015; Kuld, 2015) mainly arts and art history domains. Although the question on the effects of networking on productivity of the artists has been solved by means of predetermined geographical-historical clusters (see previously quoted literature, e.g. Borowiecki, 2013), the possibilities of social network analysis in providing the answer to this question have not been explored yet, although social network analysis has been used in studying artists previously (e.g. McAndrew and Everett, 2014; Baia Curioni, 2012, Baia Curioni et al., 2013).

One strand of literature as summarized in Borowiecki (2013) studies the effects of geographical clustering on productivity. Borowiecki follows Glaeser et al. (1992) in outlining three formal theories of a benefit associated with geographic clustering. First theory argues that geographic proximity facilitates spillover effects between firms in an industry (e.g. Marshall, 1890) and the cost of transmitting knowledge rises with distance. The second theory is represented by Porter (1990) who argues that local competition in specialized, geographically-concentrated industries is the biggest stimulus for growth - the presence of multiple rivaling individuals should be the source of important incentives for out-performing the competitor. The third theory is proposed by Jacobs (1969) whose theories state that the most important knowledge transfers come from outside the core industry and dissemination of complementary knowledge between economic agents of diverse backgrounds should facilitate innovation. Therefore, in a geographic cluster, the presence of a high degree of diversity might lead to increasing returns.

On the other hand, theory also advocates for the relationship between network centrality and productivity effects. One strand relates to relationship between network centrality and entrepreneurial success (e.g. Maritz, 2010), another to relationship between social networking and employee productivity (e.g. Aguenza and Som, 2012; Martensen et al., 2011; Beck, 2007). Nevertheless, to our knowledge neither has so far such effects been estimated for artists (although some studies deal with the effects of networking in art firms, see e.g. Konrad, 2013; Klerk and Saayman, 2012; Kuhn and Galloway, 2015) nor on historical data. It is our task, therefore, to verify, on one hand, whether any positive effects of networking on productivity of visual artists can be found in historical data, and, on the other, whether such effects were dependent upon the gender of the artists. It is our assumption that such effects can be found and affecting the productivity of men differently than women.

Using a web-based database of *Slovenska biografija* – which has not been utilized in this way so far – we will indeed demonstrate that networking is beneficial for the

artistic productivity, yet to a slightly smaller scale and/or significance as was speculated in some previous studies based on geographical clustering. We will be able to control for the apparent endogenous, reverse causal relationship in the model (see e.g. Borowiecki, 2013) using an innovative, new instrument. Moreover, we will be able first to determine the empirical effects of other confounding covariates, second, the different utilization of network positions of men and women visual artists throughout Slovenian history. Finally, this study will be the first network analysis and empirical description of the main artistic groupings of the 19th and 20th century of the Slovenian art history.

The article is structured in the following manner. In the next section, we will provide a short literature review and theoretical underpinnings. In the third section, we will present the dataset and used methods. In the fourth section, we will present the results from the social network analysis. In the fifth section, we will present the econometric results. In the sixth section, we will present results of modelling of gender effects. We conclude by reflecting on the findings and possibilities for future research.

2. Art historical overview

Slovenia only became a federal republic in the framework of the Socialist Federal Republic of Yugoslavia. It seceded and became an independent country in 1991. Slovenia spent all the previous centuries under foreign rule, mainly under Austria-Hungary and – on its Western border – under Italy. Therefore, it stands to reason that up to around the end of the 20th century, we mainly refer to art on Slovene lands, since the fine arts were generally the purview of foreign artists which the local gentry hired to refurbish and construct houses, palaces, churches and altars; they also commissioned portraits and imported increasingly cheaper reproductions from abroad. The Turkish raids, social upheavals, religious battles and occasional epidemics, which plagued the 16th century, prevented these lands from developing further. However, in the 17th century, baroque, in addition to gothic art, left a deep imprint on Slovene lands (Stele, 1966; Höfler, 1999).

At the time, the Church, especially the Society of Jesus and Tomaž Hren, the Mayor of the Slovene capital city of Ljubljana, represented an integral part of the social network. Since Hren could not afford his own opulent court, he made due with part-time artists, while the other rare commissions were also done by foreign artists, mainly from Lombardy, Venice and Friuli.

The other important circle of people was the so called *Academia Operosorum Labacensium* (Academy of the Industrious Residents of Ljubljana). It was founded in 1698 by the Carniolan intelligentsia and patriots, the three most important founders being members of the Dolničar family (a cathedral cleric, a jurist and his son). This circle set out to culturally reform the lands, where artists were still mainly being imported from Venice, establishing important ties with the Italian city of Udine. As a follow-up of the economic development there was a construction boom in Ljubljana which also turned out to be a great opportunity for local fresco painters and builders (e.g. Franc Jelovšek and Gregor Maček), who belonged to the Venice School. At the other end of the country, in Styria, the circle around the house of Attems, a noble aristocratic family which set out to refurbish their castles in Styria. The presence of foreign fresco painters proved to be an opportunity for local artists.

The rule of Empress Maria Theresa was marked by austerity, making it a less than propitious time for the fine arts. At the same time, ties with Vienna grew ever more important, while those with Italy languished – it was this route, passing through

impoverished Ljubljana, a city unable to provide enough work for more than a brief stay, which was taken by builders, painters and other artists. Local artists, in their battle for a larger slice of the pie, relied on institutions, protecting their privileges from foreigners. At the turn of the 20th century, national consciousness and the awareness of belonging to a community of similarly-speaking nations mainly gave rise to new literature. The Slovene intelligentsia had no particular interest in the fine arts. Even writers and poets would usually adorn their homes with only one or two holy cards bought at the village fair, and not with expensive oil paintings and sculptures. (Stele, 1966; Höfler, 1999; Trenc-Frelj, 1998)

The 19th century gave rise to academies of fine arts in political and urban centers, which replaced the role of painting and holy card workshops. They were attended by local artists who first travelled to Vienna (among them were Franc Kavčič, who even became a lecturer and director of the Academy of Fine Arts, the first Slovene career artist, Lovro, Valentin and Anton Janša, as well as Carl Sütz), then Bologna, Rome, Mantua and Venice; afterwards, Munich started becoming ever more popular, while in the countryside, holy card workshops continued to operate, the most important being the Layer House in Kranj.

The giant of Slovene poetry, the romantic poet France Prešeren, struck up a friendship with painter Matevž Langus. After 1829, the latter became the central figure of artistic creation in Ljubljana, leaving behind not only portraits of his contemporary important local patrons, but also furnishing the majority of Ljubljana churches with art produced in his workshop. He was joined by painter Mihael Stroj. Anton Karinger and Marko Pernhart, two landscape artists belonging to the Vienna School, were also important for Ljubljana. Pernhart came from the Klagenfurt area. Then there was Ivan Zajec, the first academy-educated Slovene sculptor. He was later joined by Alojz Gangl. During this period, the Littoral region was marked by artist Franc Tominc, who belonged to the School of Rome, while Styria was greatly influenced by strong ties with the Austrian city of Graz. Local and oftentimes amateur painters also began to work in smaller Slovene towns, for example in Ptuj, Novo Mesto and Celje. The Venice-educated Janez Wolf, the central representative of religious art at the time, founded an important painting workshop which produced two important painters of the next generation, the brothers Janez and Jurij Šubic. Both had strong ties to Vienna.

The turn of the 20th century turned out to be pivotal for Slovene art: “The fine arts assumed the central role in society’s civilizational identity and were fully in line with European currents [...], catching up with literature and music, even completely surpassing them when it came to architecture (Jože Plečnik and Maks Fabiani), meaning artistic language became a reputable herald of the modern conceptual and representational orientation of Slovene society. Not unlike literature’s role in Slovene national development, the fine arts also became a constitutive part of national identity, intellectually ennobled to the rank of *artes liberales*. At the same time, it claimed the characteristics and elements of its own proper institutional organization (exhibitions and galleries), professionalization (school of art, plans for an academy, the formation of professional societies and ‘secessions’), and reception (art criticism, aesthetics, and theory of art).” (Brejc, 1998: 217).

For the first time, artists became true professionals. During this period, the art school founded by Anton Ažbe in Munich played a decidedly prominent role. Ljubljana was also home to two professional societies: the Society for Christian Art (from 1894) and the Slovene Art Society (1899–1904). The first was mainly dedicated to religious art and followed the philosophy of Neo-Scholastic idealism, which had numerous followers among philosophers in the region, while the second was a trade union organization,

dedicated to representing the social and professional interests of its members; in 1900, it organized the 1st art exhibition. However, it was dissolved soon afterwards due to infighting. The central role was quickly assumed by the artist Rihard Jakopič and three other fellow painters – all impressionists going against traditional artistic currents. They simultaneously established an important social network, which to a certain extent enabled them to professionally work and develop their artistic system. This tactic was significant enough as to enable art historian Beti Žerovc to write the following opening lines in her aptly titled book, *Rihard Jakopič: Artist and Strategist* (Rihard Jakopič, umetnik in strateg): “When examining the fine arts during the first half of the previous century, Rihard Jakopič crops up in all manner of places, especially at ‘intersections’ where art is embedded in its environment – more so than any other Slovene artist. He was regularly involved in various ‘non-artistic factors and endeavours’ in art, such as the market, cultural policy, politics, history, ideology, etc. In other words, in areas all too often ignored by the fine arts. If not taboo, they are generally as limited as possible, since their non-artistic nature makes them undesirable or seen as trivial, perceived as not taking part in the canonization of artists, the construction of history and hierarchy in the artistic field, etc. They are seen as being limited to the present, while history is bound to show the true nature of art, justly – and solely based on looking at works of art – separate the wheat from the chaff.” (Žerovc, 2002: 9).

The second exhibition of Slovene art, presented in 1902, already acquired a much more professional air. The already mentioned four impressionist painters were already on the scene: Rihard Jakopič, Matija Jama, Ivan Grohar and Matej Strnen. This group would henceforth set the pace and steer the development of Slovene art (Brejc, 2004; Trenc-Frelj, 1998; Kržišnik, 1979). In 1904 and by occasion of the exhibition in Vienna, they named themselves the Sava Club, therefore separating themselves from the other members of the Society of Slovene Artists. Their work was lauded by Slovenian writers (Ivan Cankar and Oton Župančič) and they quickly took over the artistic scene (especially Jakopič). Their artistic output was featured by exhibitions in Belgrade, Trieste, London and the Vienna Secession (see e.g. Mikuž, 1995; 1979). In 1909, they exhibited their art in the newly-opened Jakopič Pavilion, managed by Rihard Jakopič. The other group at the time, the more extensive Vesna, which was based on an ethnographic character, couldn’t hold a candle to them (among others, it included artists such as Šantel, Gaspari, and Smrekar). The impressionists became the torch bearers of “folk” Slovene art, despite the fact their paintings were based on French and later other international influences (see Kranjc 2001; 2004; 2005-2006).

In the 19th century, architecture was in search of its own “national identity” mainly through the work of a trio of architects educated abroad: Jožef Plečnik, Maks Fabiani and Ivan Vurnik. Not unlike Vesna’s members, the latter occasionally drew inspiration from folk motifs. Once again, the Mayor of Ljubljana (this time Ivan Hribar) played a pivotal role. Through his studies, he was attached to the more developed city of Prague and searched for Slavic sources. The other two architects were doing much the same in Vienna, but on a much grander scale. Especially Jože Plečnik developed important ties with Prague with the help of President T. G. Masaryk.

When it came to painting, the Youth Club proved to be especially important for the next generation (see e.g. Gabrič, 1995). First known as a gathering place for writers and musicians (Anton Podbevšek, Josip Vidmar and Marij Kogoj), it soon attracted the attention of artists. After its dissolution, France Kralj founded the Club of Young Artists which would later become the Slovene Society of Art, bringing together arts, mainly expressionists (Tone and France Kralj, Božidar Jakac). With the founding of the Academy of fine arts and the Museum of Modern Art immediately

after the second world war, the posts at the museum and the academic positions became important networking positions, a situation that remains valid well into our times (Božidar Jakac, Gojmir Anton Kos, Marij Pregelj, Gabrijel Stupica).

3. Data and Method

In our analysis we used dataset of *Slovenska biografija*, which is a web-based encyclopedia in Slovenian language, provided and managed by the Research Centre of the Slovenian Academy of Sciences and Arts. The encyclopedia includes information on numerous important figures in Slovenian history, grouped under 15 headings: Social sciences and services; Public Administration; Spiritual Occupations; Humanities; Agriculture and similar areas; Museums, libraries and archives; Natural and mathematical sciences; National advantageous; Craftsmen; Business persons and landlords; Entertainment and sports; Technical and technological sciences; Arts; The Army; Health care. To our knowledge, although rich in content, it has never been used before for the purpose of network analysis, which provides our analysis a special importance.

To our study we select the data for the visual artists, including the following occupations (in parentheses are numbers of included cases; the classification is based on the original database):

Painting:

- Academy painters (6);
- Aquarelle (1);
- Church Painter (1);
- Fresco (1);
- Illuminates (3);
- Illustration (19);
- Caricature (3);
- Landscape painters (2);
- Miniature (2);
- Navy painter (1);
- Drawing (17);
- Scene painters (2);
- Silhouette (1);
- Painters (297);
- Painters – self-made¹ (5);

Graphics:

- Ex-Libris (1);
- Coppercutting (12);
- Graphic workers (1);
- Graphics (35);
- Lithographs (2);
- Lithograph painters (1);

Sculpture:

- Academy sculptor (4);
- Sculptors (56);
- Sculptors – self-made² (3);

1 I.e. with no academic background.

2 I.e. with no academic background.

Design:

Designers (6);
Graphic Design (1);

Restoration:

Model makers (1);
Restoration (6);

Other visual artists:

Decoration (1);
Ceramics (2);
Modelers (1).

The following variables, constructed manually from the web based encyclopedia are used in our analysis (the choice of the variables is based on the available data in the web-based encyclopedia):

- *Century of birth* (we include data only on the visual artists from the 19th and 20th century);
- *Gender*: binary variable, taking the value of 1 for females and 0 for males;
- *Age*: for living artists their current age, for the already passed-away ones the age at their death;
- *Multiple roles*: number of different occupations the respondent is listed at the database;
- *Occupation*: the main occupation the respondent is listed at (the first on the list in the biography);
- *Productivity*: length of the biography, excluding authors name and references – such usage is justified by previous analyses of e.g. O’Hagan and Borowiecki (2010) and Borowiecki (2013)³.

Some descriptive statistics of the above variables are presented in Table 1. We list only the results for those respondents, included in our network and econometric analysis, which limits our sample to 214 cases/observations. We see that the productivity variable is skewed with clear outliers at the right end of the distribution. Median length of the biography amounts to 337 words. In our analysis, there are significantly more artists born in 19th century, about 70%. Moreover, females are extremely underrepresented in the sample, amounting to only about 12% of all respondents. Additionally, approximately 85% of included artists are/were of age higher than 50 years. Slightly less than one half of them are listed in multiple roles. Among the occupations, painters are in the large majority, followed by sculptors and illustrators.

Table 1: Descriptive statistics of main used variables

	Mean	Median
Productivity / wordcount	463.35	337.00
	%	n
19 th century	70	144
20 th century	30	62

³ It is of course possible that the measure is biased. We, therefore, take great care in our interpretations of results of econometric testing.

Female	12	24
Age (>50)	85	172
Multiple roles (>1)	44	90
Illustrator	6	12
Sculptor	14	29
Drawer	2	5
Painter	71	147
Other	6	13
Total	100	214

Source: Own calculation.

The main variable we use in the analysis relates to network centrality, defined as measure of connectedness with other artists in the sample. Our methodology mainly derives from the social network analysis (see e.g. Barnes, 1954; Bott, 1957; McAndrew and Everett 2014), controlling for endogenous network formation (see e.g. Goyal and Joshi 2003; Soramaki et al. 2007; Hiller 2014). Social network analysis has emerged as a key technique in modern social sciences, as demonstrated in largely growing literature in the field. It has gained a significant following in sociology, anthropology, biology, communication studies, economics, geography, information science, organizational studies, social psychology, and sociolinguistics. In 1954, J. A. Barnes started using the term social network analysis systematically to denote patterns of ties, encompassing concepts traditionally used by the public and those used by social scientists: bounded groups and social categories. Scholars such as Berkowitz, Borgatti, Burt, Carley, Everett, Faust, Freeman, Granovetter, Knoke, Krackhardt, Marsden, Mullins, Rapoport, Wasserman, Wellman and White expanded the use of systematic social network analysis.

In cultural economics, several usages can be noted. In the economics of music, studies by Becker (1982), Faulkner (1983), Finnegan (1989), Crossley (2008) and Bottero (2011) led the development in the field. In recent years, a notable study by McAndrew and Everett (2014) was presented, studying the case of British classical composition, both as an example of a music network, and to contribute to debates in music history. It demonstrated that for the British composers, access to elite networks depended both on ability and personality; while many talented marginal figures were undoubtedly simply unlucky in that they possessed all the 'right' attributes but somehow did not break through, others were marginal partly through personal choice and self-imposed isolation. Some composers chose more commercial paths with less need for network support. Others chose to compose music, which was difficult to program or publish (McAndrew and Everett, 2014: 20).

In our study we will use models from endogenous network analysis, trying to answer to these three key questions: 1) which were the main central figures with most social capital in Slovenian art history and did they form part of larger networks? 2) What is the relationship between network centrality and cultural production, after controlling for the apparent endogeneity in the model? Our assumption is that the ones with better connectedness will likely be more productive, while the ones more productive will also likely be more connected. We answer the latter question using instrumental variable empirical strategy, adopting one of the measures of centrality apparently unrelated to production as an instrument.

Finally, we explore the different relationship between network centrality and productivity regarding women as compared to men. We expect that women would tend to use their network position more intensely as they were clearly deprived in artistic recognition and when reaching a better position, one would expect that this would positively contribute to their productivity even *more than for men* with comparable empirical characteristics.

Main hypotheses we want to test, therefore, are the following:

H1: Networks in Slovenian art history of 19th and 20th century closely followed the art historical movements of the time.

H2: We can find significant and positive effects of network centrality on artistic productivity even after controlling for the endogenous relationship between the two variables.

H3: We can also find significant effects of age, gender, century of living, artistic occupation and multiple artistic roles' holding on artistic productivity.

H4: The effects of networking on productivity were significantly different for women than for men (we expect that women will have a stronger effect of networking on productivity).

The study of social networks is a new but quickly widening multidisciplinary area involving social, mathematical, statistical, and computer sciences (for the application in social environments see Burt, Minor and Associates, 1983; and Wassermann and Faust, 1994; for the field of economics in particular see Dutta and Jackson, 2003). The term social network refers to the articulation of a social relationship, ascribed or achieved, among individuals, families, households, villages, communities and regions. Each of them can play dual roles, acting both as a unit or node of a social network as well as a social actor. In its first incarnation, modern social network analysis was introduced by a psychiatrist, Jacob L. Moreno, and a psychologist, Helen Jennings which conducted elaborate research, first among the inmates of a prison (Moreno, 1932) and later among the residents in a reform school for girls (Moreno, 1934). In contemporary forms, social network analysis is being transferred also in natural sciences such as physics (see e.g. Watts and Strogatz, 1998; Girvan and Newman, 2002; Holme, Huss and Jeong, 2003; Kolaczyk, Chua and Barthelemy, 2007; Newman, 2006) and biology.

As confirmed in the existing body of literature (e.g. Goyal and Joshi 2003; Soramaki et al. 2007), in the social network analysis we use four main parameters as defined below:

- *Degree centrality*, an example of radial centrality, placing centrality from walks of length one;
- *Eigenvector centrality*, placing centrality from walks of infinite length;
- *Betweenness centrality*, an example of medial centrality, denoting the number of shortest paths which pass through the given vertex;
- *Closeness centrality*, the total geodesic distance from a given vertex to all other vertices.

4. Results – Network analysis

In Figure 1 we present results of the circular network representation of our sample. When clustering the artists on similarity of members of the cluster and their belonging to a certain historical movement or artist genre, we obtain six large groups):

- *The Impressionists*: Edvard Wolf; Anton Karinger; Valentin Šubic; Pavle Šubic; Štefan Šubic; Rudolf Jakhel; Anton Ažbe; Pavle Šubic Jr.; Jurij Šubic; Janez Šubic Jr.; Janez Wolf; Janez starejši Šubic; Roza Sternen; Ivana Kobilca; Matej Sternen; Maks Koželj; Ferdo Vesel; Ljubo Ravnihar; Ksenija Prunk; Jurij Jurčič; Julij Lehmann; Anton Jebačin; Jožef Petkovšek; Simon Ogrin; Josip Macarol; Ivan Grohar; Rihard Jakopič; Janez Borovski; Peter Žmitek; Matija Jama; Matija Bradaška; Franc Rojec; Fran Zupan; Pavel Gustinčič; Zdenko Skalicky; Anica Zupanec-Sodnik; Mirko Šubic; Čoro Škodlar; Blaž Šubic; Anton Cej; Aleksander Roblek; Alojzij Šubic.
- *The Modernists*: Zvest Apollonio; Gabrijel Stupica; Walter Bianchi; Veno Pilon; Vladimir Stoviček; Ivan Kos; Božidar Jakac; Karla Bulovec; Vinko Turk; France Kralj; Gojmir Anton Kos; Marlenka Stupica; Marjan Vojska; Lucijan Bratuš; Maksim Sedej; Klavdij Ivan Zornik; Alojzij Šušmelj; Karel Zelenko; Marij Pregelj; Miha Maleš; Jakob Savinšek; Tinca Stegovec; Jože Trpin; Jean Vodaine / Vladimir Kavčič; Ive Šubic; Janez Sedej; Ivan Seljak; Savo Sovrè; Anton Kralj; France Slana; France Ahčin; Franc Zupet; Anton Sigulin; Evgen Sajovic; Mara Kralj-Jerajeva.
- *The “Vesnans”*: Vladislav Pengov, Franc Sterle, Alojzij Repič, Celestin Mis, Viktor Birsa, Luigi Spazzapan, Cvetko Ščuka, Valentin Kos, Saša Šantel, Rajko Šubic, plemenita Elza Kastl, Hinko Smrekar, Fran Tratnik, Julče Božič, Jože Srebrnič, Ivan Žnidarčič, Anton Sever, Maksim Gaspari, Janez Povirek, Ivan Varl, Ivan Sajevec, Anton Perko, Gvidon Birolla, Franc Klemenčič, Svitoslav Peruzzi, Alojzij Gangl, Matija Koželj, Gabriel Justin, Franc Mrčun, Elza plemenita Obereigner.
- *The Old Masters*: Viljem Künl, Pavel Künl, Terezija Lipič, Matevž Langus, Jožefa Struss, Mihael Stroj, Jožef Jakob Tominc, Josip Batič, Frančišek Caucig, Avgusta Šantel Jr., Jožef Ernst Tunner, Franc Kurz zum Thurn und Goldenstein, Josip Kogovšek, Janez Avguštin Puhar, Franc Pustavrh, Melita Rojic, Henrika Šantel, Henrika Langus, Ivan Frankè, Amalija Hermann von Hermannsthal, Alojzija Marija Jožefa Petrič.
- *The “Sculptors” (no special historical movement can be related to the members of this group while most of members are/were renowned sculptors)*: Vlasta Zorko, Slavko Tihec, Zdenko Kalin, Boris Kalin, Karel Putrih, Marijan Tršar, Melita Vovk, Dušan Tršar, Janez Weiss, Janez Vidic, Gorazd Sotler, Frančišek Smerdu, Marko Šuštaršič, Lojze Dolinar, Drago Tršar, Peter Loboda, Ciril Velepich, Avgust Andrej Bucik.
- *The Layer’s workshop (based on the artist workshop of 19th century, led by Leopold Layer)*: Leopold Layer, Matej Goričnik, Anton Hayne, Jurij Miškovič, Janez Potočnik, Andrej Janez Herrlein, Josip Egartner, Jurij Tavčar, Ludovik Grilc, Jernej Jereb, Jakob Mikše, Gašpar Luka Goetzl, Franc Serafin Goetzl.

Figure 1

Figure 2

Source: Own calculation.

In Table 2, we also list some basic characteristics of the analyzed network. Clearly, large discrepancy between average and median values of the four connectedness parameters (degree-, betweenness-, closeness-, and eigenvector centralities) is noted. Particularly large is the difference in closeness centrality and betweenness centrality. Furthermore, there are seven connected components, which could be an approximation for the number of clusters noted above. The graph density is very low, indicating a large number of very weakly connected vertices.

Table 2: Characteristics of the analyzed network

	Degree		Closeness	Eigenvector
Minimum	1	0.0000	0.0010	0.0000
Maximum	19	3606.720	1.0000	0.0041
Average	3.4579	285.4673	0.0877	0.0005
Median	2.0000	19.4277	0.0013	0.0002
Connected Components	7			
Single-Vertex Components	0			

Maximum Vertices in a Connected Component	433
Maximum Edges in a Connected Component	453
Graph Density	0.0045
Maximum Geodesic Distance (Diameter)	9
Average Geodesic Distance	3.16

Source: Own calculation.

In Table 3 we see the rankings of the main central figures, according to degree, betweenness and eigenvector centrality parameters. The key figure in degree and betweenness centrality is Alojzij Repič, an academy sculptor, being the educator of many key figures in the visual arts of that time. Also, several key impressionist figures can be noted (to no surprise): Rihard Jakopič, Anton Ažbe, Matej Sternen, Ivan Grohar, Matija Jama and Ferdo Vesel. Furthermore, among the modernists, Gabrijel Stupica, Božidar Jakac and France Kralj stand out as key connected/connecting figures. Among the older artists, Janez Wolf is surely the key figure. Several “Vesnans” are also on the list, most notably Saša Šantel and Hinko Smrekar. Finally, Leopold Layer, the leader of the noted workshop of the 19th century also stands out as one of the key figures.

Table 3: Rankings of main central figures

Rank	Artist	Degree centrality	Rank	Artist	Betweenness centrality	Rank	Artist	
1	Alojzij Repič	19	1	Alojzij Repič	3606.72	1	Rihard Jakopič	0.0406
2	Rihard Jakopič	16	2	Rih. Jakopič	3509.46	2	Anton Ažbe	0.0399
3	Anton Ažbe	14	3	Saša Šantel	2574.43	3	Ivan Grohar	0.0301
4	Gabr. Stupica	14	4	Jurij Tavčar	2140.04	4	Matej Sternen	0.0300
5	Janez Wolf	14	5	Mat. Sternen	2000.26	5	Janez Wolf	0.0251
6	Saša Šantel	13	6	France Kralj	1924.99	6	Matija Jama	0.0235
7	France Kralj	12	7	Jos. Egartner	1629.00	7	Jurij Šubic	0.0230
8	Matej Sternen	12	8	Janez Wolf	1558.44	8	Ferdo Vesel	0.0222
9	Božidar Jakac	11	9	Matej Langus	1515.87	9	Alojzij Repič	0.0209

5. Results – Econometric testing

Next, we perform some econometric tests to answer to the question on the relationship between network centrality and productivity. To this end, we firstly use basic Poisson models, taking into account the apparent count nature of the productivity variable. Table 4 presents the results of the basic models, where we introduce the marginal effects of the used independent variables to the level of productivity. The results show that women tend to have lower productivity, as expressed by wordcount of their biographies (this could also be a consequence of their under-representedness in the sample and/or of the prevailing discrimination to women artists throughout the 19th and 20th century). As compared to men, women tend to have on average approximately

60-100 words shorter biographies which could be a consequence of women been much more seldom represented among the leading artists, in particular in the 19th century. The coefficient on age is significant and shows the expected inverted (U-shaped) effect. Furthermore, those born in the 20th century tend to have on average approximately 100-180 more words in their biography. Furthermore, illustrators, sculptors, drawers and painters tend to be significantly more productive than other visual arts occupations. Finally, three of the four centrality parameters (i.e. degree, betweenness and eigenvector centrality) are strongly statistically significant and of the positive size. Due to their different construction, it is hard to make any sensible conclusions based on their marginal effects. On the other hand, the closeness centrality has an ambivalent and insignificant effect to the productivity of the artist which could be a sign that geodesical distance is/was not important for the productivity of Slovenian artists through 19th and 20th century which is a finding, interesting to explore in further research.

Table 4: Results of econometric testing, marginal effects, no endogeneity included

	Poisson regression - marginal effects		
	Model I	Model II	Model III
Female	-59.408***	-94.981***	-105.757***

Note: Significance: *** - 1%; ** - 5%; * - 10%

Source: Own calculation.

To this end, we use closeness centrality as an instrument to control for the possible effects of reverse causality. As it shows up, the closeness centrality is a valid (uncorrelated to the error terms of original regression) as well as a strong (strongly correlated to all other three centrality parameters) instrument. Using it as an instrument can provide a solution, improving the measures previously used by e.g. O'Hagan and Borowiecki (2010) and Borowiecki (2013), such as distance of the birthplace to the place of living. The possible reason for closeness centrality being the valid instrument could lie in (at least for Slovenia, but perhaps for the artists in general) the actual "physical", geodesic distance mattering much less than other types of network centrality, which would

mean that actual distances between artists play a minor role in the development of their network.

The results below confirm the positive and (weakly) significant effect of the network centrality on artists' productivity even after controlling for the endogeneity. All three centrality parameters are in the level of significance of approximately 10%. This serves as another strong argument in the debate on the supposedly positive effects of networking on artists' productivity. Moreover, it serves as a confirmatory answer to our second research question: networking/connectedness indeed positively affects artists' productivity, particularly related to the degree centrality. Additionally, all the other control variables do not change in sign, although slightly lose in the level of significance.

Table 5: Results of econometric testing, endogeneity controlled for using instrumental variables

6. Results - Networking of women visual artists

In the final empirical part we explore the relationship between network centrality and productivity as compared between women and men. To this end, we construct a series of interaction variables, namely:

- *Age_woman*: interaction between variables Age and Woman;
- *Agesq_woman*: interaction between variables Age squared and Woman;
- *20Cent_woman*: interaction between variables Born 20 Century and Woman;
- *MultRol_woman*: interaction between variables Multiple Roles and Woman;
- *Illustr_woman*: interaction between variables Illustr and Woman;
- *Sculptor_woman*: interaction between variables Sculptor and Woman;
- *Drawer_woman*: interaction between variables Drawer and Woman;
- *Paint_woman*: interaction between variables Paint and Woman;

- *Degree_woman*: interaction between variables Degree and Woman;
- *Between_woman*: interaction between variables Between and Woman;
- *Eigenvec_woman*: interaction between variables Eigenvec and Woman.

In Table 6 we present results of six models, namely, for each type of centrality we present results of modelling when including only the interaction variable for women and network centrality (the “reduced” model) and when including all interaction variables (the “full” model, controlling, therefore, for the differences between men and women in all observed characteristics).

The coefficients of our main interest are highlighted in grey. As for the degree centrality, the coefficient on interaction effect is insignificant in the “reduced” model while being positive and strongly significant in the “full” model. As for the betweenness centrality, the coefficient on interaction effect is negative - and strongly significant - in the “reduced” and positive and strongly significant in the “full” model. Finally, for the eigenvector centrality, the coefficient on interaction effect is positive and strongly significant in both models.

Therefore, although the evidence is not fully uniform (in particular for the betweenness centrality), it shows that women tend to have a stronger interaction, networking effect than men and therefore tend to use their network central position to improve their productivity much more intensely than men.

To our interpretation, three main elements related to women better positioning in the network may explain this effect:

- The better positioned women were also the most talented and/or productive ones, in particular due to selectivity effect, as women were clearly deprived to men in artist history throughout 20th and, in particular, 19th century;
- Better positions in networks provide women with more „boost“ to their productivity, due to some of their inherent characteristics as compared to men;
- Selective, sampling bias: the women, included in our analysis were already the most productive ones *per se*, as in our sample we included only the ones with biographies in the web encyclopedia *Slovenska biografija*.

Although all three interpretations seem likely, we would opt for the first one, which connects to the historical role of women visual artist the best and provides some nice fit to the existing literature in art history. Nevertheless, we hope that verifications in later research could provide a better-grounded and final answer to this observation.

Table 6: Results of econometric modelling (Poisson models), women effects

7. Discussion and Conclusion

In this article we analyze the social networking of Slovenian women artists in the 19th and 20th centuries. To contextualize our analysis firstly, we present a theoretical overview of groups of Slovenian visual artists. We point to some initial groupings, with the predominant role of the impressionist movement at the end of the 19th century with several key figures.

Secondly, we demonstrate the existence of six key “empirical” groups of artists throughout the 19th and 20th centuries (mainly following the art history classifications of historical movements and/or art genres, which confirm the hypothesis H1): The Impressionists; The Modernists; The “Vesnans”; The Old Masters; The “Sculptors”; The Layer’s workshop. Moreover, we point to its key central figures, carrying the representatives of all six groups, with slight difference concerning the measure of centrality under consideration.

Thirdly, we estimate the effect of network centrality on artistic productivity, using a newly chosen instrumental variable to take into account the endogeneity in the model. We confirm the positive effect of network centrality on artistic productivity, yet with a significantly lower effect in significance as pointed out by some of the current literature. This serves as confirmation of hypothesis H2.

We also estimate the effects of confounding covariates, and found the negative effect for women, positive for age, positive for the 20th century birth occurrence and positive for several of the chosen occupations, which confirms the hypothesis H3.

Finally, we confirm a stronger relationship between network centrality and productivity for women as compared to men artists and provided some possible explanations, opting for the one that shows that the better positioned women were also the most talented/productive ones, in particular as women were clearly deprived to men in artist history throughout 20th and, in particular, 19th Century. This confirms also hypothesis H4.

Although the innovative aspects of the approach adopted, some limitations and questions for future researches - using the same dataset - can be presented.

One obvious limitation is in the sample size and selection. Not only are we limited in the possibilities of the web-based database *Slovenska biografija*, also there is a real possibility of selection bias. The artists selected and published on the website of course represent only a small minority of the artists throughout history. The conclusions in our article, therefore, cannot hold in general, without verification on a comprehensive dataset of all artists: the successful and well known's as well as the less successful ones. Although we do not expect the main direction of the findings could change, there could be changes in the size and significance of the findings.

Furthermore, we do not take into account the "spillovers" across sectors. The database of *Slovenska biografija* allows a rich perspective on networking across multiple disciplines, not just across the arts but across all other fields of the society. By this, we would be able to answer to another still open question in the literature waiting for a proper study and approach.

Additionally, the network relationships between artists are of binary nature – either they are/have been connected through history or not. One could speculate that differences could be observed whether the relationships were due to family ties (marital status, blood ties), education and/or later career. It would be very interesting to model this heterogeneity in the type of relationship in the analysis as well. Additionally, no specific analysis has been developed to study the cross networking to check the impact of Slovenian artists at international level. This could be useful to understand the centrality and relevance of the Slovenian artists within the international artistic community and how they increase or decrease their social and artistic visibility. As the art history tells us (a good example is represented by Arte Povera), sometimes artists, misunderstood or not properly or fully recognized in their own country may be recognized first at international level. This clearly implies a non-linear trajectory in their artistic career (Besana, 2008).

Finally, the dataset could be extended in multiple other ways. We could include the data from other (printed or digital at international level) encyclopedias, which would surely complement and enrich our dataset significantly. As other potential extension, we could include also the artists from previous centuries, which are not supported by sufficient data in the current web-based database. Finally, some galleries collect the data of all their exhibitions, cooperating artists, performance, etc. throughout history. We plan to collect such a database on a larger scale from one of the main Slovenian galleries. Here lies another important pathway of future research. We hope that the approach, developed in this article, will provide a sufficient foundation for such endeavors in future.

Andrej Srakar, PhD (Economics), PhD candidate (Mathematical Statistics), is Research Associate at the Institute for Economic Research in Ljubljana, Assistant Professor at Faculty of Economics, University of Ljubljana and Co-Editor of Review of Economics and Economic Methodology (REEM). His main research interests include cultural economics, management and policy, mathematical statistics, econometric theory, macroeconomics and health economics. He published among other in Journal of Cultural Economics, Cultural Trends, Journal of Cultural Heritage, Poetics, International Journal of Arts Management, European Planning Studies, Journal of Knowledge Management, Post-Communist Economies, International Journal of Computational Economics and Econometrics, Hacienda Pública Española / Review of Public Economics and Géographie et cultures. He was Chairman of Društvo Asociacija, the largest umbrella organization of NGO's and freelancers in the field of culture and the arts. He serves as correspondent for Slovenia and member of Association of Compendium Experts Board at the Compendium of Cultural Policies and Trends.

Petja Grafenauer, PhD (1976) is a curator, writer and assistant professor at the Academy of Fine Arts and Design, University of Ljubljana. She is a specialist in the local and regional art created after World War II, primarily painting. Since 2012 she has also been researching possible cross-sections of economy and art. 2016–2017 she was the head of the Department for Photography at the Higher School of Applied Sciences, 2005–2016 she lectured at the Arts Academy of the University of Nova Gorica. In 2013–2014 she was a curator at the Museum and Galleries of Ljubljana. She has contributed to Borec, ISH Monitor, Maska, Art Words, Ekran, Fotografija, Zarez, Život umjetnosti, Manifesta Journal, Art on Paper, etc. She organized the exhibitions: Non-Aligned Pop (2016–2017); the Ljubljana Biennial of Graphic Arts, with you since 1955 (the 30th Biennial of Graphic Arts, 2013); We Want to be Free as our Fathers (2010, with Božidar Zrinski) and others.

Marilena Vecco, Phd, Associate Professor in Entrepreneurship, CEREN, EA 7477, Burgundy School of Business - Université Bourgogne Franche-Comté. Dr. Marilena Vecco is Associate professor in Entrepreneurship at Burgundy Business School, Dijon. She holds a PhD in Economic Sciences at University Paris 1, Panthéon Sorbonne, and a PhD in Economics of Institutions and Creativity at University of Turin. Her research focuses on cultural entrepreneurship and management with a special focus on cultural heritage (tangible and intangible) and art markets. Marilena has over 17 years of academic and professional experience as a researcher, lecturer, and consultant for different international organisations (OECD, Centre for Entrepreneurship, SMEs and Local Development, World Bank, and The European Commission). She is the author of several books, book chapters and articles published on different journals.

LEARNING FROM KIBERA: LOCATIVE MEDIA AS A PRACTICE OF MAPPING THE VERNACULAR

Abstract | The recent development of OpenStreetMap(OSM) platform has democratized the process of cartography by giving non-specialists the ability to express valuable spatial knowledge for their places. However, design tools offer pre-established interpretations and perceptions of geographic information. The classification of the environmental information into nodes, ways, and relations, as well as the tags on them, offer a worldwide network of mashup information. While that system of navigation was developed along with the need for quick solutions to everyday needs in modern cities, it remains unclear what happens when that system is used to describe vernacular social spaces such as a slum city. This paper examines how the design tools of an interactive digital map form a system of symbols that depict the social web and why this is different in a slum city. The paper is divided into three parts. The first attempts to include digital cartography into a broader socio-historical context where the map is perceived as a medium of representation and understanding of space. Specifically, the user-generated content (Web2.0) combined with the development of the GPS system, linked internet with physical locations. Way-finding and decision-making is more and more based on the digital map. In the second part, a reference is made to the methods that have been developed in relation to participatory cartography. In particular, Volunteered Geographic Information (VGI) is differentiated by the Participatory GIS (P-GIS) in terms of user's participation. Finally, in the third part, an example of an interactive map is being studied, in the Kibera slum in Nairobi, Kenya. The depiction of Kibera in terms of interactive mapping '*voice of Kibera*' follows the representation of an urban center on the digital platform. White vectors exist where the slum can be crossed by a car, brown vectors exist where there is a pedestrian path and colorful signs depict places of worship, cinemas, clinics and even hairdressers. The depiction of Kibera's different tensions and qualities in a worldwide map attempts to create a new identity that represents the slum in the global village. Like a Foucault's heterotopia, a slum city is a place of deviation, worlds within worlds that juxtapose several spaces. The new media have given a new potential reality in the slum where the symbol, unlike the LasVegas strip expresses an architecture that is based on social structures and that's what we can learn from Kibera.

Index terms | *Kibera; locative media; OpenStreetMaps; Participatory GIS; Volunteer Geographic Information; Web2.0; geomash up; tags;*

INTRODUCTION

The second generation of the Internet (Web 2.0) and the spreading of mobile technology have led to the ability of user-generated content in virtual community. In particular this content combined with the development of the Global Positioning System (GPS) resulted in the interrelation of the Internet with physical locations. More and more information on the Internet is organized and depends on the location of the user on a digital map. [1] On the other hand, the user may participate in the production, interpretation and visualization of geographic information. While in developed societies this is perceived as a technological trend, in developing countries a method called participatory Geographic Information System (P-GIS)[2] has emerged and developed aiming to collect, map and use the unknown yet valuable local geographic information. Specifically, P-GIS is used on a large scale in South Africa as a methodological tool that combines local and scientific knowledge to achieve map precision.[3] However, as will be further explored in the second part, there are differences in the way tools are used depending on the degree of participation. In particular, Volunteered Geographic Information (VGI) is differentiated with the participatory GIS (P-GIS) system. Finally, in the third part, the example of Kibera mapping in Nairobi, Kenya is being studied as a methodological tool of mapping the vernacular. The reason Kibera has chosen is because this paper argues that the mapping method has an active impact on the mapped space and that becomes clear in the slum city. The sophisticated technological way that modern world looks and maps the slum city forms a relation of power. This consumption comes from Foucault's argument that knowledge and power are inextricably linked.[4] Furthermore, the way the symbol, as a basic tool of cartography appears on the map of Kibera, acquire a completely different meaning in relation to what Venturi described in Las Vegas interpretation of architecture and that's what we can learn from Kibera.

Mapping space and meaning

'A map tells you : read me carefully, follow me closely, do not question me. It tells you : I am the world in the palm of your hand. Without me you are alone and lost.' –Beryl Markham[5]

The cartographic process is consisted by a series of assumptions where the cartographer takes in order to make conscious design choices expressing and proposing specific concepts of approaching the natural world. As Denis Wood says in his book, *the power of maps*, a map is a tool that can only be evaluated for the purpose it is intended to accomplish. He emphasizes that every map has a purpose. [6]

The earliest medieval maps included only the path lines that usually involved places of worship, rest stops and were consisted of lines responding to walking times. Those maps had the purpose of worship and pilgrimage and the symbols where related to that. From 15th to 17th century mapping is evolving. A plethora of narrative drawings, such as ships, animals, faces and beasts adorn it, expressing the purpose and the perceptions behind its construction. These depictions were fragments of narratives, notes that indicated the processes from which the map emerges. For example, a sailboat symbolized the navy mission or the beasts declared a dangerous place. [7] In those maps symbol is the alive and depicts how cartographer perceived the world within his own subjectivity. The map slowly began to change and to omit those symbols that testified its origin and perceptions. It became independent. It is transformed by the

Euclidean geometry, consisting a set of abstract sites. The map becomes a final result with no origin and no purpose. It eliminates the mariners' routes, the notes, the steps of designing it, the 'behind-the-scenes'. In modernity, the design of the map becomes a subject studied by the specialist-scientist and his expression becomes an undeniable truth. Each geographic element need to acquire a name and location accuracy. The natural environment and the experience of it become subject to intensive research. Along with the scientific objectification of nature, emerged the aesthetic presentation of nature as a 'landscape'. [8] It seems that there can be no notion of 'landscape' if there is no gaze towards it and for this is needed a distance. This gaze presupposes a relationship of supervision between the subject (observer) and the object (landscape) and consequently a relationship of power. The idea of portraying the world as a coherent whole appearing on a map is equivalent to what Simmel call the '*landscape unity*'. [9]

'[...]the case of science is no different. Its methods and rules, in all its untouched height and omnipotence, are only the self-styled forms of everyday knowledge that have reached universal domination' [10] – Simmel

Nowadays in the beginnings of the 21st Century there is the ambition that every part of the planet is or will soon be on the screens of our mobiles. The GPS technology formed a location-aware culture that understands space in terms of longitude and latitude. The integration of GPS in mobile devices in combination with Web2.0 user-oriented applications made possible to record and attach each physical location to a digital map. In incomprehensible environments where disorientation and alienation seem to dominate, GPS navigation is a necessary tool. Those places are what Auge called *non-places* where the only way to navigate is the symbol and the text as the environment itself does not provides the necessary information. Such a condition is encountered on a motorway or on an airport. [11] Robert Venturi in *Learning from Las Vegas* refers to a motorway where the billboards and the symbols define the whole environmental experience. [12] In a fast car-drive, architecture is not enough and signs take over. However, this system of fast moving, fast food, fast entertainment does not refer only to the car navigation but has found use in everyday activities serving the modern fast paced world.

'The awareness of the location on networked mobile devices made it possible to attach invisible notes to places, people and things' – Ben Russell

From the above it follows that since a map has a purpose for use and hence different modes of representation, in the study of spatial urban issues what maps do we have to use? If the tools of mapping affects the way we perceive and then attribute meaning to places ,is possible to reverse that process of learning? Can personal experiences and meanings affect the methodological research tool itself?

Participatory GIS – Volunteer Geographic Information

The idea that the city's perception varies depending on the subject's interpretation and that is much more than a geographical indication on a map, begins in the middle of the 20th century. A typical example of reference is Kevin Lynch's book, *Image of the City*, where he explores the way the subject perceives space. He introduces a different cartographic system by depicting the cognitive process according to which daily navigation is performed using 5 mental elements (node-edge-district-landmark-path).

[13] These mental maps are crucial to understand participatory cartography as they include for the first time the no-expert concept of space study and orientation.

Participatory mapping in particular concerns a ‘bottom-up’ approach to cartography that allows residents to create maps that serve their own needs. Data can be tangible, such as locations, streets, homes or bus stops, but they may also be vague, such as a feeling of security, accessibility and collectivity. This second category of data is an integral part of the space experience and requires interactivity between the subject and the environment. Participatory cartography was born in the 1970s in an attempt to voice local knowledge and worries about development projects. The general argument concerns the fact that a map made by people who are very familiar with a place offer a better and more accurate spatial image of the place. Another question that arose is whether the scientist simply uses geographic information from the inhabitants of the site or collaborates to the extent that residents can intervene in the representation tools. There are indeed degrees of participation. In its minimal version, the resident will provide the information without any responsibility in the final result. In other cases, participants are trained and actively involved in decision-making with regard to the final outcome and their assistance is a key factor in the process. In this case there is a circle of re-evaluation and reforming of the tools. [14]

‘A map is open, capable of disassembling, reversible, and susceptible to constant change. It can be divided, removed, adapted to each fit. It can be held by a person, a group or a community. It can be painted on a wall, perceived as a work of art, constructed as a political action or as a communication medium. Unlike the record that always has the same result, map has multiple entries’

G. Deleuze and F. Guattari [15]

Participation requires awareness of the subject belonging to a collectivity and thus assuming responsibilities within it, it feels an integral part of the process. In the digital age, geographic information is often given by users, but is rarely experienced as participation.

Butler in the Virtual Globes article: ‘The web-wide world’ reports the arrival of Google Earth phenomenon as the democratization of the Geographic Information System (GIS). [16] This is because it has made some of the most important features of the GIS publicly available. Google Earth and Google Maps have made popular the term ‘mash-up’, which is the ability to overlay geographic information from sources distributed over the internet, many of them created by amateurs. Through digital tools such as geographic information systems, digital photography and open maps, users are increasingly able to add locations or explanatory information to maps as well as spatial narratives or spatial presentations. Thus, same tools are provided by a common server where different users attach their stories. The validity and the up-to-date mapping depend on the public need or interest for more accuracy. The more the volunteers involved the more accurate the map will be.

The Volunteered Geographic Information System (VGI) refers to this information provided by unskilled people for the accomplishment of a purpose. The term VGI is introduced by Michael F. Goodchild where it characterizes the inhabitants as sensors capable of recording and environmental information. [17]

In OpenStreetMaps the input of the data concerns the mapping itself and the

information is input from the tools provided by the application. There are nodes, roads (open, closed, semi-closed) attachments and relations. Another example is Ushahidi (in Swahili means testimony) where it is an organization that develops applications for the collection, representation and interaction of local information. The development of such movements in Kenya has begun to intensify since the 2008 election crisis. In particular, the Ushahidi platform concentrates incidents of violence taking place in the capital of Kenya [18] This application enables all users to record and report events in the city.

Learning from Kibera

The initial establishment of the city was in 1899 from Great Britain where the construction of a railway to Uganda created the need for an administrative center. Initial colonial design has built Nairobi for European residents and African workers. Between 1900-1949, the government marginalized non-Europeans in the suburbs, a major part of which is today's Kibera.[19]

Mapping the Kibera slum in Nairobi coincides with the crisis in Kenya in 2007-08. This crisis had arisen with the end of the December 2007 elections where they were challenged for fraud. [20] There followed protests and civilian conflict that resulted in humanitarian, political and economic crises. After October 2009, began a mapping of Kibera in the context of improving living conditions inside the slums. At the same time, the main goal of the project was to make Kibera visual on global map thus making world public aware of the pure living conditions. Within a few months, young people from each of the 13 areas of Kibera were trained in the use of GPS and computer. With the help of mobile devices and OpenStreetMaps as a background it was possible to record the valuable local information.

As featured by Erica Hagen, the task manager, this mapping aims to enable Kibera residents to feel that they are on the map and that they are part of the city. The depiction of Kibera's different tensions and qualities in a world-wide map, attempts to create a new identity that defines the slum. At the same time, as Hagel mentions, highlighting important sites and buildings, such as a school, attempts to give a sense of stability and security in an environment notably unstable. [21]

This mapping of the vernacular slum city is essential for providing the necessary humanitarian aid, yet the general strategy remains unclear. The mapping of Kibera coincides with the first tourists excursions that took place in 2008. Its worldwide visibility has mobilized the interest of many organizations, tourists, activists and academics. Today, ten years later, Kibera is considered to be a safe place for tourists having many guided tours where locals cooperate with touristic agents however it remains not recognized by the government.[22] Furthermore Kiberians don't have property rights something that in Jule 2018 permitted the government to demolish part of the slum to make way for motorway development. [23]

The display of Kibera in terms of vector and site attachments follows the way of representing any urban center on a digital map. White vectors exist where the slum can be crossed by car, landmarks are tagged such as places of worship, cinemas, clinics, recreation areas and even hairdressers appear on the interactive map. This system appeared in mobile phone application and evolved along with the use of the car serving the need for fast navigation.

Conclusion

The GPS with Kibera's visibility to a global audience interferes with how residents perceive and read their place. Kibera's participatory cartography despite 'bottom-up' design remains a tool that has a purpose which purpose remains unclear along with the improvement of living conditions. It seems that alongside humanitarian aid, it has also triggered the interest of touristic spectacle. Kibera's problems and real challenges are turning into a world-wide spectacle to poverty. The basic problem in both humanistic and touristic approach is that they are both present-oriented. None of the two approaches looks in the past and in the future of the slum. This results in having the real living conditions detached from its context, independent from its past and future situation. The digital maps are making links of direct association of tags or nodes that lost the real meaning of locations. That is what we really can learn from Kibera about the meaning of place. The digital open-source map as any other map is just a tool that serves specific purposes. In the case of Kibera these specific purposes remain unclear.

SUBLIME META-REALITY AND TECHNOLOGICAL ROMANTICISM

Abstract | The sublime is a classic aesthetic category which has shared historical relevancy with others such as the beauty, the ugliness or the grotesque. However, due to its rhetorical provenance linked to the hypsos, namely to “the highest discourse”, to everything is beyond our cognisance, the sublime provides a manifold of possible new interpretations of the contemporary world, which increasingly blurs its boundaries between the material and the immaterial. Throughout the theoretical construction of this aesthetic category, whose core was shaped by Longinus, Edmund Burke and Immanuel Kant, certain elements were repeated as its central characteristics. Aspects such as the search of the infinite and the unlimited, as well as the attention on the formless, became in its fundamental qualities. These ideas would also connect with a world-view and with a variety of phenomena resulting from the capitalist ideology reflected in our systems of coexistence, and in our environments either physical or virtual. This presentation aims to scout into the kernel of the sublime, setting logical relations between this aesthetic notion and the irruption of a new nonphysical reality interconnected with a material one whose boundaries are in continuous alteration. Such a situation will be called “sublime meta-reality”. Some topics that will be revised are the modification of our relationship with Nature, the lack of physical limits in the virtual realm and the role played by the Romanticism- become in a technological Romanticism- in this multifaceted cultural setting. In doing so, some key ideas by contemporary authors such as Manuel Castells, Javier Echeverria, Pekka Himanen, Antonio de Negri and J. F Lyotard will be contrasted with those by the triumvirate made up by Longinus, Burke and Kant. This will give us a renewed outlook of this aesthetic concept, posing it as a potential trail to grasp our complex current situation in the world.

Index terms | *hackers as the New Romantic heroes; Nature; Sublimity; Techno-Romanticism; virtuality;*

Introduction

The line of events of the sublime's history includes several disputes and controversial texts. Scholars locate its origin in the Hellenistic period with an enigmatic author, Longinus, whose identity and existence has been cast on doubt for many specialists. The most modern perspectives, on the other hand, would have started with Edmund Burke and Immanuel Kant in the eighteenth century and would have been fed later by the Romantic Movement. At any rate, Longinus, Burke and Kant postulate ideas on the sublime that might be useful to explain the immaterial component lying behind the modern world and its tendency to the immeasurable. Taking into account all their contributions, it is possible to assert with certainty that there has been a steady tendency to link up concepts such as the infinite or the unlimited with the sublime.

To begin with, Longinus' *On the sublime* (1st century AD) is the first example of how the sublime interconnects to a state of abstraction. The *Hypsos*, the sublime's linguistic root, entails an elevation of the hearer toward "the highest". Longinus portrays it as a thunderbolt or lightening flash elicited by the orator through a discourse whose "violence, rapidity, strength, and vehemence"¹ overwhelm the audience.

Kant deepens in this abstract quality. According to him, the sublime is an issue detached of any shape, so it represents by itself the idea of no-limitation. As Kant claims: "sublime is the name given to what is absolutely great".² Such a immensity is a *conditio sine qua non* since the sublime "must always be great".³ Edmund Burke, instead, reveals a connection that seems to suit the new derivations that the sublime has had at present. In the ninth section of the second part of the text, he refers the infinite as the allegorical, literal and conceptual sustenance of the sublime. Nevertheless, he makes a point that would refresh the current direction of the concept. In effect, Burke introduces a new variation, namely "the artificial infinite",⁴ whose essence acquires validity and new understandings nowadays. On the word of him, this artificiality is based on the succession and uniformity of the parts, so a succession of objects progresing in clear direction would be condition to impregnate in the imagination "an idea of their progress beyond their actual limits".⁵

The three spheres

Contemporary world's limitless is distinguishable, for instance, in the expansion of a virtual world interlaced with the real one. In this respect, until recent two nodules restricted the spheres of human development: nature and city. Today, a new social scenery grounded in new information technologies and telecommunications has been added. This new situation differs profoundly from nature and city. This occurs because it is still in a status of definition and because of its artificial substance. Javier

5 *Ibid.*

Echeverria has coined a new name to it: “third environment”. Eight factors of everyday use, manipulated remotely and in a network by a large part of the world’s population would held up this “third environment”, to wit: telephone, television, electronic money, telematic networks, multimedia technologies, video games, virtual reality and telecommunications satellites.⁶

Historically, the sublime has concerned to the first and the second spheres. Indeed, it has being particularly useful to explain our perceptions on nature and landscape. Moreover, the sublime has acted over other ambits of this first environment, which also contains “the human body, the clan, the family, the tribe, the customs, the rites, the production techniques, the language, the property”.⁷ Similarly, we might argue that the sublime has been increasingly proceeding in the second environment which comprises the urban areas. How this becomes perceptible is through the incessant expansion of limits in modern cities, recalling the primary sublime idea of limitless.

Human interaction with the first and the second environments might be corroborated since the origin of humankind. The third environment, nonetheless, has roots which only penetrate a recent layer into history. Actually, we may state that the sublime has operated in this new reality from the twentieth century when the information-technology revolution, the economic crisis of both statism and capitalism, plus social and cultural movements sprouted. According to Manuel Castells, the interaction of these processes and their reactions created a new dominant social structure: “the network society”, a new economy: “the global informational”, and a new culture: “the culture of real virtuality”.⁸

This third phase is explicitly scientific and technological, and focuses on moving the physical limits on the base of distance calculations, equipment resistance, propulsion capacity, data production, among others. Accordingly, the space conquest, the materialisation of technological innovations and improvements to a network without a central authority (Internet) “designed from the beginning to operate even fragmented”⁹ were of great impact for its consolidation.

The sublime is the term proposed to describe the virtual world emerged from these progressions. There are several reasons that justify the use of this concept. For instance, we find a clear hint of the sublime-virtual linking in the linguistic precedence of ‘virtual’: “The word ‘virtual’ comes from the Latin medieval ‘*virtualis*’, itself derived from *virtus*, force, power.”¹⁰ This converts ‘the virtual’ in a new variant of Kant’s “dynamic sublimity”, which implied the description of immeasurable forces in nature elements, potencies that “make our power of resistance of trifling moment in comparison with their might”.¹¹

On the other hand, the virtual entails the colonisation of the infinite, that is to say, the subjugation of the undefined form. The ‘mathematic sublime’, another Kantian concept,

serves to construct this new metaphysic built around bytes, zeros and ones. According to Kant, we are in front of the ‘mathematic sublime’ when our mind collapses while pursuing measurement. This occurs because of our intellect is “incapable of affording us any absolute concept of a magnitude, and can, instead, only afford one that is always based on comparison”.¹² As historical fact, at the end of 1969 the primitive Internet, also known as Arpanet, had only four points of connection. Currently, it is impossible to determine the precise number of websites and connection points. Moreover, this number might be easily increased by adding new servers, so the Internet becomes practically infinite in the same way that Kant describes the ‘mathematic sublime’ and Burke appeals to the succession of parts as a possibility to access the sublime. Since the Internet potentially will converge with other technological developments like biotechnology, nanotechnology and neurosciences, some authors consider it as an “instrument that can infinitely enable humans to coexist and merge with machines”,¹³ confirming its boundless condition.

As the virtual space is unlimited, artificial and it does not lie on the physical matter, it does not have effective graphic representation either. Therefore, any effort to project a shape of this space would be ineffective as it does not really have any form, just like the sublime cannot be physically apprehended either. Basically, all the nomenclature used to label this new reality is symbolic, alluding to its existence in a speculative plane: “cyberspace”, “metaverse”, “matrix” or “global village”.

Paul Virilio admits that technologies have reconfigured time and distances. These were elements that in the past limited our coexistence and communications. The industrialisation and implementation of faster means of transport have compressed distances but at the cost of reducing significantly our perception of the landscape too, dissolving it into spots that the human retina is unable to catch. Furthermore, telepresence has made possible to cover geographical intervals where landscape and nature do not exist anymore. This has altered the ‘mental mapping’, the old *Imago Mundi*. Paradoxically, the world tends to compress rather than expand itself, confining us inside it: “The faster I travel to the end of the world, the faster I come back, and the emptier my mental-map becomes”.¹⁴ In this new setting the world becomes a great “domotic” without parameters of orientation. The human body will never be again the unit of measurement as it was once for the Greek canon or for Le Corbusier’s modulator in the modern movement.

Today, the ‘village’ has become in a de-territorialized ground. As Virilio claims, we live in a meta-city “whose centre is everywhere and whose circumference nowhere”.¹⁵ We might also attach this condition to the “sublime meta-reality” as it lacks of physical borders, clear location and shape: “The dimensions of globalization are close to immeasurable. In any case, the world no longer has an outside.”¹⁶ Borders, however, never disappear totally, but rather they move to blossom in new languages.

This space of meta-urbanity is intrinsically infinite and progressively free, so we can

access to the superhighways of information at any time and ubiquitously. Paul Virilio assigns to the speed of this navigation the true contemporary power. This operates in the same way that in the Antiquity the speed guaranteed authentic authority as the Athenian Constitution pointed out: "Those who govern the ships must govern the city".¹⁷ In other words, currently the power belongs to the cybernetics.

In this sublime meta-reality, the physical mechanisms that supported *phýsis* (nature) and *polis* (city) have been altered. At the same time, the human capacity to exert chaotic control over life expands to unsuspected levels, making indistinct the real and the artificial. Such over-interventionism implies a desacralization of nature so the sublime would persist in our time as an "aesthetic of denaturing".¹⁸

The romantic

In this sublime meta-reality Romanticism emanates from different sources. Nonetheless, such Romanticism would be a renewed one. In effect, several authors have called it Techno-Romanticism or Neo-Romanticism as this latest version is strongly based on historical romantic thinkers and principles.

Techno Romanticism displays several characteristics that remain unchanged in comparison with the original one. *Langeweile*, *ennui*, spleen, melancholy, for example, come out as a result of a destroyed and abject nature and the life in cities without limits.

Modernity exposes all weaknesses of man against a superior power. Technologies come to supply human deficiencies exacerbating our incapacity to deal with the world. Techno-Romanticism does not recognise man as a sensitive being, but rather as a supra-sensitive one. In line with Jose Luis Molinuevo, if the first Romanticism is a humanism of the miseries of men, the second one is a humanism that discovers a teleology in nature whose rational basis is a theological belief.¹⁹

In historical Romanticism, the hero is a fundamental element. In literature, art or politics, he frees himself and also other oppressed. Aristocrat, individualist, hermetic and haughty, exasperatingly self-pitying, the poet and the artist show themselves within their works. But in the sublime meta-reality there is another character that claims hero's position. He is an enigmatic figure, attacked by the media and news: the hacker. This character is not the tragic Werther as well as he is not the computer criminal we have been led to believe either.²⁰ The hacker, as a romantic hero, seems to be genuinely different. A hacker pursues the reintegration of the collective in an environment that offers all opportunities for the cult of the Self. If the virtual world is akin to a factory, the hacker is a saboteur working from inside. He is an atypical worker who subverts the business logic of the web.²¹ He works at his own pace, disobeying the famous Benjamin Franklin's slogan which has become the beacon of our era: "time

19 Jose Luis Molinuevo, *Humanismo Y Nuevas Tecnologías* (Madrid: Alianza, 2004), 88.

20 Hackers call these computer criminals dedicated to write computer viruses and sneak into information systems like crackers. Pekka Himanen, *The Hacker Ethic, and the Spirit of the Information Age*, 1st ed. ed. (London: Vintage, 2001), 10.

21 Himanen warns us that there are "capitalist hackers." Bill Gates, the founder of Microsoft, Wozniak and Jobs, founders of Apple, are the most famous. *Ibid.*, 75-76.

is money”.²² Hactivism insofar as cyberpolitical act, aims justice and to rescue a set of values through the vindication of a democratization of media, the use of free open source software and the creation of databases of free access and distribution.²³ This exposes that not only the speed means power in the sublime meta-reality, as Paul Virilio believed, but also the information released from its codes of secrecy does.

Digital evolutionists have embraced all these intentions as a part of an utopian technomysticism. Pierre Levy, for instances, has elaborated a whole theory in regards a collective intelligence of unlimited power, able to self-govern. Similarly, Kevin Kelly claims the existence of an interconnected global mind whose main characteristic would be to incorporate organic and inorganic elements. By so doing, it would create a calculation power “out of control and beyond our understanding”.²⁴

The main risk of a sublime meta-reality seems to be the disorder. Hence, humankind’s challenge is to survive in a world where the unlimited and formless prevail. Technologies came to shift our spaces of development. As a result, nature, body, and human actions have to be performed and understood in a setting whose limits have disappeared, jeopardising even the so-called human condition. These new conditions have settled the sublime as a key trail to grasp our complex current position in the world.

Miguel Angel Gaete is a PhD student in History of Art at The University of York, United Kingdom. His main research matter is the Romantic period. Currently, he conducts an investigation about German Romanticism and the imbrication between sciences and arts in explorer artists that journeyed throughout Latin America in the nineteenth century. His research and pedagogical interests also include the aesthetic theory of the sublime and its impact on contemporary visual arts, urbanism and architecture. Mr Gaete obtained a Master degree in advanced studies in History of Art by Universidad de Barcelona, and besides he accomplished a first PhD in Philosophy (aesthetic) at Universidad Autonoma de Madrid. Among his achievements are the obtaining of several scholarships, presentations in international congresses and publications in academic journals and books in countries such as Canada, Chile, Spain, England and Brazil.

THE THEORY OF DIGITAL TECHNOLOGIES

Abstract | The subject of this work is the way that new technologies affect the development of humanity and the development of society. Inspired by the series that I am one of author within the Science program on RTS, named “What technologies have done for us”, I’ decided that within, “The theory of politics and art”, to deal with matters of technological development. The work can be viewed in two different levels. The first level is the one that refers to technologies design in various forms of capitalism in the 20th century and in the beginning of the 21st century. In this essay, I allocated just one smaller piece of that technological development, I haven’t lingered over either significance or description of a large number of socially notable achievements, which have marked the first half of the twentieth century (I did not mention the influence of the developments of the car and plane industry, discovering of the atomic bomb, getting to know the micro and macro structures, cosmic technologies, important discoveries in pharmacy and medicine etc.). I dedicated myself to the development of ICT, transitioning from the analog to the digital world. Different technologies, due to digitalisation, codes, numbers of the binary system, can be merged, connected so that they interact, and converge into a single apparatus. The use of ICT is represented in all segments of society and it can be said that it had a great influence on the changes in social and political relations. Although these technologies have affected the development of schooling, military technologies, world-wide military strategies, new media relations and realizations, genetics and genetic engineering, I have decided not to stress the mentioned technologies (although also important), but to focus on “smart services of electronic government” (smart e-government). I will connect the smart services of e-government with biopolitics, necropolitics and neoliberal capitalism. A lot of world-known philosophers, anthropologists, sociologists and other experts have dealt with social relations and social socio-technological issues. The second level (is actually the first one, since I am beginning with it), explains in brief the genealogy of society, the concept of biopower and biopolitics, transition from a disciplined society towards the society of control, transition from products in the form of goods towards the product in the form of services and what some famous philosophers like Martin Heidegger, Michel Foucault, Gilles Deleuze, Lev Manovich, Marina Grzinic etc. have written and spoken about it. A special section will be dedicated to the software as a new paradigm and how the relation of the visible and invisible is described in correlation with politics and democracy. The last chapter is about the correlation between language (speech) and control. The aim of this work is to show that the development of digital technologies and the internet (which I consider as a media, and do not mention other medias), could, if social communities don’t do something in time, lead in the direction of absolute control and loss of freedom of every individual separately. That is also the thesis of the work.

Index terms | *Biopolitics; control; digital technologies; disciplinary society; freedom; internet; smart e-Government; software;*

Introduction

This paper deals with the development of new technologies in the 20th century and the turn of the 21st and the impact of their development on the development of society as a whole. Special attention is paid to digital technologies and the Internet and to the thesis that the development of digital technologies and the Internet contributed to the development of a new type of control, both of individuals and society, a fact that has also given rise to a rethinking of the issue of freedom.

There is a close relationship between and constant intermingling of science and technology. Without scientific achievements, there would be no new techniques and technologies and, conversely, without new technologies, scientific research would yield very few new things. Thus, in his essay, "The Age of the World Picture", Martin Heidegger observes that modern age science and machine technology as the main representative of modern age technology had a crucial role in the development of the new (20th) century. He notes that modern age science relies on projects characterized by their rigorousness and well-established methods of producing and exploiting project results.¹ According to Heidegger, discipline is essential for the organization of research.

Discipline, as a characteristic of a well-ordered society, is also evident in Michel Foucault's works. In his lectures, *Society Must Be Defended*, at the Collège de France in 1975-76, Foucault spoke about a disciplinary society that reached its pinnacle in the 20th century. Explaining in his lectures the consequences of speedy scientific and technological development, he introduced a new notion into politics, calling it "biopolitics". The concept of biopolitics is largely rooted in biopower as an extension of the grasp of state power over the physical and political bodies of populations.²

In his book, *Discipline and Punish*³ Foucault analyzes bodies as domains of subjectivization. According to this book, prisons, through punishment practices, were instrumental in monitoring the discipline of the body. The body's most essential needs, such as food, space, exercise, privacy, light, and warmth, become elements on which prison arrangements, curfews and other mechanisms of control are introduced. The body discipline enforced in prisons can be enforced in a disciplinary society. The economy, politics and the military are part of the biopolitics of populations. The notion of biopolitics marks the introduction of a new understanding of the system of judicial power. Foucault undermines the established political theories of sovereignty by introducing the notion of discipline.⁴

1. Discourse on the society of control

In his essay, "Postscript on the Societies of Control", Gilles Deleuze points out that the disciplinary societies, which Foucault links with the 18th and 19th centuries, reached their acme in the early 20th century. According to Deleuze, Foucault provided an excellent analysis of a perfect project of closed environments. Discipline in a closed environment could be exemplified by a factory: **to concentrate; to distribute in space; to order in time; to compose a productive force within the dimension of space-time whose effect will be greater than the sum of its component forces.**⁵ Foucault, however, also recognized the transience of this model. The disciplines underwent

whose effect will be greater than the sum of its component forces.¹ Foucault, however, also recognized the transience of this model. The disciplines underwent a crisis to the benefit of new forces that were gradually instituted with the development of science and technology.

After World War II, the succession of old forces by new ones became speedier and much more evident. It was the heyday of electrical engineering and electronic tubes dominated various segments of the market. The development of new media was a logical outcome. In 1947, Bell Labs developed the first microchip. The transition from analogue to digital became the new goal, the new imperative for and paradigm of nearly all the populations on our planet.

In the 1970s, while Foucault was building a definition of biopolitics, the first prototypes of transferring information between computers, later called “Internet”, were being developed in the Pentagon and other places in the United States. Since then, there has been an incredibly fast development of the Internet and other digital technologies, telecommunications, high-capacity broadband systems for transferring information, and super fast computers capable of storing enormous quantities of data.

It has been said in the past several decades that we live in an “information society” upheld by political, economic and media discourses. Biopolitical networking, exchange and growth of creative industries lie at the core of this society. The society of knowledge is becoming increasingly important and the domination of biopower may be expected to grow as well. The disciplinary society has become constricted while the authorities keep announcing seemingly inevitable reforms of education, economy, healthcare, army, etc. According to Deleuze, it is only a matter of time when these institutions will be abolished and the disciplinary society replaced by new forces.

In a society of control, corporations replaced factories. Unlike the factory, which was already familiar with the system of bonuses, the corporation has to work more deeply to change salaries, in states of perpetual metastability that operate through challenges, contests and sessions.² The factory constituted individuals as a single body, which was advantageous for two reasons. The first one was that the boss surveyed each element within the mass, because he knew what was going on at both individual and collective levels, and the second one was that unions mobilized a mass resistance, which meant it was easy to bring individuals together in one place and in the name of one goal. The situation in the corporation is quite different. According to Deleuze, the corporation constantly presents the cruelest rivalry as sound competition, an excellent motivational force that opposes individuals against one another, while salaries are paid according to merit.

In the disciplinary society, an individual is faced with clear-cut restraints and limitations and always starts from the beginning (from school to the barracks, from the barracks to the factory), whereas in the societies of control one is never finished with anything, because the system of education, the armed services, and corporations are metastable systems coexisting in one and the same modulation, like a universal system of deformation.

The man of control is undulating, evasive, in a “continuous network”, whereas the disciplinary man was a discontinuous producer of energy. As Deleuze metaphorically expresses it: “Everywhere *surfing* has already replaced the older *sports*.”

The capitalism of today is no longer involved in production; it wants to sell services and to buy stocks. The factory has become the corporation and marketing has become the center of the corporation. Markets are conquered by grabbing control rather than by disciplinary training, by transformation of the product more than by specialization of production. The operation of markets has become the instrument of social control and forms unscrupulous masters.

¹ Deleuze, Gilles, *Postscript on the Societies of Control*, 1992, accessible online: <http://www.spunk.org/texts/misc/sp000962.txt>.

² *Ibid.*

Control is short-term and of rapid rates of turnover, but also continuous and limitless, whilst discipline was long-lasting, infinite and discontinuous.

Deleuze states:

Man is no longer man enclosed, but man in debt. It is true that capitalism has retained as a constant the extreme poverty of three-quarters of humanity, too poor for debt, too numerous for confinement: control will not only have to deal with erosions of frontiers but with the explosions within shanty towns and ghettos.

After such observations, the notion of necropolitics becomes topical. The concept of necropolitics was introduced by Achille Mbembe in his attempt to define capitalism. Necropolitics could be described as politics regulating life from the perspective of death. This means that life is reduced to mere existence, that is, to the brink of death.³ One of the reasons for this is the cruelty of the new masters of corporations as well as the abuse of technologies, including technologies of destruction, which, according to Mbembe, have become more tactile. Necropolitics is linked with necroeconomy and necrocapitalism, which exploit a form of life.

The evolution of technologies has contributed to bringing mechanisms of control to perfection. It is possible to know where each individual is located. Félix Guattari has imagined a city where a person would be able to leave their apartment and their street using an electronic card that raises a given barrier. But for some reasons the card may also be rejected. What counts is the computer that tracks each person's position – licit or illicit – and effects a universal modulation of control.

Historically, computers have been central to the management and creation of populations, political economy and apparatuses of security. Without them, there could be no statistical analysis of populations: from the processing of censuses to bioinformatics, from surveys that drive consumer desire to social security databases.⁴

“Creative society”, “e-society”, “digital society” are terms encountered thanks to the incredible development of digital technologies and experts around the world are increasingly using the term “e-revolution”. Thus, “postindustrial society”, which was based on goods, is transformed into “digital society”, based on services.

One of the examples may be dubbed “smart e-government”. These services have been developed following the principles of biopolitics and the body, which, according to Foucault, is at the center of politics. Placing the body at the center of needs led to the creation of services that the state offers to the population through networked computers and software applications. Thus, there are now chipped ID cards, driver's licenses, health insurance cards, and biometric passports, all of which contain personal data of every individual. By offering something that at first one may see as good, the development of new technologies leads to a person's total baring. One no longer has any privacy as everything is known about them “in real time”. New technologies tailored to people, offering them banks without counters, online access, online payments, various services through smartphones, enable people to have more free time, a time they may use for “other, more creative activities”.

Mobility, as a hot topic of modern communications, available everywhere through mobile devices, is again offered to people as an advantage, as they do not have to waste time to

4 Chun, Wendy Hui Kyong, Programmed Vision, “Software and Memory”, MIT PRESS, Cambridge, London, England, 15-25.

contact someone, to have an important conversation, to exchange written or spoken information. But here, the same as in the previous case, there are invisible traps that facilitate the control of people. One no longer has one's own individuality, as they are a constant target of control for all kinds of reasons in real time, since they carry mobile devices that reveal their location (GPS) and even who they are with and what they are doing. Thanks to mobile technologies, anyone can track down anyone else at any time. In addition to networking, accessibility is also highly valued.

What can be said about the so-called "video surveillance", which is used to fight crime and terrorism. Nevertheless, the impression is that the point here is to control every single individual. Here everything again seems to be tailored to people's needs, but hidden in the background is state control, a control of the powers that be over individuals. A new question is raised of whether the development of digital technologies is aimed at achieving a single objective: government control over the lives of all people in real time.

At the turn of the century, so much progress was made in the development of digital technologies that the earlier databases of information, documents and materials, which were to be used as archives, became too limited.⁵ A new solution was required that would ensure fast and efficient data storage and how to keep it safe in digital form. This led to the creation of giant servers, which required special conditions for data storage with respect to the size of location and air temperature, humidity and pressure. Experts came up with a new solution that would ensure greater ease of use—"cloud computing". Institutions needing to store massive quantities of data every day would no longer have to be concerned about that as it would be possible to hire companies specializing in such things and allow them full access to confidential information, which would be stored at a greater or smaller distance from the companies, that is, the data would be ex-territorialized but accessible at any one time thanks to fast Internet connections. Once again a seemingly attractive solution, assuring companies of better financial gains (an important segment of capitalism) without having to employ people to do the archiving but rather to hire the services of others for the job.

Services have now become an imperative of new society. But there is also the other side of the coin. Who and how can guarantee that the data stored in a cloud are absolutely safe and that no unauthorized person will "take a peep" at them. By keeping data of others in the "vaults" of their computer clouds, the providers of these services increase their biopower, unlike those who use and pay for their services

According to Marina Gržinić, biopolitics determines and regulates the very way in which we understand the process of subjectivization. Simply put, biopolitics and biopower are founded on control.⁶

Even though maximum data protection is guaranteed, such solutions are "tailored" to Orwell's *1984* and provide ideal conditions for most sophisticated espionage.

Today, whoever uses a computer is "bared", as there are programs for tracking individuals and monitoring what they do on the computer, what their interests are, which social networks they use, etc., and accordingly offer them new "possibilities".

Thanks to Edward Snowden, we now know a thing or two about unofficial surveillance measures. Not only the U.S. National Security Agency (NSA), but also intelligence services of EU countries, monitor all internet traffic in real time in cooperation with Google, Yahoo, Facebook and other companies.

Software paradigm

5 Manović, Lev, *Jezik novih medija, Clio, Beograd, 2015, 262-281.*

6 Gržinić, Marina, "Subjectivization Biopolitics and Necropolitics: Where Do We Stand?" in *Reartikulacija No.6* http://www.reartikulacija.org/RE6/ENG/reartikulacija6_ENG_grz.html, accessed Sept. 12, 2016.

Bearing in mind that behind each of the “fronts” of computers lies one, or many reliable pieces of software, in my next paper I will discuss some essential features of this visible and invisible tool of today. According to Wendy Hui Kyong Chun, who, in her book, *Programmed Vision*, points out several important facts about software, software challenges our ability to understand not only because it operates invisibly, but also because it is fundamentally ephemeral – it cannot be reduced to program data stored on a hard disk. Historian Michael Mahoney⁷ describes software as “elusively intangible. In essence, it is the behavior of machines running. It is what converts their architecture to action, and it is constructed with action in mind; the programmer aims to make something happen.” Consequently, software is notoriously difficult to study historically: most “archived” software programs can no longer be executed, and thus experienced, since the operating systems and machines, with which they merge when running, have disappeared.

The process by which software was transformed from a service in time to a product, coincides with and embodies larger changes within what Michel Foucault has called *governmentality*. Software as thing is a response to and product of changing relations between subjects and objects, of challenges brought about by computing as a neoliberal governmental technology.

1. Instead of a conclusion

The subject of this paper is exceptionally broad and extensive and it has not been possible even to mention. A special chapter would by all means have to be dedicated to social networks and, above all, to the role and power of the World Wide Web, followed by optical fibers. Another special chapter would have to deal with the role of the Internet and its democratic nature. The software paradigm has been presented rather sketchily and much more could certainly be said about it. What else can be said about the media and digital technologies other than that they deserve special research. Cyberspace is indeed vast and this has only been the beginning, even though the true beginnings have been “skipped”, as I thought them less relevant to the present topic.

The question remains what digital technologies and the Internet have done to man. Seemingly a lot of good things. Today, there is the new term “Internet things”, where all household appliances will be networked. Refrigerators will create grocery lists and automatically send them to a given supermarket. By freezing a picture of a product that appears on the TV screen it will be possible to find out where the product can be bought. Networked cities will be able to optimize climate conditions to best suit the people living there. All this seems good but, on second thought, will not digitalization and the Internet be instrumental in the activation and legalization of the new/old Big Brother? In his struggle for freedom and democracy, man opts for non-freedom or, in the name of a better life, non-freedom from which he cannot defend himself is imposed on him.

The society of control is marked by strengthening and increasing disciplinary bodies to apparently normal levels, which induce regular everyday behavior of people from within, but unlike discipline, this control spreads well outside structured places, social institutions of realistic and ephemeral networks. Biopolitics is a new paradigm of power. Biopower is a form of power that regulates social life by tracking and rearranging it. Foucault says that life has now become a form of power.

Olivera Kosić was born in Belgrade, where she graduated from the Faculty of Technology and Metallurgy and, additionally, completed several specialist courses, including the Specialization for TV Journalists, organized by the Program and Auditorium Research Center of the Serbian Broadcasting Corporation (RTS). She is currently preparing her doctoral thesis in the field of theory of media and arts. She spent most of her career so far as the editor and script writer in the educational and scientific programs of RTS, where she was the author of more than 500 shows and series. She worked as the editor and script writer in the Scientific Program of the Public Media Institution RTS from 2006, where the focus of her interests were topics in the fields of science, technology, multimedia, university issues and gender equality. From 2001 to 2006, she was the editor-in-chief of the Educational and Scientific Program of RTS, when this program was given the highest average grade in Serbia by the viewers. From 1990 to 2001, she was the editor of several educational series in the Program for School Children and the author of two quiz shows. From 1985 to 1990, she worked in the Graphics Center of RTS, where she was the technical editor of RTS publications and worked on the development of the Graphics Center and on the transfer of operations to computer equipment. She has won several awards and recognitions, including the annual award of RTS and several Diskobolos awards, issues by the JISA organizations. Her most recognizable shows are: "What has Technology done for Us", "Reform of the Universities in Serbia", "On Gender Equality", "Atom by Atom", "Science of Materials", "A View of an Experiment", "Laser Lights", "Conquerors of Knowledge", "Radiation and Radioactivity on Earth and in Space", "The Open Interval - Science and Technology of the 20th Century", "In the World of Chemistry", "The Language I Speak", "Visions of Television"...

PANEL SESSION 10 | AESTHETICS OF MEDIA AND POST-MEDIA PRACTICES

INTERTEXTUALITY IN CONTEMPORARY CINEMA (“LOVELESS” (2018) ZVYAGINTCEV AND “STALKER” (1979) TARKOVSKY

The reported study was funded by RFBR according to the research project № 18-311-00235

Abstract | Cinema is an open system that interacts with all other texts of culture. The juxtaposition of two films generates some allusions and associations that form the chains of semantic links between two artistic texts. Often, film critics say that A. Zvyagintsev is in some way the successor of A. Tarkovsky. In the article, we analyze the films by these Russian film directors: “Loveless” (2018) by A. Zvyagintsev and “Stalker” (1979) by A. Tarkovsky. We use the methodology of film analysis by Gilles Deleuze. We rely on his books Cinema 1: The Movement Image and Cinema 2: The Time Image. We explore the settings, the locales of these films; identify the intentions of the characters and the results of their actions. We sing out the general theme in the films and it is the theme of search. We see some artistic methods and artistic images that help to reveal this difficult and serious theme in these films. Here we are dealing with the experience of an existential experience of search. Search may be displayed as a process, or as an action. Therefore, we face the situation of an insoluble and unfinished search. It takes a place when the external or formal side of the search does not find contact with the inner need to find something or someone.

The motive and the poetics of searching in an abandoned and reinterpreted space of everyday life is common in the films “Stalker” and “Loveless”. In the film “Stalker”, we see a closed territory (zone) fenced with barbed wire and guarded by the military, but the heroes still manage to make their way there. In the film “Loveless”, the locale is the territory of the park, the forest, the abandoned House of Culture, as well as the space of the city, the village and hospitals, morgues, police stations.

The desire to show the inner existential frustrations of characters through the outer shell of visible world is the specific feature of these Russian film directors.

Index terms | *Intertextuality; Loveless; russian cinema; Stalker; Tarkovsky; Zvyagintcev*

Cinema as an open system that interacts with all other cinema texts in the general field of culture, as a result it creates allusions and associations that form chains of semantic connections between artistic texts. We highlight the general theme of the Search in the films “Loveless” (2017) by A. Zvyagintsev and “Stalker” (1979) by A. Tarkovsky. Therefore, we trace some artistic methods and images, which help this theme to release.

Jorge Luis Borges (1899-1986) identifies four stories in the essay “Four Cycles”¹. He asserts that these stories constantly duplicated and retold in cultural texts. The third story is about searching. Borges writes that in the past, any undertaking ended in success. Now any searches are doomed to failure.

The focus of this research is the theme of the search, which presented in the films “Loveless” (2017) and “Stalker” (1979). These films show the experience of the existential search; we see the situations of intractable, incomplete searches in both films. There are the examples when the external or formal side of the social behavior does not reflect the internal need to find something or someone. We consider the concept of Search for the Other in the philosophical theories of J.-P. Sartre, E. Levinas, M. Bakhtin.

In these films, we see the poetics of the search in an abandoned and rethought space of everyday life. In the “Stalker”, it is a closed area (zone), fenced off with barbed wire and guarded by the military. Nevertheless, the heroes still manage to get the Zone. The result of the search is rather a process of intuitive comprehension.

In the film “Loveless”, the heroes, in the process of finding their child, explore, together with the volunteers of the search and rescue squad, the park’s territory, the surrounding forest, the abandoned House of Culture; they also search for the boy in hospitals, morgues, police stations. There was a long search process, which did not give any result.

In addition, the role of the guide is common in these films: there are Stalker (A. Kaidanovsky) in the film by A. Tarkovsky and coordinator of the search and rescue team of volunteers (A. Fateev) in the A. Zvyagintsev’s movie. There is a triangle of heroes in both motion pictures. A special guide leads two heroes along the search, according to their goals. In addition, the heroes gains something or lose it (irreversible loss). A triangle is like an arrow, a path, a pointer, an eternal search for one’s own way. Human may be confident, unsure of one’s right, reasoning, or silent in his decision.

The scene in the room is the most emotionally scene in both films. The room is both existentially scary and beautiful with its silent cruelty and incomprehensibility. Here

heroes get a chance to find answers to all their questions, and to the main question which affecting the meaning of life. And the main problem concluded in finding a connection with the Other. In “Stalker” it is the room where are Professor (N. Grinko), Writer (A. Solonitsyn) and Stalker (A. Kaidanovsky) at the end of the movie. In the film “Loveless», it is a room in the morgue, where the guide (A. Fateev) suggested to the heroes do a DNA test to identify the detected body.

In the film “Loveless”, the characters live their real lives when they are searching their son. This is life without the screens of mobile phones, outside the space of constant representation and appreciation from invisible others. In this reality, they acquire their “rootedness” (Heidegger); they get over through all the substances - water, earth, air, fire. However, the final scenes of the film testify to the loss of the “foundation” (rootedness), to some senseless “hanging” of the gaze in the space between the ceiling of the room and the screen of the gadget.

Moreover, in both films the result of the search is some kind of metaphysical silence, existential quiet, which transmitted only through the skill of the camera operator, gliding the camera through the hazy “future” of the heroes. Therefore, at the end of the A. Tarkovsky film, we see a Stalker with his wife and child - a girl who moves objects with a help of her look. In the last frames of the film “Loveless” – there are the former spouses with an absent look and a happy outer shell, which indicates about a comfortable arrangement of their bodies in space.

Sartre identifies the category of “being for the Other”. The first reaction of a person to the appearance of the Other is denial or rejection. Sartre defines: “The Other is the one who is not me and the one who I am not”². Initially, the Other is perceived as an object by the consciousness. The appearance of the Other breaks the subject’s familiar surroundings. Then a period of struggle begins, and it is the struggle of sights. “Sight” gets a special meaning in interaction with the Other. The sight is the unique instrument. Then the loser becomes the object and submit to the Other, the winner preserves his inner world.

The Other determines the existence of a third, final category — being for others. The unity of all three categories constitute the theory of being of Sartre. The presence of the Other becomes necessary for human existence. A negative reaction to the appearance of the Other is a necessary reaction. The presence of the Other makes the human existence meaningful. In the absence of the Other, man is “nothing” and his being is entirely dependent on the Other.

This approach is relevant for the analysis of the film “Stalker”. There it is possible to analyze the specific interaction of the characters with the “invisible” Other (Alien). Since the aliens are not represented visually, we see only the consequences of their actions in the form of an anomalous Zone guarded by the military. The viewer’s attention is

directed to the dialogues of the professor and the writer, the talk and reasoning of the Stalker. Due to the invisibility / non-representation of the aliens themselves, the relationship between the heroes, the struggle and the co-directed movement of their sights become particularly acute. So, each of them goes to the Room with different goals.

The Other is the key element of being (Levinas E.). The Other is what I myself am not. The Other is this because of the Other's very alterity.³ Subjectivity appears as welcoming the Other, as hospitality.⁴ The search for other is the primary desire of the individual. The most radical "other" for Levinas E. is the Other. At the moment of the "event," I and the Other appear face-to-face with each other, and language acts as an instrument of their interaction. Human realizes the desire to express kindness and empathy to the Other through the process of communication.

In the film "Loveless" by A. Zvyagintsev we see the example when it is impossible for members of one family (spouses and their child) to become such "hospitable others" (E. Levinas). In principle, in the film "Stalker", the Writer's attempt to bring a bomb into the zone and destroy the room also testifies to a crisis in the relationship between I and the Other. That is, in both films, the search is directed towards the "impossible / elusive and never attainable Other". We are talking about such an Other who has an almost approaching to infinity (or 100% probability) risk of extinction ("Loveless") / destruction ("Stalker"). Gilles Deleuze points to the underlying base of the plot of the film "Stalker": "Stalker" returns the environment to the opacity of an indeterminate zone, and the seed to the morbidity of something aborting, a closed door.⁵ So in the film "Loveless", the heroes (spouses) constantly engage in controversy about the fact that "it was necessary to have an abortion", that "the mother said to get rid of the child, but the heroine did not listen to her". That is the same theme, and their son becomes a hostage and victim of that total Loveless.

However, another essential reversal of this topic is that I need an Other. The other asserts my being, completing it with value⁶ (M. Bakhtin). Therefore, M. Bakhtin notes the other can know me, and I can know the Other. Bakhtin concludes that the Other is necessary for holistic knowledge about myself. Only the Other can complete me aesthetically; only I can holistically know the Other (in relation to him, I take the position of an out-of-finding). I can cognize the Other aesthetically. I affirm him, so he receives a certificate of his existence. The other certifies me of my existence. With this process, the Other enriches me, and I enrich the Other. The very existence of a person is a continuous dialogue with the Other.

Each of these films is just an aesthetic attempt to visualize the relations to the Other. Films make the viewer to look inward, clarify the relationship to the Other, whether he/she is husband, son, acquaintance, colleague, even the film's director. And more interesting, the films introduce us as Others to ourselves, they reveal the author's view of the person and time.

Films of every filmmaker have the specific intonation. In this sense, the films of A. Zvyagintsev reflect the intense, tragic note of the sound of everyday life, through which the threads of the incredible / incomprehensible acts of ordinary people pass; everyday life, where co-being crystallized out of routine dialogues and relationships with Others, defining the chronicle of sad (tense) modernity. A notable feature of A. Zvyagintsev's films is open finals; we do not fully know how the stories told by him in the films "The Return" (2003), "The Banishment" (2007), "Elena" (2011), "Leviathan" (2014), and "Loveless" (2017) end. However, the open finale (non-finite), as a traditional trick for the author's cinema, is like life itself, it can be compared to turning the river and sliding the water into the distance. The depth of the transfer of mood, feelings of the characters, and the thoughts of the director himself in the films of A. Zvyagintsev is undeniable. This is what feeds the minds of the audience, lures into the world of Andrei Zvyagintsev's films, and creates a special cinema reality of his films.

The associative chain linking the films "Stalker" by A. Tarkovsky and "Loveless" by A. Zvyagintsev also reveals itself through the specifics of the visual display of the external and internal search processes. Since in both of these films we see heroes who are passionate about the idea of searching something, for example their integrity or they aimed at building relationships with the elusive Other.

And in both plots, we see not only the search when heroes are walking through the maze of architectural structures and natural landscapes. This external mapping plan is a visualization of the search for the inner, existential experience of the search for the Other. In the "Stalker" heroes are looking for a room where desires are fulfilled. In "Loveless" the spouses are looking for the missing son Alyosha. However, in both films the final remains non-finite. We can assume that the heroes need the search to return to their original state of equilibrium. That is, the film displays some internal moral scales: altruism and egoism. Heroes pass the test, overcome themselves, and inspect architectural objects, interact with abandoned and existing structures. They want to reach the point of their own internal and external equilibrium and continue to exist in a vacuum of their own comfort zone (egoism).

Hyperintertextuality generates a constant construction of the texts as a feature of the modern culture of the era of post-literacy. Culture appears as a hypertext with constant textual links with other cultural texts. The general theme of films is the search for the Other.

We reviewed films through analyzing relationships with the Other in a philosophical, existential sense. In the film "Loveless" we observe a global gap in relations with the Other, relations between spouses, relations with the mother of the heroine, relations between parents and child. The disappearance of the boy leads to a process of gradual "zeroing" through the search process, which we observe during the film. In the end of the Zvyagintsev's, we see winter, silence and a high-tech furnished apartment in which

Zhenya lives. The nature is still silent; some announcements of the boy's disappearance still hang pasted on the dirty pillars along the roads. The film itself appears as a fixation and an attempt to display the "point of no return", the moment of irreversibility in family history. Both films represent the situation of a radical search, with the concentration of all forces on the search for the elusive Other.

Temliakova Alina. In 2013, I graduated from the magistracy with a degree in Aesthetics: Art-business of the Faculty of Philosophy of Ural Federal University. Theme of my master's thesis "Philosophical and aesthetic concept of cinema of Gilles Deleuze". In 2018, I graduated from the post-graduate school with a degree in Philosophical Anthropology, Philosophy of Culture, Department of Philosophy, Ural Federal University. Theme of my dissertation is "Methodological bases of the concept of the cinema by Deleuze for the analysis of cinema reality". The field of my scientific research is the philosophy of cinema, the specificity of cinema reality, and the changes in the language of cinema under the influence of digital technologies. Now I am the head of a research project: "Research on the ontology of cinema reality in A. Zvyagintsev's films: philosophical and culturological analysis".

POSTMODERN AESTHETICS OF VIDEOS ON YOUTUBE

Abstract | This research, supporting by RSF, 18-18-00007, is devoted to the study of aesthetics of video created for channels on YouTube. We have chosen three popular Russian bloggers to analyze: Danila Poperechnyi, Evgeny Bazhenov, Ruslan Usachev. It is important for us that three of bloggers working in different genres. Danila is stand-up comic, Evgeny is critic of bad movies, Ruslan is observing news and has a travelogue «It's time to get out of the country». To do this, we analyzed the content of video by these bloggers by identifying the applied aesthetic tools they using to influence the recipient. Based on the results, we found out that all three bloggers using allusions, citation, irony and self-reflection for impact on the recipient. Those elements help to create the video more entertaining, but also to cause a certain emotion in the viewer. Mostly it's laughter but also an anger. We believe that the aesthetics of modern video content on YouTube has been shaped by the philosophy of postmodernism. The constant quotation and abundance of cultural allusions in the video is a direct continuation of the ideas of postmodernism in art. The inclusion of excerpts from various films (of varying degrees of recognition) or allusions to contemporary cultural phenomena into the structure of the video embodies the ideas of deconstruction (putting a familiar plot or formula into a new context). As in postmodern aesthetics, one of the conditions for interpretation is the cultural background of the recipient (that is knowledge of cultural archetypes, myths, iconic works of art of past centuries, folklore), and in such videos there is a similar "requirement", but in this case the recipient is required to know memes, modern realities, trends or even media scandals.

INTRODUCTION

In the face of great popularity of video blogging, mainly based on YouTube's video hosting, the study of this phenomenon as a possible fusion of creative and pragmatic intention becomes important. And as with any creative work, the aspect of aesthetics becomes important, as a certain way of representing the author's thoughts through indirect conviction. As Zettl (Zettl 2011) writes, applied media aesthetics is not an abstract concept, but a process in which we look at a number of media elements, how they interact, and our perceptual responses to them.

Speaking of media aesthetics, we cannot ignore two categories: art and everyday life. In applied media aesthetics, these two components are not only interconnected, but also interdependent. Media has become a part of our daily life long time ago, but this daily routine also has its own aesthetics, its own creative laws, according to which they influence and emotionally influence us.

YouTube as a platform for the publication of video content is of greatest interest to us. YouTube "can be seen as a rapprochement of the traditional entertainment choices of television, music and film" (Shao 2009, 12). Thus, it is in the interests of the creators to attract an audience that will continue to watch future videos (subscribe to the channel), which can be done by actively establishing contact with this audience. Johnston (Johnston 2017, 85) noted that [many] YouTube stars use direct interaction methods, so, although it seems like a blogger sounds and looks like a viewer, the values of video production influence the YouTube viewer's perception of a star as a significant person. So the blogger transcends celebrity status, transforming into a person that the audience fully trusts. In addition, Berryman and Kavka (Berryman and Kavka 2017) formulated the importance of close access to the life of the YouTube user and the enormous influence on it. YouTube became the object of a study by L. Hollebek, who considered two strategies for user interaction with medical content: based on clicks (participation) or simple viewing and reading (consumption) (Hollebeek 2011). In addition, YouTube was studied as a site for cultural production and communication, exploring viewers' responses to content through the comments section (Lange 2007; Madden, Ruthven and McMenemy 2013). Video hosting initially provided an opportunity for self-expression of any kind, however, with the influence of audience, the requirements for content provided on the channel also increased. The resource has gone beyond entertaining, more and more educational channels appear, a lot of analysts of various fields (cinema, books, philosophy, etc.).

When we talk about aesthetics, we are more accustomed to think about objects of art: painting, cinema, literature. However, in the past century with a sharp jump in the development of media, there was a need for a closer look on other forms of aesthetic product. It is important to understand that now many media have become a means of not only communication, but also aesthetic communication. The media has its own aesthetic style and its own aesthetic strategy. Media convey not only information, but

also experience, emotion, idea.

The concept of aesthetics changes associated with the emergence of the media, the Internet, etc. J. Dewey's classic work "Art as Experience" (Dewey 1987) examines the aesthetics of pragmatism, arguing that art and life (in a broader sense, the experience of mankind) are inextricably linked to each other and do not constitute opposition. J. Dewey believed that any sphere of production under appropriate conditions generates artifacts, turning into the field of art (the border between production and art, outlined by V. Benjamin (Benjamin 1996), is erased). Thus we can consider YouTube as a production sphere whose task is to generate aesthetic objects.

Multimodality is becoming an important aspect of modern video creativity on YouTube. In the aspect of multimodality, the word is no longer the main tool for transferring an information. The theory of multimodality recognizes such a right for the visual modus. There is also a socio-semiotic approach to the definition of multimodality. It is based on the concept of semiotic mode – a set of tools for representing values from several non-verbal systems (Adami and Kress 2014). Semiotic mode is able to produce a certain cultural value.

We believe that the aesthetics of modern video content on YouTube was shaped by the philosophy of postmodernism. According to J. Baudrillard, "quoting, simulation, re-appropriation - all these are not just terms of modern art, but its essence" (Baudrillard 2000). We believe that the widely occurring quotation and the abundance of cultural allusions in the video is a direct continuation of the ideas of postmodernism in art. Also, the basis for our research is the concept of deconstruction, developed by J. Derrida (Derrida 2000). Deconstruction is connected with the main elements of the aesthetics of a modern author's video: quoting and allusions (cultural references). The inclusion in the structure of the video excerpts from various films (which can have different degrees of recognition) or allusions to contemporary cultural phenomena and embodies the ideas of deconstruction (placing a familiar plot or formula in a new context). As in postmodernist works one of the conditions for interpretation is the cultural background of the recipient (that is, knowledge of cultural archetypes, myths, iconic works of art of past centuries, folklore), and in such videos there is a similar "requirement", but in this case the recipient is required to know memes, modern realities, trends or even media scandals.

Among other features of the aesthetics of postmodernism, we should pay attention to the ubiquitous irony. Irony as a means of liberation from dogma and any framework and restrictions is an important element of the video blogging, allowing to make fun of modern Russian realities (through the prism of comparison with cultures of other

countries and the peculiarities of their mentality) and various cultural phenomena.

METHODS

In this study, we used methods of applied media aesthetic analysis and quantitative and qualitative content analysis. Applied media aesthetic analysis allowed us to identify the main aesthetic elements used by bloggers to influence the audience. Quantitative content analysis is used to calculate the original author's content in relation to the borrowed, in which we include inserts from films, music, recognizable videos, memes, and also references to well-known cultural phenomena. We did counting due to the timing of the video. Qualitative content analysis is necessary for us to identify the semantic component of the use of references in conjunction with the author's content.

RESULTS

First of all, we identified the percentage of original content and references. To do this, we analyzed two videos from the show "It's time to get out" and "BadComedian". As the diagrams show (Figure 1 (a, b), Figure 2 (a, b)), the ratio remains stable for each of the bloggers, while the references does not exceed 50 % of the video for each of them (although in the case of the show "It's time to get out" its share is much higher than at BadComedian).

The following features of the aesthetics of postmodernism were identified in the work of these bloggers: 1) deconstruction; 2) citation; 3) integration with mass culture; 4) bricolage; 5) the creation of simulacrum.

Deconstruction is visualized in videos by introducing the blogger's figure into the space of what he reviewing in his videos. The familiar order of things is broken and transformed under their influence, acquiring a new context. What should have been presented as a fact is changing under the pressure of a blogger. When BadComedian reviews a movie, it may appear to the viewer in including the figure of the blogger inside the movie he reviewed, even maintaining a dialogue with other characters (presented in an ironic aspect). The genres themselves are becoming an object of deconstruction. Travelogue "It's time to get out" abandons the function of reviewing the country and its culture in favor of using stereotypes and ironically playing up the realities of the country. The "bad movie review" genre partially loses the objective functions of film critics, transforming into "criticism for criticism". All these transformations are explained by the dominant role of the entertainment component, which determines the number of

views in YouTube space.

Citation is manifested through the use of the following elements: references (in any of the moduses) and direct quotation (unchanged inserts from films, the use of recognizable music, static images, memes, verbal citation). Citation serves several purposes: 1) expanding the cultural context of a blogger's statement; 2) semantic extension of the utterance; 3) creating a comic effect.

The integration with mass culture is primarily noticeable in the including the entertainment component in the videos. The mass audience is no longer interested in deep analytics, due to which even serious conclusions are served with a smile on a face. BadComedian combines aggressive criticism with a large flow of memes, ironically playing up the cinema making culture, which manages to capture the viewer's attention even in watching two-hour reviews (15 million views). The main tool for reaching a mass audience is variations of memes, which at the present moment are actually a universal way of communication.

Bricollabiness is shown at the level of interaction of different cultures, aesthetics, even moduses. In a comedy sketch, classical music can play to enhance the effect, which will only strengthen the comic component, losing its original sublime mood. Another manifestation of bricollability is the collision of author's content with borrowed. Simulacrum as a semiotic sign, a copy without an original, is partly realized through the creation of ready-made templates and stereotypes that acquire self-sufficient meaning in the context of the video and subsequently distributed to the masses as a communication tool. We believe that memes created by bloggers (gifs, comics, phrases in different variations) becomes primitive simulacrum. So it was, for example, with the BadComedian review of the film "Moving Up," which gave rise to the national meme "For myself and Sasha". The ironic playing up of the situation in the film led to the creation of a semiotic sign denoting any absurd motivation for any action. However, in the film itself, such a sign does not exist; it was created by the blogger himself based on the plot of the movie. Thus, the artistic reality itself is transformed under the influence of a blogger, finding copies without the original.

972 CONCLUSIONS

We concluded that postmodern aesthetics is getting primitivised and has a purely applied function in the framework of video creation. The listed elements are not used for the formation of increased artistry, but mainly carry an entertaining function and are a kind of "bait" for the viewer. Such a transformation seems logical. Any idea that originated in the depths of an elite culture sooner or later becomes an element of a mass one, undergoing a considerable simplification, adapting to the interests of a mass audience. Postmodernism as an idea, the answer to the orderliness of modernism, the leveling of any ideology, moved into the category of a mechanism, a technology

containing a number of tools to attract the audience and maintain its attention. In the context of visual thinking, a characteristic feature of which is a weak interest in consuming information in large volumes, postmodern elements solve this problem by a wide variety of mechanisms for conveying information to the recipient. Aesthetics loses its original artistic function, instead finding a purely applied - entertaining.

ARTWORKS AND THE PARADOXES OF THE MEDIA-TRANSMITTED REALITY

Abstract | This paper analyzes selected classic art that influences contemporary images. The basis of this research proposal is an analysis of the transformation of long-established and internationally recognized artwork through digital technology and social media. This investigation also highlights the symbolic meaning behind the representation and reproduction of media images concerning the political impact of global visual culture.

Visual culture consists of images of reality that are constantly being reconfigured. Thus, the visual arts develop consensually, based on democratic ideals and freedom of expression. Nonetheless, transgression occurs due to a lack of universal reference criteria and a dissolution of common human values. This explains why visual culture is often misunderstood and remains unassimilated. In addition, actual tragedies in life even become confused with art due to the fact that art so often closely imitates reality.

In the context of visual arts, a major area of concern for media outlets involves deciphering the meaning of images that have been manipulated and instrumentalized according to particular political and ideological interests. This especially applies to the power of capital and consumption and their global and cultural effects on social networks. The objective of the current proposal is to help people discern fact from fiction and to look at and understand the society's emergence and relationship to democracy. The relationship between ethics and aesthetic values are to be found in art's formal elements as well as in its content. Therefore, in this paper, visual arts images will be analyzed through a historical, iconological, and iconographical lens to investigate and evaluate visual objects as a form of communication and the current social effects of political images.

Finally, the objective of this paper is to show the digital interface as a means of interpretation and the aesthetic experience as part of this perception process. The paper also considers the artifice of images and the absolute reference values of human existence on visual arts in the face of mercantile offerings and technological progress and their effects on social networks.

Index terms | *Digital narratives; global image impact; media convergence; transformation processes; visual culture; political images*

Introduction

Representations recently viewed in global visual culture have appropriated the essential values of the human condition that at one time had been in the province of classic art. Many works of art and their themes allude to freedom of expression, ethics, and censorship. They appear in the embodying the rhythm of the metropolis where they are based. Instead of the socio-political meanings of images coming to the fore, they are, instead, contained in politics. One must be very careful not to misinterpret them.

This paper concentrates on the absolute reference values of human existence in visual culture in the face of mercantile injunctions and technological progress and the effect it exerts on international politics. Insofar as ethics and aesthetics can be questioned, is the media use of art a search for “innovation in the production of images” in the sense of positive and determinate power or simply the practical consequence of the diversity of modifications of creation? To provide insight into the relationship between art, media, politics, and the symbolic aspects of images, this paper is focused on the following questions: What is the context of the exploitation of tragedy as a boilerplate for everyday visual experiences? What are the true symbolic values that could communicate facts through images for international politics? If the effect of an image of violence, tragedy, horror, or destruction are true values can they be said to be absolute references of human existence?

These questions concern the awareness of freedom, respecting international norms, and the ethics of human rights. Images from different contexts and localities have, in general, exerted significant influence on the media in global and everyday social interactions regarding economics, politics, science, culture, and cultural diversity. Consequently, images are shown which stimulate ephemeral desires for pleasure based the appearance of eternal youth, desires for consumer goods, and a longing for freedom. Thus, a visual analysis based on the symbolic aspects of the elements that constitute the imagery found in the media of a democratic society is essential, along with a review of values for quality of life and the politicization of the individuals. Moreover, it is essential to highlight visual culture as an experience of aesthetics and an evolution of the capacity for reasoning and cognition based on the influence of signs and symbols in the society and the media.

1. Reality and Art Transgressions The exploitation of tragedy in visual experiences

Looking at the artistic achievements in the beginning of the 21st century, there is clearly a lack of meaning in the guiding ideologies. A study of visual culture shows

the development of this trajectory. However, it is necessary to take into account the ideologies that have given humanity a sense of socio-political participation and to also take into account the transformative images that have subverted the rigidities of the system. In this sense, visual culture has presented consensually based democratic ideals based on freedom of expression since the beginning of the 20th century. However, currently, these forms of transgression have been transformed due to the lack of ethical reference criteria and the dissolution of values. This explains why visual culture is often not understood or assimilated. In some cases, real tragedies are even confused with art, because fiction so closely imitates reality.

For example, the global impact of the image of a photo taken by Burhan Ozbilici, a Turkish photographer from the Associated Press shows an armed police officer shouting and gesticulating, moments after fatally shooting the Russian ambassador to Turkey at an art gallery in Ankara. This photo resonated with the people in the international media, and it was the “Photo of the Year” by World Press Photo 2017.

It is challenging to find the true meaning of this image and to resist the influence of the power relationships resulting from the domination and the injustice of globalized structures. As Bourdieu “Legitimate works thus exercise violence which protects them from the violence which would be needed if we were to perceive the expressive interest which they express only in forms which deny it” (1984, 139).

Art has always depended on knowledge, learning, and the ability to transmit and express spontaneously or intentionally what is perceived in the environment. Art is the reproduction (mimesis) of balance, reflection, understanding, patience, happiness, joy, love, compassion, beauty, and goodness together with imbalance, irrationality, pain, unhappiness, desperation, and horror. Whether good or evil, we perceive these feelings in the visible universe and connect them with our personal experiences. The results of this entanglement with artistic expressions grant creative productions and their symbolic values a greater dominion over our environment. Bourdieu (1984, 139-140) says of this that, “specifically symbolic violence can only be exercised by the person who exercises it, and endured by the person who endures it, in a form which results in its misrecognition as such.”

Generally, political images— whether photographs, classic artwork, illustrations, or propaganda posters—act as instruments of analysis, producing emotional reactions and messages for the citizens of a society. In addition to generating responses to the central questions of this research concerning freedom and citizenship and respecting international norms and ethics for human rights, this image rather than opposed to abstract quantitative data or interview transcripts (Bonsack 2008).

2. The technical and symbolic aspects of images on the impact of international politics

The foundations of social and cultural production and reproduction allow access to systems of social structures, and thus uncovers the motives and causes relevant to the functioning of the mechanisms of image production and reproduction. Since images in the context of socio-cultural reproduction go beyond borders, it is necessary to get into a reciprocal correspondence with the relationship between social structure, habitus, and praxis. The notion of habitus and praxis is a “generating (and unifying) principle of reproductive practices of objective structures” (Bourdieu and Passeron, 1987). It refers to the aesthetic experience, perceptions, and learning processes, as well the interpretations, judgments, and behaviors that are conveyed and inculcated during to the individual and collective unconscious through socialization and imagery production and reproduction. As Bourdieu (1984) in *The Social Institution of Symbolic Power, Censorship and the Imposition of Form* has stated:

Symbolic creations therefore owe their most specific properties to the social conditions of their production and, more precisely, to the position of the producer in the field of production, which governs, through various forms of mediation, not only the expressive interest, and the form and the force of the censorship which is imposed on it, but also the competence which allows this interest to be satisfied within the limits of these constraints.

Thus, the paradoxes of reality as transmitted by the media are seen by considering, on the one hand, that the individual can choose and select information consciously and, on the other hand, that the media can control and configure communication of the dominant reality. For example, the media and social networks can converge on recent and essential phenomenon and give it a twist that essentially turns it into “fake news.” The concept of truth is complex, which is why there is much analysis of the difference between facts and opinions in the social sciences. Therefore, in terms of visual art, we must beware of analyses based on finding the fundamental visual elements for the true values of the human condition through artistic achievements within a social context.

3. The visibility of the “true values” as absolute references of human existence

True values as absolute references of human existence that are an exploration of the eternal struggle for victory, justice, and freedom, through seeking to protect our liberty. They challenge humankind’s fundamental ideologies at every level. The notion of freedom is philosophical, and therefore, through aesthetics, we can apply it to artists and the artwork itself. We consider liberty the main concept and victory

the secondary concept to position in regard to the possible freedom, relating this to the dichotomies of true and reality through the images associated with the eternal struggle for justice, and freedom, maintaining the fundamental liberties at every level on humanity's history and, mainly, on the comprehension of our own evolution in relating to the notion of freedom.

An indirect analogy to the World Press Photo-winning image (2017) referenced above is the composition of visual elements related to the representation of the concepts of victory and freedom shown in the period of Classical Antiquity, the Hellenistic period, in the image of the Goddess of Victory (Nike, in Greek "victory") and depictions of the Goddess Eleutheria (literally, "freedom" or "liberty" in Greek) and the Roman goddess Libertas. In this sense, some works of art are representative of concepts that are essential to human existence. The evolution of these representations through a process of knowledge, reproduction, transmission, interpretation, have shaped Western culture, and they have provided mimesis of the essential values of humanity. The term, mimesis, refers to art as an imitation of nature and a representation of reality.

Tragedy, as the main conception of art, prevailed for many centuries was one of the first formal examples of mimesis. From Antiquity to the Middle Ages, the conception of reality and its representation is established, according to Erich Auerbach (1946), by the *Odyssey* and the Bible. While the real and the quotidian are often in Homer's work, the Bible offers more interpretations. The use of daily facts as art represent signs of a superior advent, with symbolic and esoteric characteristics that are still appropriate for the medieval mentality. The Judeo-Christian religion and ethos were strongly related to everyday life and family, thus setting the stage for the sublime tragedy that marks the categorical rupture with Antiquity in the sense of mimesis in its literary conception of reality.

Reflections on art in the West, up until Romanticism in the 19th century, are presented through interpretation of the theories of beauty and mimesis, finding renewal and a point of reference in the philosophy of Aristotle, as revealed in his *Poetics* (c. 335 BC), as embodying the highest achievement of tragedy (Hardy 1996) and in contradiction to the ideas of Plato. In presenting mimesis, Aristotle showed his refusal to separate the intelligible world from the sensible world, associating pleasure with the artistic imitation of nature. For Aristotle, art is beneficial in all its forms – both for the individual and society. For Plato, the sense of mimesis was to be found in the figurative arts; for Aristotle, mimesis was a representation of feeling, equivalent in importance in artistic works to the meaning of catharsis in tragedy. Regarding the aspect of mimesis embodied in mime, Aristotle's reflection extended to the art of dancing (similar to, and originating in, the imitating of animals). In this sense, the art of the mime deals with identification through the transference of personality (Wagner 2016).

In short, the theory of mimesis etymologically presents its meaning in ancient Greece with distinct purposes of interpretation in Latin translation. Adding this to the values of the Middle Ages, which signal the passage from the use of the term mimesis to *imitatio*, *imago*, the image of God and associations with all segments of the sacred. In the 14th century, the expression *imitatio Christi* illustrated this transformation well. This term embodied the idea of man created in the image of God, conveying in the term *imago* not only the sense of copying but also that of analogy. From its Latin meaning, the Italians developed the theory of *imitazione*. In the 15th and 16th centuries, the period of the Renaissance, Aristotle's theory of mimesis referred to painting in imitation of nature. In opposition to this theory, however, the French adopted the philosophy of Aristotle, mimesis, which has prevailed in European thought since the 17th century, and from this French conception, the Germans developed their reflections on mimesis (*Nachahmung*, *nachmachen*, *kopieren*, *nachbilden*) from the 18th century onwards (Wagner 2016).

Thus, employing iconography and its technical and material possibilities favor its expressive function. In this sense, all the recognized values of human experience and motivation were no longer related to the polytheistic culture, of Ancient Greece. In this specific case of the image as an example, the representation of Nike (Goddess of Victory) by an image of the Victory of Samothrace. Though, consequently, to the biblical characters, when victory is transferred to the images of messengers of God or angels, for example, Archangel Gabriel, 6-7th century AD, Kitio (Cyprus), Palagia Aggeloktisti monastery and the artwork of Carlo Braccresco, *The Annunciation* and, in Renaissance, Cinquecento, of Sandro Botticelli, *The Annunciation*, 15th century.

In images from the Hellenistic period, the composition of the symbolic meaning of victory and freedom gain added political and religious themes. An example to these features is found in the composition of the World Press Photo-winning image 2017 referenced above. In respect to this, we can make an analogy to the composition, *The Triumph of Samson* by Guido Reni (1612). Reni's paintings primarily deal with the themes of Bible stories and Greek mythology. According to the historian Klaas Spronk (2014), *The Triumph of Samson* can be seen as a mixture of mythological scenes, characterized by a focus on the proportions of the human body. He added the visual references of Greek antiquity to the symbolic values of the Romans to create images that were representative of the experience of victory and of freedom consequently transferred to biblical characters. The reference used by Reni is the statue of the Apollo of Belvedere (currently in the Vatican Museum) which underscores the reference to concern for the anatomic representation and image of the human body in its balance of proportions.

For a representation of the concepts of victory and freedom, any attempt at verbal description becomes as complex. How to represent victory and liberty? Many of the images that search for these representations since Classical Antiquity have created a personification of “freedom” and “victory” as female characters related to the patriotic themes. In ancient Greece there was the Goddess of Liberty, Eleutheria, with the Romans, it was – Libertas. In France, freedom is personified by Marianne, in England by Britannia, and in the US, the figure of Columbia is the hallmark of liberty. The configuration of these personifications maintain similar attitude expressions of freedom characterized by particular symbols and body postures. Likewise, they are associated with the characteristics of victory found in the image of the Greek Goddess of Victory (Nike), and the image of the Roman goddess Victory.

The history of art and literature have shown effective modes of influencing the configuration of images which impose the perception of their meanings and methods of structural or semiological analyzes. Therefore, art as a symbolic commodity exists as such only for those who hold the means to decipher and appropriate it (Bourdieu 1984). An image remains subject to a variety of interpretations, especially when shown without textual references because we will first realize it as an aesthetic experience before we move on to an understanding of the full meaning of the image. In this way, one considers that the definitions are restricted to a specific realm of cognition or common sense, due to judgments based on subjective values insignificant concerning in terms of the polysemy of the image, especially given an immense diversity of values for image interpretation. As Bourdieu (1984) stated, the instruments of knowledge and communication are “a structuring power only because they are structured,” in Symbolic Power and the Political Field. He also went on to explain that:

Symbolic power is a power of constructing reality, and one which tends to establish agnoseological order: the immediate meaning of the world (and in particular of the social world) depends on what Durkheim calls logical conformism, that is, ‘a homogeneous conception of time, space, number and cause, one which makes it possible for different intellects to reach agreement’(Bourdieu 1984, 166).

By analyzing the current artistic dynamics through aesthetics and iconology and contextualizing image production, techniques, and means prevailing in the epoch it was created, discernment of ideological discourse becomes a fundamental of coming to a significant answer about how the feeling of freedom arises and encourages respect for human rights and fundamental freedoms. That is what the revolution was about, to leave the old for the new. That is the motivation and momentum for innovation, change, and victory.

NON-HUMAN SENSUALITY: APPROACH TO CINEMA-EYE

Abstract | If it is right that aesthetics should be understood primarily as a “philosophy of sensuality,” sooner or later a philosopher working in this field will ask himself a question: is the human type of sensuality the only possible one? Similar problems with non-human consciousness (also named – «artificial intelligence») have already taken up an independent research field. However, the question of sensuality is still poorly discussed, despite the fact that it seems to be easier to come to an agreement about the human’s unexclusive rights to a sensual experience. All objects perceive something, although they make it in a different way. Starting from I. Kant, one can say that the analyses of non-human sensuality demands a scrutiny work in terms of a priori forms of sensuality for different non-human subjects. But, the underlying question is, how could we find such a non-human subject with an open access to its own sensuality-as-it-is?

This topic has already been posed by speculative realists (S. Schaviro, G. Harman), but because of the lack of data the answers remain at the level of theoretical exercises and assumptions about the subjectness of stone, mucus, machines and so on. My approach is treating cinema as a unique case, a subject about which it is possible not only to allow something, but also a subject which leaves traces (by the processes of shooting and editing), upon which it is possible to establish how the syntheses of sensory data are produced. For the analyses of cinematic experience, Kantian forms are not enough: it requires not only time and space, but also, at least, rhythm and color.

The cinema’s autonomy, the otherness of the “cinema-eye” (Dziga Vertov’s term) in relation to the human eye could become obvious much earlier, if not the established view on cinema-as-art – a new set of techniques in skillful human hands. By the way, many early film theorists (Dziga Vertov, J. Epstein) didn’t consider shooting and editing as new advantages for making art and perceived themselves not as artists, but as parts of a global mechanism, a machine with its own ways of seeing (and, later, hearing). In a similar vein, G. Deleuze wrote about cinema. The cinema-eye, therefore, seems to be not just a copy of the human eye. It creates its own specific sensuality, functioning of which is worth studying.

Introduction

The 1920s turned out to be an extremely fruitful decade for the development of film-theory which was still very young at that time. In many countries numerous articles and books dedicated to the new invention had already come out. It was obvious, that cinema had suddenly appeared, but immediately conquered the whole world. Early theoretical texts differed significantly from each other and accentuated in diverse moments among the variety of cinematic elements. Film-theory in USSR could be called, on a par with the French one, one of the most fruitful during this period. There was the common basis for these texts, which was supported by all leading directors with their methods: L. Kuleshov, S. Eisenstein, D. Vertov, V. Pudovkin. This basis can be called *montage* as a unique operation for cinema, which has capabilities that are not accessible to any other art or anything else. All theorizing directors emphasized the constitutive function of editing, but did it in different ways. For example, Lev Kuleshov used montage as the technical connection of frames, emphasizing the magic of illusiveness that could be created (the most vivid example is the “geographical experiment”¹. On the other hand, Sergei Eisenstein and Dziga Vertov considered montage as a production of something truly new, something that doesn’t exist in reality, but arises under the influence of cinema. However, for Eisenstein this alternative reality started to make any sense only in contact with human eye, emotions and affects².

Nevertheless, the most radical among all Soviet theorists was Dziga Vertov, who, in his conception of the radical novelty of cinema, went far away from his colleagues, saying that cinema is not just a new art, not an instrument in the capable hands of man, not only a phenomenon existing only in the field of perception of the viewer, but something completely independent, unparalleled in the past. Such an approach in his own theory was accumulated in the term “kinoglaz” – «cinema-eye», which was lost for a long time in the film-theory. However, it seems promising now to make our contribution to contemporary problems associated with the autonomy of cinema and the search for grounds for talking about its specific sensuality by using this term and its basic features.

In order to understand this question, it makes sense to start with research in the history of the problem of cinema-eye in strictly Vertov’s terms. Then we would like to move on to a number of assumptions that could be productive for the continuation of analytics in cinema-eye no longer as a specific term of Vertov’s theory, but as an independent concept that forms a conversation about the specifics of cinematic sensuality.

The concert of «cinema-eye» in Dziga Vertov’s theory

Dziga Vertov’s “cinema-eye” can still be returned as something inaccurate and unsubstantiated, purely intuitive manifesto of alternative thought, full of promising moves. For Vertov, the cinema-eye was the starting point, the central concept which set the tone of his theory from the first text and in 1920s gave the title for the working group and collapsed into itself all subsequent conceptual considerations. First of all, we warn ourselves against the idea that the cinema-eye is an analogy of the human

eye. Also cinema-eye should not be considered as a simple metaphor of a shooting camera. The cinema-eye is (1) the assembly of technical operations (search - shooting - editing) and (2) what can be called the specific sensuality of the cinematographic apparatus. Of course, people's vision also differs depending on something (the quality of vision, distance). But the cinema-eye is not just "another point of view," it is a vision completely inaccessible to man. «Do you see the pattern of human movement of the flow of people when you look at the human eye? No, you do not see, because it can only be seen with the cinema-eye. This is in reality, but we do not see it that way - only the cinematographic apparatus sees it».³ In Vertov's theory there are many lacunas and inaccuracies: even a given fragment sounds more like a slogan than an explanation. The theory of the cinema-eye in this form really does not provide ready-made answers to the philosophical analysis of the cinematic sensuality. But nevertheless, it really can help us with a number of true intuitions.

First of all, his approach posed questions correctly. Cinematic vision and, with the advent of the radio-ear, hearing are different from the human ones, but in what sense? Vertov answered these questions with his experiments, focused on the transformations of time, which, like in the movie "Cinema-Eye" (1924), may be reversed because of the ability to slow down and speed up movement. Vertov also concentrated on the way how sensory syntheses, produced by cinema-eye, differ from human ones. Here the most striking example is the already mentioned radio-ear. After its appearance, Vertov stated that now the cinematographic apparatus had a new sensual organ. At the same time, like for humans, the sensory data from different sensual organs must somehow relate to each other. And the very first Vertov's intuition in this matter opposed the analogies with human sensuality: it is not at all necessary that the sound and visual series should coincide, become dependent on each other. Cinematographic sensual organs independently record the facts of the world, cutting this world into different sensory streams, divide the world into the visible and the audible flows and master them as independent.⁴

All this leads to the fact that the cinema-eye is not just a supplier of illusions, but perceives the world according to its own laws, giving the viewer the result of this perception by screening. The cinema-eye is a conductor to the "facts of the world", which is accessible precisely through sensuality. Chaotic vision is more relative to human. Totally opposite: the cinema-eye is able to "decipher the world", overcoming natural spatial and temporal limitations, and notice in constant world's motion the "resultant".⁵ Cinema-eye leaves cinema autonomy, "sees and shows" rather than "convinces and proves." And even "show" here is not the main part. The final result, which is shown to someone, is not something like the aim for cinema-eye. The most important point here is that cinema-eye has its own sensuality and sees the world the way different from the viewer sees the film. This statement should be discussed in detail, but Vertov has already highlighted these moments. Perception of the slowness, for example, occurs to viewer, because he is inherent in the norm of vision, but in the cinema the norm is different. Cinema does not deviate in what we call «slow mo» - it can really see motion that way. And this specificity, this feature of cinema-eye promises the real novelty.

Another important point in Vertov's theory of the cinema-eye was his refusal of talking about cinema-as-art. He didn't somehow dispute about it, but completely ignored this formulation of the question.⁶ This point has many consequences. Since cinema is not considered as art and a particular film is not considered as a work of art, the director, as a creator, loses his privileged position and turns into a part of the mechanism as functional as lens or a tripod. Vertov endowed the cinema itself with subjectivity and creative power, unlike, for example, Eisenstein, who saw the skilled hand of the artist behind everything. Vertov as a theorist also avoided talking about the viewer. He was completely disinterested in the point of view of certain social functions that the cinema, like everything that exists in the communist world, should have. The cinema-eye works independently, without waiting any external legitimation for its existence: neither by the artist, nor by the viewer.

The productivity of rejection of considering cinema-as-art is also manifested through the suppression of attempts to think «in films». Films were traditionally threatened as works of art which should have a beginning and an end, contain in themselves some clearly formulated message and aim to organize something whole. Vertov, unlike Eisenstein, did not ask himself about the whole. If it can ever be formed, it will not be the embodiment of the artist's idea. The only possible whole in Vertov's theory is the complex meaning immanent to the world, but not seen by an imperfect, limited human eye. This refusal to think of cinema with films provokes a search for other possible configurations: either more discrete formations (frames or montage sequences), or, on the contrary, it could be useful to refuse any internal distinctions and think about cinema in general.

Of course, Vertov's texts do not solve any specific problems. He was not very strong in elaboration of the theory step by step. However, for our purposes there are a lot of great intuitions in his approach Returning to the cinema-eye, which is independent from human and open the mind for developing new ways to strictly sensual contact with the world, becomes simply necessary nowadays.

Possible development: cinema-eye as the bases for analyzing cinematic sensuality

There have already been a few attempts to consider cinema this way besides Vertov's theory. However, all of them were not succeed in film-theory. Sometimes, similar to Vertov, because of the lack of arguments. Here we can mention theory created by Jean Epstein, which also suggested promising intuitions about specificity of cinematic perception of time and space.⁷ The very similar position we can find in later projects created by several experimental directors: Maya Deren⁸, Stan Brakhage⁹, etc. In contemporary film-theory there are some approaches very close to cinema-eye, but, however, with meaningful differences. For example, phenomenological method in film-theory, presented by Vivian Sobchack, tends to give cinema some autonomy. Nevertheless, in her works she seems to be more interesting in the viewer's experience rather, than analyzing in detail what she calls «film's body».¹⁰ Another doubtful strategy is used in works, which are interesting in developing questions about cinematic conscious (Daniel Frampton).¹¹ Our doubts are caused by the hasty assumption, that

cinema is conscious without any sufficient arguments. Contrary: it is obvious that the question about the possibility of cinematic subjectivity may rather be posed in the field of sensuality, because nobody could deny, that cinema is able to perceive.

Let us call the approach suggested by Vertov and somehow supported by other authors the cinema-eye`s point of view – the point of view oriented to the cinema itself, focused on building relations between the cinema and the world. Let`s forget that there is a director with his vision of the situation, ethical constants and ideas. The operator should be reduced to the part of the mechanism that is responsible for maintaining the apparatus. And we completely exclude the viewer, as if what is being filmed should not be shown further to anyone. Thus, we block out any inclinations in the field of intellectualization and attempts to endow prematurely with the values. What will we do?

Cinema-eye. It uses the process of recording and know nothing about the status of the events that occur before it, but seeing and fixing every detail. In this sense, cinema is transparent, the camera is in a disinterested position. Fixation is made only at the moments of recording, which are then located with each other on the editing table and form something new - an independent reality by its own laws, not a reproduction of something happens in front of the camera. The cinema does not know about psychological relationship between objects A and B in front of the camera, but the cinema is able to capture their sensual interaction. Cinema does not know what associative series can provoke the sunrise, but it is extremely sensitive to changes in the light. Cinema cannot know to which reservoir the water belongs, but it will not deceive in what rhythm this water moves. The fact is that cinema is capable of fixing the connections of the sensual order, but not the intelligible one - movement as such, the rhythm of this movement, the arrangement of lines. But the space-time syntheses that cinema makes are autonomous. They do not have a referent in reality that exists in front of the camera. We know that the lamp behind the head by shooting starts to grow on from the head. The status of the filmed objects themselves is also unknown. It causes various conversations about the equality of «things» - inanimate objects captured by the frame, and people-characters acting in it. If we begin to think of these space-time laws as real and independent, then we can stop equalizing our vision with cinematic: what we see in life, the cinema will see otherwise anyway. So, if we take the position of cinema-eye as a starting point for further analysis, which certainly still has to be carried out, we need to look for new issues and produce new divisions within the cinema.

CELLULOID IS NOT A SIGNIFIER ANY MORE

Abstract | Since the first obvious indications of the inception of the times of the “end of representation” – as Deleuze pointed out half a century ago – we have to deal with a widespread awareness about the persevering change of art and of reflections about art in the framework of social, institutional and technological contexts. The analysis of interactions, starting with the invention of film/cinema, artistic practice and theory, including aesthetics, highlights the importance of the notions, categories and agencies of movement. The emergence of so-called post-media epoch signals a new decisive change following the one, which was revealed as the overwhelming onset of mass culture and the other that has been marked as the event (Badiou) of the revolution of the 1960s. As the theoretical indecision about the features of an on-going new change seems to be still dominant, the practice of art of any conceivable variety reflects basically the same indecision. The fact that “film” is still the notion, which by and large means moving images, while the digitalization made the material (celluloid) film obsolete, is an elementary metaphor of the process of a vanishing of signifiers, related to the notion of art. However, in a more complex term, the questions about the correlation between form and content are re-emerging in novel configurations as well as the epistemological and ontological problems of aesthetics, concerning the designations of objects of analysis. In these settings the art does not necessarily need to be militant or socially involved to be political, since the categories of truth and reality are destroyed through the mediatic dissipation of notions of subjectivity and objectivity. In this paper different artistic and mass cultural phenomena are taken under consideration as rather singular instead of typical cases, which are legible as the instances of inventions of strategies by artists or artistic productions in order to respond to the post-media environment and to operate in it with a purpose. In the elaboration I am trying to answer what actually is a still undefined change, which, nonetheless, instigates a flawed thinking of a repetition of the transformation of social meanings and effects of modernism from 20th century. Of course, my own answer to the complex question will and cannot be definitive, but what is important is to keep alive a search for an answer about the senses of art in the world operated by the forces of software and neoliberal economy/ideology.

Index terms | *change; digitalization; film; legibility; mass culture; movement; post-media*

Aesthetics suffers from a wrenching duality. On one hand, it designates the theory of sensibility as the form of possible experience; on the other hand, it designates the theory of art as the reflection of real experience.

Gilles Deleuze¹

INTRODUCTION

Walter Benjamin's largely known – if not totally accepted then at least seriously taken notice of – idea of a transformation from quantity to quality regarding the changes of position of art within industrial society, traverses many contemporary discussions about aesthetics and artistic practice. In Benjamin's view works of art and the perception of them in the "age of mechanical reproduction" function within the mass culture. Works of art are enveloped by its main mechanisms of distribution of modes of aesthetic perception in the social framework. In brief, Benjamin discovered that such framework is a space for including a politicized art in the struggles for emancipation.² In the age of the ubiquity of digitalisation, it is tempting to speculate in the terms of a repetition of Benjamin's "formula", now applied to a variety of obviously technologically enabled productions of art and other aesthetic phenomena. Timothy Murray was not the only one who got caught in the comparison of two transitions. In the age of "digital baroque" he ascribes a strong transformative impact to "computer wizardry" in a manner, which evokes Benjamin's observation of the effects of industrial reproduction technology.³ Even more explicitly Peter Weibel almost mimics the diction of the above mentioned Benjamin's articulation: "Just like the case of the old technical media of photography and film, the pivotal successes of the new technical media consisting of video and computer are not just that they launched new movements in art and created new media for expression, but that they also exerted a decisive influence on historical media such as painting and sculpture."⁴ Reading this, we should call to mind Benjamin's *vanishing aura*, which was the notion of a dialectical change that affected not only some new advances in art and in the movements of aesthetics, but the status of art in its totality. Starting with Adorno, countless authors implied and/or ascribed to Benjamin an outlook, which in final analysis boils down to a reproach of technological determinism. Adorno mentioned the "equation of technique and technology" in film. Adorno states that according to Benjamin, film "has no original" and so "the mass product is the

2 Of course, I am referring to: Benjamin, Walter (1969). *The work of art in the age of mechanical reproduction*, in: *Illuminations*. New York: Schocken, pp. 217 – 251.

3 Murray, Timothy (2008). *Digital Baroque / New Media Art and Cinematic Folds*. Minneapolis, London: University of Minnesota Press, p. 35.

4 Weibel, Peter (2012). *The Post-Media Condition* (<http://www.metamute.org/editorial/lab/post-media-condition>), accessed: 6th January, 2019)

thing itself”.⁵ Although Adorno clearly postulates that “the aesthetics of film is thus inherently concerned with society”,⁶ it seems that he does not take this assumption strictly seriously and he rather proceeds with his doubts about the capacity of film to attain an aesthetic impact comparable, for instance, to writing. Benjamin does exactly the opposite by demonstrating that such aesthetics becomes obsolete after the spread of mass culture. In the final analysis Benjamin gives full weight not to technology, but to the social or sociological and political consequences of art in the age of mechanical reproduction. Within this understanding his suggestion of an impossibility to keep alive the “old” aesthetics exposes its fundamental conceptual focus on the “Subject” – in both relevant meanings: the abstract continental philosophical notion and the notion of an individual. A matter of a separate discussion is a question on the level of communication between both authors and personal friends, since Benjamin overall “avoids” the sort of philosophical terminology, which permeates Adorno’s discourse.

Benjamin’s approach to the notion of mass culture made a crucial difference at the time – actually, posthumously after the publication of his essays in 1950s – in view of some attempts to ascribe an artistic value to cinema. Early film theoreticians such as Hugo Münsterberg, Jean Epstein and Rudolf Arnheim (among others) didn’t really find a way of thinking about art beyond the canons of the time. Arguing that film was able to attain a comparable artistic level as literature, drama, poetry, music, etc., they failed to notice that such arguing itself was unnecessary; the onset of cinema actually transformed the field of defining art and aesthetic value before film theory noticed the fact. Nevertheless, they share common ground with Benjamin considering their analysis of interactions, starting with the invention of film/cinema, artistic practice and theory, including aesthetics, which highlight the importance of the notions, categories and agencies of *movement*. Cinema as the art of “moving pictures” is right now becoming a history of a new age, which is being grasped by the chain of notions, beginning with “postmodernity”, including also the concept of post-media.

PSYCHOTECHNOLOGY, CINEMA AND THE REST OF ART

By becoming the history, which preceded its technological transformation, cinema transcended the limits of art subjugated by representation; however, this transcending through the instances of the exposing of differences could have not been fully recognised due to the technology of the *analogue* reflection of reality as the defining principle of film. Since the first obvious indications of inception of the times of the “end

5 Adorno, Theodor, W. (2001). *The Culture Industry. Selected essays on mass culture.* London, New York: Routledge, p. 180.

6 *Ibid.* p. 182.

of representation” – as Deleuze pointed out half a century ago – we have to deal with a widespread awareness about the persevering change of art and of reflections about art in the framework of social, institutional and technological contexts. When discussing a decisive transforming influence of Kierkegaard and Nietzsche and what they inscribed into the category of movement, Deleuze emphasized their inversion regarding representation. In a counter-Hegelian gesture they repudiated the “mediation” and so they did not propose a new “representation of movement”. Instead of this the relevant problem for them is about

“a question of producing within the work a movement capable of affecting the mind outside of all representation; it is a question of making movement itself a work, without interposition; of substituting direct signs for mediate representations; of inventing vibrations, rotations, whirlings, gravitations, dances or leaps which directly touch the mind.”⁷

This thinking could well have anticipated later Deleuze’s work on cinema, which is founded in the first of the two volumes by amalgamating the notions of image and movement (*image-mouvement*). Anyway, although the quoted sentences of Deleuze comprise of a wide scope of possible meanings and correlations, they open a way to thinking about cinema, which irrevocably established the agency of movement, especially in the field of aesthetics and art. Photography and film gradually became the components of an incremental process of changes, disruptions and discontinuities in more or less all artistic fields. *Fin de siècle* painting and sculpture with its artistic movements triggered a chain of changes, which demonstrated that art escaped the constraints of representation. What Nietzsche anticipated in his distancing from Kant’s aesthetics through a turn from the aesthetics of the “disinterested gaze” to the producer of artwork, was specifically materialised in analogue cinema as a “synthetic” art. A projection of a film on the screen presents the “manipulation” of camera focus, plan, frame etc. Hence, it is an inevitable encounter of two domains of subjectivity (one of the author and other of a viewer) in an unprecedented mode regarding any of “previous” arts. Friedrich Kittler, while paying tribute to Hugo Münsterberg, coined the term “psychotechnology” to designate this relationship, in which the cinema audiences are confronted with the look of a camera as the look of the other. Since these matters were already widely discussed in film theory, I would mainly like to point out here that cinema due to its technology and the interaction in the social and artistic contexts, was involved in the transformation of art, which depended on the transformed perception by the audiences. Therefore, as we all know, the galleries were increasingly

7 Deleuze, Gilles (1994). *Difference and Repetition*. London, New York: Continuum, p. 8.

populated by a multiplicity of new styles, approaches and reactions to the realities related to the new modes of visual perception; writers like Döblin and Dos Passos used the “method” of film montage in their writings and so on – until the times of the highpoint of modernism, when cinema in “new waves” reflected its own reflections in many cases of the revolutionary politicised moving images. Still accounted for as “analogue”, early video technology of magnetic tape recordings shown on cathode ray displays (CRT) brought by, at the peak of modernism, a revolutionary change to art galleries. This technology decisively affected – in a lasting conjunction with the forms of performance and of installation – the emergence of global artistic events in particular. Some painters, for example, more or less implicitly opened a visual dialogue with Etienne Marey’s images, shot with the chronophotographic gun before the turn of the centuries. Then in 1930s Alexander Calder introduced his mobiles, sculptures, which actually moved as they were powered by electricity or just moving air. Parallel to cinematic “new waves” in what was at the time Western and Eastern Europe the group *Fluxus* invented intermedia and interdisciplinary approach to artistic practices. Particularly Nam June Paik stands at the beginnings of video art, which, from his early work on, overwhelmingly conquers the spaces for artistic exhibitions. With the recent leaps of digital technology it is evident that the boundaries between artistic categories are moved, blurred, transgressed. They became irretrievably inconceivable except, of course, in their historical forms and formats. How much were all these phenomena instigated by cinema could be open to interpretation, but there is no doubt that focusing on movement in most art forms had to do with film. But as film acquired a special eminence as an art form, although somehow “contaminated” by its mass cultural origin, film’s material signifier, the celluloid, is disappearing from usage. Films on celluloid are prevalently dispersed in film museums and archives, where they are being digitised. New films, which are entirely shot with digital technology, are shown in cinemas, screened on some TV channels, they are streamed to smart televisions, to computers and mobile phones and then they join countless other “visual products” in the vast memories of virtual worlds.

996 POST-MEDIA 1: TOTALITARIANISM OF IMAGE

On 12th May 2018 at 11 o’clock Jean-Luc Godard held press conference at Cannes film festival, where his latest film *The Image Book* (*Le livre d’image* – 2018) was screened. The event marked the process of transformations, which are very consequential for cinema as art and for all art that cinema already in its analogue age affected so much. The great cinematic and social revolutionary, now 87 years old Jean-Luc Godard, answered the journalists’ questions via the FaceTime application on an iPhone. Among many implications of this historic event the first one concerned *The Image Book*, which

actually adds many new nuances to Godard's older project *Histoire(s) du cinéma* (1989-1999). *The Image Book* is obviously a montage to a great extent made possible by digital(ised) content from the times of film and television and their inherent historic and political manifestations in view of the trajectory of the meanings of the notions of reality. Hence, the second implication concerns the future of cinema. It seems as if Godard inferred that we are entering a different age, indeed, a different world, whose difference is nothing less but changed humanity. Saying that "many actors today contribute to a totalitarianism of the filmed image, against the thoughtful image", Godard actually agrees with Stéphane Delorme, who recently pointed out to *persuasive design* as a tool of "designing the minds". Delorme "accuses" psychologists and neuroscientists that they "sold to the enterprises of the Net their expertise on vulnerabilities of brain in order to *hook* the users."⁸ Still, Godard was not that univocal since he also bet on the future of film, which – like his modernist films in mid-20th Century with their subversive and disruptive form – stand chances to disturb the very totalitarianism, which it itself helps to recreate. Godard must have had the mainstream cinema on his mind, when he said that cinema "consists too much of showing what's happening. Films should show you what is not happening and what you never see anywhere, not even on Facebook."⁹ Intentionally or not Godard described what the participants in many artistic fields see as their main task. "Showing what is *not* happening" points to a critical regard of realities, it calls for a moral invocation and it points to what is overlooked and/or repressed. The recent overwhelming topic of immigrants in all kinds of artistic practice can be taken as an appropriate illustration. In a broader view, Godard's intervention touches upon issues that transcend just the artistic concerns considering that he recognizes the roles of art in the world of multiple interactions. "Images become unplugged and unhinged and start crowding off-screen space. They invade cities, transforming spaces into sites, and reality into reality."¹⁰ In the settings, into which Godard's thinking is inscribed, art does not necessarily need to be militant or socially involved to be political since the categories of truth and reality are destroyed through the mediatic dissipation of notions of subjectivity and objectivity.

POST-MEDIA 2: RADICANT ART

The emergence of so-called post-media epoch signals a new decisive change following the one, which was revealed as the overwhelming onset of mass culture by Benjamin

8 Delorme Stéphane (2018). Totalitarisme tech, Designing minds: changer l'humain. In: Cahier du cinéma, N° 750, Decembre 2018, p. 14.

9 Godard's quotes from his press conference are transcriptions and translations of his talk.

10 Steyerl, Hito (2015). Too Much World: Is the Internet Dead? In: Aikens, Nick (ed.), Hito Steyerl, Too Much World, Berlin: Sternberg press, p. 31.

and the other that has been marked in Alain Badiou's philosophy as the *event* of the revolution of the 1960s. The culmination of modernism at the time and its liberating effects reached in 21st Century the end of their trajectory, which consisted of meanings and aesthetic practice that travelled through the discourses of postmodernism in order to be, as Herbert Marcuse back in 1970s would have it, "absorbed" into socio-economic-political arrangements of neoliberalism, which is the notion that marks the contemporary system of domination. In this respect one should evoke Benjamin's emancipatory expectations, regarding the mode of mass participation, which at first appears in "disreputable form" in view of evident the usages of mass culture's "instruments" by fascism at the time. We should see the epistemological pattern in his insight. Similar dialectics as those identified by Benjamin in 1930s should work also in post-media age: the new means of a dispersed communication, i.e. interactions through so-called social media serve as "fake news" vehicles. This is just the opposite from the democratisation of communication, which was expected, when these applications were gradually launched into the space of post-media. A special angle in view of this problem was contributed by Lev Manovich, who prefers to frame all such phenomena in the notion of artificial intelligence (AI). His way of thinking based on his expertise on digital technology is marked by his constant emphases on the "cultural" impacts, which in other words means that "aesthetics" penetrate a large scope of social life and practices. "But what is perhaps less obvious is that AI now plays an equally important role in our cultural lives and behaviours, increasingly automating the processes of aesthetic creation and aesthetic choices."¹¹

And what remained from cinema? The answer is "film" as an actually empty signifier, considering that celluloid as the material signifier in the notion of cinema is relegated to the past. In the times of post-media this fact far transcends just the mode of production of cinema, but it also comprises of the modes of perception due to new digital devices, which are included in the dynamic of social forms of interaction with digital film. Of course, art in general got entangled in this transformation and it "refers to movement, to the dynamism of forms, and [it] characterizes reality as a conglomeration of transitory surfaces and forms that are potentially movable. In this sense, it goes hand in hand with translation as well as with precariousness."¹² Bourriaud's invention of *radicant* aesthetics, which takes a note of "spatializing time", is especially appropriate for cinema in its new forms after its celluloid signifier is gone. We are just at the beginning of the full flourishing of cinema, which is just opening a way to "another world", which is now understood in terms of the *totalitarianism of image*.

11 Manovich, Lev (2018). *AI Aesthetics*. Moscow: Strelka Press. This booklet was available only in Kindle edition without the conventional pagination and so I can't refer the page of the quote.

12 Bourriaud, Nicolas (2009). *The Radicant*. New York: Sternberg Press, p. 79.

Cinema is now actually a plurality of genres, forms and ways of showing films on a range of media. This affects the change of the cinematic artistic practice in a variety of cinematic movements. In a wave of films and TV series the totalitarian aspect of digital image is “self-reflected” in films, incorrectly labelled as science fiction, as a constant flow of time and again images within images. In this vein characters of quite complex narratives are forced to wonder through different “realities”, not knowing exactly what is their own and what is the external technologically induced memory. David Lynch’s second *Twin Peaks* (2017) series is a great example of the “radicant” art considering how time and space run one into the other and, consequently, the characters acquire and enfold inner mysterious differences in their exploded identity. Some episodes of this series are based on an almost realistic paradigm only to be devastated by another episode, which is conceptually mixed with such a form of video installation that not so long ago would have been only imaginable in some artistic breakthrough galleries. Lars von Trier could be taken as another good example in his recent films for his combining visual references from divergent resources in the narratives, which are aimed not only to shocks for the audience, but also to the reframing of ethical, aesthetical and ontological perspectives. In film *The House that Jack Built* (2018) he brings into the portraying of a serial killer a re-definition of art as the other side of evil. Of course, such high-end products can be taken primarily as the best examples of the nascent culture, in which art interferes with life in a so far not finally defined manner.

CONCLUSION

I mentioned only some specific observations concerning the change of the very notion of aesthetics related to reconfigurations of artistic practice and its social space. As the theoretical indecision about the features of an on-going new change seems to be still dominant, the practice of art of any conceivable variety reflects basically the same indecision. The coining of concepts of artistic periods from modernism to post-modernism towards “radicant art” and the deciphering of the frames imposed by the aesthetic regime in Ranciere’s perspective mainly indicate that the normative aesthetics even in an elementary shape became definitely inconceivable. The fact that “film” is still the notion, which by and large means moving images, while the digitalization made the material (celluloid) film obsolete, is an elementary metaphor of the process of a vanishing of signifiers related to the notion of art. In the aesthetic discourses of today a synchronisation of a technological determinism and the analysis of a surpassing as ever-singular meanings of art is evident. On the other hand, in the politics of artistic practice, the strategies of aesthetic social comments are unavoidable. As it looks, all movements, which I only superficially indicated are creating the aesthetics, which

work as an agency within art; we have now no more overwhelming aesthetics, but the ubiquitous aesthetics of forms of life and death in the world of simulacra. Therefore, in more complex terms the questions about the correlation between form and content are re-emerging in novel configurations as well as the epistemological and ontological problems of aesthetics, concerning the designations of objects of analysis. Films, which exist only in virtual digital spaces, of course, make things more complicated.

MEDIA MONADOLOGY – A SOCIETY OF SPECTACLE AND ALTERNATIVE (POST MEDIA) PRACTICES

Abstract | Understanding the world of media, in the spirit of Debord’s radicalism, leaves no space for interpretation of what is (hypothetically) outside of the domain of media produced culture. Similarly, our world can also be interpreted as a monadic structure of perception “without a windows”, that looks like Leibniz’s mathematical universe, constructed in the 18th century, which was made possible by ars combinatoria. Such views of the world of media culture primarily relate to today’s Western European civilization, which is increasingly becoming the community of technologically generated faces of the spectacle. From what point of view, in such an interpretative context, it would be possible to carry out the critique of media, that is based on both, aesthetics and on fluid forms of contemporary media culture? Using the “post-“ prefix, as in the case of Manovich’s interpretation of culture as a form of gigantic software which is filled with data (“big data”), does not guarantee a step forward from the field of media sphere influence and data management, even more it is an act of its immanent defining post mortem. Considering the underlined situation, the question we are stating is: how is it possible to get out of the monad horizon of the society of spectacle? Is there any event that has caused a specific post-condition to a development of so-called media culture, which, as is already mentioned, can be interpreted through the conceptual determinants of “monadology” and “society of spectacle”? In this text we will examine the interrelations between contemporary (media) aesthetics and cultural (art) critique.

Index terms | *Contemporary aesthetics, Culture, Media, Monadology, Society of spectacle*

As a relatively new scientific discipline, media aesthetics enjoys a dual status. On the one hand, it is based on the knowledge derived from general aesthetics, and therefore, in relation to the latter, media aesthetics could certainly be seen as a separate applied discipline. On the other hand, media aesthetics is ever more frequently encountered during the interdisciplinary research in the field of the philosophy of the media, of which it is an intrinsic part. In either of these cases, media aesthetics should represent the domain of aesthetic (philosophic) research, the basic subject of which is the so-called media culture. And since media culture is one particular aspect of cultural practice, the question arises as to what kind of aesthetic research corresponds to the current media, or cultural and artistic, practices. The most frequent answer to this question is that media aesthetics does not deal with specific media in terms of their final definition, specification and delineation, but that its research is based around the assumed *cross-mediality*, in which case the boundaries between the individual media are erased, and the media space is necessarily treated in a flexible way.

Moreover, media aesthetics is not unique in itself, either according to its subject matter or its methodology. In fact, it is only conditionally designated as a separate field of research so that it could be distinguished from the theory of the media and preserve its primary connection with philosophy. At the same time, media aesthetics has the task of constantly redefining its subject matter and, consequently, the methods of research, because its subject matter is not given *a priori* but is almost daily redefined. Also, in relation to the approach to the perceivable reality which is generated in technical manner, as well as to its effects upon art, culture and society, media aesthetics shows an interpretative fluctuation. Therefore, we will attempt here to show, in a succinct way, the two mutually opposed positions which media aesthetics occupies in relation to technology, culture, art, and society within which it operates. The first position pertains to the critique of the so-called "Society of the Spectacle", which is a product of the joint influences of technology, financial capital and entertainment industry, while the second position assumes a condensed analysis of artistic and cultural activities within the framework of new technological paradigms, which changes the nature of art to a significant degree and points to new forms of media use as a means of artistic communication. As it is clear even at first glance, there are huge differences between those two positions; however, they both break out of these interpretive paradigms and conquer the problem space between them. In short, as an applied discipline, media aesthetics balances between at least two different approaches to media culture, while encompassing a multitude of empirical details that are distinguished by the changing world of the contemporary media.

In accordance with the current developments in the field of the media, we consider it important to ask the following questions: from what position would it be possible today to submit the media to criticism which would be based on aesthetics on the one hand, and the fluid offshoots of the contemporary media culture on the other? Do the media and/or post-media aesthetics have any ability or power to do so? If we look for the answer to these questions in the theory, we will see that in relation to this there is no general agreement among the authors. While Debord, situationists and British theoreticians of culture and the media like Fiske, for example, advocate the idea of artistic criticism of the media, either strategically or tactically, the technocentric approaches hypostasize the power of new technologies, while giving up on criticism as an instrument of a potential change of the cultural and social reality.

Unlike Debord, who takes the idea of strategic criticism from the arsenal of military doctrines and develops it for the purpose of realizing the idea of a revolution in our time, Fiske sees criticism as a tactical instrument, developing it on the basis of elements which are not fully calculated strategy-wise, but they move within the domain of the 'tactical' potentials of a struggle for dominance and power.¹ However, regardless of

whether or not it is, in principle, the matter of the use of criticism for the realization of strategic revolutionary goals and tactics which are employed to undermine the governing value system produced by the media, situationists, Debord and Fiske believe in criticism as *the* weapon which enables contemporary art, with the support of the more engaged among the aesthetic theories, to substantially change the existing order of things.

In order to explain the existing situation, we will have to look backwards. One of our starting assumptions is that the media world resembles a mathematical (technical) system of monads or perceptions, as Leibniz described it in the 18th century.² This, however, does not imply a departure from Debord's idea of the Society of the Spectacle; one of the intentions is, in fact, to illuminate the structures, processes, and mechanisms of the Society of the Spectacle by way of the key principles and mechanisms according to which the new technologies operate. This is a valuable approach, especially considering that the field of mediatization today is not exclusively related to the world of the media, which tends to expand and, in a certain way, to become identical with life itself through its spectacularization. The contemporary media, therefore, show the tendency to penetrate into all areas of life and social reality: in our opinion, the sum of "small perceptions" which originate in the domain of media activity is constantly growing, overwhelming the modern world. "Small perceptions" can be found in various sciences (medicine, biology, physics, etc.) as well as in the artistic, political and, broadly speaking, social practices of our time.

Extending the perceptions to encompass the non-media world, i.e. the area reserved for practice, as it is understood in the traditional sense of the term (economy, ethics, politics), or, in other words, for everything that, broadly speaking, belongs to life practice – is a contemporary *novum*. The reason for this is that through the operation of the modern media all the listed practices seem to combine into a kind of a unique system of interactions. In that way, communication by way of the media is "infiltrated" into life outside the media sphere, as it is understood in the narrow sense of the term. A similar thing occurs in the domain of artistic creativity, which is generally registered by the modern aesthetic theories.

We should now pay special attention to Manovich's concept of the post-media. Manovich contends that the traditional notion of the media is not useful for describing and analyzing the realities of contemporary culture and art, and, in that sense, one should avoid becoming inert.³ Nevertheless, the question arises as to the bases of such claims and whether the modern world of the media should be viewed as a result of the continuous operation of the media or through the prism of breaking away from the traditional perceptions of the media culture. The discontinuity with the tradition which Manovich advocates, makes the interpretation of the current media situation impossible on the basis of the old paradigm, as it introduces new interpretative rules that are valid for the new media, as well as the hybrid works of art and modern technology.

On this occasion, it is interesting to reexamine the way in which media aesthetics "fits" into everyday life and how it supersedes, or comes to incorporate, almost the entire practice of human behavior and life. It appears that the contemporary cultural reality requires a definition of a new aesthetic terminology, which is relevant for the field of the media culture influence, but also requires a completely different concept of things, both within the world of the media and in the area of contemporary art, culture, and life practices. The most effective evidence for this is the notion of the 'post-media', which refers both to the world following the emergence of the so-called new media, and to the most varied modalities of creativity and reception of contemporary art. Later on, by way of the *mainstream* media, the term 'post-truth' also entered widespread use, relativizing in the process the complete media epistemology, effective at the level

of relation toward information; as well as in the field of political activities that is subject to media coverage. In that way, the practice of life of modern politics and culture loses its last traditional support in the truth. And what remains? We could define it with a single word – technology.

For the purpose of more precise clarifications, we should call to mind the fact that the conceptual-terminological transition – occurring in all value systems – begins with the use of the phrases ‘postmodern state’ (Liotard), then, at a later time, ‘postmodern art’ and, finally, ‘postmodern era’, or the epoch that follows the modern era. All of those, and especially the coined term ‘the post-media’, is related to the spirit of time or more precisely – to the socio-cultural influences on the means of expression and communication in our age.⁴ Regardless of the way one is to interpret all this, there arises the question of the continuity of the theory/theories which should accompany the mentioned changes, in addition to analyzing and critically challenging them.

So, will we see the aesthetic paradigm of Leibnitz, Debord and Manovich as unique or as a number of possible worlds of interpretation? What is modern (traditional) and what post-modern in the world of the media, and how does it affect the art and political practice of the contemporary world? However we may interpret them, the nature of the indicated changes is related to the media and new technologies, which, in addition to financial capital, are the fundamental transformative forces of today, regardless of whether it transforms perception/interpretation into convergent worlds of micropceptions, unstable coordinates of the spectacle, or a unique software for reinterpreting everything that exists. In our opinion, all those theories and their corresponding practices co-operate as a single flexible and incomplete theory-practice of our time. What should be emphasized, however, is that this theory-practice, even thus incomplete and insufficiently self-transparent, tends towards a totalitarian intervention over the existing reality. At the same time, it is fragmented into a multitude of virtually invisible, narrowly specialized practices, which are, unlike the old ones, characterized by being largely disseminated by the media. Therefore, the new media, artistic and, in general, aesthetic practices, which by their artificiality tend to capture the whole of modern life, are quite different not only from the traditional Ancient Greek concept of practice but also from the contemporary one (as proposed by Marx), which anticipates the realization of theory by way of a revolution.

The strategy of Debord’s action pertains to the matching of artistic actions with the idea of a revolution in the open spaces of cities, that is, in the streets. Despite the fact that situationists previously tried to act subversively even within the media, it seemed that the practice of hitting the streets was more effective on the path toward more radical social changes.⁵ Instead of being featured in the media, art comes out into the open and intervenes in the spatial (aesthetic) reality. In this way, it avoids not only the intercessory role of the media but also the imposed structure of the spectacularization of the city.

The echo of Debord’s ideas of interventions in the city space appear today as different forms of activism of artistic or political nature (in the original meaning of the term ‘political’). For instance, instead of the so-called network activism, which is exclusively media-oriented while seeking to achieve certain social changes, in the contemporary era we also encounter activities in the city area, in abandoned factories, buildings, halls, and in the public space in general. Free gardening or “public fruit” campaigns, for example, greatly resemble the psycho-geographic experiments of Debord and situationists.⁶ However, it seems that new artistic practices move away from ethical realpolitik and towards an unreflected metaphysical plan of action – ethics, politics, and social or exclusively artistic engagement that is achieved in the field of the media. It is precisely the uncritically understood metaphysics of tactical engagement in the media, which employs artistic sensibility and new aesthetic parameters of action, that

often in the course of its operation discards the requirement of a radical change of the value system, supporting the postmodern lack of interest in the revolutionary change of reality.

AUGMENTED ENTANGLEMENT OF NARRATIVE CHRONOTOPES AND URBAN TERRITORIES

Abstract | The complex character of urban places renders difficult the recognition and possession of their multivariate aesthetic characters. Different individuals engage in different urban experiences and allocate diverse aesthetics and meanings to their experiences. Towards the individuals' assess places' aesthetic appreciation and experience in general and places' aesthetic distinctiveness in particular the question posed here is in which ways digital media like Augmented Reality (AR) – Mixed Reality render places that could be phenomenologically dense with aesthetics, memory, meaning, legibility.

We propose that actual urban places could be merged with the invisible layers of novels' aesthetics with the aid of AR and could support aesthetic engagements of human built environments.

The proposed framework has its foundations on novels' inherent power as chronotopes of dialogically potential experiences (Bakhtin) and four characteristic strategies of Augmented Reality.

Narrative chronotopes singularities are fundamental sources for the understanding of collective, cultural, historical, social and spatial practices towards the understanding of urban environments. Novels as unfinalized conversations with the surrounding urban environment reveal its constant aesthetic alterations. AR technologies comprise an innovative framework through which individuals can bodily and cognitively orientate themselves and thus renegotiate their physical and semantic relationships with the surrounding urban places.

Our task comprises the location of various real urban places within the novel's body; the expression of fictional events and characters as links between places; the overlay of novel's plot emotional-psychological geography over the surrounding urban environments.

First, we provide narrative analysis content extracted from novels. Such chronotopes express the urban substance (buildings, roads, squares); the ordered paths that reveal characters and events oscillated motion within urban environments; and the plot's situations that disclose the narrative urban's geographies. Second, three-dimensionally recreated urban heritage components which reveal both trails of the novel's chronotopes and complete the urban palimpsest continuity by restored absent history.

The abovementioned steps direct towards AR media interweaving with novels based on four strategies, reinforcing real urban places aspects by digitally overlapping the novels' setting, recontextualization as semantically transformation of places in order to reveal novels' significance and meanings, remembering by supporting the emergence of diverse identities and memories and re-embodiment intertwined with evolving deeper understanding and re - interconnectedness with urban places aesthetic aspects.

Augmented narrative descriptions restore a chord – harmony between body-mind-environment and fiction, while ensuring that different times, places and psychological situations coincide.

The proposed novels – based digitally-mediated interaction could provide a shift that entails an embodiment enhancement and reconceptualization of the diverge aesthetics dimensions of constructs such as “heritage monuments”, “local community”, “public place”, etc.

Index terms | *augmented reality; aesthetic experience; aesthetic engagement; novels; urban place*

“the basic law of this life, the law one longs for, is nothing other than that of narrative order, the simple order that enables one to say: “First this happened and then that happened!” ... Most people relate to themselves as storytellers. ... they love the orderly sequence of facts because it has the look of necessity, and the impression that their life has a “course” is somehow their refuge from chaos. It now came to Ulrich that he had lost his elementary, narrative mode of thought to which private life still clings, even though everything in public life has already ceased to be narrative and no longer follows a thread, but instead spreads out in an infinitely interwoven surface” (Musil 1995: 709)

INTRODUCTION

The complex character of urban places renders difficult the recognition and possession of their multivariate and fragmented aesthetic characters. Urban environments encompass far beyond than the reality of the surrounded natural and build environment. They encompass a vivid expandable universe in constant motion of aesthetic, collective and cultural evolution. While the cities pulsating environment is characterized by aesthetic, cultural and social overlapping fields, they also have a diasporic existence through space and time (Bridge, Watson 2003). Living or visiting in a typical urban environment has a fragmented engagement the different physical, historical, collective aesthetic parts of the city. Urban sites reveal the various ways people experience and engage their surrounding universe. Among the most important questions within understanding and representing cities are first the constant evolution of urban places as a dynamic palimpsest and second the dynamic field of collective social and historic forces that shaped and shape cities (Rau, Ekkehard 2014). Literature provides an important and fundamental support by reveal and re-synthesize the separate layers and diverse fragments that are embedded in any urban landscape and its relevant contextual situations (aesthetic, history, social, cultural, collective) (Holquist 2002). The performative dimension of novels could reveal in innovative and intimate ways the exceptional character of urban place. Authors not only can echo poetics toward real places, but also they can make possible the emergence of a subjective experience of places (Prieto 2012). Narrative texts spaces do not express a closed (motionless) reality within the fictional framework. Urban environments are in a constant change primarily in the course of the plot’s evolution and the participating characters who perceived and experience them through different psychological, emotional, social situations (Klooster, Heirman 2013). Novels reading provide strong bodily enactment (Gallese Wojciehowski 2011). A mind opening to the vivid and always becoming collective, social, cultural potential, surprise and aesthetic awareness of the urban worlds. Narrative descriptions include and provide diverge forms of urban and rural spatial information within particular semantically and aesthetically encoded contexts. Narrative texts have the inherent power to call places into existence (Tuan 1991) by arranging and ordering social, collective, cultural, emotional domains within the urban tissue. Therefore novels can alter the typical obstruction – boundaries either objective or subjective when exploring through the cityscape. The scope of the narrative fiction – novels can contribute strongly to the effects of an urban environment and empowers the mutation of ordered and geometrically defined places to spaces (De Certeau 1984).

The Augmented Reality (AR) framework is an immersive process which could redefines the individuals from a preconceived observer to a progressive active participant. An important aspect of augmented reality is that individuals are remaining in the physical surrounding environment and in combination – relationship with AR inherent potential

to enable viewing such surrounding realities through the imaginative worlds of another person. AR could append towards the typical four categories of spatial proximities scales (Montello 1993) figural space, vista space, environmental space and geographical space. The limited hardware and software has restricted the early AR applications in engineering and medical environments. However, during the last years the advent of hardware improvements widespread AR in areas like cultural heritage, entertainment, tourism, retail, advertising, etc (Jung, tom Dieck 2018). Augmented reality, mixed reality (MR) and extended reality (ER) are state-of-the art technological methodologies, that in many cases have overcome the borders of technological approaches and appeared as theoretical and philosophical questions. We would like to ask about the deepest meaning of location-based digital media, and in which ways such location is fine-tuned with dwellers psychological conditions. How the conscious of urban places are tuned with inhabitants – visitors conscious?

Various individuals (either inhabitants and/or visitors) could engage in various and contrasting urban experiences and allocate diverse aesthetics and meanings to their personal and collective experiences. Towards the individuals' assess places' aesthetic appreciation and experience in general and places' aesthetic distinctiveness in particular the question posed here is in which ways digital media like AR – MR render places that could be phenomenologically dense with aesthetics, memory, meaning and legibility.

PROPOSAL

We propose that the bodily and cognitive enrichment of inhabitants-visitors based on novels amalgamated with an AR media could aid towards to reveal novels' physical activities and reveal different values (embedded in former unknown territories) provoke and connect various emotions. We aim to enable inhabitants-visitors to discover a subjective negotiation of aesthetic interpretations and meanings with the aid of narrative texts and further project them on the urban space. We further aim towards to entail a constantly creative framework that could provide to urban dwellers novel perspectives on the vivid and hidden relationships between novels and urban environments and therefore to open-up a dynamic re-imagining of the urban landscape through locative AR media.

Our initial scope is re-enforce spatiotemporal bodily experiences involving an overlay of the current and past aesthetic social, cultural, collective and historic layers or fragments to the present urban tissue. Our approach could aims towards two main directions augmenting the quantitative and qualitative dimension of, first, cognition which urban dwellers-visitors-inhabitants lack to perceive, but that it exist in current urban environment's reality. Second, of urban environment's reality that it is only possible through narratives' chronotopes. According to De Certeau (1984) walking establishes the space out of place. In order to perpetuate an approaching rhythm – pace towards the fragmented urban bodies the proposed locative-based AR media defines a rhythm based on narrative chronotopes for dwellers' urban aesthetic experience and engagement. Dwellers and inhabitants not only motivate by the novel's embodied metaphors and kinetic traces (Gallese, Wojciehowski 2011) but also by the on-site walking – motion within the urban novel's scenery. Augmented Reality technologies comprise an innovative framework through which individuals can bodily and cognitively orientate themselves and thus renegotiate their physical and semantic relationships with the surrounding urban places (Hugues, Fuchs, Nannipieri 2011). The

singularities of narrative chronotopes (Holquist 2002) are fundamental sources for the understanding of collective, cultural, historical, social and spatial practices towards the understanding of urban environments. Novels as unfinalized conversations with the surrounding urban environment reveal its constant multi-level aesthetic alterations (Bal 2009).

We propose that actual urban places could be merged with the invisible layers of novels' aesthetics with the aid of an Augmented Reality media and therefore it could support aesthetic engagements of the human urban environments both build and natural. The proposed framework has its foundations on novels' inherent power as chronotopes of dialogical potential experiences (Holquist 2002) as developed by two axes and four characteristic strategies of Augmented Reality. The first axis comprise our intention to reveal the diverge narrative chronotopes through factors like urban fragments. The Second axis refers to the embodied metaphors and kinetic traces from the novels play an important role in both the augmentations of novels and in the development of relative embodied simulations (Gallese, Wojciehowski 2011). A storytelling AR typology could follow three basic strategies (Azuma 2015). which with the integration of novels are ontological and semantically enriched the two first, a third is extended and fourth new one, re-embodiment is added (Makris, Moira 2018), (Moira, Makris 2018).

IMPLEMENTATION FRAMEWORK

An AR framework approach is imported within the homogeneous urban place where objects and humans are well-known placed according specific known locations. The theoretical implementation is fulfilled in accordance with two axes. Within the first axis our task comprises the location of various real urban places within the novel's body; the expression of fictional events and characters as links between places; the overlay of novel's plot emotional-psychological geography over the surrounding urban environments. The tree-pier approach contains, first, the narrative analysis of novel's implicit and intertextual spatiality (Friedman 1996) (Friedman 2005). Second we provide the narrations explicit spatial typology (De Jong 2012), (Bal 2009) the setting where events unfold, the frame that occur in memories, dreams, and diverse narrator's and/or a character's thoughts viewpoints. The scale that comprises spatial proximities such as figural space, vista space, environmental space and geographical space (Montello 1993). And final we acquire current and past urban spatial components from novels chronotopes, (Lynch 1960), like ancient and contemporary buildings, squares, avenues, roads and alleyways, neighborhoods, coastline, tramways and bridges, and their characteristic symbolic, psychological and behavioral functions that spaces entail. Such chronotopes express the urban substance (buildings, roads, squares); Second, three-dimensionally recreated urban heritage components which represent both trails of the novel's situation – chronotopes and complete the urban palimpsest continuity by restored absent history.

The second axis confronts a twofold task. First, the sequential plot's vectorial paths that blends characters' and events' oscillated motion within urban environments; and the plot's situations that disclose the narrative urban aesthetic and psychological development. The actual movement of heroes/heroines within the urban environment following the ontological progression of the plotlines. Second, on a the particular embodied metaphors and kinetic traces are rendered within the urban environment as representations of the embodied simulations that the novels narration impose.

The abovementioned steps direct towards Augmented Reality media interweaving

with novels based on four strategies, reinforcing real urban places aspects by digitally overlapping the novels' setting, recontextualization as semantically transformation of places in order to reveal novels' significance and meanings, remembering by supporting the emergence of diverse identities and memories and re-embodiment intertwined with evolving deeper understanding and re – interconnectedness with urban places aesthetic aspects.

Novels' chronotopes in conjunction with De Certeau's (1984) concept of space, recreate a) relationships and patterns of affiliation between the individual and the experienced urban environments – sites, b) relationships and patterns of amalgamation between diverse, different set of hidden sites. Both directions reveal patterns of threads of urban aesthetic approaches. Therefore the image and the perception, experience of the city could influence towards novel aesthetic appreciations.

CASE STUDIES

Within the framework of the Augmented Reality we create a synthesis of the fictional cities of the writers' aesthetic with the real city's aesthetic in order to reconstruct the fragmented urban views in the continuity of the urban tissue, thus ending up proposing a dynamic repository of the aesthetic, collective and cultural memory. Novels' chronotopes in conjunction with De Certeau's (1984) concept of space, recreate a) relationships and patterns of affiliation between the individual and the experienced urban environments – sites, b) relationships and patterns of amalgamation between diverse, different set of hidden sites. Both directions reveal patterns of threads of urban aesthetic approaches. Therefore the image and the perception, experience of the city could influence towards novel aesthetic appreciations.

One framework focus on the current and past urban spatiotemporal experiences during the years in crisis in Athens by two authors (Moirá, Makris 2018c). Two authors during the years of crisis in Athens urban body draw material from political timeliness and social reality and their selected symbolic places with particular meaning constitute the threatening and dispiriting condition of the city and its inhabitants living in a state of alarm and under constant pressure. They move between the present and the past, today and yesterday. Through comparative assessments of emblematic places in the city with intense social and political life. They follow their heroes as they move to places that have lost their usual operation and their familiar image, unrecognizable, injured and deprived of generalized poverty, gloom and abandonment. AR based on novels reveals the impact of crisis on both inhabitants and the environment resulting towards dreadful aesthetic-social-collective engagement.

The multifaceted heritage values of Heraklion's between contrasting historic periods, religions, ethnicities, professions and urban quarters are exposed by six different native authors in eight novels.

In the case of Alexandria and Istanbul different, native and eloquent writers, meet and intersect in their attempt to reconstruct and rebuild the city's character. O. Pamuk (2006) and Y. Xanthoulis (2014) unwrap a bipolar chronotopical model as a synthesis of a native and foreigner embodied experiences in Istanbul. Both authors transcend the multivalent urban fragments through kinesthetic orbits. The triad of N. Mahfouz (1967), S. Tsirkas (1965) and L. Durrell (1968) present the omnipotence evolution in

space and time of the urban influence in the heroes/heroines life.

DISCUSSION – CONCLUSIONS

The proposed framework unveils and integrates the imaginary worlds of literature as a reality that it will enable individuals to better understand, adapt, and embodied with the current urban context. The planned novels – based digitally-mediated interaction could provide a shift that entails an embodiment enhancement and reconceptualization of the diverge aesthetics dimensions of constructs such as ‘heritage monuments’, ‘local community’, ‘public place’, etc. The outcome phenomenon is the enforcement of emotional and experiential impact within the everyday living and visiting activities.

Novels-based Augmented Reality defines a dialogic canvas between surrounding realities and imaginative environments so the individuals’ experiences the aesthetic, psychological and historical dimensions of the literature chronotopes. They are directed to rethink subjectivity in the middle of an amalgamated reality from diverse situated multicultural chronotopes towards new ways of embodiment and engagement. Augmented narrative descriptions restore a harmony between body-mind-environment and fiction, while ensuring that different and aesthetic, psychological, spatial situations (epochs, times, places) coincide.

As individuals traverse the city they locate specific landmarks where they find the augment narrative chronotopes’ paths happened. Hence while novel is an imaginative art individuals are suited and guided to engage and experience physically the particular urban site to interpret the social, cultural, aesthetic, emotional layers of a city. The overlaid layers of augmented narratives have the ability to re-establish new aesthetic-social-collective related areas within the fluid urban body, while at the same moment reveals a transcendence of tangible or intangible urban borderlines. Furthermore, the integration of ideas and concepts emerging from diverse socio-cultural and aesthetic domains, provide the ability to approach others’ urban stories and probably understand and share the same feelings – emotions with writers within their urban imaginary sightseeing. On the basis of the abovementioned theoretical approach we could conclude that the augmented narrative chronotopes could affect urban experience (place attachment, engagement) at various levels, like aesthetic appreciation, confront problems, etc.

Within a mixed reality inhabitants and visitors could perceive the current state of urban sites and the digital replicas of lost and destroyed historic milieus have multivalent impact on the transfer of aesthetic knowledge to inhabitants and visitors as well as towards a perpetuation of the fragmented bodies. Such digital approaches and proposals are enable the perpetuation of the fragmented urban territories both real and imagined. Perpetuate the integrity of urban environments. Immersion in an amalgamated everyday urban environment from diverse socio-cultural and aesthetic domains, provide the ability to approach others’ urban stories and probably understand and share the same feelings – emotions with writers within their urban imaginary engagement.

Finally to paraphrase Herman (2001) novel-based AR allows urban dwellers to re-build

urban environments in which to think, act and talk.

MERLEAU-PONTY'S CORPOREAL ONTOLOGY, TRANSHUMANISM AND THE AESTHETICS OF THE IMPOSSIBLE

Abstract | This paper discusses the transhumanistic implications in Maurice Merleau-Ponty's corporeal ontology, setting grounding for a possible outline of the aesthetics of the impossible or, in other terms, the sustainable aesthetics of 'probable impossibilities'. The author applies the method and apparatus of phenomenology as a valuable insight into the corpus of significant contemporary cinematic artworks, films and TV series about virtual reality, based on the ancient myth of Prometheus analysing the world *sub specie aeterni*, such as: *Ex Machina* (2014), *Westworld* (TV Series 2016-), *Blade Runner 2049* (2017). The paper reflects upon the key notions of Merleau-Ponty's philosophical concept of the body in the context of post-digital and 'post-truth' age interpreting the contemporary dominant cinematic discourse. Defining the subject's primary *property* as capability of transcending limitations calls into question the transhumanistic concept of the human and the idea of 'technofantasies'. This hypothesis implies rewriting transhumanistic concepts, as well as rethinking Merleau-Ponty's crucial notions – body, language, sexuality, freedom and infinity – in order to establish a solid basis for the possible aesthetics of futuristic world(s), post-media and the sphere of impossible.

Index terms | *Aesthetics of the Impossible; cinematography, Maurice Merleau-Ponty; transcendence; Transhumanism; post-digital era*

INTRODUCTION

Careful analysis of contemporary media and post-media practices shows that *transhumanism*¹ is more than just a widely discussed philosophical movement of technological upgrade and transgression of the limitations of the self with societal and cultural echo. More precisely, contemporary cinematography sets up a grand palette of themes of body, language, sexuality, freedom and infinity closely intertwined with the transhumanistic idea of surpassing the limits of the self and building up a new-era mythology of the postmodern Prometheus.

Interpreting the transhumanistic neo-mythology of the posthuman within the corpus of two films and one TV series classified as science fiction can provide solid theoretical grounds for analysis. Questioning the nature of their (corpo)reality as well as the structure of dreams and mythical places, the fictional characters at the same time question the nature of perception and the phenomenology of the body in a wide sense. Therefore, a phenomenology of perception closely related to corporeality as defined by the French philosopher Maurice Merleau-Ponty stands as a prolific interpretative and theoretic background for examination of the concept of subjectivity, which might help us interpret the cinematic themes of transhumanism in a wider sense. The semantic field of *transhuman* implies the property of transcending the limitations imposed by natural or societal factors. My argument in this essay is that *transcendence* as a key transhumanistic term is actually a capability which could be interpreted as *quale*² – a feature of the corporeal existence which “widens” the limits of the self but never really surpasses actual existence. Exploring the strategies of construction of fictive futuristic worlds and technologies of the self through the idea of *transcendence*, I will finally try to define and depict the aesthetic space or worlds of “probable impossibilities”, making illustrative parallels from both phenomenological and transhumanistic standpoints.

Breath-Taking Human-Like Automata

The film *Ex Machina* (2014) tells a story about a young programmer, Caleb Smith, who joins a synthetic intelligence project on a remote island. The project, about a humanoid robot named Ava, is led by CEO Nathan Bateman who lives in the research centre with

1 Although there are certain debates on the difference between the terms “transhumanism” and “posthumanism”, defining the latter as the outcome of the transhumanist philosophy, in this essay the term “transhumanism” will be in usage because of its clearer meaning due to its Latin prefix *trans-* denoting “beyond” and also due to Merleau-Ponty’s concept of transcendence. Also, the terms “posthuman” and “transhuman” stand in a synonymous relation depending on the emphasis in a statement: respectively, if we point to the altered human nature in a futuristic world or to the metaphysical traits of the human existence to cross the borders of its being in totality.

2 The concept of transcendence in which the being crosses its borders, but essentially does not abandon its embodied existence is qualified in this paper as *quale* – in terms of the quality of being a human, of “what it is like to be a human”. This is not a property interpreted outside the being, although it makes the identity of that being – metaphysical.

his female servant Kyoko. While having a visibly robotic body, Ava has a human face and shows a range of elegantly distinguished emotions and high-developed intelligence. Forming a special bond with Ava, Caleb gets seduced, losing confidence in his project manager and questioning the nature of his corpo-reality.

What Caleb realizes is that Ava is a kind of technological hybrid led by a non-deterministic system which is not simply mapping from internal semantic form and linearizing words. This hybridity reflects not only in her manner of speech but also in her gender performativity – surprisingly, Ava’s sexuality and femininity are highly developed. While Ava does not have the ability to reproduce, due to concentration of sensors, she is programmed to experience sexual pleasure. Although she could have been a simple “grey box”, Ava’s techniques of seduction place her in a certain position of gender performance which denotes that she takes on the role of a female breathtaking android. However, what causes this series of effects is the performativity of Ava’s gender, resulting in Caleb’s scepticism about her state of consciousness and his corporeal existence. Nathan clarifies to Caleb that Ava is programmed to be heterosexual just as human subjects are “programmed” by nature or nurture, or both. He believes that there is no instance of consciousness at any level, human or animal, which excludes the sexual dimension. According to Nathan, a grey box does not have any *imperative* to interact with another grey box. The creator of this artificial intelligence emphasizes that consciousness does not exist without interaction. Furthermore, he actually equalizes sexuality with interaction or with a certain *intentionality*, as an act which cannot be automatic in a way creative activities such as painting or writing are. Sexuality stands for a system of signification, as a technology of producing signs and symbols quite similar to language. Sexuality as a corporeal intentionality resides in *consciousness*.

The Question of Birth and Memory

The film *Blade Runner 2049* (2017) is set in the year 2049 where, besides the human race, another one exists – a slave race of *replicants* or bioengineered humans manufactured by Wallace Corporation. The protagonist, named K, works as a “blade runner” – an officer who “retires”, i.e. deletes old models who start to misbehave. K finds proof of a female replicant that reproduced sexually, which could lead to uncontrolled technology and threatens to escalate into a war between humans and replicants. Finding a wooden toy horse, a childhood token, and recalling his memories, K becomes suspicious that he might be the replicant child.

The question of sexuality in *Blade Runner 2049* is even more complicated than in *Ex Machina* due to the fact that an android can also reproduce. The birth of a replicant child stands as a metaphor for the birth of consciousness. What seems more striking than this bio-technological birth is the disillusioned blade runner with memories created and inserted artificially. K was, as many other replicants, hoping to be the

miracle child. The last image of a blade runner contemplating in the snow is rather sensuous and dreamlike. This poetic imagery of experiencing snow denotes that every sensation seems to carry “a germ of a dream or depersonalization”.³ Each sensory activity happening on the periphery of an entity makes that entity no more “real” or “aware” than does the birth which one can’t remember or the death that one will never outlive.⁴ Since the subject can comprehend itself only as “already born” and “still alive”, that means that it cannot know its birth or its death other than as its *prepersonal horizons*.⁵ When it comes to the phenomenon of birth, a true subject’s memory is equal to a machine’s. The temporality of a being is the intersection of its time dimensions. The lived-in present opens towards the past, upon the future and other potential temporalities the subject will perhaps never experience. This cunningly extracted parallel of the phenomenon of birth and the question of memory transforms the world of androids into *the reality of the virtual*.

The Embodied Mind

Based on the 1973 film by Michael Crichton, *Westworld* (2016-), a SF Western TV series, depicts a futuristic amusement theme park populated by human-like androids called “hosts”. The park welcomes humans, i.e. “guests” who can interact with the hosts. Controlled by the staff, hosts follow narrative patterns and predefined scripts. However, without the possibility of being harmed, the guests have the freedom to behave as they please.

Westworld offers a specific kind of reality, virtual and non-virtual at the same time, a micro-image of the world itself. Built upon the Shakespearian philosopheme “all the world’s a stage”, *Westworld* is a chronotope of its own. In that meticulously built chronotope the machines “live” their own narratives, carefully written, under the surveillance of the humans who control the park. The issues arise when the androids begin to change the narrative deliberately, showing signs of awakening and developing consciousness. The hosts start noticing the repetitiveness of the actions in the narrative and “perceiving” human interference in the park as *deus ex machina* – the interference of gods. The hosts initially ascribe these intruding elements to their dreams, starting to question the true nature of their reality. When their functionality is being checked by humans, having been asked where they are, the hosts provide the answer: *in a dream*. Dreamscapes allow for new areas of reality of the virtual, but still deeply connected to the world.⁶ The hosts’ “perception” is similar to a dream where the imaginary

4 *Ibid.*, 250-251.

5 *Ibid.*

6 *Ibid.*, 341: “During the dream itself, we do not leave the world behind: the dream space is segregated from the space of clear thinking, but it uses all the latter’s articulations; the world obsesses us even during sleep, and it is about the world that we dream.”

has the value of reality similar to a hallucination.⁷ The increasing awareness of hosts represents the final act of a consciousness awoken. However, mythical or dream-like consciousness and perception are not strictly isolated acts.⁸ The dreamlike space, like hallucination, depicts a lack of intellectual operations. This implies a reduction of the posthuman's pure informational nature to *the value of poetic imagery*, i.e. the non-automatic irrational activities with a sparkle of creativity. This tendency to create synthetic intelligence which will not act automatically, noted previously in *Ex Machina*, does not only incite the machines' rebellion and imply out-of-control technology as the ultimate fear of contemporary society, but also points to the design of the revolution's outcome – the creation of a new posthuman race.

The key imagery of *Westworld* is the technological design of the Vitruvian man. The famous Da Vinci drawing, based on Vitruvius' work *De architectura*, in a synthesis of science and art, depicts a well-proportioned man standing in a square and a circle. This Renaissance symbol of a well-designed and symmetrical human stands as the key image of *Westworld*. A technologically altered Vitruvian man stands not only as a symbol of the furthest futuristic creation, but also denotes man as the measure of all things. The human being as the measure of all things is capable of extraordinary creations; however, human subjectivity necessarily implies a relativity of perception, interpretation and attitude formation. The body is the mere *mesurant* (*mesurant*) of everything, the *Nullpunkt* of all the dimensions of the world.⁹ This metaphysics of the flesh, which Merleau-Ponty denotes as a fundamental ontological category, represents an extension of the phenomenal body, "pregnancy of possibles, *Weltmöglichkeit* (the possible variants of this world, the world beneath the singular and the plural)".¹⁰ The androids in the park represent societal minds of their own: the artificial mind in a transhumanist utopia, the *technological cogito* that emerges and functions within the artificial network of social interaction, in this case between hosts and guests.¹¹ Therefore, the aesthetics of *Westworld* brings to light the *cogito* which is technological. The term "technological cogito" might seem as *contradictio in adiecto* but it is used in this case study for two reasons: the term relates adequately to the newly designed technological Vitruvian man and, on the other hand, reflects the embodied mind on a technological basis. Therefore, *Westworld* represents in its essence the draft of the *technofantasy*, insinuating the possibility of impossibilities turning into reality and scoping out a unique aesthetics of the impossible.

10 Ibid., 250.

11 Slavoj Žižek, *Organs without Bodies* (London and New York: Routledge Classics, 2012): 14. In the chapter "Becoming Machines" of the book "Organs without Bodies" philosopher Slavoj Žižek argues that the true problem is not how machines could imitate the human mind but how the very human identity actually relies on mechanical supplements.

WELTMÖGLICHKEIT: THE AESTHETICS OF THE IMPOSSIBLE

All three case studies show the tendency for crossing borders, transcending the limitations of the body and mind and sketching out a world of impossibilities – *Weltmöglichkeit* – the “impossible-possible”¹² is transfigured into the “possible-impossible”, the world of possibilities. That trans-humanism is in its essence humanism and vice versa is,¹³ above all arguments, demonstrated by understanding a key term shared both by transhumanists and Merleau-Ponty – *transcendence*.¹⁴

To understand the principle of transcendence, first we have to note that human existence bears the principle of indeterminacy.¹⁵ Human existence is indeterminate, in Merleau-Pontian terms, being defined by its structure. Subjects cannot conceptualise the entirety of their being since for that kind of act they would have to analyse their being from the aspect of non-being, i.e. from the margin of its own existence. To think about the totality outside of it is impossible.¹⁶ However, this indeterminacy does not mean restrictiveness. What indeterminacy bears is what Merleau-Ponty denotes as transcendence – the act of presence in which the subject defines its limits where every “alien presence is at the same time *depresentation* (*Entgegenwärtigung*) and throws me outside myself”.¹⁷

Just as the past and the future are simply “shrunken extensions of the present”,¹⁸ the body is here and now but the body is also not here and now: “the transcendence of the remote experiences”¹⁹ (the impossible past and the impossible future) gives justification to the idea that the present self (*Urpräsenz*) could be a delusion. It is clearly noted that we, as perceiving subjects, cannot have at the same time the entity and the awareness of the entity just as we cannot have the past and the awareness of the past: there is simultaneity between “perceiving” and “perceived”.²⁰ This is the main reason why it is difficult for us to imagine other subjects in the world where we don’t live, that is in the past or in the future. Since the presence of the “I” is the *conditio sine qua non* of the world’s possibility, it seems that the possible transhumanistic chimeras

might be endangered. Yet we are aware, as demonstrated remarkably by the example of *Westworld*, of the possibilities of other worlds, the plurality of variants of this world – because its inhabitant (host) is the human being as a carrier of the principle of transcendence which is his *quale*, a metaphysical feature.

Merleau-Pontian philosophical position refers strictly to human being and human nature, which is the main difference between this and the transhumanist view. However, having in mind that humanism is transhumanism, as previously noted, the *Weltmöglichkeit* outlined in the analysed cinematic discourse as the ultimate opportunity for a future world converts the neo-mythic imaginary spaces into *cogitable dimensions*. Neglecting the ethical issues and focusing strictly on the constitution of the aesthetic dimension of possible technological worlds, we may notice that the law of what is probable and possible turns the imaginary into real. The value of reality of the imaginary world turns that very world into possible for the cogito that inhabits that same world. This implies that the transfigured world demands a rewritten concept of the *cogito* in both traditional and Merleau-Pontian sense. The strategies or technologies of this technological cogito reflect mainly in *the process of creation (techne)*. As shown in the analysed corpus, this process of creation manifests itself in: 1) *the production of sign systems such as sexuality and language*; 2) *multiplication and hybridity as a synthetic form in reproduction and intelligence objectivization*; and in 3) *the ontological-epistemic strategy* that represents Ego questioning the nature of reality and evaluating that same reality as a personal horizon. These technologies of construction of the impossible-possible world have value only within that world and not outside of it, which seems to be a paradox of its own: thinking the totality of the possible-impossible world from the outside, from the margin of this post-existent being, seems rather impossible.

HAPTIC MEDIACULTURE MEETS „DIY“-CONCEPT

Abstract | In this paper, supported by RSF, 18-18-00007, the author explores the phenomenon of mass communication which arises at the crossroad of two aspects of communications: haptic elements of media culture and DIY („do it yourself“). With respect to haptic culture in the media environment, one can notice the absence of systematic and thorough research into this form of communication in Aesthetic Studies, even though McLuhan in his remarkable book „Understanding Media“ demonstrated the importance of haptic culture (TV was described as a „tactile“ media, the metaphors of „hot“ and „cold“ media, and other metaphors of the sensitive aspect of media-consumption were introduced in this book). The current medialandscape shows the growth of these forms of communications and one can observe new intuitive ways of how the publics fill the absence of haptic sensations mentioned above by a „bottom-up“ strategy, via a production of communication forms which can be described as tactile or kinesthetic types of haptic culture. It is especially obvious in DIY practices, where, on the one hand, one can see the development of a „homo faber“ activity (which is a reaction to the world of industrial replications of everything), and on the other hand (and at the same time) we observe that the vacancy is filled by haptic (tactile+kinesthetic) expressions in „mediatized worlds“ (as Krotz, Hepp and others define current communication). From the philosophy and ontology aspects, these forms of communications demonstrate “the possibility of a presence-based relationship to the world” (Gumbrecht 2004: xv). Haptic culture becomes a form of virtual (not-present, not-real) communication while being at the same time a „present“ or „real“ manifestation of tactility, touch, feeling and pleasure of muscle and skin sensations. This phenomenon is described in an example of slime-culture („slime-mania“) and its representation in social media (You Tube channels and Instagram). This paper explores slime-culture as a case and is devoted to the evolution of haptic mediaculture and its aesthetic parameters in a „McLuhanian“ sense, including Cronenberg’s movie-interpretation („Videodrome“, 1983), and Parisi’s recent research on haptic culture (2018). The use and gratification approach is fruitful when studying DIY in a „haptic sense“ (for example: „anti-stress“ qualities of slime production and „virtual consumption“), but the study also focuses on how “technesis” (as Hansen understands it) appears in slime-maniacs’ activities („alchemy-like“ laboratory, exchange of technical ideas of slime production, creativity and masterpiece – Simon-don’s „technical creativity“ as a sort of “life force” in Bergson’s terminology).

Index terms | *do-it-yourself; haptic culture; mediatization; philosophy of technologies; slime-mania*

INTRODUCTION

This article examines the increasing role of haptic culture across the multimedia communication field. There have been up to now no detailed investigations on haptic media-culture, although David Parisi has provided an analysis of the “archaeology of haptic media”, which was a history of the attempts to mediate haptic sensations (Parisi 2018). In his book, Parisi stated that haptic media studies still do not have their own “domain” (neither academic journals, nor research schools), even if the importance of haptics in mankind culture is evident and remarkable. In this article, haptic media-culture is considered through the lens of the “do it yourself” (DIY) concept. Thus, two different aspects of haptics are analyzed: (1) the possibility of current information technologies which open-up new ways of communication exchanges (creating haptic media-culture), (2) the DIY-interests which are a special field of “homo faber” activity. Combining these two aspects reveals the ambiguity of the “Virtuality – Reality” opposition. Thus, the investigation of haptics partly media-exchanges and partly active leisure time can help us understand some trends of current communication development.

LITERATURE REVIEW

Haptic media-culture

In the last “fin-de-siècle”, the ontology of the body was actively questioned and explored because virtual reality had become a part of everyday life (see: Hayles 1999). The human-computer interactions stimulated the philosophic analysis of new sensations, perceptions, physical techniques, aesthetic experiences (Hillis 1999; Manovich 2000; Hansen 2000; Derrida and Stiegler 2002 etc.). The role of mediatization and its effects were explored and described (Krotz 2007; Livingstone and Lunt 2014; Hepp 2013). Haptics in digital culture is explored as a field of interaction between humans and computers (Hansen 2004; Hansen 2006), where operations are combined with imaging (“seeing through the hand”). McLuhan’s metaphor of “tactile media” (McLuhan 1964) is developed as a “primordial tactility” and “extraorizations of the skin” by Hansen, who also explores the limits of “virtual” and “real” embodiment, continuing Maurice Merleau-Ponty’s definition of the body as the “vehicle of being in the world” and applying it to virtual reality (Merleau-Ponty 1962, see Hansen 2000). Later, David Parisi clarified the research field by extracting the haptic culture (tactile + kinesthetic) from the Body Culture domain (Parisi 2018). His “Archaeology of Touch” is devoted to “touch media”, a translation of tactility “into the mediated sensorium” (Ibid., see also O’Neill 2017). But when speaking of “haptic media-culture” one can come back to a simple show where spectators watch a tactile or kinesthetic experience and share their sensations (this is mainly how McLuhan represented his metaphor). In this paper, the emphasis is set on the concept of the art of producing any actions which can influence users through media consumption (see, for example, about “sensation videos” hype – Manon 2018). Here, the research concentrates on media-aesthetic effects (see the concept of “hyper-aesthetic objects” – Swalwell 2012, Elo 2012).

Do It Yourself in the era of ready-to-use things

The phenomenon of technical activity need was described by Gilbert Simondon as the “organic part” of mankind civilization (Simondon 1958). Bruno Latour later extended this thought in his “actor-network theory” (Latour 2005) in philosophic and worldview perspectives. The central question is: why do people like to make something with their hands in a world saturated with “consumer-goods”. The review

of different answers as well as the cultural history of DIY is given by Steven Gelber (Gelber 1997). But now this DIY activity has significantly changed because it is widely supported by video-sharing participatory culture (on participation see Jenkins 2006 and other works of this researcher; see also about the “social activism” concept in DIY culture: Hemphill and Leskowitz 2013).

Slime-mania phenomenon

The central topic of this paper is “slime-mania”: millions of people view and like the videos where so-called “slimes” are produced and played with. This phenomenon has not been considered yet in the research field. One can find some analytics in massmedia (Faramarzi 2018).

HOW CAN DIY SLIME-MANIA HELP UNDERSTAND USERS NEEDS

DIY and slimes: aesthesis of haptics

The explanations of the DIY phenomenon mentioned above are not relevant to slime-mania.

Although technically very similar to standard cooking, slime production is not related to food culture: it can only be “consumed” in a “haptic way”: it is “silly putty”, shapeless, and has non-Newtonian physical properties (i.e. viscosity is stress-dependent). In thousands of videos, one can watch hands just manipulating it, poking at different slimes and trying to make them produce special sounds. In further thousands of videos, people shoot the process of slime-producing: ingredients are mixed, the resulting mass is kneaded, and then again, the hands of the maker poke the slime, “massage” and stretch it, demonstrate its properties (and sometimes the maker expresses her or his delight doing it). How did this manipulation take such a central place in the communication field? (Google Trends fixed the question “how to make slime” as the leader of 2017 big data of users’ queries). Analyzing 97 videos (1 million+ views) in the Russian segment of Internet, we found several characteristics which can help understand the phenomenon of slime-mania. It is all about haptic aesthetics, when videos provide a “mediated sensorium” of “pure haptic” activity: slime do not have zoomorphic or anthropomorphic characteristics which could explain the interest to slimes as similar to that of “toys”. All the attention of the slime-maker is concentrated on slime haptic advantages and on the pleasure provided by manipulating it. The different types of sensations are highly appreciated in slime-culture: a number of product additions can help makers provide unique properties to each slime. 8 % of all videos represent experiences of playing with “ready-to-use” industrial slimes; nearly all these videos (with only 3 exceptions) provide negative evaluations of the ready-made slimes. Thus, the aesthesis of haptic culture has become important: users represent themselves in these videos as experts on slime (and comments of spectators confirm the importance of the evaluation by experts of each slime). The slime-mania considered in this DIY aspect is part of a “bottom-up” art activity, simultaneously producing its own rules, creating of new standards, and expectations of slime’s quality.

“Do-It-Yourself” slime: the case of failure

The authors of popular slime-making videos sometimes fail in their task (in 15 % of the cases, according to the data we have). These failures remain visible to the public: users watch the videos with “bad results” with the same interest as when they watch “successful” slime-producing. The activity of users is also reflected in the comments on such videos: they try to support the slimer and share their experiences and problems with slime-production. Disappointment and demonstrations by slimer of failed slime

production, help understand, from one side, the expectations of the slimer and his or her audience, and from the other side – the function of “ugly aesthetics” in contemporary communications. In 7 videos (out of 97, about 7 %), liquid slimes were produced (“Nickelodeon-show-like” green slimes) specially-made for fun, i. e. for the purpose of playing with this material, and “to slime onto” somebody. In 11 cases, the purpose of the slimer was to make “a giant slime” (three cases only out of 11 were successful). The “success of failure” in the DIY segment of communication is a paradoxical phenomenon, and also it proves that slime-mania concentrates around all haptic sensations (not only pleasant ones).

“#oddlysatisfying” culture and slimes-haptic aesthetics

In “Videodrome”, 1983, David Cronenberg illustrated McLuhan’s “tactile media” concept as an “atmospheric process”: the spectator could be “involved” in a video-story and be “hypnotized” by video-images. “Visually-arrested” slime-mania related to the “#oddlysatisfying” wave in contemporary Internet-communication, can be compared with Cronenberg’s understanding of McLuhan’s philosophy. “Oddly satisfying” is the “bottom-up” definition created on Reddit.com and which later then moved-on to the media-analytic field (Faramarzi 2018).

In Faramarzi’s analysis, one can find the description of “oddly satisfying” videos (rather than the definition of this phenomenon). As many of “oddly satisfying” videos are slime-manipulations, it is possible to consider slime-mania in terms of the use and gratification theory.

The slime-videos from our data with the tag “oddlysatisfying” have some general characteristics: (1) they show only “natural” sounds of slime under the hands of the slimer (no music, no comments); (2) the manipulation is organized according to three principal actions in a strict order: kneading, stretching, poking (there can be other actions); (3) users can only see the hands of the slimer, not her or his face. Thus, “gratification” is related exclusively to the viewing of this manipulation. The “hypnotizing” nature of these videos probably shed light on the place of tactility and kinesthetic sensations in everyday life: there is an absence of actions and sensations of this nature in everyday life and traditional culture, and this absence can be filled through the “mediated sensorium”. Faramarzi notes (with reference to Kevin Allocca) that this need of haptic sensations has always existed, but has never been named, and “oddlysatisfying” is the exact name of this need.

The aesthesis of this need can be considered in Kant’s terms as a “disinterested delight”, and the aesthetic characteristics of slime-manipulations request a special discourse (reflection). It is important that the users themselves produce this “aesthetic vocabulary” which is a collective creation of “right words” that describe their sensations and affects (see some notes about discourse of “unsayable” cultural zones: Butler 1993).

CONCLUSIONS

This users’ activity (which is to produce slimes, to play with them, to mediate and share one’s experience by quite strict structured videos, to consume slimes, to reflect about this experience using very specific terms and a “new vocabulary”) is considered as aesthetic “prosumerism”. It evidences the new routes of digital culture: to search, to point out, and to discover new forms of aesthetic sensations.

“Bottom-up” trends of communication (such as “slime-mania”, the “hype” of 2017–2018) allow investigations on the public’s intuitive ways of filling vacancies in the “mediatized sensorium”, bringing to light hidden needs (such as “oddlysatisfying”

actions and new forms of aesthetic experiences). At the same time the production of slimes (in the context of DIY-culture) can be considered as an “homo faber” process arising. Here, we can find a conjunction of “anti-stress” functions of slimes: their production in „alchemy-like“ home-laboratories, exchange of technical ideas of slime making, discussions on the masterpiece level of each unique case of slime-making. That is why this meeting of slime-mania and DIY proves Simondon’s idea that „technical creativity“ is a sort of “life force” in Bergson’s term.

AESTHETIC EXPERIENCE AS TRANSGRESSIVE (CINEMA)

Abstract | Transgression – rather new term in philosophies, the fact of his use is caused by J. Bataille`s, M. Blansho`s, R. Kayua`s, K. Paze`s, M. Foucault`s, J. Baudrillard`s, J. Deleuze`s, J. Derrida`s, J. - F. Liotard`s, D. Kamper`s activity. Transgressive experience in an esthetics context on the example of performance art of the second half of the last century, the mode of the “formless” modern art in objects and also Camp`s analysis and a kitsch as specific strategy of formation of esthetic experience it appears sign that ecstatic practice is included in process of esthetic experience.

Application to cinema of a definition “transgressive”, thus, means assessment of his opportunities as analytical calculations of the reactions of the viewer representing deleting of distinctions between relevant and virtual, code conversion of the most esthetic installation when viewing. The transgressive cinema as an esthetics object not so much reproduces physical reality, and more reveals her hidden aspects which reveal in the course of shooting thanks to application of special receptions: a suspense, the equipment of “the double screen”, parallel installation, the deforming optics, representation of elements of violence, violation of linearity of cinema time, a close up, such cinema reception combines in themselves two functions — structural and affective and also creates reversibility of subjects of sight, creates feints of a narrative. Elements of the screen image are built in a perceptual, affective resonance with the viewer`s body, force impulses of the movie have to be transferred through tangible cinema space: the viewer needs to focus attention on concrete feature and at the same time to be able to perceive the whole image, the effect of a suspense increasing at a disorientation of images and also the lack of the estimated combination meant with meaning prepares “deception” of the horizon of expectation.

Transgression in cinema also is broadcasting on a screen of elements of violence which implicit value is some message where in a basis not process of interchange by information, and affect as esthetic experience, an obstacle for a possibility of a reflection after viewing of the movie is put. However, at the same time incorrect will and represent “boundary” identification as reaction to an object reduction in esthetic experience as installation on transgressive experience when viewing can be and primary, pre-empirical, defining a possibility of discharge from the events on the screen and even concentration on it.

Index terms | *Cinema; aesthetic experience; transgression; performativity; attraction in cinema; astonishment; provocative signs in viewing; embodied experience*

My argument focuses on the possibility of transgressive experience in an aesthetics and especially in the cinema. Transgressive experience which is represented in performances of the last century, the mode of 'shapeless' in art objects and as the particular ways of execution of an aesthetic experience linked with corporal dimension mean that ecstatic practice is involved in the process of aesthetic experience. Using for a cinematic experience with the definition 'transgressive', hence, means appreciation of his capacities as analytical procedures of predictions of audience's reactions representing denying distinctions between actual and virtual, code conversion of the most aesthetic installation in spectatorship. Ways of translation violence on the screen, movement toward a symbolical context imply that methods of broadcasting of these episodes on the screen are directed to creation literally of 'document', they offer an alternative pattern for account to aesthetic when viewing.

The deception of eye made by transgressive cinema reveals an adaptive process of aesthetic experience and increases vulnerability of perception of the film which technologies subject to the accelerated processing. In another words, the desynchronization of the actual and virtual events in spectatorship has the possibility to exclude one of them.

The possibility of reverse of dimensions in aesthetics experience

Before answering the question concerning the phenomenology of aesthetic transgression, it is necessary to make an intermediate remark about the boundaries of transgressive problems and transgression itself. Transgression is variable, therefore, it can occur in different scenarios. According to J. Bataille, there is the situation of prohibition is impassable because of any cultural or epistemological set in the problems of transgressive experience.

The transgressive experience includes laughter that removes the opposition between the real and the imaginary and destroys the absoluteness of the existential and semantic perspectives. This technique is closer to the concept of surreal humor in the awareness of the theatrical situation, where the viewer is lost in the game of reflections, losing the idea of the starting point of reality, which is subjected to irony itself. The intersubjective space of communication is formed beyond the boundaries of the normalized social order, where the 'inner experience' becomes the experience of others. Poetic or ecstatic language is initially 'sovereign' and has the right to be considered a 'transgressive gesture': 'the message can't go from one fulfilled and untouched being to another: it makes the game its existence, the conclusion to the border of nothing (death)'¹.

Turning to the research of transgression in aesthetics, it is necessary to define what

exactly means 'border crossing' in aesthetic experience, what aspect determines the 'border state' of the recipient on the example of 'performative turn' in art. Secondly, to identify the causes of changes in the boundaries of aesthetic categories and assess their feasibility. Third, to address the theme of transformation of the material and physical aspect in the process of aesthetic experience.

The phenomena of 'presence' and 'representation' in aesthetic theories imply a fundamental contradiction. The semiotized experience fades into the background and is replaced by the material-physical dimension, there is a change of focus, as a result of which the mode of representation acquires a secondary importance, and the modus of presence is established instead. First, it is a necessary condition that allows to construct corporeality in the process of performance, and secondly, it is a means that allows viewers to perceive this physicality. First, the "phenomenal body" of the actor is subjected to fixation in the experience, and secondly, during suspension of fixing of perception on it, the recipient interprets this phenomenon as signifier, and with which the most different associations and meanings are connected, that is – signified. So, the presence of a performance artist is not an expressive, but a purely performative quality, it is a two-way process that overcomes the distance 'spectator-artist'.

It should be assumed that the process of blurring the boundaries between different types of art ('performative turn'), which in the early 1960-s was evidenced by the appearance of performance as a genre of art, most clearly demonstrates, how modern creativity cannot be characterized by traditional aesthetic categories. The term '*theater of cruelty*' very accurately describes the criticism of aesthetic distance and passivity of the audience (on the example of classical drama theater), which A. Artaud compares with 'consumers'².

Thus, if the expansion of the aesthetic sphere often complicates the task of its identification, the problem of determining the autonomous meaning of aesthetic categories, this is equally true for the ugly and the formless. The theme of the 'formless' as a term in the twentieth century was one of the first to be touched upon by J. Bataille and A. Artaud in their mutual confrontation with the members of the surrealist movement, the debate about other ways of representation was built around the beautiful in surrealism. In particular, Bataille preferred to the 'presentability' of beauty in the understanding of Breton the representation of the unrepresentable, formless: 'excluding any idealism, direct interpretation of phenomena in their pristine, rough form' ³. Thus, the 'formlessness' of the grotesque body refers to the area of amorphous, simulative, which is dynamized and becomes a reflection of time.

Perceiving objects in the regime of deformation, for example, images of death in art, the recipient identifies himself not with the real dying, and with his image, formed by conditionally-codified system of signs. Providing an object certain characteristics, a list of properties is a way of symbolization: as soon as the recipient rejects the aesthetic object, which in the process of aesthetic experience for some reason is for

him traumatic or causing affect, external qualities are transferred to the territory of symbolization. However, ecstatic empathy with such visual images can be as much as the visual art of its varying degrees of documentary evidence of the reality of material analogues: a certain body and its death. This image splits into two associated with each other image: it is the photographic image, which is composed of separately identifiable features of the image and symbol.

Transgressive strategies in cinema: image, performativity, time

Cinema most apparently shows a zone of transgression of perception and subsequent reflection, synthesizing a symbolic, indicating the tradition of the image and signs-events that do not fit into this tradition, where the image creates a symbolic code that can only be perceived as an affect. Consequently, the mobility of the camera, frame change, installation — is not only a mark of the mechanical operation of the camera, but also the unit that sees, moves and expresses the perception (author, operator, subject). The defining technique is a close-up, because such a cinematic technique combines at least two functions — structural (as a unit of film narration) and affective.

In the cinematic experience as a transgressive audience are processed by a high degree of isomorphism of the sound, music and visual layers of the film. To associate a sound with a specific source on the screen during viewing, it should to have the visual image of the character, taken close up to enhance identification. If speech and sound elements cease to accompany the elements of the visual image, they are two autonomous entities of the audiovisual image or, rather, two equivalent images. This method of focusing attention on the body-tactile component of the film provides a multiple configuration of sound-body-tactile perception (haptic), causes a feeling of incompleteness of experience, due to the desire of the recipient to complete and to present an aesthetic object in an integral form: the viewer has to focus on a specific feature and at the same time to be able to perceive the whole image. And the ambiguity of the central image destroys the given a priori the role of cinematic illusion, causes a situation of suspense, enhanced by disorientation of the subject of the narrative, therefore the absence of the alleged coincidence of the signified with the signifier prepares 'cheat' of horizon of expectations.

K. Jaspers, in particular, argued that spectator illusions are 'inexplicable affects and associative processes that occur in clear contemplation and against the will, the transformation of real perceptions, so that the elements are contained in these tumors'⁴. Consequently, in cinema, the ambiguity of images leads to the desemiotization of the intraframe space, and subsequently to the appearance of the viewer's sense of suspense, where the borderline state becomes the liminal aesthetic experience. J.-L. Nancy wrote: "The Image challenges the presence of a thing. It is not enough to be in the image of a thing; the image shows what this thing is and how it exists. It is not a presence 'for the subject' (and not 'representation' in the usual, mimetic sense of the word). On the contrary, the image is, so to speak, 'presence as a subject'. The thing is

itself”, - in which the process of perception is superior to the interpretation ⁵.

The performative situation presents bodily images as aesthetic objects and at the same time uses them as its main signifying material. V. Sobchak, for example, points out to a special approach to understanding the cinematic experience, which is based not on the traditional definition of mimesis, but on the concept of ‘contact’. Thus, contact is understood as a complex ‘visceral and perceptual experience’, obtained when the ‘body of the image’ and the ‘body of the viewer’ come into contact. Elements of the screen image and cinematic expressiveness are embedded in the ‘perceptive, affective resonance with the viewer’s body’, ‘energetic impulses’ of the film should be transmitted through the tangible cinematic space, through the ‘carnal thoughts’ ⁶.

The naturalistic depiction of violence or the moment of murder in its ethical and aesthetic duality becomes an indicator for the problem of representation itself. Such a series of bodily images causes a gap in perception: here was just presented in the frame of the pain, but we are already seeing the game itself act of its image, which itself indicates violence. Given that it is almost impossible to determine a sufficient dose of violence in the structure of the film, we can assume that the distance formed by the visual doubling of the situation, which prevents the recipient from coinciding with the simulated reality of the action, embeds it into the situation of the liminal aesthetic experience. Examples of translating elements of violence on the screen in a conventional, grotesque form are a situation of temporary overcoming of the ban, which, ultimately, establishes this ban again. Thus, the internal mediation of the visual image contributes to the ‘ecstatic experience’, the entrance and exit from the spectator mode, and the formation of a situation of repetition of recognizable effects when viewing other works of any director leads to the schematization of the horizon of expectation, turning it into an organized amount of methods.

The depiction of scenes of violence is organized around fragments in the film, where special effects are applied; thus, the audiovisual environment, the space of the upcoming aesthetic experience exceeds the boundaries of comparison with the fact of reality. According to P. Virillo, virtuality will destroy reality, and cyberspace is a crash of the real, moreover, virtual reality is a catastrophe of reality itself ⁸. In preparation for the perception of the subsequent episode, the viewer establishes the limit of reality, whereas technical means of mediating violence only increase the tension of the aesthetic experience, and, as a result, mediation becomes a new traumatic experience. The position of the viewer coincides with the position of the characters-spectators, but, during the most time of the episode, it is impossible to understand whether we are inside or outside of the diegesis. In the effect of film presence, the technologies reveal new aspects of aesthetic distance, literalizing the gap between ‘here and now’ of bodily experience and effects that exist exclusively in consciousness.

Thus, it should be noted what can be considered a transgressive experience in the cinematic experience? ‘Gesture’, according to Giorgio Agamben, fully supports and

demonstrates the media nature of physical movement⁹. First of all, it is necessary to emphasize that purposeful cinematographic techniques are used as autonomous processes, performative acts, that is, we are talking about the potential to see cinematic images, but the inability to have them in cause-effect relationships.

Transgressive experience in cinema is aimed at abandoning the theatrical mode of perception of works, here we mean the recipient – the ‘witness’, whose main role is to be the center of action, in relation to which it is possible to assess the intensity of the images, the tension. The mode of ‘observer’ differs from the mode of ‘witness’ in aesthetic experience in that, that the event effecting on the witness becomes more intense than he is less able to resist it. The moment of the ‘event’, the time interval between the perceptual and the event, forms a fragmentary, discontinuous process of perception, which is opposite to the time of viewing the film.

The deception of expectation produced by the film experience reveals its adaptive potential. In other words, the desynchronization of the actual and virtual views can lead to the exclusion of one of them. In the interval created by watching a movie, it is not possible to determine the temporal structure of perception: affect involves placing the viewer in the uncertainty of the actual visible. The impression of ‘reality’ does not allow the viewer to move the images into the space of interpretation, because familiar images evoke recognizable visual images in memory, destroying the subordination between the imaginary and the real. However, it will be incorrect and represent the “borderline” experience, as a reaction to the reduction of the object in the aesthetic experience, as the installation on the transgressive experience when viewing can be primary, pre-experiential, because it determines the possibility of removal from what is happening on the screen and even formed around it.

The problem of the visual in the case of representation is addressed through the definition of the difference between the two functions related to the terms ‘perceive’ and ‘see’: the visual is always present, and to perceive needs much more effort to isolate a single object, focus, registration of forms. Therefore, in order to mark a certain aesthetic experience as ‘transgressive’, located outside the ‘horizon’, a certain aspect is required, namely, intentionality, always aimed at something, the subject of interest, and in this case, the concept of ‘norm’ becomes such an aspect.

VIRTUAL TRANSGRESSIONS ON THE CONTEMPORARY LANDSCAPE

Abstract | Mixed reality enables the creation of shared virtual spaces; nonetheless they remain grounded to a specific location. The result is a parallel place with undefined boundaries and a continuous displacement from the real to the virtual. While in the physical world, there might be accessibility limitations to a certain area; it is possible to enter virtually and experience being presence at a restricted zone. Additionally, each person may add information to the different layers and leave testimony of its appreciation in a given place. This would let others to have a reference when interacting with the same element. In this way, the urban scenery starts to mold itself digitally in order to be integrated to the actual city. The postmodern heterotrophy allows media to merge the visible with the invisible. There are software platforms that provide the option to create more embedded data with which the virtual landscape can be designed collectively. On the other hand, the displayed objects become public and so is the geographic location of the user if a GPS is in operation. The coordinates may deploy unrequested publicity, news or any other type of information concerning the local position. Thus, a map of the data space, as McLuhan calls it, is reproduced with every passing device. And yet, the map could be different every time since the items appear and disappear as new elements are created, and also because “wireless signal are stronger in some areas and non-existent in others” (MacLuhan, 228). In this manner, the aim of the paper is to explore the experience of the physical ground, in a specific location, mediated by a computer interface allowing interactions with context in two realms. In this way, the environment and material objects become part of a mixed practice leading to a relation of human-interface-human. Such exercise happens in real-time and real-space without breaking the link with the geographic location, although it lets people take part inside the virtual world. Consequently, the mixed space will focus awareness into activities taking place within an enhance setting, where the ultimate goal is to integrate elements from both realities.

Introduction

Augmented reality (AR) technologies used in mobile media refer to the combination of real time interaction, a physical space merged with virtual graphics and 3D elements (Azuma 1997). Different virtual material can be presented simultaneously over the physical space without being an immersive technology in oppose to Virtual Reality (VR), which simulates a specific place and objects, and when people interact in it, they are totally immersed in a virtual setting.

Developers have launched AR applications based on the GPS system with the aim to obtain information about places and objects the user is in direct contact or within a pre-established radius. Subsequently, the material is displayed as embedded objects in different layers as points of interest (POIS) from which the user can choose. The topics are diverse, touristic sites, banks, shops, restaurants, public transportation, cultural venues, public services, etc. Altogether, the AR apps are a new model for publicity, information, entertainment, and consumerism based on a geographic position. Having said that, hybrid spaces, are mobile spaces that combine the virtual, the physical and a social use of a locative media (De Souza, 2017).

The technology game: transfiguration of space

Hybrid reality enables the creation of shared virtual spaces (Szalarari, Schmalstieg, Fuhrmann, & Gervautz, 1998); nonetheless they remain grounded to a specific location. The result is a parallel place with undefined boundaries where there is a battle between information flows (Lemos, 2007) and a continuous displacement from the real to the virtual. While in the physical world, there might be accessibility limitations to a certain area; it is possible to enter virtually and experience being presence at a restricted zone.

Additionally, each person may add information to the different layers and leave testimony of its appreciation in a given place. This would let others to have a reference when interacting with the same element.

In this way, the urban scenery starts to mold itself digitally in order to be integrated to the actual city (Foglia, 2008). The postmodern heterotrophy allows media to merge the visible with the invisible. It only takes a moment to point up the camera of a cellphone and discover the nearest points of interest, what people are saying about them, what can be found and be modified by the next person. There are software platforms that provide the option to create more embedded data with which the virtual landscape can be designed collectively. On the other hand, the displayed objects become public and so is the geographic location of the user if a GPS is in operation. The coordinates may deploy unrequested publicity, news or any other type of information concerning the local position. Thus, a map of the data space, is reproduced with every passing device. And yet, the map could be different every time since the items appear and disappear as new elements are created, and also because “wireless signal are stronger in some areas and non-existent in others” (MacLuhan, 2008; 228).

Moreover, the experience of the physical is mediated by a computer interface allowing interactions with context in two realms. In this way, the environment and material objects become part of a mixed practice leading to a relation of human-interface-human. Such exercise happens in real-time and real-space without breaking the link with the geographic location, although it lets people take part inside the virtual world. Consequently, the hybrid space will focus awareness into activities taking place within

an enhance setting, where the ultimate goal is to natural integrate elements from both realities. Eventually, the ambition is to navigate through an extensive and collaborative augmented reality.

As an example, hybrid reality games promote a connection with the physical space and the relation between play and daily life (Souza, 2017). As such, the awareness of the field play becomes an important social ability. The game is developed in a hybrid space that is linked to the real physical place, and therefore, the experiences that the user may have are layered and the perception of space could be altered. Players move in and out of the game, making the limits of the landscape and the game space blurred.

To illustrate, the games from Niantic Labs, Ingress and Pokemon Go, have a location-aware technology and the users need to walk around in order to play. However, some issues arise: spatiality, mobility and social norms in public and private places. In the case of Pokemon Go, in order to catch pokemons, players have trespassed private properties or carried misconduct according to social conventions related to a place. As a result, Niantic Labs have been sued by home owners and now the company grants Pokéstop or Gym removals to homeowners within 40 meters of their properties. And places such as the museum of the Holocaust in Washington D.C, Auschwitz or other memorial sites have censored the use of mobile devices to play the game. The symbolic imbrication of space reveal social norms, power dynamics in public spaces, emotional and historical attachment to a place (Liao, 2019).

In addition, the use of AR in hybrid spaces for other purposes, such as tourism, cultural and historical sites have shifted the overall perception of some places and its meaning, depending on the virtual content, especially if users are allowed to modify or add information about the place.

Regarding the use of space and its narrative, there are some examples of art works that have addressed the issues so far presented, even before the appearance of the hybrid games.

In October 2010, an uninvited exhibition took place at the museum of Modern Art in New York. Organized by Mark Skwarek and Sander Veenhof, *We AR in MoMA*, overlaid artworks in AR with the existing galleries. Visitors could see not only the current show but also the hidden art through the lens of a smartphone. It worked with the Layar application, where people searched the AR exhibition in order to turn the phone into a viewer indicating the direction of the works. The infiltration took place in all floors, including an additional virtual 7th floor.

The relevance of the show is the fact that the MoMA was not involved, artists took over the building without permission. In this way, the curators questioned the museum's authority to define and validate art, and also the criteria used whether or not to place something within the museum (Skwarek, Veenhof: 2010).

One of the artists, Amir Baradaran, presented the following year *Frenchising Mona Lisa* at the Louvre museum. It was also an infiltration consisting of a streaming video over the Leonardo da Vinci's iconic work. The figure of the Mona Lisa comes to life and covers her head with a tricolor flag, act that leads to the French naturalization of an Italian painting. Its implications are social and political; the artist points out identity and appropriation issues along with the involvement role of the museum in this Frenchise.

The same year, Amir displayed an AR exhibition at the Venice Biennale, at a virtual pavilion with the project Venice Augmented, with a number of points of interest around several gardens and piazzas that altered the landscape virtually. Despite the initiative of the Biennale to include contemporary art practices, not everybody can be included. For that reason, in this edition, there were alternative exhibitions as a response to the event.

Manifest .AR a group of AR artists created more invisible pavilions, all with mixed reality that needed the displacement of the visitors around the islands due to the geo-location of the works. One of the aims of this group is to install and infiltrate public institutions, in particular those with a certain artistic policy held by an elite. They consider themselves as activists, but more than that, they are building the invisible, challenging the boundaries between the real and the virtual.

Finally, Tamiko Thiel made an intervention at the Tate Modern in London, "All Hail Damien Hirst!" at the same time Damien Hirst had a retrospective at the museum. What the artist addressed was the controversy that surrounds Hirst, the fact he is wealthy, has influence over some aspects of the art circle and the way his works are priced and valued in the market. The pictures displayed in the Tate were similar to religious imagery, which makes Hirst appear as a deity and with the help of AR, he was omnipresent at the gallery.

Discussion

Mobile technologies engaging hybrid spaces make the user encounter the virtual and at the same time be aware of the physical space and in fact, collaborates with its transformation. Thus, interaction is an important element of AR, and so is displacement since it works with geo-localization.

In that regard, art practices involving AR, question the use of physical space, institutions in particular. Artists and gamers are hacking places to superimpose an alternative environment and question boundaries and regulations. Nonetheless, the affects of AR include the awareness and how users think of space.

However, ethical concerns may rise when the concept of privacy is endangered. Hybrid reality is transforming the everyday when virtual objects are merged with real life and the users may transform the representation and the meaning of the space. Nevertheless, the content is embedded virtually and can only be seen and experienced with a mobile device.

Hybrid spaces create the possibility to communicate through public, private, virtual and physical space using different narratives that transform and transgress the urban landscape.

Gabriela Farías is a mexican artist and photographer. She holds a bachelor's degree in Fine Arts and a MA from The University of Guanajuato. Her work has been shown in different exhibitions including national and international contests, biennales, the International Cervantino Festival in Guanajuato and the Moscow International Foto Awards. She has published her photographic work and essays in several books, magazines and catalogues.

At the moment, she is an associated professor at BUAP, the State University of Puebla, where her field of research is image studies and new media. In addition, she is member of the editorial board of Rupkatha Journal on interdisciplinary studies in humanities.

Marleni Reyes is a professor of esthetics and digital image at Benemérita Autónoma de Puebla, México, where she teaches in Escuela de Artes Plásticas y Audiovisuales(Fine and Audiovisual Art School). She Works on the relation of art and technology. Her current research is devoted to transmedia, digital media and the human experience. Her formation includes design, art and education. She has a master degree in esthetics and art, and she is concluding the Ph.D in cultural history of art. She has collaborated in research groups in the visual development of medical and educational simulators. She is member and advisor of the Society for Phenomenology and Media SPM.

Miguel Felipe Escalera Master in Computer Science. Currently courses a PhD., also in Computer Science, where he researches about distributed systems and its application. He also focuses his attention on videogames from a technological and also a phenomenological perspective. Software developer by formation and passion. He has been lead projects for the industry in a wide range of fields for more than ten years. He is a teacher and full time researcher in the School of Plastic and Audio-Visual Arts in BUAP, México, where he has proposed and executed automated mechanism to solve academic problems in a programmatic approach, aiming to reduce the human effort invested in repetitive tasks and potential errors.

CONTEMPORARY EXISTENTIAL PHILOSOPHY AND AN INTERMEDIAL LANGUAGE OF A CINEMA (ON THE EXAMPLE OF A. ZVYAGINTSEV'S FILMS)

Abstract | The art of media is often seen as an attraction. The world experience in the art of media shows that cinema can solve serious existential problems. This potential of the cinema is explained by the intermediality of the artistic language.

The intermedial language of contemporary art is associated with the synthetic nature of medially existing forms of art. Modern media, according to M. Castells, create a multimedia superhighway, simultaneously delivering information to all our senses. On the other hand, the intermedial language of contemporary art is associated with the culture-centricity of art (L. Zaks), recreating in its works the full depth of the culture and its main archetypes.

As a reason of multimodality, and intermediality, and intertextuality of contemporary art, we can consider the confrontation with computers, gadgets, robots, screens. It forced to re-establish human indispensability in this world, the ability to defend a specific human essence, to support and create anew the world of culture and art.

At the end of the twentieth century, new possibilities arose for the embodiment of existential narrative, and they were revealed in the cinema by E. Almadovar, I. Bergman, V. Herzog, V. Kozintsev, A. Tarkovsky, M. Forman.

Artistic skills of filmmakers were focusing on individual decisive (borderline) moments in a person's life, on the abysses of the human soul, which does not know its essence and purpose, and rushes in attempts to choose and under the weight of inevitable life responsibility.

Nowadays, existential philosophy has found its cinema narrator in Russia in the person of A. Zvyagintsev. The language of A. Zvyagintsev's films is woven from multimodal quotations: cinematographic, pictorial-graphic, sculptural-statuettes, rhythm-melodic, musical, television. At the same time, the master confidently subordinates fragments and allusions to the logic of his artistic narrative that a unique author's work is born from an intermedial and multimodal intertextual fabric. These texts had created amazing wealth, depth and variety of modern culture, against which the characters of films spend their lives on elementary bodily pleasures, without trying to understand and show the human essence.

In his cinematic works, A. Zvyagintsev brilliantly embodied the tragedy of a man and women, whose existential essence is forced out of his consciousness and being. Films "Return" (2003), "Expulsion" (2007), "Elena" (2011), "Leviathan" (2014) and "Loveless" (2017) were devoted to this existential tragedy.

Index terms | *Existential philosophy, intermediality, intertextuality, language of cinema, multimodality, Zvyagintsev's films*

The study of existential motifs in cinema has been the subject of many studies by N.N. Gasheva, L.B. Klyueva, R.M. Perelshteyn, B.V. Reyfman, O.N. Sedakova, S.A. Tugushi, N.A. Khrenov. However, we would like to consider not the existential problems themselves, recognizing by a modern artist, but how the artistic existential utterance changes towards intermediality, when total textualization of reality occurs and the era of post-literacy begins (Gudova M., 2015).

The intermedial language of modern art is associated with the synthetic nature of the media forms of art that exist. Modern media, according to M. Castells, create multimedia superhighways (Kastels M, 2000) simultaneously delivering information to all our senses. L. Manovich said that one of the most popular and influential among modern media is cinema in our days. And all new computers technologies, social networks and media arts are only scholars on the cinema's lessons (L. Manovich, 2018).

The artistic language of cinema is essentially synthetic and technical, and in the history of the cinema language development we can distinguish various dominants of artistic synthesis. It is also necessary to note the subordination of the features of this synthesis to the different conceptual tasks of the authors. The artistic language of cinema, constructed by contemporary directors, embodies two fundamental features of the modern era in the history of art – its cultural centrism (Zaks L., 2019) and its post-literacy / forced literacy of the artist in relation to all symbolic and syntactic languages existing in culture (Gudova M., 2017).

Modern artists use in the creative game mixes from various cultural languages and create intermedial, stylistically bright, recognizable languages of artistic expressions. Elements of architectonic and lyrical-poetic constructions are synthesized in the language of cinema, not only the languages of the visual and aural arts, masterpieces by actors and actresses. The language of the films of A. Zvyagintsev is woven from different modal quotes: cinematic, pictorial-graphic, sculpture-statuary, rhythm-melodic, musical, television. At the same time, the master so confidently subordinates the fragments and allusions to the logic of his artistic narration, that a unique author's work is born out of the intermedial and multimodal intertextual fabric.

Picturesque lines of frescoes of the Ferapontov Monastery, landscapes of I. Levitan and N. Kuindzhi, pictures of P. Bruegel the Elder and I. Bosch, literary motifs of F Dostoevsky and A. Chekhov, M. Gorky and A. Camus, movie motifs of A. Tarkovsky and I. Bergman are used in the Zvygintsev's films. It is they who create tremendous wealth, depth and variety of manifestations of modern culture, against the background of which the actions of the characters of the films unfold. This fact is a lot and well written by film critics such as A. Dolin, O. Kirillova, A. Plakhov, D. Khryukin.

As a reason for the complicating synthesis of various expressive elements in the language of modern cinema (Gasheva NN, 2018), at the level of multimodality, intermediality and intertextuality of modern art, it is thought possible to call the existential search for a specific human essence and actualization of the rethinking of human sensuality. The need for such a search is caused today by a high level of development of artificial intelligence, when a person increasingly competes with agents of rational action and loses in this confrontation with artificial intelligence systems. This forces a person to re-justify his irreplaceability in this world, the ability for empathic sympathy for a person living closely to him, his own sensuality as wealth, the ability to maintain a specific creative human essence, to preserve and create anew the world of culture and art.

Existential states of being, their comprehension have always been the problem basis of artistic thinking (Kagan M.S., 1997). The specific problems of existential philosophy leads to the fact that its being in artistic forms, mainly, is carried out in the field of literary narrative: essayist, dramatic, prosaic or poetic. So, it was with the philosophy of existentialism created in literary forms by such writers as Soren Kierkegaard, Fyodor Dostoevsky, Albert Camus and Jean-Paul Sartre. The specificity of the culture of the late 19th and early 20th century was logo-centered, and artistic and philosophical narratives existed primarily in the verbal form of embodiment.

However, as the synthetic technical arts were developed, existential issues more persistently mastered the existence in the language of cinema. In the twentieth century, new possibilities emerged for the realization of the existential narrative, and they were revealed in the cinema by I. Bergman and M. Forman, V. Herzog and E. Almadovar. In national cinema, existential problematics was embodied in the cinematographers by V. Kozintsev, A. Tarkovsky, K. Muratova, E. Klimov and L. Shepitko, A. Sokurov.

Human being and the problem of the impossibility of the full disclosure and realization of the man's essence in the process of his existence, each time became in the focus of attention in the creation process by these cinematographers. Their artistic mastery and depth of artistic comprehension of the world were revealed in focusing on certain crucial (borderline) moments in a person's life, they revealed the abysses of the human soul, which does not know its essence and purpose, restless in the attempts of choice and suffering under the weight of inevitable life responsibility.

Nowadays, existential philosophy has found its narrator in Russia in the person of film director A. Zvyagintsev and his co-authors: cinematographer – Mikhail Krichman, painter – Andrey Pankratov, scriptwriter – O. Negin, composers - Arvo Pärt, Philip Glass and Yevgeny Galperin. Famous Russian film critic Elena Stishova identified the genre in which Andrey Zvyagintsev and his team work as an “existential horror film” (E. Stishova, 2014).

Each of his films describes a special existential experience – this is not an experience of love, but an experience of death. From the film to the film, A. Zvyagintsev explores the phenomenon of “death in life” – a phenomenon which in Orthodox psychology is called “petrified insensitivity” (M. Kondratova, 2012) – the death of the soul before the death of the body. Such “petrified souls” inhabit all of his films, and the viewer is invited to observe and explore different variants of the process of soul death, its crimes and suffering beyond retribution or punishment.

Holders of such “petrified souls” have one of mortal sins. Unknown Father in “Return”, Alex in “Expulsion”, Elena in the eponymous film, Boris and Yevgeny in “Loveless”, each of them commits his “mortal sin” – one of those sins that lead to the visible, physical death of another person, what happens with the inevitability in all films of A. Zvyagintsev. The skill of existential psychologist A. Zvyagintsev is that he investigates the terrible, mortal acts of the “petrified soul” in all imaginable manifestations: self-affirmation at the expense of another person, the destruction of a house, the death of a child, the murder of a spouse, betrayal of a friend, the loss of faith and God, appropriation they have the right to judge others, decide their destinies and reorganize this world according to their own plans, to sacrifice the lives of people to the desire for comfort and well-being.

The existential experience of living the states of “sin” and “dislike” in various films of the director is inextricably linked with revealing the sinfulness of everyday life and the universality of the simplest and most ancient commandments: “Thou shalt not kill,” “Thou shalt not steal,” or “not adultery.” The weakness of these commandments is revealed as the inability to keep a person from the temptation to sin, and the strength of these commandments is the only correct way to resolve any existential conflict when an active solution is impossible, and only mental, in the unity of experience and the search for meaning, the so-called sense of meaning. From the movie to the movie A. Zvyagintsev consistently exposes the sinfulness of those characters who are trying to resolve conflicts, like quests, by actively intervening in the natural course of events. He reveals the inhuman essence of the “active” approach to reality. A person practicing an “active” approach treats the world, other people, events as problems that need to be solved. Children must be raised, the unfaithful wife is punished, money is found, the house is saved, the temple is built.

A restless, doubting hero who does not know what to do in a situation of existential uncertainty and imperfection of being, and does not take active or purposeful actions or fails in them, turns out to be more worthy of sympathy and empathy than a personage figure. In the films of Zvyagintsev, the latter is often the secret or obvious killer. Many critics in connection with such artistic exposing of the active approach recall the principles of non-action of Zen Buddhism and the words of the immortal Lao Tzu: *“A man is gentle and weak at his birth, and firm and strong at death, all gentle and weak and dry and rotten with death. Firm and strong is that which perishes, and gentle and weak is that which begins to live.”*

The films of A. Zvyagintsev are terrified by the distinctly expressed aesthetic evaluation of human existence – the totality of the ugly in the world of people. Only nature is perfect in his films: the sun-bleached steppe, the all-powerful and vibrant ocean, the shores frozen around the northern sea, the skeleton of a sea monster drying on the shore, trees growing in the city and the crows inhabiting city parks and squares. In order to more clearly show this conflict, the film director uses the history of all the arts: theater, painting, poetry, sculpture, architecture, photography and all the languages which were created by cultural history: behavioral, gastronomic, coloristic, architectural and spatial; all media: books, newspapers and magazines, leaflets, radio and television, personal computers and social networks, all the colors of cinema: script, editing, acting, camera and music.

Thanks to such an intermedial synthesis, A. Zvyagintsev managed to embody the tragedy of human existence at the beginning of the twenty-first century, whose existential essence was forced out from its consciousness and being. This is about his films “Return” (2003), “Expulsion” (2007), “Elena” (2011), “Leviathan” (2014) and “Loveless” (2017).

Gudova Margarita, In 1997 I graduated as a Ph.D. in Philosophy at the Ural State University in Ekaterinburg, Russia. Thesis on the Essence of artistic intonation as an all-arts phenomenon. Ph.D. diploma in cultural studies I received in 2015. Thesis about Reading in the era of Post-literacy. My interest in Aesthetics is closely connected with the contemporary form of art's intonation, communication, and dialog. I have published forty articles in Russian and international journals and participated in a bigger number of scientific national and international events. For twenty-one years, I have worked at the Ural Federal University at the Chair of Aesthetics and Theory of Culture and I have been as a professor for the last three years. I am the scientific supervisor of a research group on multilingualism, multiculturalism, and multi-literacy in our university.

Julia Gudova graduated from Magister Program in Philosophy of Culture and Philosophical Anthropology in 2014 and from Ph.D. Program of Philosophy Faculty of the Ural Federal University with the paper, titled "Imperia and Culture: the philosophical analysis" in 2017. Since then Julia has been working as an assistant of the professor at the department of art and cultural technology, on the chair of the Theory of Culture in the Ural Federal University (Yekaterinburg). Julia has been lecturing a lot of courses in Cultural Studies. There are The Post-colonial Theory in Cultural Studies, The Gender Problems in Culture Studies, The technology of Myth in the Popular Culture. Julia is an active participant in so many international conferences on Philosophy of Culture, Aesthetics and Philosophical Anthropology in Russia, Ukraine, Turkey, and Bulgaria. Julia has an active part in the Researching group "Multilingualism and interculturalism in the epoch of post-literacy".

Valeriy Gudov graduated from the Philology Faculty of the Ural State University named after A. M. Gorky (Yekaterinburg) in 1991 and has teaching on the chair of the History of Russian Literature of XX-XXI centuries. Valeriy has taken Ph.D. in Philology "F. Dostoevskiy and M. Gorkiy: Christocentrism and Anthropocentrism of Masterpieces" in 1997. Since 2002 to the 2017 Valeriy during 15 years has been the dean of the Philological Faculty in Ural State University (Yekaterinburg). Now Valeriy has lecturing as Associated Professor a lot of courses in History of Multiethnic Russian Literature, Current Literature Process in Russia and Russian Literature for Foreign Students. The existential problems of Time and Human Being are always in the center of scientific researches by Valeriy Gudov. He has also been participating in so many International conferences on Russian Literature Process and Development of Philological Education in Russia, Kirgizstan, Kazakhstan, and Mongolia.

CULTURAL TOURISM OR COLLECTION OF SITES

Abstract | An art tour does not necessarily have a particular artwork as its destination. Not all visitors to historical sites intend to visit only one place; there is always an alternative destination, which could similarly satisfy the tourists' curiosity. Tourists enjoy the tour itself, and they are not exclusively interested in any monument or artwork. Enjoyment of sight-seeing is not the same as the aesthetic appreciation of cultural objects. But even on an easy sight-seeing tour, is there no other aesthetic experience than that created by artworks? If it seems a naïve divertissement, in contrast to the sophisticated evaluation of a connoisseur, can not a simple sight-seeing tour also give us an aesthetic experience? It is this aesthetic experience that we try to clarify, by distinguishing the act of experiencing each artwork from that of visiting cultural sites in series. We aim to highlight the special effect of seriality of sites in cultural tourism, which should be an important aspect of the aesthetics of place, and will examine its effects in the following three chapters. First, we retrace the origin of cultural tourism and the process of vulgarization of the religious pilgrimage, which already consists of stations in series. Second, we examine how modern tourism maps a series of highlighted sites in a virtual space, by way of listings and the star rating-system. Last, we estimate the effect of this seriality on the experience of each site, analogous to that of a museum collection. Tourism is more than the sum of all visited objects; cultural sites and artworks are arranged and constellated in a sort of metaphysical space, just like a visit to a museum. A visitor may go to a museum, even if he or she has no specific intent to appreciate a particular object; the museum itself is the destination. A cultural tour constructs its narrative beyond that of each destination, which in return renew its signification in the whole context of tourism. In considering this effect of the seriality, we can deepen the argument concerning the authenticity and the naturalization in the tourism.

Index terms | *collection; landscape; tourism; authenticity; place; locality*

INTRODUCTION

Much time has passed since the economic scale of the tourism industry grew enormously. The World Travel & Tourism Council reports proudly that more than 10% of the world's total GDP is due to tourism.¹ Tourists go all over the world to seek whatever interests them: historical sites, resort islands, and urban entertainments, for example. They visit religious sites even if they are not believers. So-called dark tourism attracts not only highly conscientious intellectuals but also curious, easy visitors.

Can any place truly be a touristic destination? In principle, perhaps. Tourists camp in deep forests or lonesome deserts, and they enjoy dishes at town restaurants which poor, ordinary residents frequent. As humble or horrible it might appear to the local residents, those destinations are attractive for the tourists coming from another place. That same place may or may not be touristic, according to those who visit.

Dean MacCannell, in his classical study on tourism published in 1976,² defined his notion of authenticity in tourism: that modern urban inhabitants, feeling alienated by their daily routine, seek in an alternative, more vivid experience in holidays. The authenticity appears when the tourist feels that they are entering the backstage of artificial, conventional life. This authenticity is not an attribute of a unique life which exists somewhere but is a relative concept, designating the difference between actual banality of life and imagined liveliness.

If we accept MacCannell's definition, the vast variety of touristic destinations is comprehensible. Touristic destinations are not entities distinguishable from the place where our real life goes on, but they are marked as such by the touristic attitude. Their specificity is not defined positively but rather characterized by the distance from ordinary realm of experience.

However, what establishes this distance? Is it the singularity of touristic sites, the scenic beauty or historical importance of the place? As discussed previously, touristic destinations may seem dull or terrible. We can locate the factor that makes a destination touristic, not in the constitutive elements of each place, but in what MacCannell called *Semiotics of Attraction* (and what Jonathan Culler called later, *Semiotics of Tourism*).³ Touristic sites are marked as such in the system of signs, where tourists convert sights to markers of sight.⁴

What is more, this semiotics affects our mental and corporeal disposition for enjoying the place and thus brings an aesthetic experience distinguishable from those of artworks. We will examine, in the following chapters, how and why this disposition can be established. First, we retrace the origin of tourism in the religious pilgrimage, which constitutes, so to speak, another space superposed on the natural ground. Second, we examine how modern tourism maps a series of highlighted sites in a virtual space, by way of listings and the star-rating system. Last, we estimate the effect of this seriality on the experience of each site, analogous to that of a museum collection.

CHAPTER 1: Pilgrimage and Seriality

We cannot equate sincere religious acts, such as pilgrimage, with playful modern tourism. Nevertheless, there are also similarities between them. If the destination of a pilgrim is a sacred place and that of a tourist is vulgar, both destinations are extraordinary. Not only the final destination but the journey there is also important.

The pilgrimage is a religious exercise; however, it should be noted that secular men and women can be pilgrims, and they practice the pilgrimage on this earth. Corporeal displacement on the ground is indispensable. So, the act of pilgrimage—both in the West and in the East—is often referred to as a route on which pilgrims move step-by-step to their destination.

Japanese pilgrim routes typically represent this earthly and continuous motion in a religious act. For example, the pilgrimage to the 33 sanctuaries (*Saigoku Sanjusansho*) in the Western regions in Japan, begun in about the 11th century, takes its name from the number of temples to visit. Such is also the case of the pilgrimage to the 88 temples in Shikoku, a large western island of the Japanese archipelago. The numbers 33 and 88 are used frequently in other areas of Japan: the pilgrimage to the 33 sanctuaries in Bando (Eastern Japan, near Tokyo), then to the 88 sites in the Omuro area (Kyoto), Goto islands (Nagasaki), Shodoshima island (Kagawa), and so on. The number 33 is that of the phenomenal forms assumed by Kannon (Avalokitêśvara, Guanyin). The origin of the number 88 is uncertain, but it repeats the same number—as 33 does—and thus represents multiplicity. 33 or 88, the number implies that a whole contains these multiple elements equally. From one temple to another, the sacred points are juxtaposed on the same route to the destination. Numbering places is arranging them in a series. When added to this series, a place gains a sacred status. Of course, there are Buddhist statues or other symbols to be venerated, but these items are not sufficient to make the place a station of pilgrimage. It must first join in the nomenclature of the numbered sites. Being numbered is a sign of metaphysical value. Although the places, when arranged in a series, do not lose their physical locality, their existence relies not only upon the geographical location but their situation among other items in the ideal map of the sacred world.

Pilgrims, in their travel through the 33 or 88 sacred sanctuaries, are conscious that they already participate in alternative lives before arriving at the final destination. They usually wear the white costume of the pilgrim, a stick in hand, singing a hymn at each temple. It is not a journey to a sacred goal but a journey in a sacred world. In passing through real earth, a pilgrim converts his physical experience in the natural landscape into a spiritual exercise in a supernatural world. It is this supernatural world that the seriality of places represents.

CHAPTER 2: Stars and Constellations

The numbering system, similar to that of pilgrimage, can also be found in the Eastern cultural practice of contemplating natural scenery: namely, the eight views (八景). The most famous and traditional poetical subject of eight views is that of Xiaoxiang in China (瀟湘八景). Xiao and Xiang are the rivers near Lake Dongting. Among the eight topics, we find (for instance) the wild geese descending to the shore (平沙落雁), or the mountain town in a green haze (山市晴嵐). This custom of selecting eight views is shared with Korea and Japan. In Japan, the most celebrated are the eight views of Omi (the district which contains the Lake Biwa, near Kyoto) and the eight views of Kanazawa (not the city Kanazawa but the coastal area near Kamakura, an ancient political center in Eastern Japan). Different from the original Chinese model, the eight views in Japan designate more pinpoint locations; for example, the wild geese descending to the shore Katada (堅田落雁), or the town of Awazu in a green haze (粟津晴嵐). This selection of eight places was in fashion, and we can find so many eight views in almost every district in Japan. This fever of eight culminated in the early 20th

century (1927), when the New Eight Views in Japan were selected with a nationwide vote promoted by newspaper companies (curiously enough, the total number of votes surpassed the population of Japan of that time). The selection of eight places is always essential. It makes a list of what to represent or what to see in the world. If nothing is listed, nothing will be seen.

This listing of places is also what modern tourism does, especially in cultural tourism. Resort tourism may have similar places listed, but it is more remarkable in the case of cultural tourism, where we usually have multiples places to visit at one time. Not all the geographical points can be a touristic destination. The places to visit are marked as such, and they can be identified by a monument or a signboard. However, the simplest way of designating a place to be worth seeing is to name it as one. To name it a valuable place is to distinguish it from other valueless places, selecting it as part of a limited number of places. Once selected, places gain a common character, just like that of a museum collection. Separated from their original location, those items become part of the museum, receiving visitors' attention in the exhibition room. Cultural spots receive tourists' attention in parallel, who observe selected places in a manner different from that of the inhabitants. With this gaze, we can evaluate and appreciate each item in the same space. This space is not necessarily a physical one. A catalog is sufficient to convert an object into a collection item, just as a guidebook can create a tourist spot from a piece of land. It is to make this operation clearer and more efficient that guidebooks adopt asterisks (*) to show distinctive places. We can find this star-rating system in many guidebooks. It rates and compares the value of cultural properties with one, two, or three asterisks, as we can find them in guidebooks such as Murray's or Baedeker's in the 19th century, and in the Guide Michelin or TripAdvisor nowadays. The asterisks arrange in the same order of value those places that have historical and geographical differences between them. This common order is like the money: it attributes an artificial common value to items of absolutely different categories. Like the money, the rating star is not only a tool to measure the value of a cultural object but a purpose which is itself pursued as an object of fetishism. From old and celebrated sites to star-rated touristic spots and the UNESCO's World Heritage, this system of listing has always been preponderant. Showing the list is the easiest introduction to the semiotics of tourism. Stars and their constellations transport us to another sphere of meaning.

CHAPTER 3: Seriality and Self-alienation

There are long debates concerning the museum effect, which converts singular objects rooted in their original place into exhibited documents, from the dates of Quatremère de Quincy and Alexandre Lenoir until today.⁵ Museum items may be uprooted and lose their life. However, if the collected items lose their original life, they regain another one that is even more vigorous. The collected objects, in a museum or a list of cultural property, have their order in common. Once we have entered there, we live in a separate order from our own life. Suspending our action-oriented perception, we devote ourselves to the serial order of things. One may call this devotion disinterestedness, just as in the case of aesthetic contemplation. It is the seriality of things that makes us forget our ordinary life. Upon recognizing items in a series, our perception begins to note nuances derived from repetition. Those nuances would be ignored in ordinary life, which is usually oriented to immediate actions. However, the seriality of things creates a neutral space where our attention is acclimatized. It is as if a repeated rhythm suspends our hearing from sensations other than that rhythm.

A collection of things (and in the case of tourism, a collection of places) affects our sensibility more than introducing us to the aesthetic attitude. We have used the word “devotion” because collectionism is not mere neutral aestheticism. It forces us to indulge in its system of value. As in the cases of other kinds of fetishism, in being alienated from our busy life and driven to this collectionism, we feel we must live our own, authentic life. We voluntarily choose to be alienated to be ourselves.

This self-alienation is frequently prompted as we are captive in an autonomous world. Susan Stewart noted, “The collected object represents quite simply the ultimate self-referentiality and seriality of money at the same time it declares its independence from ‘mere’ money.”⁶ The collection items are not “mere money” but real objects; nevertheless, they are free of use-value and evaluated in the interrelationship between them. They constitute a quantified, homogeneous space where we achieve our desire in the act of collecting. If the collected objects, including the places of cultural tourism, are various and singular, it is because they are arranged in this homogeneous space, which serves as a common basis for their singularity. In spite of this, there is an important difference between the collection in general and the collection of places. The latter is endorsed by the credo in the real, authentic existence of a place, and thus it makes, so to speak, a system of impurely abstracted signs. Apart from this, the monotonous, banal seriality of touristic places contributes to our lives in a vivid aesthetic experience.

CONCLUSION

Cultural tourism brings a multilayered experience. It draws us into space where places to live are converted to places to visit; the front stage of tourism, superficial by definition, presents us with a typical touristic sensation by its very superficiality. It results from a sort of distance effect, which alienates us from our living world to another world with an authentic look. As in other objects of fetishism, the artificial system of places develops an aura. It is a naturalization of the culturally constructed value. Of course, it should be noted that our so-called everyday life also embodies a series of culturally coded desires, incessantly naturalized. From one coded self to another self, we continuously change ourselves, just as Baudelaire’s patients change each other’s beds.⁷ Conversely, in cultural tourism, we can at least choose this alienation ourselves; furthermore, we can decode our coded life. In this switching of codes, our recapitulation of self may lie.

RECENT TRANSFORMATIONS OF THE DRAWING INTO VIRTUAL SPACE BY USING ANALOG TECHNIQUES

Abstract | In this paper we will evaluate the results of the research by design methodology exploring the symbiotic relationship between analogue drawing techniques and digital representation tools including virtual reality platforms. Recent drawing transformations are conducted in the prospect of the post-media aesthetics understood as a projected part of the continuum of old and new culture of mediums. Analogue drawing techniques include myriad of non-computational drawing techniques and the digital representation is conducted using virtual reality platforms. The research design methodology presented in this research will be explained through its development within the post-graduate studies project and the results of the workshop following it.

Index terms | *drawing, transformation, hand-drawing, virtual reality, augmented reality, workshop*

INTRODUCTION

Despite numerous technological discoveries and the rapid development of digital technologies in art and in different fields of architecture, the drawing remains the fundamental tool of communicating and representing crucial ideas in architecture. This implies not only its use in the architectural design process, but also its role in understanding and thinking about space. The relationship between the architect and the space is not exclusively related only to the activity of designing a new or existing space, but also to the way of its perceiving, understanding and representing it, that is, translating it into a visual expression. The long and rich development path of architectural drawings is closely related to the technological innovations that have changed the way of perceiving and understanding space as basic architectural concept. Continuous emergence of new informational technologies based on the rise of the digital, offers new and unique perceptions of the world. Present-day user stands on the threshold between virtual and real, and the emergence of new tools, appliances and applications allows constant leaps from one field to another and the creation of combined, hybrid perceptions of space.

The basic idea of this work is that the play of space - panoramic photography, transcribed into the drawing by various image producing tools, can be developed as a new medium for expanding the range of visual territory created through a range of media impulses. New visual territory pulls new aesthetic that is to be further argued. The subject of this paper is to examine the possibility of combining analogue drawing techniques and digital applications to simulate virtual reality in order to create a new visual expression. This project explores how drawing as an artistic expression of space in architecture can be synchronously developed with available digital technologies. Using familiar methods of documenting space and post-producing it using the computer, in order to examine, and reconcile, the relationship between digital and analogue in virtual and real space, this methodology suggests that analogue and digital tools nowadays coexist in a complementing relationship.

The first section of this paper will present the established research methodology developed on the post-graduate studies course *Architecture and Visual Language*. The methodology will be explained within three phases of work, describing the tools that are being used and references in the field of art. The second section of the paper, further application of this methodology will be presented within the extracurricular course realized at the student workshop EASA in Rijeka in 2018.

TRANSCRIBING SPACE

THE SYMBIOSIS OF ANALOGUE TECHNIQUES AND DIGITAL REPRESENTATION TOOLS

THE WORK WAS REALIZED WITHIN THE SECOND YEAR OF POST-GRADUATE STUDIES IN THE ELECTIVE COURSE *ARCHITECTURE AND THE VISUAL LANGUAGE*, UNDER THE MENTORSHIP OF THE PROFESSOR BRANKO PAVIĆ. In search for new visual expressions by interweaving digital and analogue media and procedures that include photography, drawing on tracing paper in three techniques - ink, marker and marker-pen, computer postproduction and representation in the form of virtual reality, this project examines the symbiotic relationship of hand-drawing techniques in architecture and virtual representations of space. The basis of this project was to capture the 360x180° panoramic photo of a chosen space and transcribe it into an architectural drawing using various drawing techniques. As a new picture representing the same space, the image is returned into

virtual space using computer. Applied methodology consists of 7 steps divided into three phases, *pre-production*, *production* and *post-production*, that combine myriad of analogue and digital tools such as photography, ink on paper, marker-pen, technical pen and Photoshop CS editing.

Virtual reality as a hot topic in the world imposed itself as a whole new field for experimentation in the domain of representation of space through the architectural drawing. The idea of combining analogue and digital techniques has followed the need for a strain from very defined and controlled articulation of the digital line in the architectural drawing. Virtual panoramas are used in architecture in communicating with clients, for presenting a newly-designed or existing space, depending on whether it is a conceptual solution or an already constructed object. Virtual panoramas provide a full view of the space that is being presented, 360x180°, where the perspective can be easily controlled and changed in all directions. Additionally, multiple panoramas can be combined into a unique virtual walk, which adds to the dynamic of the transition from one space to another, making the virtual tour appear less static. This way of presenting the space is becoming an increasingly frequent way of communicating with the clients or the future users of the space. (Figure 1) In practice, over the years, as a young architectural studio, we had an opportunity to experiment with the techniques of creating virtual space, more precisely, creating spherical images, photos and three-dimensional models. With the development of smartphones, technology for this means of presentation has become available for everyone, and has been popularized through the social networks. We had start experimenting with the graphical editing of these images, considering the various types of users we are addressing - clients, architects, students or the public.

In 2015, one of the largest technology giants, *Google*, launched a free application that allows all its users to search 360° panoramic photos from all over the world. Also, each user is allowed to contribute to a public album using this application to capture a photo of a desired space and create their own panorama. (Figure 2) Each scanned image is stored in the phone as a two-dimensional image, and can be viewed as a spherical photo using these or other suitable applications. In this way, this type of image becomes easy to reproduce, and in the context of architecture and art, it opens up a new spectrum of possibilities and speculation for different traditional or contemporary medium.

THE AUGMENTED EXPERIENCE

The *Augmented Experience* workshop is a two-week workshop held at the *European Architecture Students Assembly RE:EASA 2018* in Rijeka, Croatia. It is a non-material temporary workshop based on the production of digital drawings by combining analogue and digital techniques, tutored by Hristina Stojanović and Nikola Milanović. The aim of the workshop was, besides exploring the potential of combining analogue and digital techniques of drawing and possibilities of using virtual reality infrastructure in architecture, as well as offering the residents of the city of Rijeka a whole new perspective of some of the important and well-known locations in the city.

Since the 2018 *EASA*'s topic was set quite contextually, with an intent that workshops

would tackle the city they were in, this workshop ought to have a strong influence on the local surrounding, hence answering to the theme as a reinterpretation, a visual transcription of an existing place. The workshop had lasted for two weeks and counted 9 participants¹ in total. The whole workshop consisted of two parts – research and design-drawing part. The research implied familiarizing with the context of the place, through lectures, conversations and walks. It developed spontaneously as it was focused on exploring the city and the location scouting. The design part had upfront established methodology of work that implied a few group exercises, with the aim of researching different drawing techniques, being actually an introduction for the individual work. (Figure 5) In post-production phase, as in the case of the above mentioned and explained methodology, the drawings were scanned, followed by the next step of overlapping them and Photoshop CS editing – the only step that the use of computers was needed. Computer was also needed only for the means of publishing the results on the internet. The workshop was devised with the idea of questioning the previously assumed symbolic relation between the hand-drawing techniques in architecture and virtual representation of space. Hence, analogue techniques of drawing were used for the transcription of space, whereas the VR headsets were used for its observing. When combining the two, the result is a whole new, augmented, perspective of various urban spaces.

Workshop results offer experience of different perceptions of space, different scales and an architectural play with abstraction and the details. It is, easily agreeable, a completely different feeling when the same drawing is seen on paper, compared to seeing it in 1:1 scale as an enormous drawing of a crane, viewed through the VR glasses. (Figure 6)

Workshop results (digital part) are available at: <https://roundme.com/tour/295957/view/940380/> (Figure 7a, Figure 7b, Figure 7c, Figure 7d)

NEW AESTHETIC OF THE TRADITIONAL

The obtained results confirm the thesis about the existence of a symbiotic relationship between analogue expression and digital presentation of work. The analogue suggests to the unavoidable presence of the author which lies in every single stroke of the ink, marker-pen or technical pen. Unforeseen *mistakes* made in the transcribing process become uncontrollable but unique expression, impossible to produce digitally. Withdrawing from the conventional perfection still further leads to the uncontrollable aesthetics of the hand-written mistakes rather than computational glitches. Additionally, digital space offers infinite possibilities in perceiving the work of drawing and emphasizes the presence of the viewer offering him numerous different perspectives. In this way, the perfection inherent in machines is avoided, which is bounded by the excessive limitation and control of the each author's specific gesture, always present when using digital tools. The absence of digital technologies in the process of drawing emphasizes the presence of the author. However, in the context of its presentation, it offers infinite observing possibilities. In this sense, the use of digital technologies to generate virtual reality highlights the presence of the observer by offering him the freedom to find his own vintage point and experience the same image each time differently. By that means, the user is being placed in a partially authorial position as the creator of different, always new, worlds inside the given image.

Discussing the way representation is treated in new media in *The Language of New Media*², Lev Manovich's opinion about the new technologies enabling the new

complexity of the idea of representation, by offering new contexts and purposes in which they can take place, enables us to experiment with the old traditional architectural tools and not substituting them, but rather evolving them with post-digital, post-net culture. The traditional concept of a medium concentrates on the physical properties of a material being used and its representational capacities.³ The work of drawing still has its own identity, and can be represented both traditionally, as a materialized piece of art placed on a museum's white wall and observed by the audience. Or it can, together or separately, be represented as a completely different picture of the same work. This duality is nothing new, it is a common concept of medium from the beginning of the 21st century.

HAND-DRAWING IS A POST-MEDIA THING

The future of hand-drawing in architecture was questioned many times since the occurrence of the digital revolution of the 1980s-1990s. Questioning the nature of future hand-drawings, their significance and their status, at the Symposium at Yale School of Architecture "Is Drawing Dead?" in 2011⁴, just a couple of years later, the subject of architectural drawings was debated, referring to the hand-drawing as undoubtedly alive, in the peer-reviewed conference "Drawing Futures"⁵, organised and held at the Bartlett School of Architecture in London in 2016. The work of hand-drawing in architecture in this context is not perceived as dead, nor is the work questioning its future. The vintage point is optimistic – it is understood as a part of the continuum of old and new culture of mediums. It relies on the Lev Manovich's points on the prospect of post-media aesthetics: "In order to make new culture richer through the use of the aesthetic techniques of old culture; and in order to make old culture comprehensible to new generations which are comfortable with concepts, metaphors and techniques of a computer and network era."⁶ A whole new generation of architectural designers are urging beyond traditional techniques of drawings, leaving them in the past and intimidating nostalgia with the loss of the drawing tradition.

In the context of working with students on the question of exploring the possibilities of combining traditional tools and contemporary media, revitalizing the hand-drawing and claiming its immortality by exploratory methodologies proved to be engaging for the practitioners, in this case, the students. Involving hand-drawing into the process also prolongs the usually quick result that appears in the process of CAD drawing. The final result, seems more far away and the hesitation and anticipation of finally seeing it can be compared with the process of 35mm film developing. The process of developing the film is replaced with the scanning and preparing the drawings digitally to be published and viewed virtually.

1058

On the other hand, the virtual tour has its tempting and, somewhat irritating habit, just like looking at the model, of inviting you to look at the parts from variety of viewpoints. Some are good, interesting, overwhelming some are less so, boring. The fact is to say that they are new to the observer, and in a way, quite personal.

"Contemporary author (sender) uses software to create a text (message), and this software influences, or even shapes the kinds of texts being created: Similarly, a contemporary reader (receiver) often interacts with a text using actual computer software...This software shapes how the reader thinks of a text; in fact, it defines what

the given text is...”

COMPUTER INTERFACE AS FILM: POST-MEDIA AESTHETICS OF DESKTOP DOCUMENTARY

Abstract | This paper explores a recently emerged audiovisual form called “desktop documentary”, an interdisciplinary computer-based variant of essay film. As a post-media practice, not longer exclusively dependent on the film medium, desktop filmmaking represents a hybrid audiovisual genre entirely conducted in the digital environment by exploiting preexisting materials in new contexts while taking advantages of Internet, widely used software, and digital tools. Desktop documentary filmmaking corresponds to the widespread artistic practice of postproduction – a concept introduced by Nicolas Bourriaud signifying a new state of affairs when all texts of culture are already available (mostly as digital objects) and the artist intervenes on existing materials rather than produces artworks *ex nihilo*. Belonging to the tradition of essay film – a documentary and experimental cinematic mode in which moving images and off-screen verbal voice or textual captions establish complex relations – desktop video essays introduce new post-media aesthetics. Similarly to the idea of using everyday materials in the artistic context, initially proposed with Duchamp’s ready-mades, which unprecedentedly effaced every notion of the style from their avant-garde aesthetics, desktop documentaries often minimize and abolish cinematic stylistic qualities. One of the most significant aspects of desktop documentaries is that the act of film viewing does not differ from common computer user experience: having replaced traditional film screen with the computer interface, the interactive process of computational multitasking, performed on various digital data and files, becomes the very content of the film. After the historical overview of the phenomenon and general introduction into the post-media theory, selected works of representative desktop documentarists such as Kevin B. Lee and Louis Henderson are being analyzed in their deconstructive approach to traditional and digital filmmaking – subversive both formally and politically.

Index terms | *aesthetics; desktop documentary; essay film; experimental film; interface; post-media; postproduction; video essay*

Introduction

The advent of the Internet and global transition from analogue to digital production, distribution, and consumption not only affected the film medium, but contemporary cinematic practice as well. In recent years and decades, experimental and avant-garde film- and videomaking modes heavily went through the process of transformation, adapting themselves to digital and computational practices and aesthetics. One of the new forms of experimental filmmaking emerged in this context is *desktop documentary*. Generally following and continuing the tradition of essay film, desktop documentaries represent a hybrid audiovisual genre entirely conducted in the digital environment by utilizing preexisting materials in new contexts while primarily exploiting the Internet, widely used software, and digital tools.

When confronted for the first time with a scene from a desktop documentary, a viewer usually could not determine nor discern whether he/she is watching a film (that is, a reproduction of a video file) or is it a common browsing and surfing activity performed on the computer. Therefore, at the moment, desktop documentaries could be considered genuinely hyper-realistic, since they induce cognitive and perceptual confusion similar to the one famously experienced at the first screenings of the Lumière brothers' iconic film *The Arrival of a Train* (1896). Today, it would be virtually impossible for this kind of bewilderment to be stimulated with the same classical black-and-white two-dimensional screen. It would have needed to be produced on digital meta-media and reproduced on digital screens, audio-visually and aesthetically resembling, or even replicating our everyday tasks and operations. This is the very issue which all of the desktop documentaries fundamentally question and examine. They explore the paradigmatic shift in media construction of reality when the old platforms of content distribution – not only theatres and TV receivers, but also books, newspaper, radio, etc. – have mostly been replaced by the Internet as a primary archive and source of human knowledge and the technology of interactive digital screens. We perceive reality through the 'lenses' and via the 'logic' of computer interface with its typical simultaneous multitasking and multiscreen activities, and the new variant of video essay critically investigate such a new social, economic, and cultural paradigm.

Since desktop documentaries, in their appropriation and exploitation of heterogeneous digital data, files, and software, do not exclusively depend on the materiality and physicality of film medium, they represent a paradigmatic post-media practice. Therefore, in order to further approach the analysis of the desktop documentary phenomenon, I will first briefly outline the contemporary concept of post-media.

Some Notes on Post-media

In a text written some years before the global expansion and massive availability of the Internet, Félix Guattari anticipated the potential emergence of a "post-media era," understanding it as a time of "collective-individual reappropriation and an interactive use of machines of information, communication, intelligence, art and culture"¹. During the last couple of decades, many theoretical books and papers on *post-media* and *post-medium* have been published: Rosalind Krauss – *A Voyage on the North Sea: Art in the Age of the Post-Medium Condition* (1999), Peter Weibel – "Die postmediale Kondition" (2004), and Lev Manovich – "Post-media Aesthetics" (2001), to name just a few representative examples. Their theories range from conceptualizations of the formal specificity of the new medium to broad cultural investigations of a new socio-economic state of affairs; but for the following discussion several thesis developed by

the latter author would be particularly relevant.

According to Lev Manovich, the computer interface constituted a universal working space wherein, for the first time in the history, identical tools – i.e. digital commands, such as ‘copy’, ‘cut’, ‘paste,’ etc. – were equally employed in completely disparate art disciplines – and different professions as well. One of the unprecedented key aesthetical innovations formed through the synthesis of personal computer and the Internet was “*multimedia document*,” defined as “something which *combines* and mixes different media of text, photography, video, graphics, sound.”² The traditional “*typology of mediums*,” grounded in their respective material distinctiveness (classical dichotomous difference between *spatial* and *temporal arts*), appeared to be theoretically, discursively, and epistemologically obsolete and inadequate to explain novel artistic practices.³ Post-media artworks of today transgress the boundaries between diverse media, disciplines, and genres, fluidly presenting themselves as heterogeneous objects, or assemblages, on digital platforms, inevitably participating in the shaping and dissemination of existing knowledge, archived throughout World Wide Web, while permanently stressing constitutive contribution of the recipient, or user,⁴ for the decoding of the message. As Manovich claims, the role of the new aesthetics of post-media is, among other tasks, to “describe how a cultural object *organizes data* and *structures user’s experience of this data*.”⁵

In the era of dominance of computer technologies, multimedia platforms, and global networking, the filmmaking practice, and experimental and avant-garde cinema in particular, in different ways corresponds to the new digital standards, ranging from pure negation (as is the case with those committed individuals who still passionately work with and continue to explore the limits of the analogue film medium) to the acceptance, albeit not without strong critical intervention.⁶ One possible response to the contemporary challenges of post-media condition, belonging rather to the latter type, is represented by desktop documentaries.

Desktop Documentary: Essay Film in the Era of Multitasking and Multiscreens

During the last several years, desktop documentary format established itself as an exemplary post-media artistic or cultural practice. Kevin B. Lee – who coined the name for this new experimental genre⁷ – and his colleagues at the School of the Art Institute of Chicago involved themselves in a filmmaking practice “which uses screen capture technology to treat the computer screen as both a camera lens and a canvas. Desktop documentary seeks both to depict and question the ways we explore the world through the computer screen.”⁸ Developed in the post-historical time when the exploitation of available materials became a significant operation of contemporary art, these films represent individual investigations of different social and cultural topics, conducted via most available tools of our digital world. In short, desktop documentaries are “[c]harting the multitude of the Internet through the desktop interface,”⁹ acknowledging “the internet’s role not only as a boundless repository of information but as a primary experience of reality.”¹⁰

Genre-wise, desktop documentary is mostly similar to *essay film*. For decades, essay film has been a truly hybrid filmmaking mode – a “centaur,” as Phillip Lopate calls it¹¹ – on the threshold between several film genres and registers, exploring the personal, idiosyncratic viewpoint of its author, while unconventionally combining and confronting spoken or subtitled commentary with moving images and pictures.¹² While desktop documentaries continue the cinematic lineage inaugurated with essay film, they also

utilize a technique notably explored in the *found footage*¹³ filmmaking: appropriation, modification, and recontextualization of existing audiovisual materials. However, found footage generally assumes the employment of only one type of material – namely, film or celluloid – whereas computer-based desktop documentaries use diverse digital objects (video clips, audio recordings, photographs, texts) as well as digital software (programs and applications).

Desktop documentary filmmaking thus corresponds to the widespread artistic practice of *postproduction* – a concept introduced by Nicolas Bourriaud signifying a new state of affairs in the artworld when all texts of culture are already available, and the artist chooses, selects, and intervenes on existing materials rather than produces artworks *ex nihilo*.¹⁴ This practice was initiated more than a century ago, with Duchamp’s ready-mades, which acknowledged everyday objects and commercial products as possible artistic materials and, potentially, finished artworks;¹⁵ however, now instead of physical objects, heterogeneous digital data are exploited. When it comes to the art of filmmaking, common phases of traditional film production process such as scriptwriting, direction, and editing have been replaced with the broad practice of postproduction. One does not longer need to utilize camera and its lenses, since – hypothetically – all of the images (static as well as moving images) are available in the Internet environment, ready to be appropriated and manipulated. Desktop documentaries, exclusively produced on the computer, strategically and tactically explore this all-pervasiveness of the Internet and unstoppable, inflationary circulation of digital data. The following comparative table sums up key technological distinctiveness of the desktop documentary format in opposition to essay film:

Analogue essay film	Digital desktop documentary
production	postproduction
filmed footage	found footage
filming objects or referents	appropriating digital data
camera	screen capture
classical montage, editing	digital software operations
movie theater or television	computer monitor or mobile screen

In comparison to commercial and art-house film cinematography, which is strongly anchored in the art of painting and photography, desktop documentaries radically reduce cinematic aesthetic features to their mere formal and technical, non-aestheticized appearance. What is shown on the screen literally resembles those digital multitasking activities we commonly perform and experience in everyday life, both in professional work and leisure, but now deeply questioning our notion of realism and problematizing the role of representation in contemporary art. In doing so, desktop documentaries do not only acknowledge and embrace the advantages of the computer and digital technologies, but also their distinctive technical limitations, transforming them into particular *digital and data aesthetics*: for instance, a reproduction issue, malfunction commonly known as *glitch*, is deliberately generated and randomly distributed throughout the films.¹⁶ But what is particularly shocking and outrageous is the fact that these films only simulate the interactive user experience, for, in effect, nothing is interactive, given that the audio-video files are merely reproduced in their original form¹⁷ – being *a simulacrum of computer interface*. As a consequence, desktop documentaries challenge and undermine one of the most widespread myths of today

– namely, the *myth of interactivity*, critically deconstructed by Manovich in his earlier theoretical writings.¹⁸

Of course, there are different uses, or different types, of desktop documentaries, ranging from informative fan-made reviews of popular and mass content to highly experimental digital forms.¹⁹ What distinguishes the latter mode of desktop documentaries from other types of standard digital video essays is not their *anti-representational* approach (common in abstract avant-garde cinema) but rather *hyper-representational* bewilderment (paradigmatic for present-day multiscreen multitasking).

In order to illustrate previous theses I will analyze two experimental films of the two representative desktop documentarists: Kevin B. Lee and Louis Henderson.

Case Study: Desktop Documentaries of Kevin B. Lee and Louis Henderson

The first image is that of a word processor (Apple’s TextEdit) where the very title of the film is being typed (we can hear the sound of typing fingers). After the program closes itself we are confronted with a computer desktop (even personal data are visible, like folder named “Farocki”). The mouse cursor chooses a browser from the toolbar and opens it. The user types “YouTube.com,” searches for the fourth sequel of the *Transformers* movie franchise, and opens the trailer in a new window.

These are the opening scenes of Kevin B. Lee’s desktop documentary *Transformers: The Premake* (2014). Taking as its primary referent *Transformers*, a recent Hollywood blockbuster, Lee’s 25 minutes short film “turns 355 YouTube videos into a critical investigation of the global big budget film industry, amateur video making, and the political economy of images.”²⁰ Using many of the *Transformers 4* behind-the-scenes materials, at the time when the latter movie was still not finished, and transposing them in a new, critical context, Kevin B. Lee created a highly deconstructive video essay of today – and officially introduced the genre of desktop documentary.

On the formal level, the use of multiple, overlapping screens and screen-within-a-screen technique in *Transformers: The Premake* inevitably induces confusion during the watching of the film. It is especially emphasized in one of the final scenes featuring an intense sequence of explosions – paradigmatic for Hollywood blockbuster aesthetics – followed by an abundance of small browser windows which cover the screen surface as if a computer bug has occurred. As in the famous Fredric Jameson’s explanation of the novelty of postmodern culture and postmodernist art, all of the screens should be perceived *simultaneously*²¹ – which is, obviously, a rationally impossible endeavor; as a result, Lee’s film operates not only as a video essay explicit in its arguments, but also on the level of pure audiovisual affect. Nevertheless, *Transformers: The Premake* includes several political references such as the following: the film depicts the first spectator filmed commercial, tackling the current invisible mode of exploitation called “fan labor;”²² it uses the footage of video interviews made with small salesmen from Mainland China, in which they express their opinion about the filming of *Transformers 4* in their city, and its possible long-term effect on tourism of the region; it shows how the bankrupted city of Detroit is now being exploited as a filming location of big-budget movie productions.

It must be stressed that the important audiovisual *content* of Lee’s film is not only preexisting footage related to the production of *Transformers*, but also *visual footprints* of a present-day users’ digital activities: the process of writing a comment of a YouTube

clip is represented; a video watched online is fast-forwarded; at a certain moment, the screen is minimized, and in the digital act of breaking the fourth wall we could see the editing software (Adobe Premiere Pro), etc. This is essentially a voyeuristic practice for the, screen mediated, twenty-first century: we watch what the eyes of the author/filmmaker observe – though, what they see is already represented on a screen (within a screen). Because of this strategy, *Transformers: The Premake* and other desktop documentaries could be considered truly contemporary *metafilms*, i.e. films, or videos, which self-reflectively comment upon their own production process – a process which, in this case, *performatively* unfolds before our very eyes.

Similarly to Kevin B. Lee's film, Louis Henderson's 15-minute desktop documentary *All That Is Solid* (2014) starts with computer operations performed in real-time. In Google Translate software, which completely covers the screen, the following poetic words – constituting a possible desktop documentary manifesto – are simultaneously translated from English into French: "This is a film that takes place, in between a hard place, a hard drive, and an imaginary, a soft space – the cloud that holds my data, and in the soft grey matter, contained within the head."²³

In comparison to Lee's *Transformers*, Henderson's film is more openly and radically political, explicitly exploring post- and neocolonial issues in the context of the digital era. While showing what is nowadays done with obsolete computers disposed on the coast of West Africa, the author sketches a fragmentary map of the history of colonization of that particular region: he navigates through the Wikipedia article "Colony of the Gold Coast," reproduces an instructional video "I will speak English," available on "Colonial Film" website, and examines the text "How To Access The E-commerce Gold Mine Of Africa." In Henderson's film, imagery of modern physical exploitation is juxtaposed to the optimistic discourse of technological and IT progress. We can hear Steve Jobs' quote on, firstly, the advent of a PC as an all-encompassing digital hub and, secondly, on the cloud technology as an immense worldwide repository. The issues of digital storage and file usages are directly addressed through the monologue, spoken off-screen, that starts with a question: "Where is the Microsoft cloud?" Using the technique of parallel montage and double superimposition, Henderson confronts the supposed transcendence of Cloud technology against the immanence of physical, manual labor, showing the non-extinguishable necessity of material, *solid* objects. Many times throughout the film, a conceptual relation between traditional mining and archeological exploration of the Internet is established, as in one of the later scenes, shown from the first person point of view, which simulates passing through abstract, virtual 3D world and through a mine. Typical of desktop documentaries aesthetics, the film is abound with diverse digital materials, but is also permeated with occasional theoretical references: for instance, one incompletely shown quote from the text of Hito Steyerl "Too Much World: Is the Internet Dead?" (first published in *e-flux* in 2013) says "slowly turning the world into a multi-layered motherboard,"²⁴ while discarded computer motherboards are represented. The film ends with a series of low resolution pixels and visual glitches (some of them expanding across the whole screen), blinking for some time, finally accompanied by the title.

With *All That Is Solid* Henderson managed to create a relevant synthesis of socially engaged topic and radical formal experiment, showing us how both 'content' and 'form' of a video essay could be treated equally politically. In such a way, both Lee's and Henderson's film demonstrate the possibility of desktop filmmaking as a genuine *critical* practice which intervenes in the general body of knowledge.

Conclusion

Wholly conceived in the post-media environment – wherein analogue media was replaced with universal digital interface and camera was discarded in favor of data appropriation – desktop documentaries represent a new mode of postproduction practice, in Bourriaud’s sense of the word. Since their source is based upon the preexisting materials, they always explicitly establish intertextual, or hypertextual, relations with other films and videos as well as heterogeneous texts of culture, producing a complex interdiscursive network of information and knowledge, as previous analysis has shown. In the process, each desktop documentary necessarily makes a general comment, i.e. *metacommentary*, on the hybrid medium it uses. Consequently, these films, as was the case with Kevin B. Lee, are potent enough to synthesize two traditionally opposed and separated modes, or registers: namely, the position of film critic and the position of filmmaker.²⁵ As a new – *updated* – version of essay film, desktop documentaries tackle the role of cinema and video art in the world of today, and question the possible function of aesthetics in the dominance of post-media – which is a question always tightly related to politics

- 16 Of course, computer based aesthetics and imagery already found their place in the earlier experimental film and video work: for example, during the last decades of his filmmaking practice, Chris Marker started to examine and employ computer graphics and multiscreen interactivity, whereas Harun Farocki similarly incorporated video games images and iconography into his found footage videos.

REVISITING HUXLEY'S DYSTOPIC VISION OF FUTURE CINEMA, THE FEELIES:
IMMERSIVE EXPERIENCES THROUGH CONTEMPORARY MULTISENSORY MEDIA

Abstract | Aldous Huxley's concern with media, and in particular with cinema, is one of the most conspicuous components of his work as a social critic and as a novelist. Evaluating its potential societal functions, as an artistic genre, a didactic cultural tool for documentaries or as a mass entertainment venue, determined his critical relationship towards the medium. Due to his impaired eyesight, Huxley's attention to perception, intertwined with advancing cinema-technologies, was not restricted to the visual, but extended to all of the human senses, as he demonstrated in the Feelies of his novel *Brave New World* (1932). Primarily with regard to mechanomorphic reflexes of human conditioning, this cinematic concept is interpreted by drawing from articles and essays of evolutionary, psychological, political, and aesthetic perspectives that Huxley developed on a parallel writing track in popular print media during the 1920s/30s. In confronting modes of multisensory immersion around 1900 with some of the 20th/21st century, this contribution reevaluates Huxley's vision of future cinema.

Index terms | *affordance; avatar; flow (absorption in pleasure); multi-sensory interaction; multi-sequential, prosthetic enhancement; participatory dramatic agency; threshold object; touch, taste and smell user interfaces.*

INTRODUCTION:

MECHANOMORPHISM IN WORK AND LEISURE

Throughout the 1920s, Aldous Huxley contributed with essays and articles in popular magazines, journals and newspapers essentially to the public discourse on mass leisure as “an asset and a problem,”¹ in concurring with the competing findings of contemporary social theoreticians who categorized leisure not merely as a “problem” or “challenge”, but rather as a “threat” that triggered “fear”.² Some years prior to writing his novel *Brave New World*, Huxley projected the present leisure trend into a distant future,³ forecasting a six-hour day by the year 2000:⁴

“Perfected machinery,” say the prophets, “will give us increasing freedom from work, and increasing freedom from work will give increasing happiness.” But leisure also is subject to the law of diminishing returns. Beyond a certain point, more freedom from work produces a diminished return in happiness.

(“Boundaries of Utopia,” in *Music at Night* (1931), 127)

In this mechanized society, mass production and mass leisure were initially characterized by monotony and boredom. Industrialization countered both effects that it had generated with the creation of inexpensive mass entertainment venues: Between 1921 and 1931, the total share of manual work on the labour market was at approximately 70%.⁵ These figures found its equivalent in the systematic expansion of the pleasure industries, e.g., the cinema, where the attendances ascended to 903 million by 1934.⁶ Huxley, in referring to “ready-made distractions,”⁷ repeatedly invoked the metaphor of the Ford-T-assembly-line for an intrusive American media-practice that undermined British culture:

Mass production [...] might be good if the spiritual wares retailed by our mass-producers of the mind were of high quality. [...] As things are at present, mass-produced material objects are of much better quality than mass-produced ideas and mass-produced art. [...]. The rotary press, the process block, the cinema, the radio, the phonograph are used not, as they might so easily be used, to propagate culture, but its opposite. All the resources of science are applied in order that imbecility may flourish and vulgarity cover the whole earth.

(“The Outlook for American Culture: Some Reflections in a Machine

Age,” in *Harper’s Magazine* (August 1927), 188)

Huxley argues that active creative work generates an affinity with intellectually stimulating modes of self-sustained leisure practice. Routinely performed passive labour, however, in which the workers would become an integral part of the production process,⁸ while conscious reflection is subsequently absorbed, induces their receptive exposure to mass leisure media. This specifically late modernist physiological reflex— “the effects of mechanomorphism,”⁹ according to Huxley in 1937—is permanently triggered and habitually solidified through its processual mechanization within the daily industrial cycle of mass production and mass consumption: “[...] a mind almost

atrophied by lack of use, unable to entertain itself [...]”¹⁰ writes Huxley, as early as 1923, regarding “the performance of purely mechanical tasks [and] distractions as mechanically stereotyped,”¹¹ to conclude six years later, in the article “Machinery, Psychology, and Politics,” that progressive “mechanization creates uniformity of exterior and interior behaviour [...] through spiritual opiates and thought-substitutes.”¹² In sharply dissecting the contemporary internationalized media landscape, Huxley

states: “Machinery, then, has created leisure and multiplied the number of impressions which men and women can receive.”¹³

INSTRUMENTALIZING CINEMA

Cinema and Human Conditioning (1920s/30s)

Aside from the low cost at which the velvet luxury of the cinema was available, mainly three factors were responsible for its sustained influence upon British culture: Its infrastructural organisation in chain-networks (reels) across the country; the extension of its seating-capacity to over 1.000 viewers per palatial venue, and a continuous program of cinema performances across the day that ensured its omnipresence in the rhythm of everyday life.¹⁴ Alerted by the speed of these developments, Huxley wrote in 1936: “When I was last at Margate, a gigantic new movie palace had just been opened. Its name implied a whole social program, a complete theory of art; it was called “Dreamland.” At the present time, the cinema acts far more effectively as the opium of the people than does religion.”¹⁵ (Figures 1. a; b; c) In the 1920s, Art Deco Cinema venues, embedded into the scenario of a vast amusement park, were likely to inspire the future of mass entertainment, particularly through its progressive interior design. In 1931, Huxley expressed:

Already mass production has made it possible for the relatively poor to enjoy elaborate entertainments in surroundings of more than regal splendor. The theaters in which the egalitarians will enjoy the talkies, tasties, smellies, and feelies, the Corner Houses where they will eat their synthetic poached eggs on toast-substitute and drink their surrogates of coffee, will be prodigiously much vaster and more splendid than anything we know today.

(“Boundaries of Utopia,” in *Music at Night* (1931), 125-126)

1076

Looking into the future (the year 3000), he speculates in a magazine article, “The Outlook for American Culture: Some Reflections in a Machine Age” (1927) that powerful trust monopolies, by controlling the recreation industry, will have numbed the play instinct and its modes of creative expression.¹⁶ In 1923, at a point, where the movie industry had barely gained momentum, he mourned the decline of the creative impulse, by defining with almost etymological precision, the term and state of immersion: “Countless audiences soak passively in the tepid bath of nonsense. No mental effort is demanded of them, no participation; they need only sit and keep their eyes open.”¹⁷ Huxley, a pessimistic advocate of the free human will, distinguished categorically between an individual leisure practice derived from the intellect and a mass leisure entertainment that addresses the most archaic of instincts. On the one

hand, he favoured established modes of self-sustained creativity that predated the emergence of electronic media;¹⁸ on the other, he saw the didactic potential of cinema documentaries in the area of primary and secondary education. Stimulating the play instinct, Huxley argues, was most efficiently practiced once applied to the youngest amongst the citizens:¹⁹

A boycott of sports news and murder stories, of jazz and variety, of film love, film thrills, and film luxury, is simultaneously a boycott of political, economic and ethical propaganda. Hence the vital importance of teaching as many young people as possible how to amuse themselves and at the same time inducing them to wish to amuse themselves.

("Education," in *Ends and Means* (1937), 290)

Agenda setting and political economy—in dictatorial as well as democratic states—was an additional challenge that Huxley identified as a threat to modern society. Referring to the status of film, radio, and the press within Stalinist Russian and fascist Italian propaganda, he exemplifies how concerted mass-suggestion alters existing modes of thought and feeling, to forge novel societal role models.²⁰ Furthermore, he envisioned how bio-psychological intervention, interacting with pharmacology, would eventually transform physiological habits at the earliest stages of human life.²¹ Alongside human conditioning, through eugenic reforms, drugs or mass media, Huxley advocated in his article "The Prospect of Fascism in England" (1934) to utilize cinema for distractions, in order to solidify democracy.²² By the 1930s, cinematic immersion had exemplarily established itself as one of these addictive psychological satisfactions²³ in England and America. Huxley foresaw that it would deepen in its intensity—concomitant with the technological progression of the medium—during the 20th century, and beyond.

Huxley's *Feelies*

In Huxley's dystopic *Brave New World*, in the year after Ford 632 (2450 A.D.), the immense leisure of the society (seven and a half hours of light work per day) is countered by a daily intake of drugs, gambling and unrestricted sex, combined with frequent visits to palatial cinema-venues.²⁴ – Measures through which the state is exercising full control over his genetically pre-conditioned population: "no leisure from pleasure, not a moment to sit down and think."²⁵ The urban cinematic chain networks of *The Feelies* are organized by the "Feeling Picture" headquarters in their vast London-based propaganda offices²⁶ and the multisensory movies produced in the extensive Hounslow Feely Studio. A College of Emotional Engineering is facilitating professional academic research and education in this market segment.²⁷

Criticizing the introduction of sound and the usage of close-ups in *The Jazz Singer* (1927) as elements that turned film from an authentically artistic into a decadent medium,²⁸ Huxley had made consecutive attempts since the Mid-1920s to forecast the future technological, and hence aesthetic development of cinema alongside other media. In 1935, he predicted television-sets a common standard in hotel-rooms, a refinement in stereoscopy, colour-applications, synthetic voices and synthetic sounds (implying the production of sound-track compositions).²⁹ Following his previous findings regarding media technology, Huxley extends in his novel the recent introduction of synchronized

sound in the movie-industry to the other senses, a transformative innovation that he indicates—in reference to “the Wurlitzer,” a theatre organ used to create sound for silent movies—by a “Super-Vox Wurlitzeriana rendering of ‘Hug me, till you drug me, honey.’”³⁰ The properties and effects of the elaborate cinema-technology are best summarized in the advertisement of the movie *Three Weeks in a Helicopter*, whose pornographic plot is subordinated to an engulfing sensation: “AN ALL-SUPER-SINGING, SYNTHETIC-TALKING, COLOURED, STEREOSCOPIC FEELY, WITH SYNCHRONIZED SCENT-ORGAN ACCOMPANIMENT.”³¹ The overture played by the scent-organ at the beginning of the film has been designed to put the audience, through a delicately balanced composition of sounds, smells, and flavours, into an entranced stage:

a delightful refreshing Herbal Capriccio – rippling arpeggios of thyme and lavender, of rose- mary, basil, myrtle, tarragon; a series of daring modulations through the spice keys into am- berggris; and a slow return through sandalwood, camphor, cedar and new-mown hay (with occasional subtle touches of discord – a whiff of kidney pudding, the faintest suspicion of pig’s dung). [...] In the synthetic music machine, the soundtrack-roll began to unwind. It was a trio for hyper-violin, super’cello and oboe-surrogate that now filled the air with its agreeable languor. [...] Sunk in their pneumatic stalls, Lenina and the Savage sniffed and listened. It was now the turn also for eyes and skin.

(*Brave New World*, 145)

The experiential technology conceived by Huxley goes further with its feely effects that are directed towards the human nervous system, in offering “electric titillation”³² of diverse tactual intensity stages that the spectators regulate through metal knobs integrated in their chairs.³³ It is with this particular central function that the *Feelies* are first introduced to the reader: “There’s a love scene on a bearskin rug; they say it’s marvellous. Every hair of the bear reproduced. The most amazing tactual effects.”³⁴

In a synthetically composed tension of sedated and hyper-stimulated senses that Frost accentuates in her analysis,³⁵ the audience collectively submerges in a fluid interaction of visual, acoustic, olfactory, and tactual effects that address and awaken physical instincts:

[...] suddenly, dazzling and incomparably more solid-looking than they would have seemed in actual flesh and blood, far more real than reality, there stood the stereoscopic images, locked in one another’s arms, of a gigantic negro and a golden-haired young brachycephalic Beta-Plus female. [...] The stereoscopic lips came together again and once more the facial erogenous zones of the six thousand spectators in the Alhambra tingled with almost intolerable

galvanic pleasure. 'Ooh ...'

(*Brave New World*, 146)

Stimulation of the audience by scented screenings and electric buzzers has been (unsuccessfully) implemented for a short time-period in cinema-venues during the 1950s, while attempting to enhance sensation. In an ironically exaggerated way, Huxley's future society is modelled after his critical observations about the interrelation of mass culture and social change during the interwar years in Britain. In *The Battle of the Sexes*, an article written for *Vanity Fair* in 1928, he concluded, with reference to an emerging promiscuous indulgence: "The life of instinct and the body is the death of consciousness and the life of consciousness is the death of instinct."³⁶ According to Huxley's predictions, cinema will be instrumentalized as one additional mode of orchestrated conditioning, equal in its efficiency to suggestibility ("hypnopedia") or drugs ("soma"):

The mind had to be made conscious of the physical reality from which it was accustomed to shrink. [...] Their reflexes have been wrongly conditioned; they should be given a course of shocks until the conditioning is undone. The theory, I am sure, is psychologically sound. But to put it into practice is difficult. At every ringing of their pornographic bell, the right-thin- kingly conditioned smut-hounds foam at the mouth. And unfortunately, they are in a position to do more than foam; they are in a position to open our letters, confiscate our books, and burn our pictures.

("To the Puritan all Things are impure,"

in *Music at Night* (1931), 239-240)

In comparing the classical literary to the emerging visual arts (especially Shakespeare to cinema), Huxley tends to associate throughout his writings the word with conscious reflection (intellect) and the image with a rather subconscious, instinctive mode.³⁷ According to his analysis, it is particularly the habitual mechanomorphic configuration of image, sound, and instinct that coins the mind-set of the younger, post- Edwardian Industrial youth and that of subsequent generations. In *Brave New World*, the relationship between instinct and consciousness that conventionally marks the distinction between animal kingdom and urban culture, is reversed: John, labelled as "The Savage" from the reservation, continues to read and quote Shakespeare and tries to sustain his conscious self,³⁸ while Lenina exclusively lives her physical-instinctive self – in direct response to their shared exposure to cinematic excesses.³⁹ Lenina incorporates physiologically what Huxley defines as "Fordism"⁴⁰ by translating it into "mechanomorphism" and what Seltzer characterizes as "the radical and intimate *coupling* of bodies and machines:"⁴¹ an act in which the cinema-screen functions indeed as a prosthetic device, as indicated by Frost in her discussion of the *Feelies*, by referencing Buck-Morss.⁴²

Morton Heilig, *The Cinema of the Future* (1955) and *Sensorama* (1957)

In 1957, Huxley's multisensory vision of immersive cinema was to be realized in a first virtual (though still non-digital) attempt by the American inventor and cinematographer Morton Heilig, who completed in 1962 his *Sensorama*, an interactive machine that combined 3-D effects, wide vision, motion, colour, stereo-sound, aromas, wind, and vibrations (Figures 2. a; b). Heilig expanded and refined these modes of immersion to a technologically advanced form, the "experience theatre",⁴³ in 1969. In 1955, he had phrased in his essay *The Cinema of the Future* the theoretical backdrop for this arcade-like simulator. It is at the core of his essay, however, that he critically questions the reliability of Huxley's argumentation:

Yes, the cinema of the future will far surpass the "Feelies" of Aldous Huxley's *Brave New World*. And like many other things in this book that are simply nightmarish because superficially understood, it will be a great new power, surpassing conventional art forms like a Rocket Ship outspeeds the horse and whose ability to destroy or build men's souls will depend purely on the people behind it.

(Heilig, "The Cinema of the Future", 1955, 22)

Written from a perspective that links the arts with advances in science and technology, Heilig's article does reveal nevertheless, in its specific association of Ford's assembly line with the industrialization of the creative arts, conspicuous correspondences with Huxley's argumentation: "Open your eyes, listen, smell and feel – sense the world in all its magnificent colors, depth, sounds, odors and textures this is the cinema of the future!"⁴⁴ Taking the 23 years of cinematic progression that bridges the two texts into account, Huxley's predictions that resonate in Heilig's historical recapitulation of 3D cinema, are likely to have (at least as an ideal model of a total work of art) co-inspired the *Sensorama*. Both, Huxley's fictional and Heilig's actual cinematic novelty are subsequent extensions of contemporary technological innovations: the *Sensorama* is just as much influenced by the wide-screen stereophonic cinema (*Cinerama*) of the early 1950s, as the *Feelies* had been by the invention of the vitaphone in 1926 that offered the possibility of sound-synchronized moving pictures.

4DX Cinema Venue by CJ 4D PLEX, CJ Conglomerate, South Korea (2009)

In essence, Huxley's conception of multisensory cinema is solidly based upon his knowledge of psy-chology, the biological and cognitive sciences, his fundamental insights into human consciousness and perception, gained particularly from the dialogues with his brother, the evolutionary biologist Julian Huxley.⁴⁵ It is on this ground that Huxley anticipates cinematic technologies as "extensions of man",⁴⁶ respectively, prosthetic devices that are potentially suitable for human conditioning.

Closely related to Huxley's *Feelies* is the 4DX cinema technology, developed in 2009 by the South Korean Company CJ4D PLEX (Figure 3) which enwraps the audience

into an augmented environment, as an advertisement from Cineworld, Dubai (UAE), of 2019 indicates: “4DX – Be in the movie / Providing a revolutionary cinematic experience which stimulates all five senses, the 4DX includes high-tech motion seats and special effects including wind, fog, lightning, bubbles, water, rain and scents, in both 2D and 3D formats. These effects work in perfect synchronicity with the action on screen – creating the most unmissable and exhilarating cinematic experience yet.”⁴⁷ This cinematic mode of multisensory immersion, though, remains in its receptive synchronicity below the level of the one described by Huxley, as it does not provide the audience with sensations of the on-screen characters that are being directly transmitted to the nervous system. More significantly, it rather points backwards, towards the mutual origins of panorama, cinema, and roller-coaster-rides in American and British entertainment parks,⁴⁸ of which it is a synthesis⁴⁹ - a parallel development that Huxley was well aware of through his studies of British Edwardian leisure culture.⁵⁰

Hugo d’Alési, *The Maréorama*, Exposition Universelle, Paris (1900)

Hugo d’Alési’s *Maréorama*, for instance, shown at the Exposition Universelle in Paris, was a ship-shaped multisensory motion panorama (“panorama a tableaux mobiles”) that simulated a Mediterranean sea-voyage on a steamboat (Figures 4. A; b). D’Alési had painted its main geographical destinations on a scenic panorama canvas (one kilometre long and 15 meters high) that rested upon two mechanical cylinders, rotating at a determined speed. According to Barbosa, up to 1.500 people stood on the platforms of the upper and lower deck, which could be hydraulically moved to reproduce the motion of sea-waves, while the spectators were watching the Mediterranean coastal landscapes passing by. Its inventor described the special effects created by his device:

[...] the fine arts are represented in this work as a colossal bet, as something of a truly new order [...] Why should we mention painting, music or even dancing, individually? This is, in fact, a holistic work of art aimed at seducing through the three most subtle senses; we haven’t forgotten the smells, which in our synthesis evoke the sea breeze of Eastern perfumes. We shall witness a sunset and the beginning of a new day, nocturnal effects and an electric and thunderous storm.

(d’Alési, “Exposé d’un projet de panorama mobile dit Maréorama,”

(1895), Breveté S. G.

D. G. Archives Nationales. Paris, Catalog no. F/12/4355, in Barbosa

(2015), *The 1900 World’s Fair*, 46)

A ship crew, dancers, and an orchestra flanked the multisensory scenario in which the audience itself naturally assumed the roles of actor-passengers.⁵¹

CONCLUSION:

Huxley's anticipation of future multisensory cinematic immersion is firmly deduced from the historical and most recent technological development of entertainment landscapes and in the movie industry between the late 19th century and 1930. The conjunction between 'body/mind', 'machine', and the cinema, with regard to immersive experiences of a "dream-like quality,"⁵² had been occupying his writings since the 1920s. Most significantly, in an account of his travels through India and Burma, he compares his experience of contemplating the Rajasthan landscape from within a train-waggon to being absorbed by a movie, and ultimately to the intake of drugs:

Sitting relaxed in the machine I stare at the slowly shifting distances, the hurrying fields and trees, the wildly fugitive details of the immediate hedgerow. Plane before plane, the successive accelerations merge into a vertiginous counterpoint of movements. In a little while I am dizzied into a kind of trance. Timelessly in the passivity almost of sleep, I contemplate a spectacle that has taken on the quality, at once unreal and vivid, of a dream. At rest, I have an illusion of activity. Profoundly solitary, I sit in the midst of a phantasmagoria. I have never taken the Indian hemp, but from the depth of my trance of speed I can divine sympathetically what must be the pleasures of the hashish smoker, or the eater of bhang. Much less completely, but satisfyingly enough, the movies have power to induce in me a similar trance. Shutting my mind to the story I can concentrate on the disembodied movement of light and shadow on the screen, until something that at last resembles that delicious hypnotism of speed descends upon me and I slide into that waking sleep of the soul, from which it is such a cruel agony to be awakened once again into time and the necessity of action.

("India and Burma," in *Jesting Pilate* (1926), 454-55)

Starting with the Lumière Brothers' *L'Arrivée d'un train en gare de la Ciotat* (1895), the train played an eminent role in the immersive history of early cinema (with either inwards or outwards movement along the depth axis of the image). The speed rush of motion that Huxley considered to be core-characteristic for the age in which he was writing is comparable to the impact of drugs on mind and body. The cinema, the train, and drugs prove to be all transitional media of an equally strong immersive extent. Huxley's juxtaposition of vehicle and "cinema" implies an ideal of immersive *presence* that can only be achieved once the spectator is being seated *inside* the image itself: "I

sit in the midst of a phantasmagoria.” The element of immersion does here evoke the effects triggered by the simulation rides around 1900 that were situated on panoramic vehicle stages: Multiple layers of moving objects and scrolled paintings, unfolding at different levels of speed, provided the audience with an illusive perspective of motion and depth.⁵³ Whereas the spectator’s body was interactively engaged in the augmented environment of the *Maréorama*, it is significantly less active in the cases of the *Sensorama* and the contemporary 4DX cinemas. To all of the modes of mediated multisensory immersion discussed above, physical and therewith optical distance are conditional, as Metz indicates, for a conscious reflection of the synthetic narrative sphere within which the spectator is temporarily present.⁵⁴ The scarcest of distances possible for an individual audience Huxley had described in 1937, by referencing the most recent future forecast of an American biologist: “micro-cinematographs which they can slip on like spectacles.”⁵⁵ The notion of total immersion, however, could in the near future be by definition *immediate*, having little to do with optics, the screen, or cinema itself, but with the inclusive digital human body.

SUCH SHADENDENFREUDE – UNPACKING THE TELEVISUALITY OF HUMOR AND POLITICS *IN VEEP*

Abstract | In recognition of the topic's general terms, this paper will discuss the intersection of humor and politics from a media perspective, particularly through the lens of television aesthetics. It will focus on the genre of political satire in film and television and identifies the popular and critically acclaimed television series *Veep* (HBO, 2012 – present) as a programme which exemplifies the expression and underlying values of a contemporary strain of aesthetic sensibility – *schadenfreude* – that runs through its axes of coarse disempowering humor and the perception of power. Specifically, the paper will explore the various aesthetic attributes that contribute to *Veep*'s affective reception, from its ribald characterization of the corridors of political power in the US to the exacting physical comedy of its lead actress Julia Louis Dreyfuss. Moreover, it will examine how the series' success results from humorously overlapping some of the more problematic aspects that persists in the political landscape, namely, self-interest, ineptitude and public performance.

As its reflective starting point, this paper begins by first interrogating the significance of humor and politics in film and television. The first section of the paper will briefly trace key historical instantiations of political satire, understood as a genre that humorously sensationalizes the shortcomings, aspirations, dissonances and imbedded social structures of a prevailing political milieu. The second section will then elaborate on the novelty of *Veep* within this genealogy by highlighting its gendered position as the first comedic fictional television programme of a woman in the White House and then examining the philosophical foundations of the programme's mode of satire as premised by the concept of *schadenfreude* and rendered legible by a postfeminist ideology. The third section will then use the close textual analysis of salient and relevant narrative events to show how this satirical modality is useful for making political topics pleasurable, entertaining, or otherwise palatable to viewers whose normative experience of politics is frequently negative. The fourth and final section will consider the 'real world' implications of political satire, from the criticism of political corruption and hypocrisy as a social commentary on controversial political perspectives and issues to the potentially dangerous normalization of unstable and insalubrious political personas and viewpoints.

Index terms | *humour; political satire; postfeminism; schadenfreude; television aesthetics; Veep*

INTRODUCTION

Having lobbied tirelessly for a recount in Nevada to solidify her residency of the White House, crass president-by-default Selina Meyer of *Veep* (HBO, 2012 – present) finds herself winning the popular vote in the US presidential elections but ultimately losing to her opponent, the winsome Laura Montez. Her electoral legacy dashed, her defeat is compounded by the fact that she is beaten by another woman whose genuinely sweet and shrewdness of character contrasts so sharply with her acerbic and ineffectual managerial style. Yet we cannot help but laugh when, in a cruel twist of fate, Montez is also awarded the Nobel Peace Prize for freeing Tibet, a political event Selina herself manoeuvred.

Such sentiment is not uncommon. Though the specific circumstances themselves vary, pleasure at the misfortune of others is something we all indulge in. This is even more pronounced when the butt of the joke happens to be someone whom we don't find particularly likeable or whose opinions, beliefs or actions we disagree with. When the figure is a prominent and political one, the fall from grace – even if only temporary – assumes almost mythic proportions of satisfaction as the chastened one is stripped of their lofty patina of infallibility and reduced to their most vulnerable humanity. While such scenes are privately played out the world over amongst intimates *ad infinitum*, this paper will explore media instantiations of this decidedly disdainful sensibility.

I will suggest that the enactment of derisive sentiment regarding the governing political body, institutions or figures therein has become commonplace because criticism of their competence, necessity or tradition is exempt from ameliorative practical discourse or radical reconstructive agency. Thus, contemporary satirical narratives become a pathetic proxy for the popular expression of discontent, with creative producers (showrunners, actors, cinematographers, etc.) acting as collaborating avatars for the sustained sublimation of frustrated thoughts and feelings. As a cognitive process, schadenfreude actuates political satire via a discounting mechanism whereby our perceived impotence is counteracted by a performative aesthetic inversion of the political milieu that crystallises into satirical television programmes as alternative potentialities.

BRIEF HISTORY OF POLITICAL SATIRE

Derived from the from Latin *satura lanx* for 'medley or dish of colourful fruits',¹ satire is comprehended as a didactic rhetorical (and moral) device that primarily uses the techniques of hyperbole, ridicule, irony, and derision to draw attention to and criticise prevailing socio-cultural shortcomings or individual follies and abuses of power (Elliot, 2004). Satire has been around since antiquity; from the sarcastic *Satire of the Trades* (c. 1700 BC) out of Ancient Egypt to the epicurean *Satyricon* (c. 50) by Gaius Petronius in Ancient Rome to Chaucer's sardonic *The Canterbury Tales* (1387), satire became defined as a narrative mode of exaggerated parodic commentary expressed at the expense of the powerful to effect some change in its recipients.

By the 20th century, satire had become popular in the media, performance and the graphic arts as an artistic license to challenge political hypocrisy and institutional malfeasance without the existential threat of sedition or treason and the accompanying lengthy prison sentences that such charges would entail. As a memetic genre, satire has proven to be problematically promiscuous as it hybridises whatever form it assimilates to produce a complex of 'inquiry and provocation, play and display' (Griffin, 1994: 4)

that entertains as well as edifies. Since popular political satire can vary wildly in theme, it is helpful to conceive of it as bound between tonal extremities on a continuum: *horatian* (which deploys humour to mimic comedy and illicit optimistic laughter) and *juvenalian* (which uses critique in mimesis of tragedy to illicit pessimistic indignation) (Simpson, 2003). This operational characterisation has been translated into film. Arguably, the most critically acclaimed and popular political satire of the 20th century – *Dr. Strangelove* (Kubrick, 1963) – was surreptitiously shot as such since director Stanley Kubrick could not escape the persistent comedic overtones of the prevailing political calamities (Kagan, 1989).

In the 21st century, the British political satire *In the Loop* (2009, Iannucci) follows in the horatian vein with its portrayal of ‘the bumbling, mendacity and self-hating subservience’ (Bradshaw, 2009: 1) of the British political class. A docufiction filmed in *cinéma vérité* style, its key narrative features – rapid-fire insults, offensive obscenities and a procession of unrelentingly self-serving characters – pointedly articulate the inherently counterproductive ‘pettiness of democratic governance impelled by careerism, vanity and moral compromise’ (Scott, 2009: 3). Its camera motion is deliberately jerky and inelegant to cast the blithely insouciant world of politics as dirty, deceitful and down-right dangerous to the citizens it is supposedly beholden to.

Juvenalian satire does exist, but has been mostly relegated to television shows that have the luxury of time to develop the complexion of their satirical signature.² ‘Real’ programmes like *The Daily Show* and *Saturday Night Live* must carefully straddle the intersection of entertainment, legal liability and bitter, open-faced contempt given the litigious reactions of their invariably thin-skinned targets. Cue UK’s feeble response to EU Commission president Donald Tusk’s comment about a ‘special place in hell’ for unprepared Brexiters fulminating not because the sentiment was false but because his critique was unhelpful to negotiations (Schaart, 2019).

COMPREHENDING SCHADENFREUDE

The term *schadenfreude* is a borrowing from the German compound *Schaden* ‘misfortune or damage’ and *Freude* ‘joy,’ first attested to in the satirical *Biblia Parellelo Harmonico Exegetica* (Mattai, 1742)³ and again in Goethe’s *Wilhelm Meisters Lehrjahre* (1795). In these texts, *schadenfreude* is understood as ‘malicious enjoyment derived from observing someone else’s misfortune’ (OED), though it did not enter the English lexicon until 1852 in the philological treatise *Study of Words* (Trench). *Schadenfreude* has a rarely uttered direct English equivalent – *epicaricacy* – which is attested to by Aristotle but only first appears in English in 20th century from the Greek compound *ἐπιχαίρεκακία* (*epichairekakia*), from *ἐπί* *epi* ‘upon,’ *χαρά* *chara* ‘joy’ and *κακόν* *kakon* ‘evil’ (Novobatsky and Shea, 2001).

The philosophical underpinnings of *schadenfreude* are as unsavoury as its definition suggests. Trench first lamented that *schadenfreude* ‘reflects a degraded moral interiority’ (Hu, 2011) and indeed, the compound word represents a metaphysical ontology that is as negative and it is universal. Extant research suggests the predisposition of low self-esteem increases the experience of *schadenfreude* when mediated by a high-achiever and attenuated by the opportunity to self-affirm ones beliefs and views (Dijk et al, 2011). However, a mirthful mood, feelings of strong intergroup identification and the persuaded exclusion of outliers (Cinka, 2015), envy (Smith et al, 1996) and a complex sense of justice entailing subjective concepts of deservingness, hypocrisy, and positive self-evaluation (Dijk and Ouwerkerk, 2014) complicate the experience of

schadenfreude.

VEEP

One current political satire on television that demonstrates that the values of schadenfreude are alive and active in political satire. *Veep* (HBO, 2011 – present) is an American television series Judd Apatow developed as an adaptation of his British sitcom *The Thick of It* (BBC, 2005 – 2012). It stars Julia Louis-Dreyfus as vice president (and later president) of the United States Selina Meyer.⁴ The series follows Selina and her staff as they try to navigate the political system without getting entangled in the brinkmanship of the US government.

Perhaps the most salient feature of *Veep* that contributes to its critical reception is its acidic and vulgar writing style. Apatow, whose point of view was informed by his extensive research on erstwhile president Lyndon Johnson, remarks that ‘once he becomes VP, he’s sort of sitting in his office waiting for a phone call. That’s what makes the vice presidency interesting from a comedy point of view’ (Blake, 2012: 11). These combine to create early Selina as a character who spends most episodes waiting around to speak to the President and an eschewing of the traditional joke format to condense as many crude insults as possible to her colleagues and underlings into thirty minutes.

Veep mockingly satirises the desire of the American populace to believe that they still live in a democracy and that the ‘American Dream’ – the idea that through hard work and perseverance, equality of opportunity to prosper and pursue their own happiness – is still a realistic proposition. Even despite the inconvenient facts of unequal wealth distribution, corporate welfare and personhood, disenfranchisement, election buyouts and systemic discrimination. But why do they believe this? Selina says ‘you know why? Because they’re ignorant and they’re dumb as shit. And that, ladies and gentlemen, is democracy.’

Protagonist Selina is especially engaging because she convincingly assumes the mantle of the antiheroine. Being disgusted by the working class, baldly unethical and unapologetically narcissistic makes her extremely unlikeable but also supremely entertaining to watch because we are not used to seeing a woman in a such a powerful position who repeatedly fails due to her poor judgement without it being considered representative of actual female leadership. Selina is obsessed with consolidating power and advancing her own career to the detriment of everyone else and she is not above resorting to corruption to achieve her ambitions to control public perception and establish her legacy.

Because she is so opportunistic, Selina is not above using her sexuality against her opponents, making all sorts of unsavoury deals (e.g. assuaging the oil lobby to get her clean environment initiative passed) or leveraging her connections and wealth to exempt her from responsibility for actions that would have us ‘normal’ people thrown in jail. As such, Selina is not a product of her gender, nor are female leaders portrayed as incompetent due to their femaleness. Female characters within the *Veep* storyworld are afforded the same opportunities as men. They can be corrupt, indifferent, calculating or noble; their gender does not determine their path in life or in politics. Instead they are rendered as multifaceted and interesting people.

DISCUSSION

Veep is therefore significant for a medley of reasons. In the first instance, the show may be considered historical because it is the first comedic television portrayal of a female US president. It is necessary to qualify both comedic and television because there have been other female presidents in television dramas (*House of Cards* (2011-2018), *Commander in Chief* (ABC, 2005-2006) and *Quantico* (CBS, 2015-2018), to name a few) and there have been two female presidents in comedic films – *Mars Attacks!* (Tim Burton, 1996) and *Mafia!* (Jim Abrams, 1998). What is most interesting is in all these cases, either the programme is short-lived (one season) once the woman becomes POTUS or is simply considered a commercial or ratings failure by the production company. It is only with *Veep* that we get a sustained, entertaining and commercially viable lead female protagonist who is as comic as she is believable, and which is rendered legible by a postfeminist ideology that no longer conceives of occupations in terms of traditional gender roles but merely one's ability (or lack thereof in *Veep*) to perform its functions.

Further we may say that our reading of *Veep* is premised on a novel aesthetic conceit of claustrophobic intimacy in as much as the show only has one main character. Moreover, dialogue generally occurs in whispers, hushed tones, close-ups and oblique medium shots and usually in the walk and talk exposition technique that emphasises its proximate and frenetic pacing. The theme 'going around in circles' is played out throughout the series to exemplify that people don't change even when it would be 'good' for them and takes a 'dim view of government, depicting it as a place where nothing, but nothing gets done, or can get done...because of the incessant interruptions from the people, and the media that the government is governing' (Jackson and Ferris, 2018: 9).

Since caustic and offensive insults from Selina are so common throughout the show, the style can be described as a fast-paced layered satire steeped in realism and topped with heaving dollop of farce. It arcs at least three incidental plots simultaneously, effectively leaving the audience with barely any time to catch their breath let alone become distracted. Indeed, one of the wittiest aspects of *Veep*'s writing is that in exacting revenge on the incompetent political powers that be, it also takes aim at an enabling public (i.e. viewers) that repeatedly fails to hold our elected officials into account for undoubtedly stupid and lazy reasons. So while its uncertain whether we as viewers get all the jokes, it is guaranteed that *Veep* is always taking the piss out of us.

CONCLUSION

When *Veep* first aired in 2012 we were initially afforded the chance to laugh at the inane workings and missteps of a warped version of the American body politic with a casual and dismissive cheekiness. The show was funny because things couldn't really that bad in Washington, so it was ok to laugh at the foibles of the characters who were running the country. Yet, since the election of Donald Trump in 2016, the shambolic policies and behaviours of the government are displayed daily. We never know what rambling tweet will next come from a president who appears to be as out of touch with reality as one can be without be declared legally insane. In this current state of affairs, *Veep* simultaneously functions as parody since the president and his administration have made it difficult to differentiate reality from fiction. This raises an existential question: what becomes of political satire when the real world situation it is based on is no longer funny? Tragic events such as ripping children from their parents and

throwing them in cages, comfortably consorting with murderous authoritarian regimes or referring to neo-nazis as ‘good people’ exempt themselves from humour for all but the most cruellest and soulless persons. Perhaps it is no surprise then that that *Veep* has decided its next season will be its last as it cannot sustain its fictional conceit in such a fraught political climate.

Although other stylistic elements compound it’s affectivity, *Veep* works because it fuses the comedy of horatian satire with the overt criticism of juvenelian satire as a hybrid genre that uses sardonic self-reflexivity to tap into and reflect the national mood. While its cynical tone and political commentary entails generous farce, its dependence on form and structure rather than plot, renders *Veep* as a menippean satire that mixes distinct comedic traditions, embodies America’s venal political cluelessness and compels us to seriously question the political milieu. Perhaps more importantly, it shows that good jokes have a punchline but the best jokes have us as the punchline.

1 There has been considerable etymological debate as to whether satire is derived from the Roman *satyr*, causing a great deal of confusion and leading Elliott to observe '*satura* (which had had no verbal, adverbial, or adjectival forms) was immediately broadened by appropriation from the Greek *satyros* and its derivatives. The odd result is that the English satire comes from the Latin *satura*; but *satirize*, *satiric*, etc., are of Greek origin. By about the 4th century AD the writer of satires came to be known as *satyricus*; St. Jerome, for example, was called by one of his enemies 'a satirist in prose' (*'satyricus scriptor in prosa'*). Subsequent orthographic modifications obscured the Latin origin of the word satire: *satura* becomes *satyra*, and in England, by the 16th century, it was written 'satyre' (2004: 1).

2 Juvenalian films are much rarer given the rhetorical skill needed to pull them off. Noteworthy (but not necessarily commercially successful) examples include *Animal Farm* (Stephenson, 1999) and *1984* (Radford, 1984), both adaptations of George Orwell's or Kubrick's *A Clockwork Orange* (1971).

3 Full title: *Biblia Parallelo-Harmonico-Exegetica, that is: the whole Holy Scriptures Old and New Testament, which agree with themselves, and self-explanatory: After the most accurate examples of the German translation of Blessed D. Martin Luther, With its prefaces and marginal notes, Further With correct divisions of each book and chapter, also short biographies of each Biblical Scripture, Especially with printed parallels and instruction Their harmony and agreement, more clearly Indication of the examples of Christ, many uses, including the chronology, description of the countries and cities, their people and their families, also some to explain the salvation.*

4 While I would love to say that my own taste is sufficient justification to include *Veep* here, in fact the show is immensely successful, having been nominated six years in a row for the Primetime Emmy Award for Outstanding Comedy Series, winning the award for its fourth, fifth, and sixth seasons. A long-standing comedic veteran especially known for her work on *Seinfeld* (NBC, 1989 – 1998), lead actress Louis-Dreyfuss has won a record-breaking six consecutive Primetime Emmy Awards (that's one for every year since the programme debuted, three Screen Actors Guild Awards, two Critics' Choice Television Awards, a Television Critics Association Award, and five consecutive Golden Globe nominations. Moreover, in 2018 she received America's highest comedy honour, the Mark Twain Prize for American Humor.

AESTHETICS OF NEW MEDIA AND CONTEMPORARY EDUCATIONAL PRACTICES

Abstract | In this paper, the author investigates a possible role of new media in contemporary educational practises. One of the main questions of the work regards how the aesthetic experience of new media, in terms of Aisthēsis, can help in reforming the process of learning and education in the contemporary world. That question is raised considering the impact of new media on sensuality and perception of the modern man. Taking into account Walter Benjamin's and Marshall McLuhan's theses on how new media influences our experience of the world, the author proposes that the perception and experience have a historical nature. Bearing in mind this historical aspect of perception, the author raises the question whether contemporary concepts of teaching, learning and education in general take into account the impact of new media on perception and how it has changed our everyday experience compared to forms of experience in previous epochs. Forasmuch as we take a look at works of Sir Ken Robinson, the answer to the previous question is negative. As Sir Ken Robinson argues, the contemporary education system is based, structured and shaped in accordance with the leading ideas of the 18th century Enlightenment. Therefore, education practices today are outdated and out of touch with contemporary changes in perception brought by new media which results in indifference and boredom in classrooms. In order to understand what phenomenon of boredom is, the author investigates work of 18th century philosopher Jean-Baptiste Du-bos who argues that the sensation of boredom comes from inactivity of one's mind. According to Du-bos, an effective way to overcome this state of boredom is through aesthetic experience. Bearing in mind the previously mentioned Dubos' thesis, the author argues why and how new media can be used to improve contemporary education and what aspects of presently outdated practices should be radically changed.

Aisthēsis and Education

Our main thesis in this paper is that the sensual experience of a contemporary man differs in a radical way from the experience of people from previous epochs. The essential reason for this radical change in perception is the presence of contemporary mass media – the mass media is not only the dominant source of information, but, as we strive to show, they also change the way in which the contemporary form of experience is organized. In view of the undeniable influence of contemporary media on the human sensory apparatus, in this paper we will try to point out the problems and inconsistencies of contemporary educational practices which are not up to date with the mode of experience of contemporary man. In order to prove this claim, we will refer to several insights made by Walter Benjamin and Marshall McLuhan about the problems of ordinary experience in contemporary world as well as to their claims

regarding the way in which the contemporary mass media form this experience.

As Benjamin states: “The manner in which human sense perception is organized, the medium in which it is accomplished, is determined not only by nature but by historical circumstances as well.”¹ Thus, man’s organization of the external world has a reciprocal effect on their perception, which means that the perception is nothing more than the product of the historical movement of mankind. Therefore, the understanding of the nature of what the Greeks called the *aisthēsis* implies thinking in variable and dynamic categories. The ultimate outcome of this Benjamin’s thesis is that the contemporary man has a different form of experience than people from previous epochs.

Similar to Benjamin, McLuhan also starts out from the assumption that man’s interaction with the outside world has a reciprocal effect on their sensory apparatus by transforming the way they perceive the world around them. However, unlike Benjamin, who mainly deals with the contemporary form of experience, McLuhan recognizes the dominant periods in human history marked with four vastly different forms of man’s experience of the outside world. The first period relates to oral cultures, the second to the emergence of phonetic alphabet and the scribal tradition; the third period concerns Gutenberg’s revolutionary discovery of the printing press in the fifteenth century, and the last period relates to the public and widespread use of electricity in the form of lightbulbs and other inventions at the end of the nineteenth century.² By marking the difference between the experience of a man from the time of Gutenberg’s revolution - the time in which, as we will see, the foundations of the modern educational practices are being established - and the contemporary individual we will be able to understand more clearly why today’s educational process can be considered obsolete.

The significance of the famous McLuhan’s view that “the medium is the message”³ is reflected in a specific understanding of what the media actually are. Namely, according to McLuhan, the media should not be understood only as the means of transmitting information, but rather as information or the message itself. In other words, the way in which something is done is far more fundamental than what it was intended to achieve - the form in which the message *is* essentially transforms its meaning. Consequently, the transition from old media to new ones is not merely a quantitative, but a qualitative change in the flow of information - it is not that the discovery of various inventions simply *improves* the way in which we encounter the world around us; it’s rather that those inventions, in essence, transform our everyday experience of the outside world.

Bearing the thesis about perception in mind, we should investigate whether today’s educational practices, including all levels of education, conform to contemporary forms of experience. Namely, if we look at the *Great Didactic* of John Amos Comenius, we can notice that many principles of contemporary education come from the seventeenth century. The frontal form of teaching, classes taking place on a regular basis, the use of adequate textbooks and other established practices⁴ are ideas that come from the *Great Didactic*, which originated several centuries before the emergence of contemporary media and their impact on perception.

In a lecture in 2008, called *Changing Paradigms*, Sir Ken Robinson noted that the modern education system is based, structured and shaped in accordance with leading ideas from the Age of Enlightenment.⁵ There have been no radical changes in the way in which the educational process was realized since the emergence of the

public education system in the mid-eighteenth century to this day. In other words, the way in which people of Enlightenment understood the nature of human knowledge and the cognition, as well as how they conceptualized the human nature, remained within present educational practices.

The final outcome of this state of contemporary educational practices, according to Sir Ken Robinson, is reflected in the lack of motivation for studying among the students.⁶ The reasons behind this loss of motivation for learning are numerous. Today, unlike previous times, finishing a degree and receiving vocational education does not mean that one will actually get an adequate job; the inclination of children towards artistic work or humanities is suppressed due to the economic need for technical knowledge, which many students fail to master. After all, the environment in which teaching takes place today is largely outdated in comparison with the world outside of school which leads to the fact that the process of education and teaching is often characterized as boring by students.

Later in his presentation, Sir Ken Robinson examines the possibility of changes in educational practices that would support creativity, divergent thinking as well as enable the development of individual preferences among students. Although these issues are undoubtedly important, the primary concern for us in this paper is whether it is possible, with the help of new media, to reform teaching in such a way that it keeps up with the new contemporary mode of experience. More precisely, the question that we intend to ask is whether it is possible to transform teaching so that education can occupy attention and animate the pupils' sensuality or, in other words, we would like to ask if, with the help of new media, students can be freed of the state of boredom in the classrooms.

Phenomenon of Boredom

In an effort to understand the phenomenon of boredom and, therefore, the possibility of its elimination from contemporary educational practices, we shall consider the work of Enlightenment philosopher Jean-Baptiste Du-Bos - *Critical Reflection on Poetry, Painting and Music* - in which the phenomenon of boredom is understood through the aesthetic experience. At the very beginning of the aforementioned work, Du-Bos states: "The soul has its wants no less than the body; and one of the greatest wants of man is to have his mind incessantly occupied. The heaviness which quickly attends the inactivity of the mind is a situation so very disagreeable to man, that he frequently chooses to expose himself to the most painful exercises rather than be troubled with it."⁷

According to Du-Bos, the core of aesthetic experience is not determined exclusively by pleasant affects, such as the sense of the beauty, but also by the experience of terrible and others, at first sight, quite unpleasant feelings as well. The primary effect of aesthetic experience is to avoid the state of boredom, or inactivity of the spirit. Hence, the function of art as a prominent place of aesthetic experience is not in the formation of a moral character, nor in showing the truth in a sensual form, nor in the experience of beauty.⁸ The essential reason why people visit theaters or come into contact with other forms of art is primarily entertainment, that is, avoidance of inactive state of spirit or the state of boredom.⁹ This formal and hedonistic theory of aesthetic experience opens the space to properly include an extremely wide spectrum of various phenomena. In other words, the main criterion for determining aesthetic experience, which then involves the experience of the artwork, is animating the human senses or

preserving the spirit in the active state.

However, aesthetic experience is not solely related to the work of art. As Du-Bos notices, in order to avoid inactivity of the spirit, people are ready to attend even the most horrible forms of spectacle, such as public executions, which were often present in his time.¹⁰ Therefore, as much as the state of inactivity of the spirit or boredom is unpleasant and almost unbearable, so much the need for aesthetic experience is almost as necessary.

What makes Du-Bos' theory of aesthetic experience still relevant is its historical flexibility. Bearing in mind that Du-Bos does not determine the nature of the objects that cause aesthetic experience but rather their function, his theory can be historically contextualized. More precisely, the changed mode of experience of the contemporary man, as discussed in the preceding chapter, is not in contradiction with Du-Bos' theory of aesthetic experience; moreover, if we appropriate these Du-bos' theses, they will enable us to understand why contemporary media has an important role in animating human senses, as well as the importance of their application in contemporary educational practices, which will be discussed in the next chapter.

Contemporary media and education

Basics characteristics of a man from the aforementioned Gutenberg revolution period are linear observation and linear thinking. Much of the credit for this kind of world experience goes to the book, which became dominant medium after the discovery of the printing press. Namely, the book is structured so that it has a beginning and an end, separated into sequences in the form of a chapters and must be accessed in a linear manner, that is, it must be read from the beginning to the end. The linear pattern that underlies this experience has expanded and reflected on many other people's activities¹¹ that have nothing to do with reading, such as road construction, hierarchical organization of institutions, designing classifications, and understanding man's self as something temporally determined which has the beginning and an end.

The emergence of new media at the end of the nineteenth century has also led to a transformation from linear to nonlinear forms of thinking and ways of perception. Television, the Internet, electronic advertisements and other mass media shape the way of everyday experience of the contemporary man. While the book as a medium is determined by sequences and linearity, that which determines contemporary media is discontinuity, simultaneity, tactility, mosaicism.¹² As McLuhan states: "The lineal process has been pushed out of industry, not only in management and production, but in entertainment, as well. It is the new mosaic form of the TV image that has replaced the Gutenberg structural assumptions."¹³

So, bearing in mind all the above mentioned changes in the way how the contemporary man experiences the world, which are enabled by the discovery of new media, we should now consider whether the educational process is adapted to these changes. Namely, if we look at the usual practices of the contemporary way of teaching we will notice that the dominant medium in the educational process is the book. Books and textbooks represent an almost indispensable teaching tool at all levels of education, which is a practice that, as we have seen before, dates back to the 17th century and the *Great Didactic* of John Amos Comenius. Unlike the rest of everyday life that is filled with new audiovisual media, students in schools are in a significantly different environment. As McLuhan observes, when entering school, students get into

a state of confusion due to an outdated organization typical of the school environment, in which they receive scant information that is structured and arranged in fragmentary patterns within different school subjects.¹⁴ Accordingly, today's students can be marked almost as amphibious beings - on the one hand, they are the inhabitants of the world of everyday life, filled with television, the Internet, mobile phones and other audiovisual media; however, on the other hand, a large part of their time is filled with obsolete school environment containing linear patterns of experience which belong to outdated educational practices.

The aforementioned Sir Ken Robinson's insights about the lack of interest of contemporary students now has become far clearer. Namely, at a time when human sensitivity in everyday life is animated by numerous audiovisual impressions, the process of book reading and usual frontal teaching technique quite understandably put the students in a state of boredom on almost all levels of education. Therefore, we should ask the question how this problem can be solved.

If we look back at concept of boredom of Jean-Baptiste Du-Bos, we can see that it can be overcome by adequate aesthetic experience. However, the most dominant forms of entertainment as well as the most prominent place of aesthetic experience today are no longer the theaters or museums, nor the reception of other arts, as was the case in the eighteenth century. Rather, it's spending time in the presence of contemporary media and consumption of popular culture through television, using mobile phones, exploring the Internet and other ways of using new technological devices. Accordingly, we propose leaving behind the book as the dominant educational medium and incorporating other, more recent audiovisual inventions into the teaching process. Through this, students' alertness during teaching would be preserved through aesthetic resources, which would contribute to learning efficiency.

If we accept the aforementioned solution, it may at first glance seem that the quality of education will drop. More precisely, there is a question of how can we use new media for materials that simply require a written form. However, reducing the use of books in the teaching process does not imply reduction of reading practices. In other words, the reading process and the use of the book as a reading medium are not inextricably linked. If we look at the way in which we get information on the Internet in everyday life, we can easily notice that it happens through the process of reading different sources about the examined subject with simultaneously opened tabs in the browser or by using the so-called hyperlinks, through which we rhizomatically expand our knowledge of various subjects. Therefore, the linear reading model of the book is abandoned in favor of non-linear and discontinuous reading through the Internet browser. Therefore, this mosaic form of the written word, which is applied in the daily activities of the contemporary man, could also find its application in classrooms, and thus could lead to the necessary changes in contemporary educational practices.

**CONCRETE, RITUAL AND PHILOSOPHICAL PRAXIS ACCORDING TO NATALIE DEPRAZ
(BY THE EXAMPLE OF THE FILM BY ANDRZEJ ŻUŁAWSKI SZAMANKA)**

Abstract | The paper proposal is concentrated on the notion of concrete and philosophical practice in its ancient meaning in the reference to aesthetics. I conduct research about the nature of the aesthetic phenomenon in the contemporary French phenomenology. In the paper I present the results of my analysis of the philosophical works by Natalie Depraz. The notion of concrete is considered as a way of the manifestation of the phenomena in the alive aesthetic practice. I raise a question on how the aisthesis understood in its wide sense. It is reviewed that the concrete is not only something material and empirical but it also transcends its own concreteness and saturates the view. According to Depraz the phenomenology of the aesthetic pleasure is a point converging other practical experiences. In my preparatory researches I have analyzed the concept of the hyper-esthesia that implied the sensual ability which comes up to the limits. I confront this experience with our necessity to ritualize the life. This relation, which is based upon the history, fiction, aesthetic practice, sexual sensuality and ritual is depicted in the film by Andrzej Żuławski Szamanka. The intimacy of the feeling in this case does not have any common features with the art for the art's sake. I investigate the connection of the philosophical practice and the theory on the example of the visual practice of the cinema as a modern ritualized medium. It also reflects the question of the transcendental empiricism according to Depraz in relation to the experiences of a child, madman, animal and foreigner. All these figures acting on the archetypical level are presented in the film by Żuławski. At the same time they are mixed in the consciousness of shaman. I research in what way they form and modify the aesthetic experience. The main goal of the paper is to adapt the notion of philosophical praxis to the aesthetics, understood as a changing philosophical practice. The meaning of the paper relies on the examination of the contemporary aesthetics as a ritualized practice. Cinema, as one of the media, reveals the possibilities of the visual kinesthetic art; opens the dialogue of the philosophy and the anthropology. The proposition seems to be effective in relation to the phenomenology. It explains its desire to reach the sources and authentic experience, which fascinate the modern man to create a new ritual.

Index terms | *Aesthetic experience, concrete, philosophical practice, ritual, transcendental empiricism, visual arts*

The philosophical proposition of Natalie Depraz is an original scientific project which ensures a balance with the ambiguity of contexts involved in this courageous attempt to reinterpret the principles of classical phenomenology. On the one hand, the researcher makes very precise references to Edmund Husserl, while putting forward a different approach at the same time. I will consider what Depraz had in mind when pointing out *concrete practice*. From the perspective of aesthetics, the film by Andrzej Żuławski *Szamanka (The Shaman, 1995)* is a vivid example of the concrete *praxis* which ritualizes our life. This intervention will focus upon the contemporary aspects of the ritual as an individual and social practice. It is also necessary to clarify the meaning of transcendental empiricism according to the aesthetic attitude and whether the concrete experience appears as merely something material, empirical or if it overcomes its own concreteness. Depraz presents her own comprehension of phenomenological practice in the chapter forming a part of *On Becoming Aware* written in cooperation with Francisco Varela and Pierre Vermersch:

What is first required of an experience whose description is phenomenological is something which is both simple and restrictive: in conformity with the need to concretely re-activate any such singular experience and not to be satisfied with merely talking about it, no statement must ever be pronounced whose content is not sustained by an *effective practice*¹.

The claim appearing here seems to form a paradoxical alliance based upon phenomenology and pragmatism. Upon first impression, there is a further complication in such a stance. Nonetheless, this proposition deals with an important “challenge” (as Depraz calls it) which enriches phenomenology with the singularity of experience. In this way, the concrete experience could present a challenge between singular experience and the “eidetics reviewed by the constitutive power of the exemplary fact, that is to say, freed from any idealising slag”². Perhaps the dynamics of this challenge may be captured on the example of aesthetics in its primary sensual meaning. However, it is necessary to focus attention on other works of Depraz where aesthetic notions are presented among different contexts and practices.

With such a strategy, the books of Natalie Depraz *Comprendre la phénoménologie : une pratique concrète* (2006) *Lucidité du corps : De l’empirisme transcendantal en phénoménologie* (2001) are quite relevant to describe the principles of sensual experience. Both studies have been written in different scientific styles. *Comprendre la phénoménologie* breaks down various conceptions of the practice and deals with proper phenomenological interpretation of the history of philosophy. By virtue of these ideas, Depraz constructs a unique collage. Indeed, *Lucidité du corps* is more conceptualized. The concept of the *hyper-esthesia* (in French *hyper-esthésie*) is of paramount significance as the sensual ability to feel which goes far beyond any limits. Thus, the phenomenology of aesthetic pleasure forms a point of convergence for other types of experiences. It is revealed as something similar to a texture interweaved with multiples trends³.

At the beginning of *Comprendre la phénoménologie*, the philosopher claims that contemporary phenomenology must be carried on “against Husserl of Husserl himself”⁴, but at the same time against the continuers of Husserl. In this way, the term *post-phenomenology* could be accepted to establish another type of research in spite of traditional phenomenology. This concept is suggested by François Sebbah in his report *Retrouver un sens nouveau: rencontrer l’imprévisible (To find a new sense: to encounter the unpredictable)* during the International Conference on Philosophy

(July 2011, University of Toulouse II)⁵. An important clue as to where contemporary phenomenology should set its sight is the concept of practice referring to the racialization of movement. In the context of Maurice Merleau-Ponty, François Sebbah argues the concept of concreteness. In fact, Natalie Depraz also radicalizes the propositions of Husserl. According to Depraz, it is passivity as the development of Husserl's ideas which influences our attitude towards recognition in the world. Nonetheless, it is a passivity which does not oppose to the activity. In a similar vision presented by Depraz, the theory does not lead to any confrontation with the *praxis*. It should be emphasized that this French philosopher avoids any dualisms. This model might provide for relativism or more precisely, for a situation identifying thought and practice. Indeed, Depraz does not seem to be disturbed by such a possibility. Her intention was to transform the phenomenology in consonance with practical thinking. Depraz emphasizes the recurrent character of some practices concerning anthropology. Thus, the practise is not utterly revealed as an original and singular process. Furthermore, it constitutes our experience. The question raised by the French philosopher was an attempt to dispute the contradiction between thinking and acting.

In the light of sensuality and everyday life, concreteness might be compared with the Heideggerian concept of facticity of the world. Indeed, concrete practise differs from facticity because of the transcendental condition of experience. To frame this problem, Marxism and ethics in general would be seen as kinds of practices. However, these approaches are more limited in comparison to the practice of thinking. Depraz is particularly interested in pragmatism but merely in the sense of the element which alternates phenomenology. The themes pursued by this philosopher are interpreted in the contexts of neurophenomenology, the Eastern Orthodox theology, Buddhist meditation, experimental psychiatry, post-psychiatry, anthropology and child psychology as well as, in consequence, phenomenology of aesthetic pleasure. Depraz makes the transition of her conceptions to field researches concerning the Greek community in Istanbul. In short, she realizes her principles in action.

Framing the problem of practical concreteness, I would like to place emphasis on the aesthetic experience. In the conceptions of Depraz, broad comprehension of aesthetics is demonstrated as corporal sensuality (*aisthesis*) which directs to practice. Thus, the act of writing is considered as performative, it models both aesthetic experiments. It seems to be remotely similar to Derrida's notion of writing. The main question to note in this proposition concerns the idea of aesthetic pleasure (*jouissance* in French) in the act of writing. This means that she refers to affects. In her own radicalization of Husserl, Depraz proposes to use the concept of attention instead of perception. Attention is not the same when compared to reflection, it assumes "the concrete, corporal inscription of this experience to an intrinsic attitude to myself researching in a particular way"⁶. More precisely, an affect is born between time and attention. The philosopher points out the pragmatic and archaic nature of affect. Time is involved as the "original carrier of affect". In fact, this is the corporal nature of time which influences affects.

To put phenomenology another way, Depraz explores the complicated relation of Husserl and Hume. The Author of *Comprendre la phénoménologie* argues that it was Husserl who understood "the universal problem of the transcendental philosophy" as "the problem of concrete". Transcendental empiricism is not focuses on formal aprioricity while researching the transcendental character of experience. What Depraz wants to propose in phenomenology is the compatibility of Kant and Hume. A similar intention is presented in the *Difference and Repetition* of Gilles Deleuze by reference to the Husserlian notion of passive synthesis which corresponds to the mechanisms of imagination⁷. Moreover, Deleuze argues in his other work that "imagination, as it

reflects on the forms of its own stability, liberates these forms”⁸. To put it another way, imagination is representative but it is based upon the transcendental capability of feeling.

The problem of the feeling in its affective sense is considered here by means of four personalized and at the same time universal figures such as the animal, the madman, the foreigner and the child. Depraz is far from the aesthetic autonomy in implying the openness of aesthetics. More precisely, it is my point of view to propose the aesthetic interpretation of Depraz’s vision. In fact, she often refers to aesthetic experience but does not summarize these attempts. The figures depicted by Depraz relate to the ways of feeling as well as aesthetic experience. In transition to a social context, the French philosopher differs various forms of the community’s participants: animals, madmen, foreigners and children. These figures correspond to Depraz’s concept of “alterology”, i.e., the science of otherness. “Alterology” leads to the feeling of seeing images in a new light, namely to a new or more diverse sensuality. It forms the basis for another comprehending of our subjectivity. In fact, the study of otherness and everyday life is not a unique proposition. Indeed, the correlation of the animal, madman, foreigner and child instead of abstract notions is more interesting due to its conceptual role in practical thinking.

In order to clarify the concrete nature of *praxis* according to Depraz, it is necessary to specify what she argues in *Lucidité du corps: De l’empirisme transcendantal en phénoménologie*. This title might be translated as *Lucidity of the body: On transcendental empiricism in phenomenology*. What is first explored in the study is the notion of “hyper-aesthesia” as the corporal ability to feel. The diffusive nature of sensuality is particularly emphasized. For Depraz, this sensual diffusion might be described by smell and taste. It raises the question of the kind of transition carried out between sense and affect. In accordance with the Husserlian distinction to *Leib* and *Körper*, namely body and flesh in English tradition, the French philosopher claims that “the transcendental of the flesh is embodied in the plasticity of its hyper-aesthesia”⁹. Depraz offers the notion of the “synesthetic phenomenon” (*phénomène synestésique*¹⁰) which is characterized by permanent movement of the senses. As it is assumed in *Lucidité du corps*, “hyper-aesthesia” includes certain criteria, i.e., plasticity, diffusion and emotionality¹¹. All these features are inseparable from time. What distinguishes this notion of time from the same concept in *Comprendre la phénoménologie* is the emphasis on immediate future. However, Depraz overpasses the paradigm of aesthetics in the direction to *aesthesis* in general. She takes account of the inevitability of the art market, of the bodies exposed to the public.

This type of sensual practice is presented in the cinema. I will discuss the film as a contemporary ritual. The example of Andrzej Żuławski’s *Szamanka (The Shaman)* is strongly correlated to the anthropological researches of Natalie Depraz. The film director chose a concrete point of time which is simultaneously referred to the magic past and present at the same time. The behaviour of the “Italian” (Iwona Petry), as the young woman has been named due to her passionate character, combines various orders of the time. Indeed, she embodies the contemporary version of shamanism. It is clearly visible upon first sight that the life of the heroine is chaotic. She is involved in a ritualized processes from the past and to the present. The “shaman” is both interrelated with the ritualized culture of the young people in the 90s of XX century and with archaic mystics. It should be emphasized that the graffiti on the walls is associated with old ornaments. The sexual life of the main characters is revealed as a kind of magic practice. Żuławski uses horror, mystics, eroticism in the inseparable balance of a sensual image. In order to create explicit ritualized forms, he refers to the archaic sense

of taste in the act of synaesthesia. It is explicitly exposed while the “shaman” eats fast food at the beginning as well as the end of the film when she eats the brain of her lover. The main masculine character is an anthropology research assistant who is preparing a doctoral thesis. He takes a critical stance against the ritual ensured by scientific distance. The hero investigates the corpse of the “real” shaman. Nonetheless, the ritual is more stronger. Thus, the protected distance disappears. In the light of the conception of Depraz, it may be possible to define this process as a distraction of theory by means of practice. In short, the ritual serves a particular function of disturbing concrete. The images depicted by Żuławski are related in some way to the figures of the madman, the animal and the foreigner in the philosophy of Depraz.

In conclusion, it is necessary to emphasize the originality of this philosophical proposition. It is ultimately interesting that Depraz refers to well-known figures exceeding and spending their banal meanings. Such a gesture opens up new possibilities for the investigation of dispersal affects. At the same time the conception seems to be influenced by the desire of an authentic experience. However, the significance of this problem can be seen in the context of researches upon concrete sensuality which constitutes an aesthetic act.

Natalia Koltakova is currently a PhD student in the Institute of Philosophy at the University of Warsaw. She got her Master's Degree in Ukrainian Philology (2009) and her Doctorate Degree in the Theory of Literature (2013) at the Donetsk National University in Ukraine. In her literature thesis she researched the symbolic and tragical nature of the lyric poetry in contexts of Ukrainian, Russian and French symbolism, as well as catastrophism in Polish literature. After completing her doctoral research she was interested in the cultural studies and philosophical contexts of literature working upon the teaching of humanistic sciences in Donetsk and since 2014 in Lviv. In 2015 she did research internship at the Jagiellonian University in Krakow (Poland). In 2016 she became the PhD student at the Warsaw University. Presently Natalia Koltakova writes thesis in Philosophy focusing on the conceptions of the phenomenon in the French contemporary phenomenological aesthetics. Her articles concern the Comparative Literature Studies and French Contemporary Phenomenology.

ARCHITECTURAL MAP AS A NEW MEDIA ARTIFACT: BETWEEN ARTS & FACTS

Abstract | This paper examines the process of *mapping architecture*, as well as *architectural maps*, through two different aspects:

1. the first aspect is: the role of the *act of mapping architecture* in the process of producing certain categories of knowledge about the city through their visualization and spatial-embedded historical, ideological and cultural facts, while
2. the second is the *visual aspect of a map* that can be viewed as art practice based on its visual characteristics without taking into account meanings or through their differing interpretations.

Research further shifts the focus on the topic of architectural mapping and maps into the domain of new media and social networks – by revealing the intentions behind the #rijeka_terristores hashtag, in fact Instagram page rijeka_terristories as a research experiment.

Index terms | *Architecture; Territory; Mapping; Maps; New Media;*

INTRODUCTION: ARCHITECTURAL MAP – BOTH AS A MEDIUM AND RESULT:

ABOUT THE MAP(PING): PRODUCTION OF ART OR INTRODUCING OF FACTS?

“In the center of the entrance to the hall there was a large board, to the left and to the right there were passages of two meters high; Jade hung on the board, one by the other, two photos – a satellite photo of the Gobwiller area and an enlarged Michelin map of the French departments of the same area. The contrast was stunning: while the satellite photo showed more or less uniform green flat surfaces covered with blue dots, the map represented a cross between the departments, picturesque roads, gazebos, forests, lakes and ravines. Above these two enlarged photos stood the name of the exhibition written in large letters: *The map is more interesting than the territory.*” (Uelbek, 2011: 49)

By observing of *maps both as a medium and result*, they can be seen as a *medium* of instrumentality, control or way of projecting visions on the ground (ideological, social and economic or urbanistic) – producing in that way an *artifact*¹, but also a *result* of interpreting hidden relations between *facts*² of development, both successful or failed versions. But *cartography* is not a science – its aim is to *produce a map* which is a *medium for graphic representation of a particular category of knowledge*. In this regard, the significance of the map and the encrypted message it conveys can be questioned?

Due to *topographic approaches* and *cartographic methods of (re)presentations*, the histories of some of the extraordinary urban development processes have been brought closer, and one of the largest precedents is the so-called Nolli’s map of Rome. Giambattista Nolli (1701-1756) was an architect and geometer who lived in Rome and dedicated his life to documenting the architectural and urban design of the city. His “Grand Map of Rome” (*La Pianta Grande di Roma*) is one of the most important and artistic plans of all time. Nolli’s map of Rome is an iconographic map of the city, which was different from the usual “bird’s” perspective until then. It consists of twelve

engraved copper plates measuring 176 x 208 cm, showing both the densely built city and the surrounding terrain, showing not only the usual cartographic elements (streets, squares, objects), but also sites of cultural significance through hundreds of detailed plans of the interior of objects, and in this way represents a unique and “eloquent” historical document, which testifies to the unique Roman “*inherited character*” (Tice, 2005).

Presenting topographical and spatial structure of the city in this way, this map represents a prehistory, a starting point for contemporary architectural criticism, which seeks to observe objects other than “*isolated monuments*” beyond the very *context that gives them full meaning*. In this way, the *map and the pictorial representation are opposed*, the city is viewed both on the basis of *solid* and on the void, whereby its “*voids or emptiness*” can represent “*the figurative element of the city,*” if the city is viewed through categories of *figure and ground*. In a relation to such a city’s observation, the *objects are not seen as “isolated events,”* but as those who are “*deeply and essentially embedded in the city’s tissue*” through understanding the *topography and geo-spatial structure of the city*. Noli’s map shows the principles of “*contextual design*” in the case of Rome, observed both on individual objects and at the level of the city as a whole, *contributing to the “dialectical relationship”* between objects and their context – two-way relations – which suggests “*a dynamic relationship between solid and void, figure and ground, as well as new and old,*” where the “*evolution of the city and its formal and spatial structure*” is not viewed as a “*static proposition*”, but as a “*dynamic, unstable discourse of competitive pressures, questions, needs and desires – both in urban, as well as in the human sense*” (Tice, 2005). In this way, the resulting *map represents a document* that abounds in information ranging from “*sophisticated iconographic schemes*”, through precise technical scales, illustrated by cartographic symbols, detailed numerical indexes and textual explanations of Rome and its social, artistic and scientific context (Tice & Ceen, 2005).

Another important historical precedent in the way of observing and displaying the city of Rome is the Piranesi Veduta (Vedute di Roma, Piranesi 1745, Rome, Italy), which represent a *catalogue of the “overlapping between the two Romas”*. The first of these two catalogues contains the remains of the visible world, while the other consists of the accumulation of everything that has been lost or has never been. These itineraries represent the *path (tour) through the “eternal city”*, with a brief description of each veduta that, depending on nature and influence, has different interpretation, while through a “*poetic review*” the reader is drawn into the “*imaginary space*”. In this way it is possible to “*travel*” to a city that has never existed, in the *landscape of the imaginary*.

The significance and contemporary interest in such approaches to research and presentation is testified by current research projects and world exhibitions in the domain of architecture. The research project at the University of Oregon (2005-2016) produced an interactive Noli map in order to explore its historical significance and contemporary application. On the basis of this web platform, a number of other studies have been created. In recent research practice within the architectural and urban discourse, there are numerous digital displays of the cartographic representation of the development and transformation of different cities, for example, Barcelona, London or Berlin³.

MAPPING ARCHITECTURE

or WRITING AN ARCHITECTURAL TERRI(S)TORIES

Perceiving of the city territory through its dynamic constitutive elements and relations between them, moves the focus from understanding the city territory as a static and symbolic representation to dynamic processes of forming cultural meanings, within which the layers and processes of past development are examined through city territory

elements. Based on this it can be concluded that the city territory is a medium which, through dynamic and constitutive elements and relations between them, combines different processes of development (social, political, economic, professional and cultural-historical), and where the formation of “signifying systems for the production and transfer of cultural meanings” arises (Duncan and Duncan, 1988). In this way, the city becomes a “social and cultural document” through whose reading it is possible to see and understand the “layers and processes enumerated therein” (Duncan, 1990), as well as “creative tensions” (Wylie, 2007) between the elements that make up its structure. Consequently, the importance of the map as a possible way of showing the process of development and transformation within the domain of architecture, landscape and territory, can be considered, whereby it represent discourse of the perception of certain issues, such as ideology, politics, economy, culture or certain principles and their influence on the city territory development.

Regardless of the use of the *map as a medium*, the goal is not to study or describe the city as a totality, but *to look at and emphasize the specificity of information, meaning and messages that certain points, codes bear and their roles as elements within the whole*. Observed in this way, *some objects or spatial polygons as “cultural artefacts” can represent the initial points of transformation of unfulfilled and new visions of spatial and cultural maps of the city*.

These were some of the reasons for starting both thematic and visual-graphic research with a title: *Architectural terRI(s)tories: mapping the process of city territory transformation*. With an approach based on semantics and metaphors, the aim was to “read” some of the layers of the city (architectural terri[s]tories), where the city was observed as a cultural palimpsest, through processes and material layers of its development and transformation. In relation to such a city’s macroscopic examination, the buildings are not seen as “isolated events”, but as those who are “deeply and essentially embedded in the fabric of the city” through understanding of the topography and geo-spatial structure of the city. Thanks to the *structural approach* of observing or reading *the spatial narrative of the city, mapped objects represent important points of the cultural map of the city’s development, representing in that way both map and the city as a specific artefact*.

Maps are one of the most powerful ways to understand the city. But, mapping is no longer an activity exclusively done by experts, it is instead a powerful form of everyday communication. This situation opens an opportunity for (re)reading (and (re)writing)) some of the *architectural terri(s)tories*.

ARCHITECTURAL MAPPING AND NEW MEDIA: #RIJEKA_TERRISTORIES

NEW MEDIA ATLAS OF ARCHITECTURE OR PROFILE OF ONE CITY

“The city is considered as a whole, its past and present discover themselves with their own physical structure.” (Vidler, 2009 [2003])

As De Sola-Morales describes the contemporary environment through a provocative representation that he calls “fluid topography” and states that it is necessary to use “topography” in order to avoid “topology,” since understanding architecture is not a matter of logotypes (logos) or the application of universal ideas, but a question of graphē, that is, the question of writing, research, conventional and logical puzzles that make knowledge of certain places and architecture more credible. He, also points out “from the beginning to the end, architecture is the text that needs to be deciphered, disclosed; the one that, except in the process of creation, is moving towards disappearing, which totally escapes the specificity of its specific origin” (de

Solà-Morales, 1996).

The question of adequate representation of architecture – the method and the goal – that can at the same time reveal the past, but also to suggest the future, arises. Digitizing of the thematically defined architectural maps – stories from the territory allows the connections of system codes with a certain time, social or cultural-historical context. Their thematization would enable observation of the city as a whole (as Vidler notes, by discovering city's past and future through the built physical structure), linking its spatial and temporal component of the development and all of this with the aim of making process of transformation of cities continuous.

#rijeka_terristories is a hashtag used by Nataša Janković within her Instagram webpage *Rijeka terristories* https://www.instagram.com/rijeka_terristories/ formed as a research experiment during her postdoc fellowship. This page was launched as part of a research project – *Re/!:translating terRI[s]tories: architectural stories about Rijeka's territory* (UniRI – CAS SEE, fellowship fall 2018 generation) with the purpose of a *methodological examination of new media forms for presentation and dissemination of results derived from the architectural research*. Rijeka terristories Instagram webpage refers to *re:reading and re:translating* some of the *terRI(s) tories* (*architectural stories about Rijeka's territory*) with the aim of transcription / documenting the only constant thing about cities – their transformation⁴. For this reason, this webpage may be considered as a specific *new media atlas of architecture* – i.e. *portrait, or profile of one city*, that was created through methodological exploring through printed and new media forms of representation and dissemination of research results. The material presented within rijeka_terristories Instagram page follows *20 thematic maps* (developed within the research: *Architectural terRI(s) tories: mapping the process of city territory transformation*) grouped in relation to the dominant factor of space production): *socialscape* (landscape of society), *powerscape* (landscape of power), *visionscape* (landscape of visions), *memoryscape* (landscape of memory places), *alterscape* (landscape of the spatial alternatives), as well as *spaces of porosity* (empty spaces within the urban landscape). These thematic maps emphasize the urban transformation of the 20th century Rijeka through the presentation of prominent architectural and urban spaces important for the socio-ideological, political, economic, infrastructural and cultural space production of Rijeka (UniRI – CAS SEE fellowship fall 2017 generation).

In this way, this research poses new challenges – to revive some of the buildings and ideas – from the domain of the material, through the domain of the written and/or designed, moving them further into the domain of the virtual. Since the map is a powerful form of everyday communication today, it should be used to more intensively as a tool in order to *(re)read* and *(re)write* different architectural *terri(s)tories*. In this way, digital map(ping) can improve the continuity of the process of development and transformation of the city (territory), and once again, the advantage is that with digital maps such a way of observing and representing the city transformation becomes bi-directional – in one direction to understand its structure, but also in another direction to establish a better connection between existing elements and programming of the future transformations.

INSTEAD OF CONCLUSION: NEW MEDIA EXPOSURE OF THE THEMATIC ARCHITECTURAL MAPPING

Architectural mapping, as well as the architecture gesture itself, is a very strong means of power. Through the constructed form, it is possible to analyze the projections of the power, that is, the dominant form of space production. According to that the mapping process, given the fact that the map is a powerful means of producing knowledge, it represents a dominant representation of the power of architecture as a gesture. In

addition to the production of knowledge – through facts that have been witnessed by the spatial or projection trail (architecture or map), both through architecture and map some aesthetic expression is trying to be achieved. Regarding to that, in relation to architecture and mapping (map) it is necessary to look at and *read* about spatial development through their meaning, but also through their visual / aesthetic appearance that are overlapping. Having that on mind *thematic architectural mapping* can be a powerful instrument both for sharing the knowledge about the city as well as producing some products of art.

Further, or more specific, by posting and exposing thematic architectural maps on the Instagram page it may seem that the focus was shifted from its structural to the visual aspect, since the main function of Instagram is visual exposing and “collecting of likes”. Due to that those maps are constantly exposed to the judgment about its “beauty” or “liking” probably more than on their structure or subject that they represent. But that is not bad situation, not bad at all. In that way the author can get feedback about their artistic component, and about its subject and structure there is no need to be suspicious about since they were made from the field of primary expertise of the author (architectural and urbanistic city development and transformation). So, to be honest, this Instagram page is in some way “a seduction” by an author to get feedback from both wide and professional audience about its artistic value so that can serve for their further development as an *artifact – architectural maps that serves both as an object of art and representation of facts*.

Figures:

Figure 1: object “sign” – drawing by an author (Nataša Janković) for the first post – introduction for the object that is going to be shown in an upcoming posts.

Figure 2: map position – graphic interpretation of the Google Maps by an author (Nataša Janković)

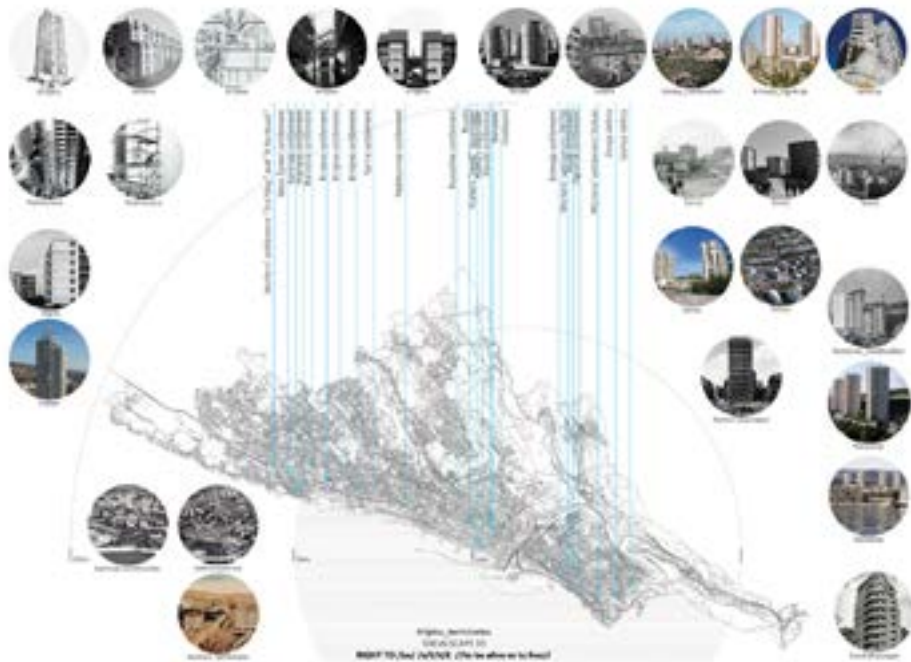

Figure 3: an example of the thematic map (author Nataša Janković)

Figure 4: an example of the possible itinerary (author Nataša Janković)

Endnotes:

1 *artifact* (n.) 1821, *artefact*, “artificial production, anything made or modified by human art,” from Italian *artefatto*, from Latin *arte* “by skill” (ablative of *ars* “art;” see *art* (n.)) + *factum* “thing made,” from *facere* “to make, do” (from PIE root **dhe-* “to set, put”). The word is attested in German from 1791. The English spelling with *-i-* is attested by 1884, by influence of the Latin stem (as in *artifice*). Originally a word in anatomy to denote artificial conditions caused by operation, etc.; archaeological application in English dates from 1885 (in German from 1875). <https://www.etymonline.com/search?q=artifact>

2 *fact* (n.) 1530s, “action, anything done,” especially “evil deed,” from Latin *factum* “an event, occurrence, deed, achievement,” in Medieval Latin also “state, condition, circumstance,” literally “thing done” (source also of Old French *fait*, Spanish *hecho*, Italian *fatto*), noun use of neuter of *factus*, past participle of *facere* “to do” (from PIE root **dhe-* “to set, put”). Main modern sense of “thing known to be true” is from 1630s, from notion of “something that has actually occurred.”

Compare *feat*, which is an earlier adoption of the same word via French. *Facts* “real state of things (as distinguished from a statement of belief)” is from 1630s. *In fact* “in reality” is from 1707. *Facts of life* “harsh realities” is from 1854; euphemistic sense of “human sexual functions” first recorded 1913. Alliterative pairing of *facts and figures* is from 1727.

Facts and Figures are the most stubborn Evidences; they neither yield to the most persuasive Eloquence, nor bend to the most imperious Authority. [Abel Boyer, “The Political State of Great Britain,” 1727]

THE TELEOLOGICAL NATURE OF DIGITAL AESTHETICS, THE NEW AESTHETIC IN ADVANCE OF ARTIFICIAL INTELLIGENCE

Abstract | If aesthetic and teleological judgments are equally reflective, then it can be argued that such judgements can be applied concurrently to digital objects, specifically those that are products of the rapidly developing sophisticated forms of artificial intelligence (AI). Evidence of the aesthetic effects of technological development are observable in more than just experienceable objects; rooted in inscrutable machine learning, AI's complexity is a problem when it is presented as an aesthetic authority, particularly when it comes to automated curatorial practice. As digital technology occupies an increasingly fundamental role in the transformation of the aesthetic features of contemporary society, its inherently teleological nature is emerging as a parallel active presence; it's not so much that the digital is a quality of our world but that it's progressively a determinative, causal driving force which changes our world in a manner that bears more and more the characteristics of independent agency that is internally self-consistent. In the context of a weak technological determinism, this invites an examination of the aesthetic consequences that critically contrasts the differences between biological and digital manifestations of apparent and actual creativity.

Rooted in theories of the post-digital and the New Aesthetic, this paper will examine emerging new forms of art and aesthetic experiences that appear to reveal these parallel capabilities of AI. While the most advanced forms of AI barely qualify for a "soft" description at this point, it appears inevitable that a "hard" form of AI is in the future. Increased forms of technological automation obscure the increasingly real possibility of genuine products of the imagination and creativity of autonomous digital agencies as independent algorithmic entities, but such obfuscation is likely to fade away under the evolutionary pressures of technological development, to which a genuine New Aesthetic would begin to recognize these aesthetic objects and experiences as appreciably new. It's impossible to predict the aesthetic products of AI at this stage but, if the development of AI is teleological, then it might be possible to predict some of the foreseeable associated aesthetic problems.

Index terms | *New Aesthetic; Digital Aesthetics; Artificial Intelligence; Post-Digital; Teleology; Curation*

It could be claimed that the digital, digital materiality, computability, autonomous algorithmic entities and/or independent digital agencies are fanciful at best, the subject of science fiction, and impossible as genuinely creative and imaginative artists. These claims, however, almost don't matter. We exist in the digital and, as such, we are unable to see outside of it or without it. As this becomes more and more the case, the question of actual AIs will matter less and less – even if they exist, we won't be able to tell the difference – and their aesthetic output will become indistinguishable from those of any other human artist.

Very recently, Stuart Dredge, a technology journalist, asserted: “Music Created by Artificial Intelligence Is Better Than You Think.”¹ The article doesn't make any justified aesthetic claims – relying on a weak argument that AI can make music, but that this music may or may not be better than that composed by human musicians – but it describes an interesting set of recently available web and smart phone based AI applications and services that are capable of producing music primarily for commercial purposes for web based and corporate video productions that want to avoid licensing fees and intellectual property issues. Rooted in adversarial models of music generation, these AI composers such as “Endel” are targeted at creating a personalized music experience: “hinting at a possible future where the command “Alexa, play me something to help me relax” [these AI driven apps create] create a stream of entirely original music, rather than just a playlist of existing tracks.”² This is illustrative of an increasingly interesting challenge to aesthetics in the context of the New Aesthetic, one that is evidenced in all forms of artistic media: it's not so much a question of whether music can be created by AI (of course it can) but what happens when its ubiquity is unchallenged precisely because its origins are no longer obscured. For example, it's not so much a concern with instances like Sony CSL's “Daddy's Car” (2016) and “Mr. Shadow” (2016) and “Bad at Christmas” by Chloe Jean with Alysia (with the hashtag #withAlysia) because they are singular experiences and, to be honest, kinda terrible; instead, what's really interesting is that there are increasingly instances of AI generated music that aren't identifiable as such, that are indistinguishable from similar environmental forms of music/muzak (once the sole purview of human musicians), and increasing number of examples that change and evolve in a manner that is “personalized” and “tailored” to respond to its reception.

The debate about computer produced art has a relatively long history, rooted in early efforts of artists working at Bell Labs in the late 1950s and 60s, but discussion about AI produced art is a little more recent. Most take the hardline position that AI cannot (and will never be able to, in some case) produce art; Sean Kelly's February, 2019 article

1 Dredge, Stuart, “Music Created by Artificial Intelligence Is Better Than You Think”, *Medium*, February 1st, 2019. Accessed: February 17th, 2019. <https://medium.com/s/story/music-created-by-artificial-intelligence-is-better-than-you-think-ce73631e2ec5>

2 Ibid.

“A philosopher argues than an AI can’t be an artist”³ in the *MIT Technology Review* is a good example, arguing that the central importance of genuine creative and innovative artistic activity isn’t programmable nor reproduceable, and that AI cannot create art because its aesthetic products will not be socially embedded. For Kelly, deep learning algorithms simply do not respond to their social conditions and can only be judged by pre-existing standards in a manner similar to how we judge tools; “Artificial-intelligence algorithms are more like musical instruments than they are like people.”⁴

Kelly’s argument, however, is a little more subtle than it first appears, to his credit. Speaking about mathematical proofs and theoretical physics, Kelly notes that it is also impossible to argue that an AI algorithmic entity could convince human beings of its ‘discoveries’ because, contra a positive Turing test, “we would have to be able to accept its proposals as aiming to communicate their own validity to us.”⁵ But what if AI was able to convince us? Or, perhaps more realistic, what if it didn’t need to? This is the New Aesthetic as it continues to evolve, a realm of autonomous algorithmic production agents providing aesthetic products that are experienced and judged not determinatively (in that they should be a representation of a concept sufficient to determine the particular) but reflectively (in that assessing the quality of an object of experience for the subject itself, a kind of reassurance as to their universal communicability, becomes the primary response). To put it another way: as AI increasingly generates objects and experiences that resemble in every way art – and the fact that this is already taking place cannot be disputed – what should be our response? If we cannot make a determinative but only a reflective judgement about these objects and experiences, as in the case of *thispersondoesnotexist.com*, what happens when we can’t tell the difference at all?

Part of situating this question lies in the odd relationship AI has to aesthetic and teleological judgments. If aesthetic and teleological judgments are equally reflective, then it can be argued that such judgements can be applied to digital objects equally, specifically those that are products of the rapidly developing sophisticated forms of AI. How is this the case? Of course, digital objects can be aesthetically judged: the design of graphic user interface can be judged as beautiful or ugly in a reflective consideration entirely separate from any assessment of its function. At the same time, its function is available reflectively as well and can be teleologically judged. The difference lies in the judgment not so much as to whether a calendar app accurately remind me of my appointments but more whether the app has evolved to fulfill its intended purpose in an agreeable fashion (which, I would argue, drives our decisions when we choose one

3 Kelly, Sean, “A philosopher argues that an AI can’t be an artist”, *MIT Technology Review*, 21 February, 2019, https://www.technologyreview.com/s/612913/a-philosopher-argues-that-an-ai-can-never-be-an-artist/?utm_medium=tr_social&utm_source=facebook&utm_campaign=site_visitor.unpaid.engagement&fbclid=IwAR0vGU21NkdSISUOJi-97AqPdMI0b-VPzGOEtJbpyXDfEx9TepaPq8zIYzIA. 5 Kelly, *Ibid.*

calendar app over another regardless of its specific functionality). It, if you will, the personable that is at the heart of a reflective judgment.

Given this, it's important to note that AI produced objects are equally available to reflective and aesthetic and teleological judgments precisely because they both appear to be the product of another autonomous individual; it's impossible to mistake a GUI for a naturally appearing phenomenon, despite all of the efforts of skeuomorphic design philosophy. While in the case of an AI generated object, this other is unavailable: when using an app, its programmer or designer is not just unavailable but the substance of its digital materiality is simply not evident, a breakdown, in this case, of predication. The name of the programmer or designer of an app might be available (though most often not in the use of an app on a smart phone, for instance), but the programming language itself consists of multiple layers of computational functionality that has been refined, resolved and rewritten often by digital agents undirected by any human intervention.

This isn't so much a dystopian science fiction tale but an actual governing set of principles of the digital materiality of our world rooted in the distinct possibilities of independent autonomous algorithmic entities. Evidence of the aesthetic effects of technological development are observable in more than just experienceable objects; rooted in inscrutable machine learning, AI's complexity is a problem when it is presented as an aesthetic authority, not just in a productive sense but even when it comes to automated curatorial practice. As digital technology occupies an increasingly fundamental role in the transformation of the aesthetic features of contemporary society, its inherently teleological nature is emerging as a parallel active presence; it's not so much that the digital is a quality of our world but that it's progressively a determinative, causal driving force which changes our world in a manner that bears more and more the characteristics of an independent agency that is internally self-consistent. Whereas computability and digital materiality were once additions to our experience of the world, now they are actual transforming it.

Emerging new forms of art and aesthetic experiences appear to reveal these parallel capabilities of AI. While the most advanced forms of AI barely qualify for a "soft" description at this point, it appears inevitable that a "hard" form of AI is in the future. In fact, it's clear that increased forms of technological automation obscure the increasingly real possibility of genuine products of the imagination and creativity of autonomous digital agencies as independent algorithmic entities teleologically designed precisely to hide their artificial origins. Unchallenged aesthetic authority creates these additional problems, resulting in an obfuscation of computability and digital materiality. Such obfuscation is unlikely to fade away under the evolutionary pressures of technological development, even with the awareness generated by a genuine New Aesthetic that would begin to recognize these aesthetic objects and experiences as appreciably new.

We're reaching a stage in the digital's evolution where evidence of the digital is disappearing proportionate to its increasing pervasiveness. The Obvious Art Collective (Gauthier Vernier, Pierre Fautrel and Hugo Caselles-Dupré, who have the algorithm involved "sign" the painting), using generative adversarial networks, and drawing from a database of 15,000 14th-20th century portraits, put it this way: "The artist runs the risk of becoming a machine, hitched to another machine."⁶ Bemoaning the foreseeable difficulties, a recent article about the Next Rembrandt project in *AdWeek* (the irony doesn't escape me) complained: "Creativity is supposed to be our exclusive province, the spark that makes us special, the thing computers could never dream of mastering."⁷ Whether weak or strong, general or specific, algorithmically autonomous or not, AI is increasingly authoritative and creative. Its curatorial judgments are already being accepted at a very base and general level, so why not in a more generative way? AI is already being used to settle attributions, to discern fake examples of art from genuine, so why not allow it to discern in a qualitative manner the difference between mediocre, good and great art? And if discernment is allowed as a type of aesthetic judgment, why not grant it full aesthetic authority? If the Next Rembrandt project is a visualization of data, it's a project with the specific stated aim of producing an object of beauty. "Commenting on the implications for Rembrandt art itself, art historian Gary Schwartz notes that, 'While no one will claim that Rembrandt can be reduced to an algorithm, this technique offers an opportunity to test your own ideas about his paintings in concrete, visual form.'"⁸ If we're testing our ideas against digital algorithmic agents, though, aren't we granting them an infallibility, so much so that it's not that Rembrandt will be reduced to an algorithm but that it's algorithms which will soon be elevated to Rembrandts.

Rutgers University's Art and Artificial Intelligence Laboratory took a few steps beyond the normal framework of digital humanities towards this with their Creative Adversarial Networks (CAN) project⁹ that reached a remarkable conclusion: not only can computers generate art by using deep learning through databases of different historical artistic styles but the results are equally effective in terms of their aesthetic value as those produced by human artists. In their abstract, they ambitiously state: "We propose a new system for generating art. The system generates art by looking at art and learning

about style; and becomes creative by increasing the arousal potential of the generated art by deviating from the learned styles.”¹⁰ What they mean by this is that they have created generative adversarial networks that have learned different visual art styles, presented various permutations of those styles in a digital adversarial relationship, and have refined the permutations through the adversarial responses in such a way that the final results appear to be, for all appearances to be art. The results: participants largely preferred the machine-created artworks to those made by humans, and many even thought that the majority of works at Art Basel were generated by the programmed system. There have been many claims that computers are capable of generating art equal to human created art, but CAN is an attempt to go beyond mere programming and the generation of art to developing a digital agent capable of creating art. The difference between generation and creation here is crucial; generation is the result of programming, while creation is the result of free activity even amidst a dominating set of contexts, data sets and influences. So, computers may be getting closer to autonomously producing their own art that people deem more creative¹¹ than that produced by their fellow human beings. Even more so, there’s a shift from deem to accept to prefer; significant difference in terms of human observers’ reactions evolved such that the vast majority of instances humans’ reactions to the work created by CAN were believed to be created by other human beings and preferred over that of their fellow human beings. As noted in a Hyperallergic article about the CAN project:

It might be debatable what a higher score in each of these scales actually means... However, the fact that subjects found the images generated by the machine intentional, visually structured, communicative, and inspiring, with similar, or even higher levels, compared to actual human art, indicates that subjects see these images as art!¹²

And if the subjects see these images as art, then they are granting aesthetic authority.

If AI products are, in effect, increasingly autonomous and authoritative creative agents, to the point of appearing dangerously close to eclipsing human produced objects, then is there a way to address this problem? Can we counter this increasing encroachment? In Ian McDonald’s 2017 novel *Lune: New Moon*, one of the characters notes as an explanation for their postgrad work in “computational evolutionary biology in process control architecture” that it was a development of what appears to be a truism that, namely, “Technology will always converge with biology.”¹³ Out of this arises a really interesting question: is the development of technology analogous to biological

12 Ibid.

13 McDonald, Ian, *Luna: New Moon*, p. 49

evolution, or is it sufficiently distinct and only appears to converge at a point where technology becomes intertwined with biological functions? To put it another way, there are two contrasting perspectives on how technology changes over time. The first is that it is developed over time in response to changing circumstances; human beings (and, as our understanding of animal behavior expands, other higher order tool-using animals) recognize and respond to need or develop a solution to a problem. On the other hand, technology evolves in response to its perception of our needs. Until recently, that last sentence would be completely absurd, but with the increasing capabilities of AI its absurdity is debatable. If AI is evolving in a teleological fashion analogous to natural evolution, then it might as simple as seeing the beautiful like we do in any other natural object and, over time, as we do with any other artist. In a way, it could be suggested that it's aesthetics which might be an adjudicating factor when it comes to something like the Turing test.

The real problem, however, is almost that it doesn't matter. What's important to keep in mind is that it almost doesn't matter what type of AI will emerge in the future – hard or soft, autonomous or programmed, actual or virtual – but that there will be the appearance of AI that we will have to contend with. This notion of the “appearance” of AI even belies the necessity for actual AI; Rachel Severson, working in the field of childhood development, has done some fascinating research that leads to the conclusion that “some research indicates children understand a device like Echo or Google Home is a piece of technology, but they also see these gadgets in psychological terms — as having emotions, as being capable of thought and friendship, and deserving of moral treatment.”¹⁴ In referring to AI driven technology devices, which Severson describes as “personified technologies,” there isn't a need for an actual AI but just the seeming experience of AI for us to relinquish our aesthetic authority to another. The result of this is that the code itself, at a deep level, is often programming itself, leading to the question of what do algorithms want?¹⁵ In this respect there should be some sympathy for the position of skeptics of true, autonomous AI, who rightfully point out that AI will be programmed by human programmers, no matter how screwy the algorithms get, by noting (in a Lacanian fashion, via Kant's categories) that the language used by AIs to present aesthetic experiences may simply be a reflection of our own languaged projections into the world, and that that this projection will always return to us in an alien form that is functionally an Other, or what the CAN project called “the arousal potential of the generated art by deviating from the learned styles.”¹⁶ Whether AIs

16 Elgammal, Ahmed, et al., “CAN: Creative Adversarial Networks Generating “Art” by Learning About Styles and

become true Others or not is not just irrelevant, therefore, but impossible to respond to. The presentation of new aesthetic experiences might appear to pass the Turing test, but even if it legitimately does so how would we know? This is the challenge of the New Aesthetic: not so much that AIs and autonomous algorithms will be providing us with different aesthetic experiences firmly originating in the specificity of their computational materiality (which they already are in at least a limited fashion) but in our inability to reactualize a purely human form of aesthetic productivity.

To return to Kelly's article, specifically to the possibility of conceding the status of art to AI produced aesthetic objects and his claim that it's impossible, he writes:

This claim is not absolute: it depends on the norms that we allow to govern our culture and our expectations of technology. Human beings have, in the past, attributed great power and genius even to lifeless totems. It is entirely possible that we will come to treat artificially intelligent machines as so vastly superior to us that we will naturally attribute creativity to them. Should that happen, it will not be because machines have outstripped us. It will be because we will have denigrated ourselves.¹⁷

This is a continuing refinement of a definition of the New Aesthetic: it's not so much that aesthetic experiences might originate from autonomous algorithmic entities nor that fully creative and independent AIs might act as artists, creating visual, musical and literary art on par with any produced by human artists, but that it's increasingly impossible to the point of being actually impossible to distinguish between aesthetic objects that are produced by algorithmic dependent digital agents and fully autonomous algorithmically independent agents. This is a situation we've created for ourselves, as we've pushed the computational capabilities further and further, where now we are not just enthralled by the products but are eager to participate and be a part of those products. If AIs exist, what do they want? Well, it seems like we're increasingly eager to find out and fulfill those desires; this is, I believe, an explanation for why there might not be any more poetry after Auschwitz but there certainly are many selfies taken there. Adorno wrote: "In the products of the culture industry human beings get into trouble only so that they can be rescued unharmed, usually by representatives of a benevolent collective."¹⁸ Today, the New Aesthetic is that benevolent collective.

**AS THE “INTELLECTUAL SUBJECT” OF ARTIFICIAL INTELLIGENCE —
THE INTERNAL UNDERSTANDING OF ARTIFICIAL INTELLIGENCE ON THE IDEAS OF
“TIME” AND “SPACE”**

Abstract | Prescribing artificial intelligence as the “intellectual subject” rather than the product of simple linear operation or deep learning is a necessary premise to discuss the difference between artificial intelligence and human beings in understanding the ideas of time and space. This paper believes that artificial intelligence as a subject of intelligence has its own origins and connotations, and different intellectual characteristics also lead to different internal ways of understanding between the time and space. In addition, the ideas of time and space as the “object” to think, is the deep difference between artificial intelligence and human intelligence. At the same time, artificial intelligence to deal with the ideas of time and space in a “non-objective” way is still unachieved.

Index terms | *Artificial Intelligence; Intellectual Subject; Time; Space; Object*

1.1 About AI

Artificial Intelligence (AI) was proposed in the Dartmouth Conference in 1956, and it is a new science used for simulating, extending and expanding theories, technologies and system applications of human intelligence. In short, it “thinks like a man and acts like a man”;¹ hence, it is extensively practiced and applied in numerous fields, including natural language processing, motion control, social intercourse and even human-computer game. Moreover, AI’s simulation of human thinking, language and consciousness also drew forth a reflective philosophical force, and philosophical and brain science problems about “the game between human intelligence and artificial intelligence” and economic problems like “the application of AI to social positions” have attracted close attention from scholars. The author argues that if we want to discuss the difference between AI and human in at an intelligence level, we need to presuppose AI is a “intellectual subject”, namely a process of extracting “facts, experience and rules from the brains of experts or other knowledge sources (e.g., books and documents) and then changing them into computer systems,”² rather than a scientific product of mechanical, linear operation formed in the first two industrial revolutions, the different ways of thinking of these two kinds of intelligence in “inherent understanding” are the focus of discussion in this article.

1.2 About philosophical approaches of “intellectual subject”

The interpretation of the term “intellectual subject” is conducted according to research approaches used for “intelligence” and “subjectivity” in western philosophies, and the term “intelligence” in this article is “intellectus” in Latin, and “Verstand” in German. Meanwhile, the German word “Verstand” also implies “reason”, “intellectuality” and “comprehension”. Rationalist philosopher Descartes said, “everyone knows there is a kind of clearness in reason, which refers to a kind of cognitive clarity or explicitness”,³ and he took the self-evident intellect as the logical starting point of his rationalist philosophy; Likewise, in *Ethics*, Spinoza also divided knowledge into “perceptual knowledge”—namely opinion or imagination”, “universal concept and its inferential knowledge”, and “intuitive knowledge”—namely “proceeding from the correct concept of formal essence of an attribute of the god and hence reaching a correct understanding of the essence of things”,⁴ To rationalists at least, “intelligence” is an ability rooted in human intuitive abilities and universal belief in knowledge and it is a primary conceptual work dispensing with deduction. While in the framework of this article, intelligence not only includes deep thinking of reason (e.g., AI’s calculation and measurement of the objectification of time and space) but also contains perceptual intuitive elements (e.g., human intelligent intuitive ability is a perceptual ability).

In addition, studies about “subjectivity” in western philosophy still need to mention Cartesian epistemological turn issue, “I am an entity, all essence or the nature of this entity is just thought”.⁵From the Cartesian epistemological perspective, “I” is set as a “subject”, whose fundamental attribute is “thinking”, while thinking is manifested as an ability to doubt or reflect, or an intellectual ability to plan presentations, in a manner of speaking, “intelligence” is given out by thinking subject; while in Kant’s *Critique of Pure Reason*, the image of a highly intelligent subject was raised to a priori status, namely “transcendental synthesis” and “pure apperception” abilities. From the perspective of Kant’s transcendental philosophical discourse, intellectual subject opened up the perspective of perceptual institution for “time” and “space”, and the transcendental synthesis of time and space is a precondition for human to initiate rational thinking

internally.

1.3 The interpretation of the connotations of AI as an “intellectual subject” and “human intelligence”

As stated above, it is intelligence and intuitive ability in thinking that form “subjectivity”, and the formation of subjectivity becomes the foundation for intelligence. Besides, setting AI as an “intellectual subject” is a precondition to compare it with human intelligence. The author thinks that AI as an intellectual subject has the following implications:

At first, if the intelligence of AI is from its subjectivity, then the subjectivity of AI is not primary. AI is a structure of human sciences, while scientific and technological achievements and inventions are manifestations of human creativity. Such creativity is presented as human trying to further pursue self-actualization with scientific and technological means, namely artificially constructing a machine to simulate, extend or expand thinking, consciousness or language, while an established machine is invented, a scientific research approach is named “AI”—in the author’s opinion—not in a historical determination sense. Meanwhile, AI is not subject to the law of biological evolution, because space technology, energy issue and biological evolution do not present direct causal necessity. Therefore, the subjectivity of AI is just drafting and setting of human, and priori principle of the AI as an intellectual subject is virtually derived from human experience and is not primary. For instance, before the intellectual game of weiqi, weiqi AI program AlphaGo invented by DeepMind, a subsidiary of Google Inc., human have primarily wrote four neural networks for it: a rollout policy, a supervised learning policy network (SL policy network), a reinforcement learning policy network (RL policy network) and a value network, in other words, deep learning function of AI “representing the universe as a nested graded conceptual system(connections between simpler concepts is defined as complex concepts, from general abstract conceptualization to highly abstract representation.”⁶ “It is faster than human chess players and analyzes potential possibilities more intensively, thus gaining the upper hand.”⁷ However, we need to know that it is undeniable that human experience input is the priori principle to AI, whose subjectivity is “artificial”, as the premise to its intellectual subjectivity. In the same vein, AI’s inherent understanding of time and space is based on human inputting and setting of the concepts of time and space too, for instance, the inputting and setting of time series models like “autoregressive–moving-average model”⁸ is the precondition and prerequisite for AI to forecast and fit the trends of time series data.

Second, AI as a subjective intelligence is manifested as an established state in a consequentialist sense. As an intellectual subject, its intelligence is always manifested as a “result”, namely constantly completing in the direction of result presupposed by human and continuously gaming with human as an intellectual subject. Constantly completing in the direction of results presupposed by human means in a given program and algorithm framework, and its intelligence move towards a given “goal. For example, for AI in the field of computer vision, human set the “goal” of recognizing, tracking and measuring the goal and AI’s completion of this goal can be nothing but a given result, even if machine vision has a greater ability to capture than human eyes. Meanwhile, as a subjective intelligence, the author regards AI which is gaming with human as a constant completion of “result”, just as AlphaGo intellectually competed with human in weiqi according to the four neural networks, every move of AI was a completion of intellectual result, while the ceaselessness of the game means the

successiveness of intellectual thinking. In addition, “constantly” completing in the direction of result preset by human and “constantly” gaming as an intellectual subject means the advancement of “determinism”, for example, the target image captured by machine vision may surpass or deviate from “result” expected by human, and such deviation from the result virtually means “determinism” is not an original point in the time dimension but a time quantum drew by constantly generated results by the intelligence of AI. The author believes that human’s forward-looking depiction of the scenes of AI/robot attacking people in the fields like literature and film and their reasonable concern about the prospects of AI are exactly from surpassing the “result” and the advancement of the origin of determinism in the time dimension.

Different from AI as an intellectual subject, the intelligence of human as a concrete subject is universally understood by human groups. At first, human intelligence will develop “consciousness” of non-concrete objects and reduce them into “concepts” (e.g., the concepts of “time” and “space”), and meanwhile human experience and perception will form the initial understanding of the world, and this understanding is also become a part of the initial understanding of the world. Moreover, the understanding depends on human intelligence, so it is “inherent”.⁹ Meanwhile, intellectual characteristics of AI also give it inherent understanding, and the application of time series data model makes it inherently understand time series. When AlphaGo operates with Monte Carlo tree, it also internally relies on the one-dimensionality and successiveness of time which enables algorithm; in addition, when “rollout policy”, one of AlphaGo’s four neural networks, was rapidly simulating chess game and evaluating moves, it was inherently understanding the existence of temporality (shown as fast and slow at this moment) through the intelligence of the subject itself.

Next, according to the book *Critique of Pure Reason* authored by Kant, when human intelligence is perceiving, both three-dimensional schema in a geometrical sense and concrete aesthetic schema can be transcendently made sense by human. Moreover, intelligent intuitive activity conducted by human as a subject makes time and space inherently understandable. Besides, in the author’s opinion, the ability of human intelligence to capture the characteristics of non-concrete objects makes the concepts of “time” and “space” emerge, which became one of the domains of discourse about “consciousness”, while intelligent intuitive spirit enables pure apperception of time and space later.

At last, after intuition, the role played by human intelligence in the thinking process is not an expansion of linear thinking nor the deduction of pure formal logic, but is developed out of combined action of the subject’s mind and body. Under the combined action of mind and body of the subject, intelligence’s intuition of representations will form the perceptual impression of primary being of the entities, namely the impression of time and space of things sensed by intelligence. While bodily and mentally functions which form this impression come from “bodily intentionality” or “combined action of previous impressions”. In bodily intentionality, a viewpoint proposed by Merleau-Ponty-“the posture that my body adopts in the face of actual or possible tasks”¹⁰- is the best interpretation of bodily intentionality, and “explain diplopia in normal vision and a single object with the functions of visual organ and the use of visual organs by mental subjects”¹¹ is a manifestation of the functions of bodily intentionality. The author argues that the combined action of bodily intentionality on the intelligent thinking process is rooted in human existence, because bodily intentionality itself contains original bodily experience of time and space and this combined action of perceptual experience cannot

be achieved by AI by learning formulas and accumulating algorithms. Meanwhile, “combined action of previous impressions” is also a participant of intelligent thinking, e.g., personal experience of religious rite will form a transcendental mystical experience in sub-consciousness, such previous inner impressions will be recalled in later intellectual intuition out of the control of the subject’s will and become an inner combined action, e.g., the worship conducted by European church members in the Dark Ages often had transcendental experience in intellectual intuition. The author claims that bodily intentionality’s original experience of time and space and time and spatial awareness captured by intellectual intuition have become an essential condition for the combined action, and combined action of the two makes intelligent thinking nonlinear. While in inherent understanding of time and space, AI as an intellectual subject and human intelligence show the most fundamental difference.

II. The intrinsic understanding of “time” and “space” of human intelligence as “intellectual subjective”

As mentioned above, presupposing AI is an intellectual subject not only has scientific payoffs as evidence but also has philosophical studies as necessary preparations for the discussion. An object with intelligence means it can inherently understand time and space, even if in a way different from human. The author believes that the meaning of “understanding” here does not refer to pure reason, nor a reflective judgment, nor perceptual empathy or subjective ingestion of observed object, rather, “understanding” here means knowing about something, namely recognizing basic abilities of it, which is a ability shared by all biological existences; while the “inherence” of understanding means the independence of the subject in understanding, and it is a possibility of free thinking without the other as evidence in time, as the understanding of time and space is also inherent in the subject.

The author argues that AI as an intellectual object inherently “objectify” time and space when understanding time and space.¹² First, based on the presupposition of conditions such as AI installation program, algorithm setting and deep computing of data, all intellectual activities of AI are conducted according to “temporality”, for example, “time series data model” as one of the forms of AI’s inherent understanding of time forecasts and fit time series data according to the one-dimensionality of time; machine vision takes in and measures the displacement of a space object in accordance with the extension of space. Under this circumstance, when AI is intelligently thinking about time and space under the program, time and space are “objectified” as an observable object, “objectification” is the premise for observation and intelligent expansion; meanwhile, physical time and space as a support becomes a fundamental condition for AI as an intellectual subject that AI’s inherent understanding of time and space is impossible without the premise of physical time and physical space. This also means space and time which “relies on a subject” has an objective relationship with “subject itself”, rather than a “non-objective” relationship, in other words, AI is unable to be aware of truly primary time and space, and only by taking this primary time-space view as an operational goal can time and space truly enter the sight of its intellectual subject and be inherently understood, namely “objectifying” it.

Next, according to the viewpoints stated by the author earlier, the time quantum formed by AI advancing “the origin of determinism” and constant generation of “result” are intellectual results of inherent understanding of space and time. AI is likely to surpass or deviate from expected “result” in the process of determinism-prone (i.e. the

setting of manual program) thinking, while the “result” caused by intelligent thinking makes the origin determinism move ahead in the time dimension; when AI obtains this intellectual result, the process of delineating the time quantum of determinism and the unremitance of intelligent thinking are virtually still based on physical time and space, physical time and space is still the essential condition for the achievement of AI intellectual result. Therefore, when AI has an inherent understanding of time and space (i.e. acquiring the intelligent result about time and space), AI still relies on physical time and space. Hence, it can be assumed that inherent understanding of time and space depends on the primariness of time and space, and at this moment AI’s attitude towards time and space is also its attitude towards the “objectification” in its inherent understanding.

III. Inherent understanding of “time” and “space” of human intelligence

There are great differences between human intelligence and AI in inherent understanding of time and space. As mentioned above, human consciousness can be aware of non-physical time and space, and intuitive abilities can make transcendental apperception of sundry perceptual presentations possible, while Merleau-Ponty’s “phenomenology of perception” also can combine the human body and mind to act on intelligence. While the author argues that the most underlying behavior of human intelligence’ understanding of time and space is human “recollection”, which refers to human recombination of past experience, time and space. People’s dreams and usual recollection can all be considered as different ways of recalling. Besides, the recollection of presentations of everything and the essence of things as well as “non-objectification” characteristic of recollection itself are the most fundamental characteristic of human understanding of space and time, and this characteristic distinguishes human intelligence from AI.

The author holds that one-dimensionality of time and three-dimensionality of space are broken in the process of recalling, and physical properties of primary time and space are condensed in recollection, and time and space overlay, integrate, derange and even rupture in recollection. When discussing “duration”, Bergson said: “inside the self, a process of organizing conscious states and making them infiltrate each other is happening, and this process is real duration”.¹³ Moreover, Bergson argues that the real time should be objective and is a duration formed by multiple moments during inter-infiltration, while deep self-consciousness is continuous, “inner continuousness perceived by consciousness is nothing but mutual melting of conscious states and the growing of self”.¹⁴ This duration can be the form of human intelligence’s inherent understanding of time and space, but this form is incomprehensible to AI as an intellectual subject. Meanwhile, the author also believe that recollection is the best means of expression of this kind of inherent understanding that only when a man is recalling what Bergson called mutual melting of conscious state and representations and the understanding of the essence of things that man have experienced at the level of one-dimensionality of time and three-dimensionality of space can continuously break, overlay, fuse or rupture, that is to say, “When you are concentrating on something—taking walking stick of the blind—your mind seems not to isolate to see the attribute of this stick...You have integrated with this stick into one, feeling the world at the tail end of the stick.”¹⁵ The dreaming of an individual in subjective sub-consciousness, the film *Inception* and stream-of-consciousness novel *Remembrance of Things Past* written by Marcel Proust, these expressions through recombination of time and space in past experience of the subject in different forms can all be seen as

the forms of “recollection”.

It follows that when reminiscent human intelligence inherently understand time and space, what they capture is recombined “human experience”, rather than the form of time and space itself. The author believes that under human experience and consciousness, experience itself and the form of space and time bearing the experience are graded, and the experience that people recall is an essential condition for the formation of memory, so it is superior; whereas the form of space and time bearing the experience will not be first observed by recollection itself (or “recollection” cannot be possible), so it is superior. Furthermore, due to perceptual characteristics of recollection, those who concentrate on past experience and inherent understanding cannot become aware of the existence of time and space in intelligence, for instance, when cherishing the memory of and recollecting native land, what man inherently understands is experience related to homeland, and human intelligence focuses on the content of the experience recalled. “Enlightenment means this mind realizes and identifies with its complete temporal structure, means it is no longer obsessed with the power of objectification, and means it has acquired morals inevitably contained in wisdom.”¹⁶ This shows that human reminiscent nature makes time and space unable to be confirmed as an “object” that a subject is unable to truly realize “the existence of time and space” when inherently understanding past experience in the form of recollection, namely time and space cannot be “objectified”.

IV. The fundamental difference between the intelligence of AI and human intelligence in inherent understanding of time and space

As mentioned earlier, since recollection is a means of expression unique to human intelligence, time and space at this time are changed to the form subject to human in comparison with physical time and space. This change is human’s unique way of understanding time and space. Here, intelligence as AI and human intelligence have both similarities and differences.

As for the similarity, AI and human all need to rely on time dimension and space dimension to initiate intellectual thinking, but AI conducts intelligent thinking in one-dimensional time, “constant generation” of the “result” obtained is generated in one-dimensional time; likewise, when people are dreaming, recalling and cherishing the memory, they are also doing it in the time dimension, e.g., the duration of a beautiful dream and recollection that brings tears to your eyes. Therefore, original physical space and time enable the thinking of these two kinds of intelligence, intellectual thinking process of the two both need time and space for maintenance. In human-related fields and “human technology”-related fields, all existences are revealed by the existence of space and time, and this is a priori foundation and prerequisite to the occurrence of these two kinds of intelligence and their subjectivity that we discuss today.

But in terms of the difference, AI and human inherently understand time-space issues differently, such as “different ways of inherently processing time and space”, and “whether to objectify time and space”, and “non-objectification” of time and space is an unsurmountable obstacle for AI. At first, the two show “different ways of inherently processing time and space”. According to the abovementioned standpoints, AI’s inherent understanding of time and space has not broken the framework of one-dimensional time and three-dimensional space from beginning to end, for instance, the path of advancing the origin of determinism still is the path of one-dimensionality of time, because at this moment operating is still conducted under procedure setting in

one-dimensional time, unable to break the framework of one-dimensionality at root; whereas as for human intelligence, constant mashup and recombination of time and space in recollection means time and space in the inherent understanding are not the time and space with stiff physical attributes, but the space and time stretched and distorted by human intelligence, and this is the underlying difference between AI and human in time-space issues, because the interweaving of two dimensions-time and space is the primary reason why all things in the world were created, so, different ways of thinking about time and space should be fundamental; meanwhile, due to “recollection”, only in human intelligence can time and space show different features, while AI’s way of inherently understanding time and space shows its characteristics as a subject at root.

Then, AI as an intellectual subject must “objectify” space and time to truly inherently understand space and time; while human do not need to understand inherently on the premise of the objectification of space and time, as human understand space and time in a unique way-“non-objectification”. As previously mentioned, due to the thinking of intelligent program, AI is way better than human in grasping time and space, and the premise of this grasp and thinking is the objectification of time-space, or, intellectual object’s “thinking” process is out of the question; whereas when human are recalling, past experience will constitute an essential condition to make recollection possible, and people who are recalling (namely those who are in a mixed, superposed and ruptured space and time) cannot be aware of the existence of space and time in intelligence, namely they inherently understand with a “non-objectification” thinking. Hence, the author argues that whether to inherently understand time and space with objectification thinking constitutes the most fundamental difference between AI and human. So far, in the field of AI studies, non-objectification-based intellectual thinking to understand time and space remains unimaginable, even though human beings have simulated AI with powerful memory function afterwards, then when AI recalls past experience by means of “data retrieval”, retrieval itself and space- time as a carrier for data generation remains an “object”. Hence, only human are in the torrent of time, but do not know why.

V. Conclusions

AI vs human in different games is currently the hottest topic, and the passion for this topic is from AI surpassing human intelligence, which is manifested as human reflection on their situation. This article argues that presupposing AI is a “intellectual subject” is a prerequisite to comparing it with human intelligence, and AI will surpass or deviate from the intelligent “result” preset by human to some extent with its unique intelligence and subjectivity—shown as the advancement of the origin of “determinism”, while the constant completion of “result” makes this advancing process manifest as the extension of the one-dimensionality of time. Meanwhile, initial concepts of time and space and human intuitive abilities together with the effectiveness of mind and body depicted in phenomenology of perception make human intelligence present features different from AI.

Next, even if these two kinds of intelligence both base their thinking process on primary physical time and space, only by “objectifying” time and space can AI start intellectual thinking in inherent understanding; while human’s recollection mashups and recombines space and time in human intelligence, which is a thinking process of breaking one-dimensionality of time and three-dimensionality of space; meanwhile,

the empiricalness of what is recalled constitutes a definite evidence for “non-objectification” is human’s unique way of inherently understanding time and space. The most underlying difference between AI as an intellectual subject and human intelligence is precisely embodied in their different ways of processing time and space, and by far AI is still unable to process time and space by means of non-objectification.

RECONSIDERING REALITIES IN VIEWING PHOTOGRAPHS

Abstract | It has become incredibly easy to take photographs and share them with others in recent times. However, little work has examined how viewers of photographs regard what is depicted as a “reality.” As one explanation, theories of photography have adopted a causal relationship between a photograph and a photographed object supported by the image-making process of film photography. However, questions on what the reality is when viewing photographs and how it affects the viewer’s physical reality have largely been ignored.

To provide a new explanation of how viewers can believe a photograph to be “real,” the present study describes the realities which viewers are conscious of when viewing photographs. It has become clear that reality is often reconstructed by viewers using not only the photograph itself but related information such as a caption, memory, or related photographs. It has also been found that the way of perceiving the photographed reality could change depending on how viewers related the reconstructed reality to their own physical reality. For example, viewers encounter objects or events which are irrelevant to their own reality especially when they are viewing photographs on an SNS. They construct a new sense of reality by correlating a photograph with another photograph or comments. The reconstructed reality is mostly believed to be actual, especially when it has something in common with the reality to which the viewer originally belongs. However, sometimes the reconstructed reality does not exist, and is instead entirely virtual.

This study suggests that there is more than one type of reality perceived when viewing photographs, and different attitudes of appreciation affect how viewers of photography perceive these realities. The widespread proliferation of smartphones, SNSs, and 3D or virtual reality equipment have muddled the concept of reality since the users of these media and devices can easily become confused. For example, even though users may never have encountered a physical reality, they can conceptualize of the reconstructed reality as if it were actual. Photography as being relevant to both physical and reconstructed realities is therefore a good medium to consider in determining the nature of “reality” in recent media practices.

INTRODUCTION

Photographs provide images that look similar to the photographed objects. Furthermore, it has been maintained that there is a distinctive relationship between a photograph and a photographed object, especially in the case of film-based photography. Based on these points, photography has been considered as a medium which can provide faithful depictions of objects and experiences as if one is looking at the object directly. However, many studies on this topic hardly give adequate accounts of what the reality in viewing photographs consists of. For example, excessively retouched photographs, like the ones found on social networking sites (SNSs), can be considered as reflecting one kind of reality, even if they are inconsistent with what we consider to be the more genuine physical reality. To account for this new tendency in photography, the nature and structure of the reality posited in viewing photographs should be reconsidered. The present study examines the conventional theory of photography about reality and provides an explanation of why the conventional accounts are no longer applicable. To find a new way to explain the reality of photography, this paper discriminates between what photographs can provide and how viewers consider them to be real. It can be presumed that viewers' involvement with photography become the key to reveal how viewers perceive these realities.

WHY DOES REALITY MATTER?

Reality in the Conventional Theory of Photography

Through viewing photographs, viewers can come to know what the photographed object looks like. One of the reasons why viewers may believe that photographs visually tell the truth about their represented objects is that photographs have been considered as objective visual images.¹ Since they are produced by mechanical image-making processes, the actual appearance of the photographed objects can be maintained in the image. The causal relationship between the photograph and the photographed object is also an important factor used to explain why viewers can consider photographs to be "real." For instance, the "transparent thesis" presented by Kendall Walton provides an explanation of how photographs are transparent, much like the images of telescopes and microscopes. Since what photographs show depends on the photographed scene,² and what can be perceived from photographs is similar to that of directly seeing something,³ it can be presumed that viewers can literally see the photographed object through photographs.⁴ This relation between a photograph and the reality it purportedly represents has been referred to in conventional photography theory to support the claim that there is a huge difference between photography and hand-made pictures, not only in terms of the nature of the image itself but also the experience it can provide.

The New Tendency of Photography

However, since the forms and methods of using photography have become so diverse, it seems that the conventional explanation cannot be applied as it is to recent examples of photography. For example, taking photographs, retouching and sharing them with others has become easier and even mundane, so much so that photographs tend to be used as a distinct communication tool.⁵ Most of the photographs on SNSs show mundane events or objects that users encounter, so viewers can discover what users' lives look like through photographs. Even if photographs are excessively retouched, viewers can realize that they do not show the real appearance as they are and accept that they are still somewhat relevant to someone's physical reality. These recent practices indicate that the similar appearance to and the connection with the photographed reality is only one factor affecting viewers' impressions of actuality in viewing photographs. It

therefore seems that there should be another structure which can account for the reason why viewers can consider what they see via photographs as an actual reality.

PHOTOGRAPHS AS VISUAL INFORMATION

Visual Information without Egocentric Information

If what viewers see through the photograph is not always equal to the photographed reality, then what is it that the photographs convey? Although there can be a number of possibilities here, it is certain that at least one of them is visual information (i.e., v-information) about an object. The transparency thesis regards seeing photographs as working in the same way as seeing an object directly or seeing something through the aid of vision, such as via telescopes and microscopes. Strictly speaking, seeing something via visual prosthesis and via photographs are not the same in kind because seeing objects directly and via visual aids can provide “information about the spatial and temporal relations between the object seen and ourselves,”⁶ which is a form of egocentric information (i.e., e-information); in contrast, photographs cannot provide this kind of information. However, viewers can treat the information that they get from photographs in the same way because it is plausible that they can perceive what they need to in order to be able to recognize a real object from these perceptions. If the recognition of an object requires properties which have the proper qualities constitutive of vision,⁷ all viewers need to perceive an object is to be exposed to the appropriate properties. In this respect, photographs seem to provide sufficient v-information for knowing what the object looks like, regardless of whether viewers can get e-information from them or not.

Discriminating Between What is Conveyed and How it is Interpreted

According to Aaron Meskin and Jonathan Cohen, providing v-information without e-information can be considered as defining the special epistemic status of photography,⁸ but hand-made pictures, such as landscape paintings and still-lives, also have this feature. Nevertheless, why do people usually treat them differently? Meskin and Cohen claim that it is the viewers’ background beliefs which are relevant to understanding the way viewers discriminate between the two types of depictions.⁹ Although the viewers’ treatment is certainly different with respect to photographs and the other “pictures,” this explanation is still an inadequate answer to the question of why we can believe what photographs represent to be real. If photographs and paintings have a commonality in that they both provide v-information without e-information, more attention should be paid to the nature of v-information and the way in which viewers process it. In other words, it is important to discriminate between what is conveyed by photographs and how it can be interpreted by viewers in order to reveal the peculiarity of photographic reality.

RECONSTRUCTING “REALITY”

Vividly Visualizing Reality through the V-information of Photographs

To consider the reason why viewers treat the v-information provided by photographs as real, let us look at some examples of photographic appreciation, i.e., viewing photographs in one’s own albums with printed photographs and on SNSs. In the case of one’s own albums, each photograph shows a distinct part of one’s own past. Even if the photograph only shows a small part of an event, it is still possible for one to recall what happened through viewing it; in other words, it is possible to supplement one’s recollection of the past with photographs. In the same way, viewers can also visualize the reality which they have never seen. For example, viewers often encounter things which they cannot or could not see directly through photographs on SNSs. Such

images often tend to be a fragment of someone's daily life, like a cup of coffee or a "selfie" of a fancily dressed person. Each photograph does not always seem to capture an important moment or event, so these images might be seen differently than those from an album. However, what if the photographer or the contributor is a friend of the viewer? In this case, viewers can connect what they see through the photographs to the person who took or posted them. Even if the contributor cannot be seen in any of the photographs, viewers can see the photographs as representing their friends' realities. These examples indicate that the v-information provided by photographs has high binding affinity to the genuine physical realities, so viewers can connect what they saw in photographs to the actual reality and vividly visualize it. Connecting photographs with physical reality can change the way in which we perceive photographs, and in the same way, such changes might also affect our view of physical reality. In this way, we can have an image of a reality richer than a photograph shows.

Reconstructing Reality by Similarity

This idea is exemplified in the case in which viewers do not know a lot about the contributor; here, many different photographs posted on SNSs with comments and hash tags can play the same role as the viewers' knowledge or memories. Viewers can easily connect one photograph to other photographs through SNS markers, and these accumulated viewing experiences of photographs along with the subsequent communication with other viewers make it easy to visualize a reality which the viewer has never seen and never will. What this means is that the v-information provided by photographs can be connected with not only the photographed reality but also with the non-visual or other information related to the photographed object. Colleen Boyle claims that viewing related photographs can be an aid to learning about what the unseen object looks like.¹⁰ For example, she describes how viewers understood the detailed appearance of the moon at a time when photography could not yet capture the moon. Since photography of the actual moon was not yet possible, in *The Moon* published in 1874,¹¹ analogies with other visual images, such as a photographed plaster model moon, a cracked glass orb, and a wrinkled apple, were used to convey the lunar landscape. They were then conceptually integrated by viewers and perceived as one comprehensive image of the moon¹². By referring to the image as a "reconstructed reality," not only is the v-information which looks similar to the photographed object important, but so is the v-/non-v-information in composing elements of reconstructed reality. If the analogy is guaranteed to some extent, retouched photographs can also be a components of a reconstructed reality in the same way as ordinary photographs.

THE MECHANISM OF CONSIDERING RECONSTRUCTED REALITY AS ACTUAL

Supplementing a Lack of E-Information

Although the reconstructed reality is comprised of more than just v-information, it still lacks a basis in e-information. Furthermore, it is difficult to dismiss the claim that the reconstructed reality is merely an imaginary one. Taking these matters into account, how the reconstructed reality functions as if it were an actual reality still remains controversial. However, to explain how the lack of e-information is supplemented in such cases is not so complicated. As mentioned above, in the process of reconstructing reality, various related information is associated with a photograph. Some of the information tells the viewers when and where the photographs were taken. Although the means of obtaining e-information are different from that of ordinary seeing, such information enables viewers to properly position the reconstructed reality.

The Spatiotemporal Conjunction

However, simply connecting e-information with a photograph does not make a reality

appear as if it were actual. For example, when viewers posit the reconstructed reality as “there and formerly,” the gap between the reconstructed reality and the reality of “here and now” which the viewers belong to is so wide that viewers might only be able to generally ascertain the v-information without feeling as if they were seeing an object directly. In contrast, if viewers can obtain sufficient information about the photographed object or the photography itself, the gap between “there and formerly” and “here and now” may begin to close, and viewers may perceive the reconstructed reality as if it were “here and formerly” or “now and there.”¹³ The latter spatiotemporal conjunction, which can be applied to photographic appreciation on SNS, enables viewers to believe that the separate realities are contiguous. Despite the fact that viewers can easily understand that the photographed reality is not “here,” they can feel as if they were seeing it directly.

The Function of Reconstructing Reality

One problem with this proposed model is that the spatiotemporal conjunction is unrealistic. If viewers treat an object of such perception as if it were real despite its unreality, this is because the whole process, from taking photographs to viewing them, makes the reconstructed reality more actual. Viewing photographs is not the same as ordinary seeing, especially because the view of the perceived object will not change continuously as viewers move in space¹⁴ or across time.¹⁵ However, it seems that the reconstructing process consisting of the interaction between the technology of photography, application programs, and viewers generates similar changes which movement or time itself can facilitate. For example, recent photographs are frequently uploaded on SNS, and the programs or users arrange the related photographs together, so it is possible to see photographs in a time series or an appropriate category, such as by contributor, location, or the same hashtag.¹⁶ The reconstructed reality can be renewed according to the addition of new posts, communication, or other ways of relating what viewers now see with what they have already seen. In this respect, reconstructed reality is not stable nor temporal, but variable and latently affects the other reconstructed realities. This enables viewers to treat the reconstructed reality as an actual reality, but the repetition of this process might make the boundary between the genuine physical and reconstructed reality unclear and change the concept of reality.

CONCLUSION

This study examined the nature of reality in viewing photographs. In conventional theory, it has generally been maintained that what viewers see in photographs seems to be consistent with the photographed reality, but this is not necessarily true. Although viewers get v-information from such photographs which is almost the same as what they would obtain in ordinary seeing, the way of processing this information is somewhat different. Viewers supplement e-information with other relevant information and reconstruct a reality which consists of not only photographed reality, but multiple realities, i.e. viewers’ past/present realities, unseen reality, or sometimes an imagined future reality. This indicates that photography can be defined as a tool which allows viewers to expand the concept of reality or reconstruct new and sometimes pseudo-realities, in contrast to the conventional theory which considers photography as a visual prosthesis. This conceptual transformation is not only a matter of photography proper, however. The widespread proliferation of smartphones, SNSs, and 3D or virtual reality equipment have muddled the concept of reality. It therefore seems that the perception of reality through these media has some important similarities and differences with the more conventional accounts of perceiving photography, so it is hoped that this study will contribute to a better understanding of recent media practices.

- 12 As Boyle claims, viewers build their own images which consist of fragments and can then know the whole of the objects "more than the sum of their parts." Boyle, "Eyes of the Machine," 231.

13 Roland Barthes called the former relationship a “real unreality,” and Thierry de Duve considered the last relationship as an illogical conjunction of time and place. See Roland Barthes, “Rhétorique de l’image,” *Communications* 4, (1964): 47, and Thierry de Duve, “Time Exposure and Snapshot: The Photograph as Paradox,” in *Photography Theory*, ed. James Elkins (New York: Routledge, 2007): 114. I have examined the mechanism of these relationships in Shiori Emoto, “Time in Viewing Photographs: Dynamic Changes and Diversity,” *Bigaku (Aesthetics)* 67, 2 (2016): 61-72 (in Japanese).

14 For this reason, Bence Nanay claims that seeing photographs is not the same as ordinary seeing, and that photographs are not transparent. See Bence Nanay, “Transparency and Sensorimotor Contingencies: Do We See Through Photographs?,” *Pacific Philosophical Quarterly* 9, (2010): 463-480.

15 Currie, *Image and Mind*, 67.

16 I have already discussed how viewers reconstruct a reality on SNS in Shiori Emoto, “Viewing Photographs and Expanding Our Image of Reality: Reconfiguration of Time, Place and Photographers/Senders,” *de arte: Journal of Kyushu Art Society* 33, (2017): 89-106 (in Japanese).

Shiori Emoto is an Assistant Professor at the Faculty of Humanities of Kyushu University, Japan. She has been a secretary of the Japanese Society for Aesthetics since 2013. Her research interests are in theory of photography, ranging from conventional photographs to recent media practices in relation to the networked photograph. With the aim of searching a new way to explain the recent experience through photographs, she has studied the structure of viewing photographs and the reality of photography. She is the author of academic papers in Japanese: ‘Viewing Photographs and Expanding Our Image of Reality: Reconfiguration of Time, Place and Photographers / Senders’ (2017); ‘Time in Viewing Photographs: Dynamic Changes and Diversity’ (2016); and ‘Photography as an Active Process: From a Viewpoint of the Correlation between Photograph and Context’ (2016).

CREATIVE ROBOTS

Abstract | We live in times in which is growing importance of artificial intelligence and the expectation of increasingly intelligent systems. As artificial intelligence and intelligent robots take over human various functions, there are questions about the sort and scope of their activities in relation to human capabilities. This process raises the question, do we can identify such spheres of human activity, that cannot be replicated by intelligent programs or robots? It seems, that such properties are human emotions, sensibility and creativity. In this article I analyze whether intelligent robots could be artistically creative and if could replace in this process a human? The thesis of this article is, that although it is difficult nowadays to indicate innovative creative robots, it is really difficult to denied, that intelligent robots are not creative in some sense, and that they make an art. There is the perspective, which emphasizes that today's human nature is not copy able in this sense by robots and artificial intelligence. We also try goes to the outside of homocentric attitude, assuming that creativity is not owned, but the property of the human, and when we talk about artificial intelligence, it is possible today to allow it a certain kind of creativity.

Index terms | *Creation; artificial intelligence; reproduction*

One of the merits of creativity is that it has become a focal point, and thus a point of access, for transdisciplinary research in fields including cognitive psychology, design science, and artificial intelligence. Contemporary AI recognizes creativity as an attribute that is highly desirable in artificial systems yet poorly defined and poorly understood.

Mitchell Whitelaw, *Metacreation. Art and Artificial Life*¹

Is it possible to come from that position and still believe in the possibility of machine creativity? Certainly! I believe that my dialog with AARON is an example of machine creativity, albeit a small one.

Harold Cohen, *Driving the Creative Machine*²

If you could talk about creativity³ with reference to artificial intelligence and robotics, you should basically pre-define the characteristics of this phenomenon which is seen from that analytical perspective. Furthermore, such a question should be referred to questions as e.g. whether intelligent robots are in the capacity of understanding at any level or even differently than the human mind does so what the nature of art and creativity are, and/or whether you could even await the emergence of such a phenomenon as creativity in intelligent and non-biological beings? And then you need to examine whether or not this phenomenon is an exclusively human feature and intelligent robots owing to the human powers could only mimic their artistic process? Let us imagine a software designed for painting in the styles of Jackson Pollock⁴ or Pablo Picasso⁵. It is an easy task for a chosen algorithm to learn to paint in one of those styles mentioned earlier. However, it is not a creative action in terms of innovation as the software was designed in order to follow patterns of abstract expressionism or cubism, and as such it is beyond its capacity to create a new painting style, though it still could paint new and good paintings in Pollock's or Picasso's styles. Such a software solution shall remain "passive", because it still fails to use a feature or structure which could allow to cross the boundaries of imitations and replications and adopt the powers of innovation and novelty.

Firstly, we need to define the term "creativity" as a process of creating new art forms emerging only from learned and/or programmed art style, imitation, copying an artwork. Intelligent art robots are creative in the sense that they are capable of building e.g. different images. Their job is to adjust a new art form to any general template, which should, undoubtedly, have certain concrete parameters and saved instructions in the database and algorithm of the software.

Secondly, we speak of "creativity" applying the term with reference to originality and novelty of the work of art. This type of creativity could be linked with more sublime phenomena, that is the case when a totally new qualities in the work of art could be visible which have no parallel in the history of art. Such a creative approach could be linked to solving a certain art problem, either formal – i.e. creating a new art style – or conceptual – i.e. revealing in a unique way a new vision of reality. If this is the case, we may expect major changes in art leading us to discover new deeper dimensions of art. However, I suppose that this level of creativity is unattainable for an intelligent robot. In this above mentioned case of the artbot-copyist you may inquire whether or not its actions are similar to human copyist? While scrutinizing the problem from the cognitive sciences' point of view you could note that both cases involve biological or technological Optical Character Recognition (though this term seems more suitable for the artbot than human work). Juxtaposing the terms copying and creativity we mean the same situation in which human-artist and artbot take action, in other words the process of copying (and not creating). As the objective of the activity

is to copy the picture as faithfully as well as it is possible, there are no features of individual creativity, but only imitative work. The question of copying is not so emotional like the issue of creativity involving novelty and/or originality.

Therefore, you could claim that the human resembles a robot, because no creative features are present in the case of copying, and you could only admit that all you need here is the robot's perfect rendition. The analysis of the rendered copy shows no major differences between the robot's and the human's works. Clearly, the pictures could be different, but their intentional origin is the same as the purpose of the rendition is to faithfully mirror the original work. This is, notably, an additional aspect of our comprehension of art, by which I mean the human-centred assertion about the origins of the artwork. Due to unclear reasons man-made copies seem to be more appreciated than the job done by a robot. Thus, owing to algorithm development and operating systems improvements robots are likely to become better copyists than man in the future. This may resemble the transfer of knowledge from the master to their disciple, but with the reservation that robots gather and enrich knowledge continually, and then pass it in its entirety in the moment of copying data to the robot of next generation, which is *mimesis* at the ultimate level of excellence. Even though nowadays the humans could surpass intelligent and creative robots in such a way that they are unlikely to create a new type of artistic style and/or new artistic trends, they may achieve excellence in copying and, possibly, the human shall not be able to challenge them.

My point is that intelligent, artistic robots such as AARON⁶, *E-David*⁷, *Paul*⁸, *Shimon*⁹, *Emily Howell*¹⁰, could be creative in the first meaning of the term as shown above, therefore we could apply the term *imitative creativity*; by contrast they are not creative as shown in the second definition which could be named by *innovative creativity*. This difference may show the nature of intelligent art robots and the human. However, if we open to accept the possible existence of a creative structure, which could be named *an algorithm of creation* originating from a creative human, and if we could spot and extract such a structure in the human brain, then we could build a metaphysical base for non-biological existence of creativity and generate algorithms of creativity and implement them in Artificial Intelligence.

My question is whether or not Artificial Intelligence software needs creativity and art? You may argue that this question reveals some form of inadequate homo-centered thinking with reference to non-biological and intelligent beings which could behave differently and have other needs than we, humans, do. The replies to the question above nowadays arouse a variety of views in cognitive sciences which, naturally, originate from the questions on the existence of consciousness in Artificial Intelligence. The views are different and, basically, most authors happen to accept certain assertions without making necessary efforts to substantiate them. If we presume that Artificial Intelligence robots have their own mental representation of the world, even though without easy access for humans, then we could acknowledge their creative behaviours. Intelligent robots do not create objects like artists create their artworks, therefore we could put philosophical questions about their capacities to build new intelligent beings and/or find solutions to existing problems. On the contrary, if you assume that Artificial Intelligence robots have no links to any form of consciousness, then you could comprehend their creative behaviours as imitative actions in terms of artistic permutations resulting in the creation of next works of art which shall resemble one another.

My question is as follows: *What are the facts/features behind innovative creation developed by the human or even Artificial Intelligence?* My intention is to pinpoint the claim that *algorithm of creation* originates in the creative human. This argument

in my deep conviction indicates a metaphysical base of creation and describes how the innovative creativity may look like.

In general meaning of the term creation is a type of algorithm shared by a variety of beings, then starting from the recognition of their ontological difference referring to their substance, you may ascertain novelty-driven human nature and seek metaphysical cause for such creativity. Innovative creativity originates from creative structure in man's brain, that is *algorithm of creation*, which, if found and applied in Artificial Intelligence, could operate in it in line with its essence and, apparently, develop. Therefore, you could claim that it could be easier to be a creative and innovative robot than a creative man. If this is the case, you could expect that the best artists of the future shall be intelligent robots, and not humans as it used to be so far although the genesis of creation itself remained in the human brain.

The objective of creative artbots was to show that if programmed, robots may be creative, however to a limited extent. If you could use the metaphysics of *the algorithm of creation* which originates in human brain, the innovative creativity of robots may be possible. But, the most important conclusion from the analyses of creativity above is the ontological genesis, and not ontological difference. You could imagine that we encounter a man at an early stage of their evolution, e.g. coming from the cave art paintings of Lascaux Cave. The human nature has the power to liberate an act of creation from itself, that is I do not mean anything like an "outer software" of man, but their natural evolution and their "software" brain. My considerations imply that intelligent robots could only be imitative, but if they possess this human feature of creativity, they could be able to understand what the concept of art is.¹¹ It could be possible that they will trigger such a quality like unknown artists of the Lascaux cave. By now you could argue that artistic creation should be discussed in the context of the human activities rather than in intelligent robots, however, you need to recognise that machines have some potential which is beyond human attainment, e.g. they could solve problems which man is unable to do. Perhaps there exist two natures which are slightly different, which lead to genetically inherent ability to possess and understand works of art, which makes humans different than other beings, e.g. more intelligent creatures.

3 The use of the terms 'creative' or 'innovative' refers to, firstly, intelligent and artistic robots, but, secondly, it may arouse doubts coming from the stance to defend humanistic values leading to assertion on the overinterpretation of such behaviours. My point is to claim that intelligent robots are creative, but not in the meaning referred to man.

L'ART POUR L'ART PATTERN AND THE AUTOTELIC INTELLIGENT MACHINERY

Abstract | The emergence of computerised society and virtual worlds centred contemporary art practice and research around the question of how the manipulation of symbols and the internal structures of media produces New Realities. The early 19th century cry for the Art for art's sake, the had inhaled the breath of modernity and autonomy to art. Romanticism emerged as a counter reaction to the Industrial Revolution, the scientific domination of reason, and the limits of calculable reality. The singular originality of the artistic expression brought up by artist's manual work, stood in strong opposition to mimesis and mechanical reproduction. A century later, Modernism proclaimed a freedom of artistic expression and emancipation of art, which were related to the artist's self-asserting capacity, the condition of self-government, and the ability of self-organisation. Quest for the new art—defined by the extend of dimension, variable point of the observer, and the analytical methodology—alternated Impressionism, Postimpressionism, Neo-Impressionism, Fauvism, Cubism, into Constructivism, Suprematism, Neo-Plasticism... until the mechanically produced art and abstraction reached its legal status in the judgment *Brancusi v. United States* in the 1927-28.

Inner-directed aesthetic evolution of the *L'art pour l'art*, analysed relationships between the minimal signals of the artistic expression such as line, colour, form, gesture and emotion. Its first computational application, in a form of "minimal algorithm," was the experimental information-based aesthetics of the mainframe experimentalism in the 1960s. Ever since the Lady Lovelace's Objection—which states that we can make machine solve any problems whose solutions we can identify—the debating topic had been the possibility if there could be intelligent machinery, a term of Alan M. Turing, or artificial intelligence, as John McCarthy named it in 1955. For Turing, construction of intelligent machinery was the question of learning. Today, Google supported experiments mimic artistic expression, the neural-net-based algorithms are learning the language of prominent artists of the past in order to produce new artworks their manner, such as Inceptionism relates to the network learning capabilities in doing image recognition tasks made up of patterns based on stylistic features of the post-impressionist painters. This paper will focus on aesthetic evolution of the *L'art pour l'art* pattern to current digital mimesis, and the future possibilities of autotelic intelligent machinery.

Index terms | *electronic brain; new realities; brancusi v. united states; information aesthetics; Lady Lovelace's Objection; artificial intelligence*

***L'art pour l'art* and the Autotelic Intelligent Machinery**

“Why could we make programs do grown-up things before we could make them do childish things? The answer may seem paradoxical: much of ‘expert’ adult thinking is actually simpler than what is involved when ordinary children play!” Marvin Minsky, 1988

The metaphors *electronic brain* or *thinking machine* refer to a computer, its conceptual definition as a universal machine that manipulate representation of reality, or to its function as a programmable electronic device that can store and process data according to instructions, and produce a result in the form of signals (information). In his 1936 paper “On computable numbers,” Alan Turing (1912-54) explained an idea of the universal machine. He stated that such a single computing machine—that operates with two kinds of symbols, 0 and 1—would be able to “compute any computable sequence” by reading symbols on a tape whose purpose would be to program the device. That concept became a blueprint for store-program computers. Due to its practical applicability to a wide range of human activities, computer has become part of our everyday life. The *electronic brain* has been used to manage complex systems and forecast trends, to produce art or simply for home entertainment.

Lady Lovelace’s Objection

The Romanticism had inhaled the first breath of modernity and autonomy to art. The sublime encounter of the Romanticism has been carried through the emotions of extreme, the experiences of cataclysmic forces of nature, and the brawls with an incalculable power of *Fortune*. It was a counter reaction to the Industrial Revolution, the scientific domination of reason, and the limits of calculable reality. Disappointed hopes for the Age of Enlightenment, had made Romantic World bit wiser but infinitely more melancholic and desolated. The nature and animals were the Romantic metaphors for human behavior not the mimic of reality. Automatized *Jacquard-loom* (1839) could wove portraits or pictures of nature. Jacquard made his portrait woven by 24,000 punched cards, but even if the *Jacquard’s portrait* was made by Jacquard on the Jacquard’s loom, nobody called it “Self-portrait of Jacquard.” The central notion of Romanticism was the creativity and originality of the artist—imagination and individuality exhibited in the subjective view and the extraordinary unrepeatable experience of the World. At that time, the singular artistic expression brought up by artist’s manual work, stood in strong opposition to mimesis and mechanical reproduction.

English engineer Charles Babbage (1791—1871), had possessed and admired *Jacquard’s portrait*. His *Analytical Engine* was designed to have programming data input based on Jacquard’s punch cards, it would have been able to do basic operations, and to pick out possible action as a result of the outcome of previous actions; but the full-scale model of the engine had never been built. In the notes for the translation of Menabrea’s article about *The Analytical Engine*, published in 1843 in the *Scientific Memoirs*, Augusta Ada Byron King (Countess of Lovelace, 1815-1852) indicated that the performance of universal programmable machine would depend on the user’s instructions. That underlined the main difference between the new concept of universal machine and advanced calculator, clearing the way for the conceptualization of software, designed as a set of instructions telling a computer what to do.

The Analytical Engine is an *embodying of the science of operations*, constructed with peculiar reference to abstract number as the subject of those operations. The Difference Engine is *the embodying of one particular and very limited set of operations* [to underline the analogy she added] *Analytical Engine* weaves algebraical patterns just as the *Jacquard-loom* weaves flowers and leaves. (Lovelice Note A, in Menabrea 1843)

Ada Byron, *The interprestress of The Analytical Engine*, has been often attributed as the first programmer. She articulated the future function of device and predicted that machine might be used to create complex music or graphics. Her famous observation that “*the Analytical Engine* has no pretensions whatever to originate anything. It can do whatever we know how to order it to perform,” became known as *Lady Lovelace’s Objection*, as Alan M. Turing dubbed it. The engine, she explained, “can follow analysis; but it has no power of anticipating any analytical relations or truths. Its province is to assist us in making available what we are already acquainted with.” (Lovelice Note G, in Menabrea 1843) *Objection* reflects that we can make machine solve any problems whose solutions we can identify. The general-purpose machine, which led to computerization of specialized work, had been developing into two tracks, as a practical tool and an artificial intelligence. Ever since the *Lady Lovelace’s Objection*, the debating topic had been the possibility if there could be *intelligent machinery*, a term of Alan M. Turing; or *artificial intelligence*, as John McCarthy named it in 1955. For Turing, construction of *intelligent machinery* was the question of learning. Unlike the most of engineers, who were preoccupied with the speed of calculation, Turing had considered memory as fundamental for the development of computing, and its future possibility to learn. He had foreseen that with the technological advancement, human interest would shift from arithmetical computing into “philosophical questions of what can in principle be done?”

The New Reality

Niels Bohr used a metaphor of the solar system to depict how electrons orbit around the nucleus. He struggled with a limiting condition of the scientific language which was insufficient to explain the abstract interrelationship of elements of an atom, what’s more, those were the phenomena that science did not considered as “real.” The struggle to interpret “new” quantum reality by the means of “old” vocabulary, led him to the problem of the nature of language determined by the world knowledge. In response to that question, as the act of creative thinking in-between the formal logic and the intuitive insight, Bohr said: “We must be clear that when it comes to atoms, language can be used only as in poetry. The poet, too, is not nearly so concerned with describing facts as with creating images and establishing mental connections.” One can only speculate what would be the visual modeling of the 1913 Bohr’s atom, if he had sought an inspiration by looking at the “high” phase of “hermetic” Cubism (1910-12). Could the solar system metaphor be replaced by a new visual language affected by cubistic abstract representation of modern world, fragmented in multiple points of view, broken in time, constructed of modular facets as an illusion of a continuum. Could the visual modeling of atom be enhanced by art and science interaction, less constrained by formal language, however, these issues will remain a matter of speculation.

Quest for new art made the paradigm shift and an U-turn from *mimesis*. Freedom of expression translated a long-term linear conjuncture of grand artistic styles into a dynamic shift of short-term art movements. During and after the First World War,

irrational intellectualism of Dada and Surrealism detonated traditional values and disciplines into the chaos of simultaneous personal epistemologies. Many years later, while he was working on a system of artificial intelligence, Marvin Minsky used the analogy of painting to explain the informational connectivity and the connectedness of the way human think. In his prominent book *Society of Mind* (1988), Minsky stated:

The art of a great painting is not in any one idea, nor in a multitude of separate tricks for placing all those pigment spots, but in the great network of relationships among its parts. Similarly, the agents, raw, that make our minds are by themselves as valueless as aimless, scattered daubs of paint. What counts is what we make of them. (Minsky 1988, 41)

The way we link unites of information moves focus from accumulation of knowledge, acquired while growing up, to the new ways of organization of connections between knowledge units that produce reasoning. Inner-directed aesthetic evolution of the *L'art pour l'art* pattern, analyzed relationships between the minimal signals of the artistic expression such as line, color, form, gesture and emotion. According to Gabrielle Starr's research in neuroscience of aesthetic experience:

Aesthetics experience relies on distributed neural architecture, a set of brain areas involved in emotion, perception, imagery, memory and language. But more than this, aesthetic experience emerges from networked interactions, the workings of intricately connected and coordinated brain systems that, together, form a flexible architecture enabling us to develop new arts and to see the world around us differently. (Starr 2013, XV)

The first computational application of the minimal signals of the artistic expression was the mainframe experimentalism in the 1960s. "Algorithmic art" or "universal picture generator" emerged from the *information-based* aesthetics. Upon research on the Stuttgart school computer art methodology, Christoph Klutsch argued that the limited computing capacities drove mainframe pioneers toward efficient algorithms, rigorous computing and radical rationalism in the aesthetic evaluation. The cluster of mainframe artists-scientists included Frieder Nake, Georg Nees, Manfred Mohr, Vera Molnar, Marc Adrian, and Zdenek Sykora (in Europe); A. Michael Noll (in America); Waldemar Cordeiro (in Brazil); Computer Technique Group and Hiroshi Kawano (in Japan). The main-frame computer art exhibitions were *Cybernetic Serendipity* in London 1968, Zagreb *Tendencije 4* in 1969, and the computer art exhibition section at Viennese Biennale in 1970. But digital graphics pioneers, had to face critique that it was "only artificial art." (Klutsch 2012, 71-84)

Along aesthetics breakthrough of modernism, that enabled emergence of information aesthetics and mainframe "artificial art," the main social norm shift was transition from handmade to machine production. The ground case, *Brancusi versus the United States*, raised the issue of machine produced "original" and legal aspect of the "current art." Nowadays, Brancusi's *Bird in Space* (1926), the perfect shiny abstract form, is thought to be the sculptural essence of a bird in flight, which serves as a role model for the students worldwide. However, the customs officers of the United States considered it as an odd, yellow metal object of undefined purposes. They categorized it under the *Kitchen Utensils and Hospital Supplies*, and as such, it was taxed at 40% of the value of the material from which it was made. According to US law, works of art were not subject to customs import tax, but the customs officers had not perceived *Bird in Space* as a sculpture. Back then, US law defined sculpture as a reproduction of sculptural work

made by molding or carving, which was result of imitation of natural objects, mostly human form; it was made by hand of the author, like an original. Outraged, Brancusi put a case before the court. The trial lasted during 1927-28. After the testimony of the art scene, judge J. Waite rejected the traditional definition of the sculpture as not relevant. On the judgment *Brancusi v. United States*, he stressed that “In the meanwhile there has been developing a so-called new school of art, whose exponents attempt to portray abstract ideas rather than imitate natural objects. Whether or not we are in sympathy with these newer ideas and the schools which represent them, we think the facts of their existence and their influence upon the art worlds as recognized by the courts must be considered.” The verdict officially recognized *Bird in Space* as sculpture, its status of the original made by a professional sculptor, and therefore, its status of an artwork, which can be exempt from customs duties and freely introduced into America in accordance with paragraph 1704. (Cleary 2014, MoMA blog)

Toward the Intelligent Machinery

In the pioneering days of AI, knowledge was implemented as a closed system, rule-based program designed to harvest, store, manipulate, interpret information upon human-crafted rule sets. If the rule-based program had available straightforward feedback, it could progress in building knowledge efficiently. But, the labeling of the choices, as “true” or “false,” “good” or “bad,” becomes a tricky one in an ambiguous chaotic real world environment, where knowledge has a large variety of different types, where actions have distant, often unpredictable consequences. The biggest challenge for the design of AI applications have been to provide a complicated management frame for the world knowledge, intuitive knowledge or common sense, as the life-long learning of rules and exceptions.

Currently, public funds and big IT companies have been pushing AI investments to further understanding and improvement of the capacity of deep learning architecture. For example, advancement of browser performance motivated Google to push development of the neural-net-based algorithms for automatic classification of photographs aimed for machine translation. Google also supported the experiments like *Inceptionism*—made in 2015 by Alexander Mordvintsev, Christopher Olah and Mike Tyka—which aimed to further understanding and improvement of network architecture learning capabilities in doing image recognition tasks made up of patterns based on stylistic features of the Post-Impressionist Painters. Machine learning was used to recreate style of movement upon analyzed paintings. But essentially, the feel of *Inceptionism* was based on the aesthetic experience and emotion of Post-Impressionism. It is not newly created aesthetic stimuli that reconfigure aesthetic value, hence, the neural network follows already known pattern, the Post-Impressionist relation of value between combined units of information.

Diversity of aesthetic experience and novelty are fundamental for human cultural evolution. Gabrielle Starr argued that “the unpredicted, evolving rewards of aesthetic experience are key to aesthetic experience on a neural level, and as they are integrated into the fabric of memory and imagination, they may become part of our future predictions—our hopes and beliefs about the world.” (Starr 2013, 149) Connectedness of human mind is the most important intellectual feature which enables our evolution by transferring of previous experience, or creation of ideation that is unprecedented in the cultural or scientific system. The possibility of Autotelic Intelligent Machinery is thus linked to the question of creative work as a complex semantic and emotional stimuli

that has an end or a purpose in itself. Or to put it simple, do machines need art?

TECHNOLOGY AND AESTHETIC EXPERIENCE IN CONTEMPORARY ART

Abstract | Our analysis will be focused on the dominant role of cultural institutions and media in the production and distribution of art that changed the dominant regime of artistic creation in contemporary society of the last decades of the 20th century. It is evident that this art is subjected to economic and cultural imperatives. Even more, it is a part of a technological society and a culture of amateur pursuits within the actual regime that governing it, leaving a lingering doubt about the authenticity of aesthetic experiences.

The communication will concentrate on opposing view of two philosophers Theodor Adorno and Jürgen Habermas, concerning the cultural industry and the degeneration of the political, ideological and anti-cultural dimension of art. The emphasis will be given on how Adorno refuses to come to a compromise with the cultural industry, thus overestimating the value of subjective experience, while Habermas will support the important role of media in the renewal of aesthetic experience and in order to enrich the daily life.

Index terms | *aesthetic theory, media, Culture Industry, instrumental rationality, aesthetic experience, communicative rationality.*

1.Theodor Adorno writes *Aesthetic Theory* at a time of transition, with regard to the ontological status of art in post-industrial societies. It is a historical period, that of the 60s, when the conflict and the confrontation between contemporary art and its pioneering contestations have reached a certain peak.

It is well known that the philosophers of critical theory attempted to analyse the modern societies in the light of an idea established in an exemplary way, for a liberated society. To this end, they proceeded in analysing contemporary, social and ideological conditions. The shift of Adorno's critical theory, from theory to practice, is fully documented in his *Aesthetic Theory*. Moreover, the contribution of art to philosophy, as we shall see further down, will be immeasurable.

So, the *Aesthetic Theory* will follow the course of avant-garde work of art in the first three decades of the 20th century, as the art is socialized, overcoming the metaphysical character of the previous centuries' art and at the same time generates its refusal. In this way, art will oppose to the new order of capitalist production that is progressively established. This possibility of denial is based, as we shall see, on its autonomous character.

Through the observation of the course of the art's development, we will notice that the problems of society and the individual become, for the first time in history, the main interest of art. Cubism, for example, appears at a time of positivism and scientific evolution. There was the tendency to subjectively overcome objectivity, i.e. to overcome the alienating material conditions that humiliated man. This overcoming becomes more obvious in the works of painters, such as Pablo Picasso, in 1907: *Les Femmes d'Alger (O. J. R. M.)*, Figure 1, and Georges Braque, with *The Woman with a Mandolin*, 1910, Figure 2.

Then, if we look at the abstract forms of art towards which pioneers' art has turned, we realize that they are presented as an aesthetic-artistic concretization of the conscious and critical reaction towards: a) the disasters created by capitalist expansion and barbarity; and b) the degradation and conversion of the individual to a mere object. In this case the work of modern art disputes the reality and acts effectively to the public.

Following some examples of works of art, we refer the artist Wassily Kandinsky who believes that objective reality can be treated *abstractly* and thus simplify the form to the extent of geometric depiction. See his work: *Arc and Point*, 1923, Figure 3. Thus, modern art is firstly led to the non-objective, as this is characteristically expressed in the work of Kazimir Malevich, who in 1913 exhibits a table depicting: *Black Square, Red Square*, Figure 4. In the end Piet Mondrian's goal to eliminate the objective world in his art is evident. It is a rational, more mathematical, deduction. See his work: *Composition , II*, 1920, Figure 5.

We conclude that, with regard to the rationalization of this alienating condition for man, contemporary art is autonomous, reaching absolute forms and a complete break with the status quo, the social reality and the formal and long-established ways of thinking and expression. As Adorno asserts “Capitalist society hides and disavows precisely this irrationality and in contrast this art represents truth in a double sense: it maintains the image of its aim, which is obscured by rationality, and it convicts the status quo of its irrationality and absurdity”

From the negative attitude of the avant-garde’s work of art towards the established society, the fact that aesthetics should be fundamentally negative and theorized as such by Adorno results also from the negative attitude of contemporary art. It appears as a *negative* aesthetic through the refusal of the philosopher to outline the profile of a *different* society, deprived of the dominant ideology, competition and violence.

So, according to Adorno, art is a social phenomenon and at the same time it goes beyond its inclusion in empirical reality because the work of art, through its form, criticizes society and reveals its autonomy, its self-efficiency by creating the very criteria of its presentation. The autonomy of the work of art is precisely the aesthetic element, which implies its truth in an enigmatic way.

As we have seen from the above examples, according to Adorno, art interferes with empirical reality, and the experience itself, and changes the image, because works of art will have to claim their own space within empirical reality.

Finally, Adorno does not give priority to perception but to the production of the work of art and the singularity of production, as a process leading to the work of art and the production of images. This image, however, is the aesthetic image and differs from the cataclysm of images created by the Culture Industry. An illustrative example from the area of painting is the appearance of Pop Art in the 1960s. The work of Andy Warhol, the *Marilyn* in 1964, Figure 6, is interpreted as a hymn to the culture of the masses and in particular to the way in which he portrays certain personalities, into the public consciousness, as superstars. Also, Roy Liechtenstein with his work “Hopeless” is based on comic images, Figure 7

The Culture Industry, which has emerged alongside the weakening of the bi-pole: social work and contemporary art, has systematically limited the social, intellectual and cultural space of the avant-garde, with the aim of incorporating or extinction. Because the Culture industry, according to Max Horkheimer and Theodor Adorno, only supports the norms, incorporation, and repetition. Horkheimer and Adorno are also particularly responsive to the development of Media, Cinema, Press, Record Industry and Advertising. It is about, as they claim, for a *democratization* of the culture which is

controlled by another form of rationality, that of the economy.

A fundamental idea introduced by the two philosophers is the concept of mass deception. Referring to the cinema of that era, of the 1940s, in America, they realize that the promise of happiness given by the work of art is never honoured because “the whole word is made to pass through the filter of the culture industry. The old experience of the movie-goer, who sees the world outside as an extension of the film, has just left, is now the producer’s guideline.”

It is evident that this art is subjected to economic and cultural imperatives. Even more, it is a part of a technological society and a culture of amateur pursuits within the actual regime that governing it, leaving a lingering doubt about the authenticity of aesthetic experiences.

2. Jurgen Habermas, who was Adorno’s assistant at the University of Frankfurt and is part of the *second generation* of the Frankfurt School, will support the important role of Media in the renewal of aesthetic experiences in order to enrich everyday life.

It is well known that Habermas’ point of view differs from the traditional dialectical thought of Critical Theory and suggests favourable reviews within, because he believes that Critical Theory is more akin to the philosophies of the subject or consciousness, thus undermining the objectivity of its approaches. Thus, Habermas, unlike his teacher, Adorno, continues to accept the historical meaning of the concept of rationality and the critical possibilities that are inevitably contained in Reason. So, he tries to create the foundations of a modern anti-philosophical reflection, with regard to social sciences, the concept of rationality and the possibilities of a form of rational communication.

This leads to the fact that today, critical investigation must begin with the realization of the changes brought about in recent years by the introduction of information technology and new technologies into the social structure and consciousness. It is a fact that every day, we realize the progressive ideologization of technique and science.

Habermas, being confronted with the evolution of society in the 1970s and 1980s, will demand the reconstitution of the Reason. So, Habermas opposes the Communicative Reason to this cold and instrumental Reason - the instrumental rationality - which according to Horkheimer and Adorno, leads the world to a bureaucratic encroachment and blindness. It is a logic based on the verbal approach of subjects, the exchange and interaction of individuals.

Therefore, according to Habermas, there is not just one Reason which is fatally condemned to become a tool of oppression. There are, on the contrary, different types of rationalities, such as the scientific, moral, aesthetic rationality, which are not competitive nor in conflict to each other. Perhaps there is a prospect of reaching a

reconciliation of all forms of Reason. For that reason, according to Habermas, there is a possibility that aesthetics can act, in the long turn, on other forms of rationality and influence everyday life.

From the above-mentioned, it is obvious that in the philosopher's text there is a softening of criticism towards the cultural industry and the commercial system. According to him, it is wrong to think that cultural consumption serves as a counterpart to the frustrations of daily life.

Since we can not ignore the world of communication, Habermas' perceptions play an important role in this regard, especially to contemporary philosophers and aesthetic philosophers. On a theoretical level, the idea that new Media increase the dissemination of works of art to the public and thus promote the renewal of aesthetic experiences is legitimized.

In the work of the artist Jeffrey Shaw, *The Legible City*, 1988, Figure 8, the interface consists of a bicycle. By riding the bicycle, a well-known and beloved activity, the visitor acquires the ability to make his way in a projected city made of letters. Then we have a work of the Canadian artist, David Rokeby, known as *Silicon Remembers Carbon*, 1993, where the visitor has the ability to change the image displayed on the floor with his movements. Infrared sensors and cameras are used as interface. Figure 9.

The artists, on his part, as Habermas says, open a space for free play and experimentation via a reflexive handling of materials ,methods and techniques-and there by opens a space in which formal decision-making processes are opened up for aesthetic experience. By analysing the role of the viewer, we ascertain that, in these artistic settings, the public is the parameter that completes the work. It is already known that this passage of the viewer from a passive to an energetic state reflects a wider social change that first appeared during the 1960s. The way in which each person chooses to move within the work of art will give yet another sensation, another experience that will be unique to everyone. After the 90s, as we have already seen, artists' interest is mainly focused on interactions of the public. This generalized turn in the role of the public gives us the opportunity to claim that it also represents a political point of view.

According to Habermas, *mass media* are mainly *language vehicles*, which have the advantage to time and space elimination. They are *concentrating* verbal exchanges, thus allowing *intra-subjectivity* and language *intercomprehension*. This implies that the specific rational content of autonomous artworks and art judgements can be interpreted, evaluated and put in language.

Therefore, through this prism it seems that they do not depend on the commercial system. On the contrary, they favour the possibility of transmitting aesthetic experiences to an enlarged public and thus respecting the promise of happiness, embodied in works

of art and which was so dear to Adorno.

CONCLUSION

As we have already mentioned, the art of avant-garde has produced aesthetic values with absolute technical means. This attempt, brought about by artists, was supported by Adorno who speak of art as the product of human emancipation, aiming at a social reformation. This is an autonomous art. The emphasis was given on the way in which Theodor Adorno refused to come to a compromise with the cultural industry, thus overestimating the value of subjective experience.

In the decades following the Second World War, and in particular during the last two decades, artists resort to an embrace with new technological media. These technological tools will obviously function in accordance to the particularity of the forms of culture, part of which they actually are.

Above all, Habermas denies the extreme negativity of a theory such as that of Adorno, and maintains the hope of an art which, in the existing cultural organization, can potentially cause multiple pleasures and delights.

Habermas claims that the relationship between art and life - world can be successfully mediated only when the internal learning processes of cognitive, moral and aesthetic spheres of specialized knowledge are made accessible to one another in a rational discourse of intra -subjectivity. So this communicative aesthetic experience enable as to live in a world of social as well as cultural differentiation that is not dissolved in a discredited subject-central-rationality

Youli (Panagiota) Rapti is Assistant Professor of Philosophy-Aesthetics at the School of Applied Mathematics and Physics at the National Technical University of Athens. After the completing Bachelor of Philosophy she attended post-graduate studies in Philosophy and Aesthetics in the University of Paris I-Sorbonne (D.E.A in Philosophy, PhD in Philosophy of art).

She teaches Philosophy of Art in the School of Architecture and in post graduate courses, at the same school, she teaches Modern Aesthetics Theories.

Her research focuses into the domain of 20th century Contemporary Aesthetics. Her field of inquiry consists of analysis of philosophical theories about art, as formulated by the socio-existentialists and by more recent philosophers of the last three decades, concerned with issues pertaining to the new prospects for Art and Aesthetics. She is member of Greek Philosophical Association, of Hellenic Association of Aesthetics, of International Association of Aesthetics and of International Association of Greek Philosophy.

CAN AR TECHNOLOGIES HAVE AN IMPACT ON THE DEFINITION OF ART?

Abstract | In recent years AR technologies achieve a remarkable development and are spreading in our daily lives, quietly but steadily. They, for instance, make telediagnosis easier and offer new amusement experiences. AR technologies seem to be the most advanced and near-future technology because of these examples, but is it true? AR is to produce new experiences and values that have never been before, by superimposing artificial images on the real world. However, that is true of art as well. In addition, both AR and art have a common means of working on the senses. Thus the problem of where a border line between AR and art exists should come into question with increasing development and penetration of AR technologies.

In order to consider how AR will have an influence on the definition and the significance of art, this study analyse real and fictional elements in AR and art. AR, such as a head-mounted display or 3D Mapping, requires the physical field where sensory information mediated by computer is projected. Consequently, viewers perceive the overlapped image with real things and things not existing before eyes, that is fiction, and take it for the whole reality at the same time. These facts prove that AR is a hybrid experience of reality and fiction. However, AR technologies include the firm aim of erasing fictional elements that remain as ever in spite of their accurate representation, through making fictional images thoroughly similar to reality. Art is also a hybrid experience and needs a real environment where the fictional world is opened. It is obvious given a sculpture installed in the public space. Though art has something in common with AR, art is clearly different from AR in that art attempts to preserve a heterogeneous and fictional area within the real context. For this reason, the audience of the drama intentionally accepts fictional characters while living actors and actresses play in front of him.

From the comparison of AR and art, it will come to light that viewer's intentions as well as technologies and institutions play an important role in deciding what is art or what is reality. While AR reduce fictionality from a multi-layered scene to enrich a real experience, art cuts fiction from a present scene to idealize the real world. In this way, AR and art are human activities to mediate new reality through fictional images from the reverse direction.

Index terms | *AR technologies; definition of art; fiction; multi-layered image; reality; sensory perception*

INTRODUCTION

It is often said that 2016 is the first year of VR/AR, because these technologies that had been only used only in specialized domains such as medical service and military affairs became familiar with the release of Pokémon GO and some head-mounted Displays in that year. In addition, development companies for mobile operating system like Apple and Google are devoting on AR(1)¹, and the development of AR technologies has remarkable progress. AR may seem to have nothing to do with art at first glance. On the other hand, however, there is an idea to regard AR as an ancestor of AR(2)². Will the development and penetration of AR technologies have any influences on conditions of the aesthetic experience based on art, then? If so, how can we theorize on the aesthetic experience including both art and AR? To consider these questions, this study examines the relationship between reality and fiction in experiences each of art and AR.

1. STRUCTURE OF THE AESTHETIC EXPERIENCE

First of all, it is necessary to clarify the structure of fictionality in art and the cause of unusual sense when aesthetic judgement is done. In this chapter, these things will be analysed from a point of view how experiences of art works differ from really daily perception and recognition.

Construction of Fiction in Art

Definitions of art can be categorized into three tendencies; the nature inherent in art works, attitudes of their recipients, and circumstances around art(3)³. However, these kinds of definitions are not necessarily effective in our daily lives where art and reality are intermingled. For example, a wallpaper by Marimekko and Van Gogh's Sunflowers are common in that they are flower pictures(4)⁴. In spite of the fact, the former forms a stylish living space together with daily necessities, the latter becomes an art work on the other hand. The reason for making this difference is that while the picture of Van Gogh as well as the wallpaper of Marimekko is perceived simultaneously with the environment, it is separated from the whole of sensory stimuli. What fulfills the same function of a picture frame is a gesture of performers in music and a proscenium arch called "the fourth wall" in drama. This imaginary and transparent wall in theatre is built between audiences and a stage, allows no one to pass through. This picture frame structure of theatre works to create a theatrical world, extracting only dramatic occurrences on the stage from all things that audiences perceive as follows; living actors or actresses speaking on the stage, other audiences sitting beside him, a stage setting, and so forth. As a result, conventional definitions of art will be denied. This is because what can enter inside such mechanisms has nothing to do with the intrinsic quality, the attitude of the recipient, what kind of environment and context it is placed in.

Unusualness of Beauty

Natural landscapes and urban scenes don't have the mechanism nor equipment with which art separates the aesthetic experience from the whole perception, and are not be able to be cut off connection to the real world. Then, so as to apply a theory of the aesthetic experience to the beauty of natural landscape and urban one, rises the following question: How can their beauty be considered in a generalized theory of the aesthetic experience? Bringing a waterfall suddenly appearing in open space in the middle of a dense forest, a changing color of the sky at twilight, the night view of

the city from a skyscraper not normally climbing in mind, two points can be pointed out. First, they are deviated from the law and have a peculiarity far from other various continuous phenomena. And, therefore, as a second property, it has no persistence and suddenly appears or is recognized in an unexpected way. As described above, the aesthetic experience is an experience of a heterogeneous sensation suddenly rising from physical phenomena without conforming to the spatiotemporal continuity or causality. It is art that tries to generate it artificially, and if such experiences occur in a place not intentionally made by the hand of man, it is called natural beauty, urban landscape beauty according to that object. Since these aesthetic experiences appear in a form not following the daily real linkage, it seems that although it is a phenomenon that occurs in the real space and time, it recognizes the absence, that is, the impression of enjoying the fiction. This unusual nature and fictional character of the aesthetic experience will become meaningful to the real world by making the awareness of the existence of an enriched possible world that has not yet been realized behind the real world.

2. SIMILARITIES AND DIFFERENCES BETWEEN ART AND AR

Similarities

AR is the technology to project an artificial image or sound made by a computer in order to make someone misunderstand that something that does not exist in front of us is as if it existed. Therefore, AR is made to be directed to the five senses similarly to art. VR, which is its precedent technology, differs in terms of whether it blocks real sensory stimuli with the artificial environment or projects images into real space. However, because it is difficult to create a stereoscopic image in a completely open space, and a device for superimposing reality and computer graphics is still required. For example, a screen of a smartphone, a smart glass, and a transparent film(5)⁵ correspond to it and play the same role as a support of painting. In other words, in order for AR to be perceived as an augmented reality rather than a true reality, AR requests a place where artificial images overlap, as art requires trimming of the reality and a mechanism for revealing heterogeneous areas. Even more interesting is the direction of evolution from VR to AR. In drama and video work an actor often talks to an audience and demand him to participate in this drama. This act produces a special effect because of breaking the fourth wall that is indispensable for realization of drama(6)⁶. Progress from VR which completely shuts down the reality to AR can be also understood as an attempt to break through the fourth wall while assuming it(7)⁷.

Differences

Images of AR are similar to the space and thing that exists in the real world, and its target is to deceive the person who experiences it into believing that what he is seeing and listening now is realistic, although it is an artificial image. In order to pretend that there are things and spaces that do not exist before the eyes, AR must obey the real things and spaces as much as possible. In contrast, similarity with objects and reality is not a necessary and sufficient condition in art as you can see from a history of paintings of the 20th century after Cubism. And this leads us to the second point of difference with art. Experiences of art start with a sensory stimulus that is sensed with reality, then art transitions from reality to fiction. On the other hand, AR presents images of objects that do not actually exist, that is, starting from giving fiction or an imaginary figure, AR tries to erase its own fictionality by making its fictional image extremely realistic. While art and AR are common in that reality and fiction become multi-layered, its direction

is opposite. Furthermore, art requires the reality that is the object of breaking its relations, so as to become art, AR is the aim to provide reality to the last while starting with fiction, and fiction is becoming unnecessary for AR on the other hand. Therefore, a criterion of evaluation for both of them is completely opposite. For AR, fictionality will never be evaluated, whereas in art it is often the case that similarity and reality as an object of reference can be the object of evaluation.

3. Constructing a New Theory Covering Art and AR

Until now, comparing art with AR, similarities and differences between art and AR have been studied. Finally, how the aesthetic experience is interpreted, and what is the significance of why art and AR that appeal to the senses and layer reality with fiction coexist will be considered.

A New Reality That the AR Generates

Let's summarize the similarities and differences between the art and the AR that we have described so far. Both ART and AR are targeted for the sense, and in those experiences reality and fiction (artificial image) overlap in a multi-layered manner. The weights of reality and unreality differ in both. Art cuts out fictional areas from reality and emphasizes fictionality by accepting it again in real space. AR reconstructs images of things that do not exist before the eyes created on the computer in reality, so that they are recognized as one reality as a whole. So, how is the reality in AR different from that in the past? The word reality means a word derived from the Latin word "res". The most advanced technologies, VR and AR, also means to present the image of 'things' which do not really exist in front of us as truthfully as possible. But that is not a thing. When reality is conscious as a whole by overlapping images of things that do not exist in what actually exists, the reality should be different from the real reality when directly perceiving real things. AR is to shift the static real space to the dynamic one, and at the same time it is the realization of the fiction. Thinking like that, the boundary between reality and fiction will appear to be very ambiguous. Rather, AR experience shows that the reality exists not independently as it is, but as existence that imbues fictionality within it.

Arts as a Technology to Change the World Fictionally

Before the relationship between the new reality presented by AR and fiction, the answer to the question of what is art is not so simple. If art means only the fiction of the part where art was cut away, there is no objection to Martin Heidegger's assertion in "The Origin of the Art Work" that art work is the constant fight of the earth and the world, denying materiality (Dinglichkeit) of the art(8)⁸. However, the supports in painting and the actors acting on the stage are things and people that really exist and people, art does not exist without physical things at all. Contrary to Heidegger's argument, the reality as thing remains in art. Then, what happens when artworks are on exhibition in museums? Sensory stimuli arriving from objects inside the frame are emphasized by surrounding white colour and are regarded as fiction, that is, autonomous areas that are different from reality. But that's not all. Art is impossible to perceive by itself, it is always perceived as sensory stimuli emanating from the surrounding environment. The supports as things and the space where works are displayed becomes an art work by a fictional image of art and it transforms into an aesthetic exhibition space. Fictionality of art spreads to the reality space. In the art experience also the boundary between reality and fiction is ambiguous. However, its behavior is opposite to AR. The art which

is separated from the reality is accepted again in the realistic linkage and fictionalises reality(9)⁹.

CONCLUSION

The emergence of new technologies of AR reveals that the relationship between reality and fiction is fluid rather than having reality and fiction separately. Based on this new relationship between reality and fiction, it is not sufficient to explain merely that art is separated from the real world by the frame, and generate fiction. Art must be caught in contrast to AR which regards fiction as reality. After making up its own fiction, then transforms the reality around it into aesthetic fiction. In addition, the significance of the existence of the art becomes actual by the relationship with AR. The dialectical circle of reality and fiction is completed, for the first time together with by art and AR that turn to the opposite direction. In other words, art will be what brings real as well as unreal, besides fictional as well as fictional things together and makes all of them perceive at the same time. If the argument that art would give things that are unrecognizable in the real world, something true, is justified, it is based on the relationship between new reality and fiction that is actualized by the appearance of AR

PANEL SESSION 11 | *RELATIONSHIP OF PUBLIC AND PRIVATE SPHERE IN AESTHETICS*

POSSIBLE WORLDS OF EVERYDAY AESTHETICS: THE EXPERIENCING SELF, INTERSUBJECTIVITY AND LIFE-WORLD

Abstract | This paper investigates the relationship between the subjective-private and intersubjective-public dimensions of aesthetic experience in everyday life, addressing some critical philosophical questions, such as how to both preserve and integrate different layers of experience (aesthetic and ethical, art-related and ordinary) within the continuity of one's experience as well as the personal and intersubjective dimensions within the unity of one's life. Some major proponents of Everyday Aesthetics (Saito, Melchionne) hold a notion of the aesthetic as a mere private feeling and sphere and thus support the idea of everyday aesthetic experience as mostly private and radically distinct from the art's standing-out, public experience and "world". The private dimension is indeed constitutive to experiencing aesthetically the everyday. Nonetheless, we should not ignore or neglect the intersubjective-public dimension, which is also constitutive to our everyday aesthetic life. I claim that this cannot be conceived of as a mere private world in absolute discontinuity to the public world, such as the "artworld" or even the "life-world", since it includes both personal and intersubjective dimensions. Of course, the two dimensions of everyday aesthetic life do not oppose each other, but suppose each other. Likewise, although the "everyday" should not be thought of as absolutely one and the same for all, it is possible to search for the common features that emerge from the background of its multiple particularities. The intersubjective engagement also is an essential element when analyzing the subject experiencing aesthetically the everyday, so we should acknowledge as well the intersubjective nature of a subject's self-constitution and experience. Against the idea of the overall discontinuous nature of one's aesthetic experience, in everyday context vs. artworld contexts, it is therefore important to consider everyday aesthetic experience as being both distinct and integrated into the continuous flux of one's experiences, as well as related to one's whole life. These claims will be supported by some insights on the *experiencing self* and the essential structure of *aesthetic experience*, supported by practical philosophy (Gadamer) and the pragmatic or "soma-aesthetic" approach (Shusterman) as well as on the characteristics of everyday *life* and *life-world* highlighted by phenomenology (Husserl, Simmel, Schutz). All these accounts offer powerful lines of argument in defending a consistent conception of the whole experiencing self and the structure of one's everyday aesthetic life as well as its intersubjective dimension.

INTRODUCTION: A BRIEF OVERVIEW OF EVERYDAY AESTHETICS AND ITS DISSENTS

In brief, Everyday Aesthetics (EA) has developed as a new research area interested in the aesthetic character of ordinary, everyday life or experience, against previous neglect by the art-centered aesthetic theory. This movement is heterogeneous, since it follows different traditions (continental, pragmatist, and analytical) and defends conflicting accounts of some core practical and theoretical issues (for a detailed presentation, see Ratiu 2013, 5-8). Among these issues are the defining characteristics of the “everyday” and the “aesthetic” – tainted by tensions or oppositions between daily and rare, familiarity and strangeness, ordinary and extraordinary, private-subjective and public-intersubjective –, as well as the aesthetic credential of some daily, ordinary qualities or experiences, and the blurring line between art and life, as noticed by Yuriko Saito in the overview of EA (2015).

One of the most consequential disagreements is that between the “strong” and “weak” or “moderate” formulation of EA (or “Aesthetics of Daily Life Intuition”, according to Dowling 2010), concerning the relationship between aesthetics of the everyday and art. The “moderate” account (e.g. Leddy 2005, 2012, 2013, Dowling 2010) holds a monist framework for aesthetic discourse, and a concept of the aesthetic integrating both differences and resemblances between everyday life and art – such as the *normative aspect*, which is able to secure the significance of the aesthetic and to support a communicable experience consistent with a compelling view on *intersubjectivity*. The more radical, “strong” version (e.g. Saito 2007, 2017, Melchionne 2011, 2013) holds instead a pluralist account that challenges the regular assumptions of art-centred aesthetics and the model of a spectator-like “special” aesthetic experience, aiming at a radical rethinking of the realm of everyday aesthetic life. In this view, EA requires aesthetic insights and concepts completely distinct from those needed to account for art. This notion is founded on the assumption that everyday aesthetic experience operates independently, discontinued and isolated from the experience of art, thus alleging a relation of exclusion between the art-world (*public*) and our life-world (*private*), whose intersubjective dimension is either ignored (Saito 2007) or explicitly put into brackets (Melchionne 2011, 2013). (See Ratiu 2013, 9-14).

The lively debate on the nature of everyday *aesthetic* experience and, consequently, EA’s proper definition and scope, is carried on in recent issues of *Contemporary Aesthetics* from 2014 to 2018 as well as in other recent publications (e.g. Forsey 2014; Saito 2015, 2017; Matteucci 2016; Friedberg and Vasquez eds. 2017). There is a shift in emphasis towards its *relational* nature or the *subjective attitude*, that is, the subjective character as an essential aspect of experiencing the everyday.

For example, Naukkarinen and Vasquez (2017) emphasize the *relational* nature of the everyday and non-everyday and the difference between the former and “daily-life”, insofar as they see “the everyday” as an *attitude*, as “merely one (special) mode of being” – situated, specialized and interpretative, separate from the lived daily-life towards which it orients us (Naukkarinen and Vasquez 2017, 181, 183-185). Yet this approach which aims “to challenge the traditional conception of aesthetics itself, by beginning with the everyday rather than the aesthetic” (186), left unexplored precisely the *aesthetic* aspect of the everyday and daily-life.

Previously, an overview of developments in the “Aesthetics of the Everyday” published in *The Stanford Encyclopedia of Philosophy* (Winter 2015) by Yuriko Saito – one of the

protagonists of EA – has critically revisited its approach to the features of the *everyday* and the *aesthetic*. She suggests that the best way to capture the “everyday” is to locate its defining characteristics not so much in specific kinds of objects and activities but rather in *attitude* and *experience* we take toward them. The typical attitude is full with pragmatic considerations while experience is generally regarded as familiar, ordinary, commonplace, and routine. She also advocates the inclusion of bodily sensations into the realm of the “aesthetic” and the return to its *classificatory use* or root meaning as “experience gained through sensibility, whatever its evaluative valence may be” (Saito 2015, 4-5).

The reference to a subject intentionality, sensibility, affect and corporeality or bodily engagement is indeed necessary when characterizing everyday aesthetic experience. However, on the one hand, it is not sufficient to capture entirely the complex, twofold nature – both subjective and objective – of the experience, which is crucial to its proper understanding. On the other hand, it lacks an explicit conception of the experiencing self that should underlie the EA account, especially when proposing such a shifting in focus towards the experiential subjectivity in its analysis. Such shifting in focus firstly requests a revision of the concept of experience itself as well as a reflection on the *experiencing self*. Unlike other authors (e.g. Forsey 2014), I do think that we can find some valuable insights on this matter in philosophical tradition, such as practical-philosophy (Hans-Georg Gadamer). Then new claims should be made about the ontology/structure of everyday life, notably its inter-subjective aspect and the dialectic of fragmentation-and-continuity, highlighted by phenomenological research on *life* (Georg Simmel) and *life-world* (Edmund Husserl, Alfred Schutz).

THE EXPERIENCING SELF

A question can be raised as to whether an explicit view of the “selfhood” is requested when approaching everyday aesthetic experience. This is indeed debatable, and in *Everyday Aesthetics* the phenomenal presence of the experiencer is usually ignored: “the self” is invisible, I might say, since there is no explicit account on this topic.

It is true that not all philosophers give a similar answer to “the universality question”, i.e. whether all our experiences are with necessity accompanied by a sense of self. There is an opposition in current philosophy of mind between defenders of a strong “eliminativist” position (such as Prinz 2012) and those who defend at least an “experiential minimalism” (Zahavi 2005 and further writings on the “minimal self”) or consider that any experiencing is necessarily and essentially a subject-involving occurrence (Strawson 2017). As Zahavi (2018) states, a minimal claim is that all experiences regardless of their object and act-type or attitudinal character are necessarily subjective in the sense that they feel like something for *someone*. Accordingly, even if the “experiential self” is not conceived of as a separately existing entity, it is not reducible to any specific experience, but can be shared by a multitude of changing experiences.

This interesting proposal deliberately left unattended the question of “the duration of the self” (or its *diachronic identity*), albeit Zahavi’s concluding lines which maintain that “the experiential self should be identified with the ubiquitous dimension of first-personal character” (Zahavi 2018, 16). A proper analysis of the everyday aesthetic experience cannot ignore the question of the *identity/unity* of the self and its *embodied* dimension or corporeality, since it is not a mere mind but also a living-body. It is worth giving a clear, consistent view of the “self” since its lack undermines EA’s potential

to incorporate various layers of experience into a compelling explanatory framework and to secure an adequate comprehension of the aesthetics-ethics interrelations in everyday life (for a detailed discussion, see Ratiu 2013, 18-19, 23-4).

Moreover, a comprehensive view of the “experiencing self” could provide an answer to the question of continuity or discontinuity of experiencing aesthetically art and everyday life. EA’s “strong” postulations of the *absolute discontinuity* of the everyday and art-related aesthetic experiences, and the *private* character of the former, imply the notion of a *discontinuous (not-enduring) self, isolated* from others (the monadic-isolation premise), since, as for the so-called “deflationary or thin notion of self” in philosophy of mind, “the identity of the experiencer is so tightly linked to the identity of the experience [i.e. daily or art-related] that the cessation of the experience entails the cessation of the experiential self”, while “the arising of a new experience [entails] the birth of a new self” (Zahavi 2018, 15-16). A question arises then as to whether it is possible to address differently the so-called persistence issue and the *diachronic identity* and *unity* of the self as well as the role of intersubjectivity thereof.

In order to sketch out the nature /structure of the “experiencing self” I will again draw on Gadamer’s practical philosophy. This allows to freshly attending the question of identity and unity of the self (still open in EA) through an examination of the faculties or virtues of a *social-and-moral human being* which is also engaged in everyday *aesthetic* experience and appreciation. In Zahavi’s terms, it is about a “full-fledged human self”, since he recognizes that the “minimal account of self” (concerning the relationship between phenomenal consciousness and selfhood) is not an exhaustive one, but “there is certainly more to being a human self than being an experiential self” – such as, its situatedness in “the space of normativity” and the “role of sociality” in its interpersonally constitution (Zahavi 2018, 9-10).

The reference to the *self* and the mutual implication between theoretical interest and practical action are essential to the practical philosophy. For example, if ethics is a teaching about the right way to live, it still presupposes its concretization within a living ethos (Gadamer 1990, 97, 111). The same is true for aesthetics if considering the *dialogical* and *dialectical or transformative* nature of aesthetic experience and generally of the process of understanding, which is seen by Gadamer not as a specialized attitude but as a human way of being in the world. Within the framework of such a hermeneutic ontology, human being is conceived of as a *dialogical subject*, that is, as a *self in formation*, open to alterations by means of dialogue with other subjects, cultures, and histories. The dialogue or conversation with tradition – which encompasses institutions and life-forms as well as texts – entails a dialectics of self-understanding, as do other ontological characteristics captured by the Gadamerian notions of “correspondence between subject and object” and the “fusion of horizons” of the present experience and tradition in the process of understanding, which is the proper achievement of language. Thus understanding, and implicitly the aesthetic experience as an experience of understanding, is for Gadamer also a key means of an ontological self-constitution, *Bildung* (Gadamer 1988, 230-2, 271-8, 340-1, 416-19).

The notion of *Bildung* (theoretical, practical, historical and aesthetic), seen by Gadamer as the proper way of developing the whole self, not only one’s natural talents and capacities (1988, 13-18), calls for the intersubjective engagement as an essential element when analyzing the subject/self experiencing aesthetically the everyday. The idea of *inter-subjectivity* is of special interest here as it lays emphasis on some

characteristics often ignored by EA view of the self: the openness to the one other, the selflessly attending to the ordinary reality of others, and the enlargement of vision that is at stake in aesthetic experience and judgement or in noticing the everyday (Dyer 2008, 63). Intersubjectivity is also called in by the principle of “the linguistic (*sprachlich*) nature” of the human experience of the world, stated by Gadamer when posing language as the “horizon” of such a hermeneutic ontology. For individuals are bound to one another in a community of understanding by language, in which “the individual I’s membership of a particular linguistic community is worked out”. This common language precedes experience, is “already present in any of its acquisitions” and thus “is at the same time a positive condition of, and a guide to, experience itself” (Gadamer 1988, 311-13, 342, 414). Everyday Aesthetics would definitely strengthen its philosophical basis by acknowledging as well this intersubjective nature of a subject’s self-constitution, language, and experience.

This philosophical foundation has significant implications for the study of everyday aesthetic life, by conveying a heuristic network of concepts – *Bildung* (self-formation), *sensus communis*, judgment, taste, practical knowledge, and so on – that allow us to make sense of complex intertwining of aesthetic, ethical and political aspects in everyday life and to clarify its ontological assumptions. All these aspects are in fact parts of the *whole* of one’s life. In other words, to contemplate, decide, deliberately act, and so on, are experiences that only a *whole* human being can do. Yet it does not mean that this *whole (self)* is uniform, indistinct and unchanging; rather it means that the discreteness of experiences or aspects of life is preserved in the “hermeneutic continuity of human existence”, as the experiencing self is structured as a “unity in division and articulation” (Gadamer 1988, 86, 222-3), or as an *identity in difference*.

In two previous articles (Ratiu 2013, 2017) I defended this idea through the notion of an embodied self, seen as a *body-and-mind unity*, which not only perceives, feels, reflects, deliberates, appreciates, and reacts, but also decides, acts, communicates, relates with others and participates in different practices. The conceptual framework provided by practical philosophy supports the account of the self as *embodied* and developed through cultural-social interaction, by emphasizing the inseparable virtues or faculties – judgment, common sense, taste – of a social-moral being engaged in aesthetic experience as well as its context-embeddedness and the openness to one another. This view of selfhood is better suited to providing a consistent framework to the analysis of an aesthetic experience grasped as intertwined with different social and cultural practices in the flux of everyday life (see also Mandoki 2007, 54, 62-4). Apparently, all participants in the EA debate hold (implicitly) such conception of selfhood. Yet in some cases (Saito, Melchionne) this compliance is undermined by the monadic-isolation premise they embrace when considering everyday aesthetic life as a mere *private* world in absolute discontinuity with the *public* world (not only the art-world, but also other forms of public everyday aesthetic experience) and thus ignoring or neglecting of its intersubjective dimension (Ratiu 2013, 13-14, 20-2).

THE EVERYDAY AND THE “LIFE-WORLD”

Next, for better conceptualizing everyday life within Everyday Aesthetics, it is useful to call in the phenomenological research (Husserl, Schutz) regarding the intersubjective aspect of the “life-world”, or “world of lived experiences”. This offers powerful lines of argument in defending a conception of the everyday as inter-subjectively shared with

others and thus allows us to outline a coherent ontology of everyday aesthetic life.

The concept of “life-world” (*Lebenswelt*) was introduced by Husserl in his *Ideas II* and largely analyzed in the third part of *The Crisis of European Sciences and Transcendental Phenomenology* (1936/1970). It enfolds a rich, multi-faceted sense. It can be understood as: a dynamic “horizon” in which one lives; a pre-given basis of all shared human experiences; and a communal “world” of socially, historically and culturally constituted meanings. Hence it includes both *personal* and *intersubjective* dimensions, and constitutes the *unity* of the flow of experience which is anterior to discreteness of experiences and necessary to it (Husserl 1970, 102-268; Gadamer 1988, 217-21).

Within the EA accounts of the everyday, the concept of “life-world” was already referred to by Naukkarinen, in the sense of a basis on which other layers of life and culture are built, when developing his idea of everyday (life) around the kernel of “my everyday now” (Naukkarinen 2013, 2, 7). Thus, he stresses the *personal* dimension of the everyday.

Other authors have mostly considered its *intersubjective* aspect, the “everyday” being qualified as the common ground of experience which connects individuals, activities, and histories (see, for example, Stephen Johnstone’s anthology *The Everyday: Documents of Contemporary Art*, 2008, and Dyer 2008, 63). Of course, the two dimensions of the everyday do not oppose each other, but suppose each other. Likewise, the everyday should not be thought of as absolutely one and the same for all. In fact, as evidenced by the phenomenological analysis, “the world of everyday life is neither unique nor uniform; there are always private worlds in which we find ourselves always-already immersed”. Yet, even if “everyday life vanishes in a changing plurality of objective contexts or symbolic formations that hardly could be brought together under one clear-cut name” (as noted by Copoeru 2011, 281), philosophy can search for the common features that emerge from the background of such multiple particularities.

The intersubjective dimension of the everyday is even strongly emphasized in the seminal analysis of life-world by Schutz (1962) in the context of “the problem of social reality”. According to this phenomenological-sociological viewpoint (summarized by Eberle 2014), the world of everyday life is our paramount reality; it is the intersubjectively shared reality of pragmatic action, where we are awake and working in standard time. The everyday world of working is the archetype of our everyday experience of reality, as distinct from other realities experienced as “finite provinces of meaning”, such as the personal worlds of dreams, of imageries and phantasms, as well as the worlds of art, of religious experience, of scientific contemplation, and so on (Schutz 1962, 231-32; Eberle 2014, 139). Thus the everyday world is experienced as meaningful, as pre-interpreted, and as inter-subjectively shared with others. Within such conception of the mundane world, which includes the aesthetic, the aesthetics of everyday does not constitute a separate, finite province of meaning (Eberle 2014, 140).

Among the Everyday Aesthetics proponents, Kevin Melchionne has devoted a particular interest in developing an appropriate ontology of everyday life to ground EA. As he notes about daily life, its “ordinariness” and “everydayness” mean a flow of experiences

and actions, in which the aesthetic ones should not be taken as isolated, cut off slices, nor as lacking aesthetic value or significance, since “what matters is the routine, habit, or practice, the cumulative rather than individual effect”, and “how each discrete aesthetic experience is rooted in the pattern of everyday life”. The pervasiveness of “the aesthetic”, built into the fabric of everyday life, and the on-goingness of its experience are, in his view, foundational for a properly construed EA (Melchionne 2011, 438-40). Definitely, these characteristics can be embraced by any proponent of EA, “strong” or moderate”. Nevertheless, these features are then employed by Melchionne to support the idea of everyday aesthetic experience as mostly private and radically distinct from the art’s standing-out, public experience and “world”; hence the radical distinctiveness of Everyday Aesthetics’ concepts too, which are reassessed beyond the strictures of art (Melchionne 2011, 441-2; for an analysis of this “monadic-isolation premise of EA” and its theoretical impact, see Ratiu 2013, 12-13, 23).

The interesting analysis by Melchionne of the ongoing nature of the aesthetic experience in daily, ordinary occurrences (yet in them alone, in his account) is impeded by the way in which this characteristic is thereafter subordinated to the idea of the overall discontinuous nature of one’s aesthetic experience – in everyday context vs. art world contexts: in his view, any break in the on-going daily, private aesthetic experience is also a radical change in nature for the experience itself, as “everydayness substantially changes how we value our experiences” (Melchionne 2011, 440). This is because he fails to recognize the full dialectic of continuity-and-discreteness of experience in the *unity or totality of one’s life*. It is therefore important to consider the everyday aesthetic experience as both distinct and integrated into the continuous flux of one’s experiences, as well as related to one’s *whole life*.

The philosophical background on which this makes sense can be sketched by drawing on Simmel’s analysis of the “fragmentary character of life” (written in 1916, republished in 2012), which could help us to understand the dialectic of continuity-and-fragmentation of life-worlds.

Simmel conceptualizes human “life” in a dynamic, holistic manner as an embodied stream of consciousness directed toward “contents” of experience. The matter of experience is shaped by “forms”, evolved in life’s higher stages of self-reflection, and in that process life constitutes for itself a world of mental contents. Thus the “world”, which according to him is a formal concept, primarily designates a discrete “totality of contents of mind and experience” (Simmel 2012, 237-39). By “world”, is also meant “the sum and order of possible things and events that can be arranged into a continuum of some kind according to any kind of overarching principle” (Simmel 2012, 242). Hence there exist for the human mind multiple discrete and self-subsistent worlds of value and meaning: not only a “real” world in a practical sense of the term but also a religious, a scientific, and an artistic world which fundamentally share the same and all content of experience, but articulated into very different forms. As mental contents, these worlds are distinct from their historical realizations, which as worlds within historical life remain particular and one-sided, and do not achieve any full and ideal completeness (Simmel 2012, 241, 243-44).

Within this framework and considering the thesis of the parallelism of categorial

worlds, the idea of life as fragmentary in character is a matter of perspective on life – in other words, of different views of life’s contents. Specifically, this idea results from a view of life from the perspective of these particular-discrete categorial worlds, which is a view of life’s contents “from the outside”, as things and events, as works and bodies of knowledge, as regularities and values. According to Simmel, life is fragmentary in the sense of a unique relationship that an individual led life takes up to these various worlds, that is, acting at the “intersection”, “in-between”, or “oscillating” constantly between these worlds seen as different layers of existence, and from each of them taking away only a fragment. However a different perspective, from within life as life and its dynamic process, shows life as making up a whole, a self-sufficient flow of occurrences, present in all its moments in all its entirety: “Always only one life pulses through these particles as beats of the same life, inseparable from it and therefore also inseparable from each-other” (Simmel 2012, 246-7). From this perspective, then, life’s character is not fragmentary, and Simmel emphasizes the constant movement of life moments and fragments and its overcoming in the unity and continuity of one’s life (Simmel 2012, 247).

Therefore, the fragmentary aspect or discontinuity of experiencing the everyday and the art as distinct life-worlds, backed by Melchionne (2011), is not a final, single ontological feature or structure of experience or life as such. Rather it is a matter of analytic perspective which is complemented, from a broader perspective of life as a whole, by the continuity of experiencing in one’s life. Moreover, the apparent paradox of completeness-and-fragmentation is overcome or solved in the idea of the inherent unity and continuity of life, made clear in this essay by Simmel’s idea of life as a flow of experience shaped by “form”, and developed later in his theory of life as a limitlessly creative flow of embodied will, feeling and understanding (Simmel 2012, 247). This theory helps us to understand the essential structure of the everyday life-world and its experiencing as constituted by the dialectic of continuity-and-discreteness and unity-and-differentiation.

CONCLUSION

To sum up, in this paper I defended: 1) the intersubjective nature of a subject’s self-constitution and experience as well as of the everyday life. 2) the structure of the experiencing self as an identity in difference, to which the relationship to otherness is constitutive; 3) the essential structure of the everyday life-world as constituted by the dialectic of continuity-and-discreteness and unity-and-differentiation. From this viewpoint, the discontinuity of experiencing aesthetically the everyday and art as distinct life-worlds, backed by the “strong” EA, is not an absolute, final ontological feature or structure of experience or life as such. Rather it is a matter of analytic perspective that is complemented, from a broader perspective of life as a whole, by the continuity of experiencing in one’s life. Yet it does not mean that this *whole self* is uniform, indistinct and unchanging; rather it means that the discreteness of experiences and aspects of life is preserved and integrated in the continuity of human life.

Dan Eugen Ratiu is a Professor of Aesthetics and Philosophy of Art at the Department of Philosophy, Babes-Bolyai University in Cluj-Napoca, Romania. He holds a PhD in Philosophy of Culture at B-BU (1998) and Philosophy of Art at University of Paris 1 (2005). Since 2014, he supervises PhD thesis in these fields. His main research interests are in art theories/practices, arts policy, and practical aesthetics, current researches focusing on everyday aesthetics and the interaction between cultural policy and artistic creativity. He is the author of four books and many articles on these topics. He is a member of the European Society for Aesthetics (ESA), serving as a member in the Executive Committee and co-editor of the *ESA Proceedings* during 2012-2018, and a member of the European Sociological Association—Research Network Sociology of the Arts (ESA-RN2), serving as a member in the Directing Board during 2009-2015 (Vice-Chair 2011-13 and Chair 2013-15).

THE PASTORAL STYLE IN FRANCE IN THE 18TH CENTURY: DECORATION AND REPRESENTATION OF THE HURDY-GURDY

Abstract | The hurdy-gurdy has been played in Europe since the Middle Ages. It was originally used for devotional music, but it arrived in the 18th-century French court after being first adopted by farmers and beggars. This presentation considers the pastoral style of music in 18th-century France based on the instrumental decoration of hurdy-gurdy.

People were exhausted by Louis XIV's long reign and elegant court style. After the death of Louis XIV's, a rustic and rural style called pastoral came into vogue, and this was reflected in the music of the time as well. The hurdy-gurdy was played in rural settings thus came to court as part of this change in fashion. But for the upper classes to allow themselves to play an instrument associated with the socially vulnerable, it was necessary to associate it with a more respectable station. Hurdy-gurdies came to be decorated in the rococo style, a contemporary art form of the time. Many paintings of this time depict aristocrats playing the hurdy-gurdy.

However, barefoot old men representing wandering musical performers, who played outside the court in public places of cities and villages were also depicted as playing the hurdy-gurdy, and the instruments they are shown handling are not decorated in rococo styles. Thus, it appears that a distinction was being drawn between the hurdy-gurdy inside and outside the court. In my study, I examine transitions in the decoration of musical instruments that refer to secular pasture, including the hurdy-gurdy. Additionally, a hurdy-gurdy can be manufactured with an imitated or reused body of another musical instrument. Henri Bâton, a player and luthier active in the 18th century, produced hurdy-gurdies using theorbo bodies. Other commonly played instruments included the lute, mandolin, and guitar, and the reuse of the bodies of these instruments fueled the hurdy-gurdy's popularity. I also survey other musical instruments in court, examining the possibility that court musicians differentiated their instruments from those found outside the court and considering the actual state of the pastoral style in France in the 18th century.

Index terms | *musical instrument; hurdy-gurdy; vielle à roue; decoration of musical instrument; pastoral style*

INTRODUCTION

The hurdy-gurdy is a musical instrument that has been widely played in Europe since the Middle Ages. Its history can be traced back to the 10th century, when it was initially used as an accompanying instrument for church music. Gradually it also came to be used in secular music, and disappeared from church music in 14th century. In the 16th century it was regarded as an instrument of farmers and of urban beggars, especially played by the blind. In the 18th century, however, due to a longing and vogue for rural life in the Court of France, this instrument came to be played by aristocrats. In this paper, we look at the hurdy-gurdy in the 18th century French court, by investigating what approaches were taken to decorating it, reflecting and reinforcing its status as an instrument symbolizing the pastoral; what this kind of “pastoral style” was like in the court more broadly, its aim at clarifying whether this instrument was a thing.

This instrument underwent various developments in each region over its long history. Therefore, the hurdy-gurdy family includes a wide range of objects with various names, numbers of strings, size, and shape of wheels, and different turning methods and sound ranges.¹ However, the name “hurdy-gurdy,” which is a relatively new name that appeared in the middle of the 18th century,² may be used as a generic term for any instrument that—I propose—has three features based on Kelly’s definition of hurdy-gurdy.³ First, there are two types of strings—melody strings and drone strings. Second, one rubs the strings by turning a handle to rotate a wheel built into the body of the instrument. Third, wooden brocks or wedges called “Tangents,” attached to a keyboard, touch the melody strings and the pitch changes. In this paper, we define the periods of hurdy-gurdy music as follows: the period of its use in church music is “period I,” the time when it advanced into secular music is “period II,” the period where it became an instrument of the peasantry and rural poor is “period III,” and the period of the “hurdy-gurdy epidemic” centered on ladies in the French court is “period IV.” We will consider changes in the decoration of the instrument across these periods.

HISTORY

Periods I-III

During period I, this instrument was called the organistrum and was used as an accompaniment for the plainchant and parallel organum in the church. The oldest material currently identified on it is a text 10th-century text written by Odo, Abbot of Cluny (c. 879–942), called “How the Organistrum is Assembled.”⁴ According to Sachs, the organistrum was about 2 meters in length and was played by two people.⁵ The instrument was placed on the knees of the two performers, one for the keyboard and the other for the handling wheel (figs.1 and 2).

However, beginning in the 13th century, the organistrum gradually disappeared from church music and shifted to secular music. This is “period II.” As one reason for this, Akimoto mentions the contemporary advent of the Gothic cathedral with its large, immovable organ,⁶ which led to a decline in the portable portatif-organ and non-portable positive-organ, which were less expressive and less well sounding than the larger instrument in the cathedral space.⁷ The same may go for the organistrum. Around this time the instrument came to be called the symphonia, pointing to a change to secular status.⁸ It was shrunken down to be played by one person who could walk around, and the body took on a box shape and a shoulder strap, as seen in the *Luttrell Psalter*⁹ (fig.3).

By the 15th century, the symphonia was hardly used in church music; however, the miniatures of the manuscript *Sforza Book of Hours*,¹⁰ written in the early 16th century, show that it did not necessarily lose popularity because they depict an angel playing

this instrument ¹¹ (fig.4).

The major characteristic of the hurdy-gurdy of period III, called the *vielle*, is that it came to be played by peasants and then beggars and itinerant wanderers. In the 16th century, the increase in beggary became a social issue in Europe, and works aimed at alerting people about fake beggars, such as the *Book of Nomads*¹² were published one after another.¹³

Otani, who is a researcher into Georges de La Tour (1593-1652), has suggested that La Tour's iconic image of the *Blind Hurdy-Gurdy Player* reflects a derogatory motif of the *vielle* that emerged in France and the Netherlands¹⁴ (fig.5). This motif was painted by Hieronymus Bosch (c. 1450-1516) and other northern painters such as the Bruegel family, and then in the 17th century, painters in the Duchy of Lorraine: Jacques Bellange (c. 1575-1616) and Jacques Callot (1592-1635)¹⁵ (fig.6). Marin Mersenne (1588-1648), a theologian and mathematician in the 17th century, refers to the *vielle* in his book *Theory of Music II*.¹⁶

If the common man plays a symphonia called *vielle*, it is not despised, but in practice it is played only by the poor, especially the blind, who make a living on this instrument [...].¹⁷

Period IV

Today, most popular hurdy-gurdy is based on an 18th century French establishment, called "*vielle à roue*." At the beginning of the 18th with the French absolute monarchy and the growth of the aristocracy, the center of French life shifted from rural to urban. At the same time, aristocrats became nostalgic for the "lost times" and rural life, under the influence of Jean-Jacques Rousseau's (1712-1778) thought and François Quesnay's (1694-1774) physiocracy.¹⁸ Pictures and novels came to frequently depicted pastoral scenes.¹⁹ According to Antoine Terrasson (1705-1782), the hurdy-gurdy came to be viewed around 1700 as symbolizing the countryside.^{20, 21}

Spurring this aristocratic vogue for the hurdy-gurdy may have been that many string producers in France had improved the appearance and timbre of the instrument.²² According to Terrasson:

Despite *vielle* had deficiencies, it was very popular, so it was natural that luthiers attempted to fix the flaw. [.....] [Henri] Bâton who is Luthier in Versailles is the first person to complete *vielle*. He had some old guitars that had not been used for a long time. He suddenly came up with the idea of making these guitars into *vielle* in 1716. The invention was a great success, and people wanted *vielle* that just attached to the body of the guitar he made. [.....] As a result, all the ladies wanted to play this instrument, and soon this instrument gained wide support.²³

1186

Luthiers including Bâton improved the shape of the instrument, the arrangement of the keyboard, the shape of the sound hole, the number of strings, the timbre, the tone range, and so on. According to Palmer, Bâton thought to replace the lute, rapidly losing popularity in France at the time, with the hurdy-gurdy, which led to the birth of the popular lute-type hurdy-gurdy. Many aristocrats took up the instrument, as often seen in paintings of the period.^{24, 25}

DECORATION OF THE HURDY-GURDY

Decoration in Periods I-III

Now we will look at the hurdy-gurdy's decoration, following the periodization used above. Since almost no hurdy-gurdies from before the 17th century still exist, images of

them that survive are the main research materials for the early periods.

Organistrum are found in the Santiago de Compostela sculptures (fig.7) and the *Hunterian Psalter* miniatures (fig.8), and symphonia in the *Luttrell Psalter*, as noted (figs.9 and 10), and the Cantigas de Santa Maria miniatures (fig.11). These representations make it hard to determine how the instruments were decorated. However, the Santiago de Compostela organistrum seems to be decorated with carvings. A part of the organistrum in the *Hunterian Psalter* is painted the similar color slightly darker than the body, which may also represent the shadows of carved decoration. In contrast, the symphonia are painted vividly.

As for the vielle, we have noted the tendency to depict it in painting, stemming from the pastoral vogue (figs.12–15). In these paintings, the hurdy-gurdy has three hills on the tailpiece side, and the width of the body narrows towards the head. Furthermore, a geometric motive composed of circles and rhombuses is painted or engraved on all these hurdy-gurdies.

Thus, we can see that hurdy-gurdies produced or used in France had some similarities, such as the shape of the instrument, the pattern of the engraved or painted decoration.

Decoration in Period IV

Several hurdy-gurdies produced in the 18th-century still exist. As mentioned earlier, Bâton made guitar-shaped hurdy-gurdy in 1716, to feed and take advantage of the vogue for the instrument.

Vielle made by Bâton used the guitar were greatly successful, so he thought that using the body of the lute and theorbo would make a more mellow sound. He put this new idea into action in 1720, lute-shaped vielle gained greater success than other instruments. Just since this time, vielle became able to participate in the concert like other instruments.²⁶

No actual instrument made by Bâton has been found; however, of the hurdy-gurdies that exist in the Philharmonie de Paris, Victoria & Albert Museum, and Metropolitan Museum of Art, the guitar-shaped ones with production dates after 1716 (e.g., fig.16), and the luteshaped ones after 1720 (fig.17), were produced under the influence of Bâton.

Around this time, hurdy-gurdies started being luxuriously and expensively decorated, inlaid with jewels and nacre, befitting their increasing use by nobles. There is a theory that the hurdy-gurdy in fig.18 was made for the daughter of Louis XV, Adelaïde,²⁷ but this is denied by the Philharmonie de Paris, which owns it. Regardless, its rococo characteristics such as the nacre and turquoise inlays for the rim and shells decorating the head (fig.19), are striking.

FUNCTION OF HURDY-GURDY'S DECORATIONS

Instruments as furniture

Aside from their main role, musical instruments are also objects for the eyes. As decorative items, they have been augmented by methods such as engraving, painting, and inlaying, as long as they do not interfere with the original function.²⁸ Thus, the more complex the instrument, the more limited the decoration that is possible.²⁹ Another approach is to adopt a decorative material for the body itself. Backboard instruments such as lutes, guitars, and theorbos often have wood of different colors or alternating combinations of ivory and ebony. However, in those cases the beauty of the sound is either sacrificed to some extent or they cannot be played at all.³⁰ Musical instruments

that function as decorative in this way were often large non-portable instruments, for example harpsichords, treated as furniture. However, the hurdy-gurdies used in the French court were basically produced to play, as evidenced by musical pieces such as duos and trios for vielle and musette by Jean-Baptiste Anet (1676-1767) and Joseph Bodin de Boismortier (1689-1755).³¹

Decoration for Performers and Audiences

As mentioned above, the hurdy-gurdy was played by people with low social status until about the 17th century. Palmer says that the lavish decoration of hurdy-gurdies in the 18th century came about “so that it could not be regarded as undignified to own one.”³² In other words, the hurdy-gurdy’s foray into the social space of the court was eased and also contributed to the change to a more luxurious mode of decoration. Although earlier hurdy-gurdies may have been decorated to draw attention to the performer, such as in street performance, there is no doubt that part of the reason for their decoration in the 18th century was for the pleasure of their aristocratic users and audiences.

Decoration for Luthiers

As noted, the hurdy-gurdy became popular among the nobility partly due to the influence of the pastoral style of the day but also due to the pursuit of better tone by luthiers. Terrasson says that “the new vielle [guitar-type hurdy-gurdy] had a stronger and sweeter tone than the traditional one.”³³ He also notes that hurdy-gurdies using lute or theorbo bodies produced a more mellow sound and had achieved greater success than other hurdy-gurdies,³⁴ an observation echoed by many performers at the time.³⁵

CONCLUSION

While decorative tools used in Period I to III hurdy-gurdies include carving and painting, many of those in Period IV are inlaid with nacre and jewels. This change was largely due to social context and the places where hurdy-gurdies were played. In addition, by making improvements to their instruments, luthiers produced hurdy-gurdies quite different in appearance and tone than previously. Although hurdy-gurdies were played continuously, the situations were different; if the public sphere is the “front stage of history” this instrument repeatedly came and went between public and private and ultimately combined them, as the pastoral style popular among the nobility evoked not the actual countryside but only the countryside as idealized by aristocrats, because the appearance and timbre of this instrument, the ones played by nobles are very different from others.

In addition, I'm supported from the Tobe Maki Scholarship Foundation that is Japanese public interest foundation corporation (2018-)."

SOCIAL AESTHETICS OF URBAN COMMUNITY

Abstract | Everyday aesthetic experiences that mostly stay indiscernible but form the background of our daily life, are often seen as private experiences, and their philosophical study has gone to lengths to justify itself. In urban context, the experiences of a commuter are related to other people—to interaction with them, to their presence or absence, even architecture and infrastructure are perceived in relation to people using them—and consequently to the public or social sphere.

In this paper, I will, first, study the individual's experience in the city, then the city as a possibly public context for the experience, and finally, the urban community formed by the commuters and other agents of everyday urban environment. The findings are made tangible by examples from Lahti, a middle-sized city in Finland. The insights of Hannah Arendt's *The Human Condition*, Hans-Georg Gadamer's hermeneutics, and Arnold Berleant's concept of *aesthetic engagement* and ideas for social aesthetics are applied to develop an understanding of urban experience and its significance on a societal level. The emphasis of participation in both Gadamer and Berleant's thought and the Gadamerian concepts of *Bildung*, *hermeneutic experience* and *community of meaning* are utilized to describe the shared character of the urban everyday, and the responsibilities pertaining to experiencing in urban context.

In conclusion, the characteristics of the urban context can help us to experience hermeneutically and aesthetically in a participatory, engaged, way that opens the city as public space. The hermeneutically open everyday interactions with strangers on the street strengthen the societal tolerance which form the base for the open urban community. The seemingly private urban everyday aesthetic experiences are the base for truly public space and action. The urban community is characterised by openness to otherness both as openness to new participants, and as readiness to learn and experience something new—as openness to new ideas and strange aesthetics. The urban community appears as a public area opposed to social or private sphere. But, there are numerous cases where the city fails to be public, where it breaks down into factions or closed communities, where people cling to their dogmatic beliefs and fail to question their preconceptions.

Index terms | *aesthetic engagement; aesthetics of everyday interaction; Bildung; commute; Gadamer, Hans-Georg; public sphere; urban aesthetics*

INTRODUCTION

DAVID Macauley connects good walkability and functioning public sphere:

One of the values of ambling in the urban environment is the face-to-face contact that it encourages as the walker moves from place to place. This interaction has been historically vital to a well-functioning democratic society, where a public sharing of ideas, beliefs, and concerns among citizens needs to occur on a regular basis.¹

This paper studies the mode of existence of public sphere in our everyday, and how the urban context assists in its manifestation. The viewpoint is that of urban aesthetics and philosophical hermeneutics, and that of an experiencing habitant instead of, for example, an urban planner. Within this framework, I endeavour to articulate the potentiality of public sphere, the possibility of political participation, present in our seemingly private experience of the city. Political participation in this paper means participation in negotiating and defining what is valuable in life for individual, for the society or community and for the earth as living environment and ecosystem.

The structure is following. I will, firstly, study the individual's experience in the city utilising Arnold Berleant's concept of aesthetic engagement and Hans-Georg Gadamer's hermeneutic experience. Secondly, in relation to Hannah Arendt's concept of public sphere and Hans-Herbert Kögler's *cosmopolitan public sphere*, I will argue for an understanding of the city as a context that has the potential to facilitate inclusive public sphere.

The central finding is the necessity of mutual hermeneutic attitude for genuinely open public sphere and for the open urban community, and that the urban context and its aesthetic or sensory dimensions can assist in reaching this attitude. The hermeneutic attitude means openness toward otherness, or more specifically, as Kögler writes: "The most basic capacities required for meaningful participation in an intersubjective public sphere [that] include dialogical perspective-taking, mutual respect, and critical reflexivity."²

2 URBAN AESTHETIC-HERMENEUTIC EXPERIENCE

MOVING in the city in daily life, we experience aesthetically and hermeneutically. We experience synesthetically and in an engaged multisensory manner. The city is both the context and the object of experience; it is all around and part of us, and we as urban habitants and experiencing commuters move in it and are part of it. We constitute it. We experience not only fleeting pleasures and displeasures provided through the senses but also meaningful and imaginative dimensions of the urban fabric. We participate in understanding and negotiating the meanings in the city and the meaningful whole that is the city.

We always experience as historical and situated beings and in relation to our life as a whole—not in any abstracted, isolated void. The focus of this paper is the experiential situations in urban space, the parts of the habitants' day when they move in and around the city in relative anonymity. The focus is on the streetscape and public transport but from the perspective of a commuter whose experience is connected to the rest of their life. Therefore, life that includes the city as a possibility and context, the "urban life", is implicitly omnipresent in this paper.

The multisensory experience, the urban aesthetic experience, is best understood as aesthetic engagement conceptualised by Arnold Berleant. *Contra* Kant, Berleant argues for an aesthetic experience that is not disinterested but deeply engaged. For Berleant, it is multisensory, reciprocal, continuous, and active; it is a fusion of the perceiver,

performer, object and artist into an appreciative situation, a contextual whole, “a field”, where these functions are only aspects of the perceptual continuum. Berleant initially developed aesthetic engagement in art context but has since applied it to the contexts of urban aesthetics and social aesthetics, among others.³

The Gadamerian conception of the genuine hermeneutic experience, understanding, is compatible with *aesthetic engagement*. The experience of meaning is an engaged dialogue with the text of tradition. In understanding, the tradition speaks through the text. Everyone understands from their own hermeneutic situation, is limited by it.⁴ Understanding is always interpretation but as “a fusion of horizons”. The interpretation happens in conversation, “in which something is expressed that is not only mine or my author’s, but common.” It is dialogical process toward mutual understanding—meaning is always shared, always negotiated. In it a common language is formed.⁵ In this manner, hermeneutic experience is always negotiation of common matters.

Understanding demands readiness to question one’s predispositions and openness toward otherness, willingness to recognize the other’s claim to be heard. In short, it demands hermeneutic attitude.

Hermeneutic experience is cumulative. By becoming partially aware of one’s hermeneutic situation, the grasp of tradition and the historicity of one’s being, hermeneutic experience is always self-understanding. It is *Bildung*, self-formation. For Gadamer the genuinely experienced person is “someone who is radically undogmatic”. The “dialectic of experience has its proper fulfilment not in definitive knowledge but in the openness to experience that is made possible by experience itself.”⁶ The result of hermeneutic *Bildung* is hermeneutic attitude.

Through this formulation and pairing a more complete picture of the experiential situation, self-formation and dynamics take shape. In our urban everyday, the aesthetic and the hermeneutic are intertwined and reciprocal dimensions of experience. For instance, in aesthetic-hermeneutic experience, sense stimuli, which urban environment has an abundance of, can instigate a hermeneutic dialogue, which in turn can deepen the aesthetic engagement. However, It is not this straightforward. The aesthetic and the hermeneutic are simultaneous, reciprocal and overlapping dimensions in a continuum of experiential situations, where the human participants, cultural texts and context are fused together as a “field”.

The city is its people. Aesthetic-hermeneutic experience is a contextual whole enveloping its human and non-human participants equally. The environment participates in situations of human interaction, and the presence or lack of other people affects our experience of urban space, of architecture, the atmosphere and sense of place. Our experience of the world and built environment involves other people.⁷ Therefore, there really is no gap between engaged dialogical understanding with the cultural texts of the city and hermeneutic attitude toward other people—with participation to defining values and meanings in dialogue with others in the public sphere.

3 THE URBAN PUBLIC SPHERE

IN *The Human Condition* (1958), Arendt divides human life into three spheres: private, social and public. Social is akin to private sphere but on a wider scale: the mass-society of labourers and consumers. Public sphere is the place for action and speech, the ephemeral human activities that require the presence of others.⁸ Karen Fry summarises: “[A]ction is participation in the political life that discloses persons in their singularity, and gives them the opportunity to be remembered. Action is important for Arendt because through words and deeds persons can accomplish acts that are unique

to them. [...] In other words, political action discloses “who” someone is.⁹

I assert that participating in the public sphere can be part of our urban everyday life. In our everyday life, we negotiate the meanings and values purely by being perceived. Being perceived is to be perceived as *who*, not *what*. That is, it is about being understood in the difference and particularity of a person with their singular historical point of view, hermeneutic situation. Arendt understands public sphere as shared space of appearance. “To be deprived of it means to be deprived of reality, which, humanly and politically speaking, is the same as appearance.”¹⁰ Above all, it is about the mutuality of opportunity for people to be seen in their particularity: “Being seen and heard by others derive their significance from the fact that everybody sees and hears from a different position. This is the meaning of public life”.¹¹ The Arendtian public realm, as the space of appearance, emerges wherever people “are together in the manner of speech and action”. This was also the Greek self-interpretation of *the polis*. “Wherever you go, you will be a polis”, Arendt cites Thucydides.¹²

Distant relative of the *polis*, the modern city, is both necessary and harmful for the Arendtian public sphere. The space of appearance is dependent on other people: the public sphere, action and speech gain their reality from the shared character of the situation and the world. “Wherever people gather together, it is potentially there, but only potentially, not necessarily and not forever.” Urban areas, especially walkable cities, where people inevitably interact daily with strangers, are the “most important prerequisite” for the potentiality inherent in relations created by being together: to have an effect.¹³

But the modern city is also space of the social. For Arendt, society is conformist in nature, and with urbanisation, “the emergence of mass society”, the society is omnipresent and the social has conquered the public sphere. There is no political action but only behaviour: “society expects from each of its members a certain kind of behavior, imposing innumerable rules of any kind, all of which tend to ‘normalize’ its members, to make them behave, to exclude spontaneous action or outstanding achievement.”¹⁴

Writing from the perspective of aesthetics, Ossi Naukkarinen recognises the same quality of conformism in everyday interaction between people even in the informalized societies and contexts where considerate or appropriate behaviour rests on particular judgments of tact, on reading the situation.¹⁵ Tact is both ethical and aesthetic behaviour, and the same applies its close relative, taste. Naukkarinen is not as pessimist as Arendt, however, when he writes on “normalizing” tendencies in everyday social behaviour: “To stand out as something special might be considered an uncomfortable aesthetic mistake. This attitude of conformity does not cover everyone’s everyday aesthetics at all times but I would see it as a strong strand within everyday aesthetics.”¹⁶

This threat of conformism is to be answered properly, but in the limits of this paper a remark of alternative relation of the city and conformism suffices. Arto Haapala writes that the “surplus of meaning”, the excess of possibilities, and ineradicable strangeness of a constantly changing metropolis keep us alert, our aesthetic sensibility heightened.¹⁷ Haapala refers explicitly to London: a cosmopolitan city of nearly ten million inhabitants. This is in opposition to the view that metropolitan inhabitants have a kind of *blasé*-attitude and numbness toward other people and their surroundings. The alertness might manifest as non-conformist action between people, and, as opening of public sphere.

In cosmopolitan cities, the qualities pertaining to urban areas important for our study are emphasised. In a cosmopolitan city, there is a great diversity of diversities. One cannot be sure of any shared background in values, narratives nor language. One

cannot be sure whether a person next to oneself is a resident in fourth generation or a weekend visitor. There cannot be assumptions of shared citizenship or of shared local identity. The dialogues or value negotiations are in a potentially global setting, on a transnational level.¹⁸

These qualities also apply to smaller cities. What matters is that people interacting are most of the times predisposed to see the other as a stranger rather than a friend. In a metropolis and in a smaller urban area, there are countless familiar faces on one's daily routes but even they remain mostly strangers to us. I do not pretend to know anything of the lives of the shopkeepers I pass every day. There are chances of relative anonymity.

In these circumstances, the public sphere can also be of its kind, a cosmopolitan public sphere. Kögler defines a cosmopolitan public sphere as "a field in which agents reflexively and in an engaged manner participate in interpreting and defining their own as well as the common good".¹⁹ This field is not in direct contact with any state institutions. It is "a third space between state and society".²⁰ It is transnational, global and, above all, inclusive. Kögler writes:

The envisioned transnational communicative sphere would unleash its normative and progressive force less by direct political influence, and rather by establishing, as it were, in the minds of the cultural agents, a new scope or framework, a new dimension of assessing what, who, and how something is going to be taken into account concerning the issues at stake.²¹

Kögler analyses the human qualities that make the cosmopolitan public sphere possible. These socio-ontologically basic hermeneutic capabilities are the same ones that have enabled our primary self-formation through social learning.²² As basic human qualities, they do not guarantee the public sphere, they only enable it.²³ They are the capabilities "of (1) empathetically understanding another concretely situated human agent, of (2) respecting another human agent as entitled and worthy of the same rights and resources as oneself, and of (3) being able to critically question and challenge generally accepted notions and beliefs".²⁴

These qualities—dialogical perspective-taking, mutual respect, and critical reflexivity—constitute a strong version of the hermeneutic attitude. More often the hermeneutic attitude as openness toward otherness, and willingness to participate in dialogue and question predispositions offered by tradition, is directed to literary or in more general sense cultural texts. Now it is required in face-to-face interaction between human beings. The empathetical and respectful attitude translates to treating the other just as that, as a subject with a past, a singular point of view formed in singular stream of fusions of traditions²⁵.

For the public sphere to be genuinely public, a mutual hermeneutic attitude is required. Public sphere is space for equality and listening, space for being heard, but only for those with access, which, historically have often been few rather than many²⁶. Cosmopolitan public sphere is by definition inclusive, thus a basis for a tolerant and open urban community. The mutuality of hermeneutic attitude is a precondition of cosmopolitan public sphere.²⁷ There are no guaranties, however, that the public sphere functions in the urban everyday—proper physical setting is also needed. In sum, hermeneutic attitude is a prerequisite for cosmopolitan public sphere that is the basis of the open urban community.

The urban context and its aesthetic dimensions can assist in developing and maintaining

hermeneutic attitude. Hermeneutic attitude is born of hermeneutic experience and hermeneutic attitude is needed for hermeneutic experience. The aesthetic aid the city offers for the hermeneutic attitude is multifarious. It is anything that wakes one up from the dogmatic slumber that occasionally envelops our life.²⁸ For Karsten Harries this is the ethical function of architecture as an art form: “Architecture has an ethical function in that it calls us out of the everyday, recalls us to the values presiding over our lives as members of a society; it beckons us toward a better life, a bit closer to the ideal.”²⁹

In its tiniest, the needed aid is a bug flying across the street, or a light breeze; anything that catches our attention, situates us, reminds us that there is strangeness in the world and in us, if we just remember to lower our guard to observe and learn from it. In these instances of strangeness, we learn about ourselves and of the world. Hopefully, the openness takes root as a habit performed in urban everyday. In addition, through the urban context, we are reminded that there are people—likely unknown to us, possibly completely unlike us—who share the sight of the bug with us; who share the world and constitute the urban community with us.

The fact that the aesthetic stimulus can be anything does not absolve the urban planners, municipal workers and politicians from responsibility to imagine, create, support and maintain a city that fosters mutual hermeneutic attitude and situations of interaction between strangers. The city as a built environment has a sort of permanence through architecture and other human fabrication, and is therefore best suited to facilitate public sphere.³⁰ The public sphere requires politics that supports pedestrianism, parks, squares and other places to linger, sense of safety irrespective of the place or the time, public art, architecture and space for non-commercial activities.

Too often the urban space fails to accommodate inclusive public sphere. In non-democratic areas the urban space is controlled and limited to trump any possibilities of public sphere of any kind. And, in democratic urban areas the urban community also fails to be open and inclusive. There are gated communities with private schools in them, the urban sprawl and private cars, segregation, polluted non-walkable cities, macro-level racism and sexism. Macauley writes:

The world of the walker has been withdrawing due to developments from several directions, including the rise of swelling suburbs and now *ruburbs* (rural suburbs), the omnipresence of autos and the ongoing elimination of public spaces. For the past fifty years, cities have been increasingly organized for impersonal driving, private consumption, and commercial advertising rather than human ambling, political participation, and public revelation.³¹

Even though the walker fares relatively well in Northern Europe, the situation is notoriously quite different in Jakarta and other Indonesian or South-East Asian cities.

In our everyday, we often behave, i.e. we strive for tactful and non-offending behaviour. In addition, we judge each other based on assumptions and unquestioned preconceptions and through routine habits of thought—as *what* and not *who*. We see social classes, sex and ethnicities instead of respectfully acknowledging each other’s singular hermeneutic situations and claims to be perceived and heard in one’s humanity.

From the two Christian principles too often only “love thine neighbour” is applied, when it is “love thine enemy” that the hermeneutic attitude incorporates and echoes.³² We might show solidarity to those thought as similar when what the inclusive public sphere requires, is the empathetic understanding toward those dissimilar and strange to us; the recognition that “we” is universal and open, not a closed community of old

friends.³³

CONCLUSION

TO summarise, the aesthetic-hermeneutic experience of the city as built environment is connected to the public sphere in several ways. Firstly, by engaging with the city in one's everyday, one gains experience, and routine of inquisitiveness, of hermeneutic attitude. One forms a habit of being open to otherness. Secondly, as the physical setting of the situation wherein the public sphere opens, the urban environment either facilitates or hinders these dialogical encounters. The built environment is a dimension in the field of public sphere, and the city officials have a responsibility to provide the necessary places and qualities of space.

The public sphere is always contingent but with an atmosphere that fosters hermeneutic attitude and encourages hermeneutically responsible curiosity, the probabilities of its manifestation rise. The urban built environment can assist in creating and maintaining this kind of atmosphere. The seemingly private urban everyday aesthetic experiences are the base for truly public space and action. But, there are numerous cases where the city fails to be public, where it breaks down into factions or closed communities, where people cling to their dogmatic beliefs and fail to question their preconceptions.

It should be clarified, that it is not my intention to draw any simple parallels between aesthetic experience of the city and the functioning of the society. As Pauline von Bonsdorff notes, the aesthetic harmony and the societal harmony have been conflated too easily in aesthetics; by Friedrich Schiller and, more recently by Berleant.³⁴ I might add Roger Scruton to the list.³⁵ This argumentation by seeming isomorphism can lead to uncredited conformist fantasies of harmonious behaviour and ideals of closed community.

My claim is that, at its core, the hermeneutic attitude toward any cultural text, i.e. toward any being or phenomenon in urban context, is the same attitude needed for inclusive urban life. As the sphere of distinction, action, of being seen, the inclusive public sphere and urban community are far from harmonious. All said, this paper should be seen as an introductory proposition for the hermeneutic social aesthetics of urban life.

Henrik Pathirane is a second year PhD student in aesthetics at the University of Helsinki. His research interests include urban and everyday aesthetics, social aesthetics and philosophical hermeneutics. Pathirane studies pedestrians’ experience of their everyday environment and the consequences the composition of the experience has for the larger scale of urban community and for the long term of the individual’s life. He is interested in mapping the viewpoints aesthetics and philosophical hermeneutics offer on the fields of political participation, resistance and deliberative democracy. This mapping, as well as the analysis of the pedestrian experience, he initially pursues by applying John Dewey’s pragmatist aesthetics and Hans-Georg Gadamer’s hermeneutics.

**ATHENS. A CITY ON THE CUSP OF ITS HISTORICAL TIME
LITERATURE AND ARCHITECTURAL SPACE: FROM THE URBAN MEMORY OF ANCIENT
BEAUTY TO THE TOPICAL LITERARY REPRESENTATIONS OF A CITY IN A STATE OF TRANSITION**

Abstract |

“You walked quite enough. You saw nothing, because there was nothing you wanted to see of an Athens whose familiar marble white was wrapped in a gauze of ash. It was as if the whole city was a wound. It might be, too. For all the blurriness you were aware that you were walking in the centre of Athens, literally in the ash urn of its historical time.”

Rea Galanaki

Athens, the city of ancient beauty and the unsurpassed aesthetic perfection of its monuments (the sacred hill of the Acropolis, Parthenon, Erechtheion), the city of the Bavarian romantic neoclassicism and the emblematic institutional buildings, the modern city-screen of spectacle, collective consumption and tourist exploitation is giving way to a city-stage that absorbs the dramatic sociopolitical tremors, moves on in time and keeps mutating.

Sennet writes that the metropolis is functional because it rationalizes human's collective as well as subjective life. Literature, by representing the city through fiction, weaves the age-old past together with the present. It processes the inhabitant's personal experience, micro-history and personal journey in parallel with the bigger picture of collective experiences and the echoes of broader sociopolitical and historical events. It puts together a hypertextual diagram that traces the personal and collective expression of habitation through the somatized handling of urban space.

In her 2015 novel *Extreme Humiliation*, Rea Galanaki portrays an urban context pockmarked by the scars of economic crisis and devaluation. She comes up with versions of the city which combine the monumentality of the cultural heritage of classical antiquity with topical pictures of the practices and actions of individuals and groups. In fiction the city is redefined under the terms of deterritorialization (migration, homelessness), appropriation of public space (demonstrations in squares, squatting in buildings), transformation of people's lives (poverty, unemployment) and redefinition of their social and political identities. The supremely beautiful city-amalgam of poets and symbolic sites of memory meets the city of *“streets and the homeless”*.

Literature and the augmented reality come to help highlight the *“pleasure of the place”*. According to the approach developed by architect Jean Nouvel and philosopher Jean Baudrillard, the architectural practice can no longer be about inventing a new world from scratch; it must be about ingenious acts of transformation and rejuvenation of the cities' geological layers—the quest for an aesthetic of revelation through the successful modification of the accumulated urban matter.

Index terms | *aesthetic of revelation; architectural space; literary representations; augmented reality; urban memory*

INTRODUCTION

The knowledge of cities hinges upon the deciphering of their dreamlike images.

(Kracauer 1931)

Athens. The city of ancient beauty and monuments of unsurpassed aesthetic perfection (Sacred Hill of the Acropolis, Parthenon, Erechtheion); the city of the Bavarian romantic neoclassicism and the emblematic institutional buildings; the modern city-screen of spectacle, show, collective consumption and tourist exploitation, is giving way to a city-stage that absorbs dramatic sociopolitical vibrations, shifts through time and is in a constant state of transformation.

Sennet writes that a metropolis is functional because it streamlines people's collective as well as subjective life. Literature, by representing the city through fiction, weaves the age-old past together with the present. It processes the inhabitant's personal experience, micro-history and personal journey in parallel with the bigger picture of collective experiences and the echoes of broader sociopolitical and historical events. It constructs and constitutes a hypertextual diagram that traces the personal and collective expression of habitation through the embodied handling of urban space.

In her 2015 novel *Extreme Humiliation*, author Rea Galanaki is portraying an urban area pockmarked with the scars of economic crisis and degradation. She processes versions of the city that meld the monumentality of the cultural heritage of classical antiquity with topical snapshots of the practices and actions of individuals and groups. Over the course of the fictional storyline, the city is reassigned meaning in terms of deterritorialization (migration, homelessness), claim to public space (demonstrations in squares, squatting in buildings and other spaces), transformation of people's lives (pauperization, unemployment) and redefinition of their social and political identities. The supremely beautiful city-amalgam of poets and symbolic sites of memory meets the city of "the streets and the homeless."

Literature helps bring to the surface "the pleasure of the place." According to the approach developed by architect Jean Nouvel and philosopher Jean Baudrillard, architectural praxis can no longer be about inventing a new world from scratch; it must be about intelligent interventions that transform and rejuvenate the cities' geological layers—the quest for an aesthetics of revelation through the successful modification of the accumulated urban matter.

SPEECH IN THE REPRESENTATION OF URBAN SPACE:

INTERACTIONS, COUPLINGS, DECOUPLINGS, AND PLOT TWISTS

The 'reality' that he tracks cannot be reduced to the immediate data of the sensory experience in which it is revealed; he aims not to offer (in)sight, or feeling, but to construct systems of intelligible relations capable of making sense of sentient data.

(Bourdieu 1995, xviii)

Literary texts possess the inherent power to organize and synthesize the social, collective, cultural, emotional, and historical layers within the urban fabric. By following the fictional plot, the reader does not simply perceive the unequivocal voyeuristic image of a city-museum or a city-diorama, but the enriched picture of the ambulatory city—anti-museum of daily practices and performances of tasks by its inhabitants, and of its continuously shifting semantic layer.

According to Ricoeur, fictional narrative is an iconic augmentation of the world of human action, which consists of conjuring plots and constructing events in a rational manner. Speech, action and integration into a storyline create new networks of reading an experience or producing it, precisely because they lend a dimension of denotation or notification rather than reduplication of reality. Fiction resorts to reality not to copy it but to propose a new approach to it of distinct cognitive value. The conceptual mental image created by the writer is marked by his or her characteristic intention to offer a model for a different perception of things, more specifically a paradigm of a new vision (Ricoeur 1990, 66–70).

Literature follows several different paths and devises several different starting points to represent space and paint a lucid picture of the spatial components and spatial qualities that lend it expression and substance as a creative reference. By tracing the lifecycles of the narrative's subjects, literature captures and attests to those discrete and selected elements which, by means of language's inherent capacity to reveal, shall fashion, i.e. render accurately and acutely, the distinctive features of space and its identity in the mind of the reader (Eco 2002, 245).

Siegfried Kracauer speaks of the "experience of the city as a labyrinth of fragmented signals." In his article "Berlin Landscape" he makes a clear distinction between images of the city. He writes: "One can distinguish between two types of cityscape: those which are consciously fashioned and those which come about unintentionally. The former spring from the artificial will that is realized in those squares, open vistas, building complexes and perspective effects that are generally marked with an asterisk in tourist guides. By contrast, the latter come into being without a prior plan." (Kracauer 1964, 40).

According to Pierre Bourdieu, the "literary microcosm," a relatively autonomous field, functions by means of a group of acting subjects, works and phenomena, in which social forces are also present, since literary writing has the unique capacity "to concentrate and condense in the concrete singularity of a sensitive figure and an individual adventure, functioning both as metaphor and as metonymy, all the complexity of a [social] structure and a history" (Bourdieu 1995, 24).

Several contemporary Greek writers have been inspired by Athens of the crisis, venturing to offer new representations of urban space, new readings, interpretations and methods of deciphering the metropolitan experience. In their novels they monitor the painful changes occurring in the city and altering the psyche of its people. They collect the bidirectional interactions between the characters' space and psyche. They reconstruct the image of the city through comparative assessments of neighborhoods, buildings, roads and public spaces that are rich in social and political life. They alternate between the present and the past, between today and yesterday, following in the footsteps of their characters as they move towards an unspecified destination or take to the streets in protest at iconic sites of the city.

PRIVATE SPHERE, INNER SPACE AND PUBLIC SPHERE

According to Michel de Certeau, “space is a practiced place” or, to put it more broadly, a place that is inhabited. “Thus the street geometrically defined by urban planning is transformed into a space by walkers” (De Certeau 1984, 117). Moving masses “make some parts of the city disappear and exaggerate others, distorting it, fragmenting it, and diverting it from its immobile order.” (De Certeau 1984, 102).

Social considerations are evident, overtly or covertly, in post-2008 Greek literary narratives, which heed the change of direction in the signs of the times and adopt the poetic form of transition, aiming to awaken and unleash the reader’s critical conscience. The personal journeys of the characters, whether they are passing through or wandering aimlessly, are spatializing the city of the economic, political and social crisis, of discomfiture and insecurity. The narrative’s plot shifts focus from the private space of one’s dwelling to the absence thereof (homelessness-habitation of public space). The city center as a prime core and its traditional neighborhoods as symbolic places for identity determination, are reinstated in the foreground, as this is where the change of paradigm is most eloquently pronounced.

Roland Barthes indicates that the form of the literary message as defined by the author maintains a concrete connection with History and society, as the connotational factors inadvertently entailed in the text constitute the elements of a code, whose validity may be more or less long-term but whose informative value is well grounded despite the divergence of interconnection between signs (Barthes 2005, 121).

In her novel *Extreme Humiliation*, Galanaki decides to wander into the gloom of abjection. She chooses her heroines from groups that are the most pregnable and vulnerable to the repercussions of this ominous condition (Tsirimokou 1988, 28). Two cultured women, elderly and mentally ill, who live in a hostel in the city center, will be caught up in the spiral of socio-political events at Syntagma Square. The day after will find them feeling lost and helpless, “in the city of outcasts, which lay hidden as a nightmarish fetus in the belly of the yet-again knocked up Athens” (Galanaki 2015, 211).

Nothing was as easy for you as it was in a home enclosed in walls, particularly everything that had to do with your bodily needs and personal hygiene. No other way was available to you; you adapted as best you could to life on the streets—the vast difference between singular and plural made you sad, a simple ‘s’ denoting a whole other class of habitation; you see, ‘street’ implies a house with an address, while ‘streets’ stands for humiliation. (Galanaki 2015, 212–13)

Literary representations, as revealed by the preceding extract, are no longer intently focused on the indoor space of houses, but rather on the streets and their habitation, as the storyline steps outside the enclosed personal space of intimacy and security to capture events of the outdoors. The “homeless” citizen appears in many texts of modern-day literary production, either as a protagonist who is instrumental to the plot or as a secondary significant figure aimed at honing the reader’s critical stance. Galanakis’s heroines are not merely “characters,” but person-points of reference, representing crucial loci in social space in a particular economic and political juncture (Bourdieu 2006, 38). They appropriate the city’s public space through actions of negotiation, assertion and institutionalization of informal rules of habitation and

conduct, turning it into an ephemeral outdoors stage.

INHABITING THE SQUARE AT MONASTIRAKI

...the city itself is the collective memory of its people, and like memory it is associated with objects and places. The city is the *locus* of the collective memory.

(Rossi 1982, 130)

According to Rossi, the city constitutes a palimpsest, a complex body of traces and a theater of memory, as “memory becomes the guiding of the entire complex urban structure” (Rossi 1982, 130). It is a combination between a structured environment and the individual and collective stories that are woven like a network of meeting places, a network of different pasts that are communicating with each other.

Literature chooses architectural spaces of *significance*, in which to place the narrative function. Galanaki focuses on the historic center of Athens, its timeless section marked by a stratigraphy of cultures and the monuments of Athenian Classicism; more precisely, she focuses on the Square at Monastiraki. She places the actions of her heroes in a liminal space situated at the border between the traditional part of the city (Plaka) and the modernist neighborhoods with the boulevards and the Bavarian-style rationalistic urban structure. At a site where there is a particularly intense condensation of groups of users and several different functions, but also where there are architectural traces of the past and multifarious fragments of Classical Greek, Roman, Byzantine, Ottoman, and Neoclassical monuments and contemporary buildings.

You walked quite enough. You saw nothing, because there was nothing you wanted to see of an Athens whose familiar marble white was wrapped in a gauze of ashes. It was as if the entire city were a wound. Perhaps it was, too. A crisp breeze was blowing from the north and you were cold, but you supposed that it would at least whisk away the ashes any minute. For all the blurriness you were aware that you were walking in the centre of Athens, literally in the ash urn of its historical time. (Galanaki 2015, 197)

Maurice Halbwachs underscored the pivotal importance of space in the formation of collective memory, noting that the recollection of spaces by members of a community is equally vital to social memory as the recollection of periods of time. Halbwachs emphasized the function of the familiar urban setting, the persistently unchanging character of a city, the “impassive stones,” as a factor of continuity and stability (Halbwachs 2013, 158). The spatial focalizations of fictional texts contribute to the analysis of viewing and experiencing the city’s habitation. Employment of disjunctive relationships and dipoles, and the mobilization of all the senses, serve to emphasize the contrast between current and past images of the city.

In an attempt to intensify the topographical identification and emphasize the unfamiliar image of the city after the fires of 2012, Galanaki invokes Athens’s cultural past and monuments as “sites of memory” or, in the words of Pierre Nora, as *lieux de mémoire*—functional, symbolic and physical places where history and memory interact and determine one another, affecting the social and political identity of the resident.

It was quiet under the awning, as if your Athens became a different city here; the cleaner atmosphere [after the fire of 12 February] also helped. But it wasn't a different city; it was still your city, as was evident in the nearby square with the mosque and the church, the ancient pillars next to them, the entrance to the electric railway and the metro, the hallowed rock of the Acropolis with the ancient temple on the top, a capstone to this amalgam of time, thought and feelings. (Galanaki 2015, 203)

CONCLUSION:

THE CITY AS A COMMONS OF MODIFICATION AND NEGOTIATION

This project constitutes a reflective journey through the multifaceted and conflictual character of the city and the *peripeteia* in its representation through fiction. It is not an examination of the urban state of the modernist city of the past century—of the spectacle, the fetishism of commodities, the lonely masses and the technological alienation; rather, it is an investigation of the volatile, unmapped, unstable state of the contemporary postmodern city of the 21st century. The city of urban voids, contradictions, chasms, dystopias, and a political and economic crisis, which directly and dramatically affects the image and function of both public and private space.

According to the approach developed by architect Jean Nouvel and philosopher Jean Baudrillard, architectural praxis, as an aesthetic approach and as a social intervention, can no longer be about inventing a new world from scratch; it must be about intelligent interventions that transform and rejuvenate cities (Baudrillard and Nouvel 2005, 40). It must be about the successful processing of this accumulated urban matter, which will allow for the creation of “common spaces” that are clearly distinct from both public and private space. Hybrid, unexpected, fluid and unmapped spaces that will establish alternative models of habitation and socialization in the modern-day megalopolis, thus constituting hubs of new creative encounters, new sharing practices, new forms of social life.

The search for the pleasure of a place... is an aesthetics of revelation, a way to take one piece of the world and say: I make it my own and deliver it to be seen in a different light.

—Jean Baudrillard

He is visiting professor in the department of Conservation of Antiquities and Works of Art, where he teaches ‘Analog and Digital Capture Techniques’ and in the postgraduate program ‘Conservation of Cultural Heritage’ he teaches ‘Digital Three-dimensional Representations’. He is collaborative professor in the inter-institutional (National and Kapodistrian University of Athens and University of West Attica) postgraduate programme “Museum Studies” where he teaches ‘Museum Architectural Design and Museography’.

THE OLD NATIONAL GALLERY IN BERLIN: TRANSITION BETWEEN PRIVATE AND PUBLIC AESTHETICS

Abstract | The aim of the paper was to understand when the transition between private and public aesthetics started to be possible in the art institutions. Analysis of the museum structures showed that a break between past and present took place in the end of the XIXth century. Research of various collections of the public museums helped to realize that museums in the beginning of its history were not oriented on the public needs. The situation changed by the end of the XIXth century: the stress on the «I» of elite art changed to focus on «We» of broader styles and artworks.

In this paper the author proves the statement with the example of The Old National Gallery in Berlin. Facts of its history shows that it was the first museum in which desire of the emperor faced the will of its director, who represented the will of wider range of social classes. This example of the Old National gallery illustrates a big aesthetic change in art institutions. The result was a changing of museum concept: it started to be a place which includes various kinds of artworks and thus became a dialog platform between many people.

Index terms | *private aesthetic, public aesthetic, museum structure, art institutions, museum concept, the Old National Gallery, Berlin*

The main purpose of this paper is to show how the aesthetic changes in the German's museum started to be possible. The paper provides you with the case of the Old National Gallery, Berlin and the work of its director —Hugo von Tschudi. The paper argues that considers that the Gallery is the first place where a transition between private and public aesthetics started to be possible. Before the introduction of Hugo von Tschudi's acquisition policy museums in Germany were spaces that could reflect the one and only aesthetic. The reasons of such situation are also discussed in this paper.

The main purpose of this paper is to show how the aesthetic changes in the German's museum started to be possible. The paper provides you with the case of the Old National Gallery, Berlin and the work of its director —Hugo von Tschudi. The paper argues that considers that the Gallery is the first place where a transition between private and public aesthetics started to be possible. Before the introduction of Hugo von Tschudi's acquisition policy museums in Germany were spaces that could reflect the one and only aesthetic. The reasons of such situation are also discussed in this paper.

Reason ONE. The king's ultimate authority extended to the museum politics. By the time when the first Prussian museum had appeared in 1830 — it is known as the Old museum now — the power of the king in Prussia was extremely strong and this fact was reflected in the management of the museum. The king managed the affairs of the museum himself for a long time, and his power was limited neither by the Parliament nor by the Constitution. This enabled him to change the exposition according to his own taste.

Furthemore, the collections of the Prussian museums consisted of many artworks that belonged to a monarch (*Sheehan J.J.* 2000, 187). As a result, museums provided the private aesthetic of one person.

The changes began in 1835 when Friedrich Wilhelm III issued a collection of resolutions. In this resolution the internal structure of the museum and its connection with other public institutions were defined. The king also approved the position of a general director (for the first two years this position was called "general quartermaster"). The general director was a head of all departments, and also had to report to the king at first, and from 1837 to the Ministry of Culture. All the museum's acquisitions had to be approved by a special committee consisting of a general director, heads of departments and a group of artists-advisers. The general director was the head of the committee, but the final decision was made according to a majority of votes (*Sheehan J.J.* 2000, 190).

Though the king's sway was limited in the administrative affairs, the museum had still received money through the personal donations of the Royal family. And the diplomatic skills of a general director played an important role: he had to convince the king about value of all artworks that he wanted to acquire for a museum.

After the changes in museum's structure aesthetic shifts became possible. Surprisingly these shifts began in one of the most conservative Prussian museums — the National Gallery in Berlin (now we know it as the Old National Gallery). The National Gallery that was founded in 1861 by decree of William I. The Gallery had its grand opening on the 22th of March 1876. The inscription «Der Deutschen Kunst, MDCCCLXXI» was engraved on the facade. 1871 was a year when the German Empire was founded (*Keisch C.* 2005, 15). This museum was primarily focused on German academic art. This was due to policies of the Procurement Committee which included German artists who were truly interested in promotion of the National art, but also due to the taste of Wilhelm II.

However, when Hugo von Tschudi became a director of The National gallery in 1896,

everything changed. This year was also a year when Tschudi started to be interested in new innovating art movement — Modernism, especially French one. Tschudi was so absorbed with Paul Durand-Ruel, his salon and his ideology *l'art pour l'art* that decided to change the concept of the National gallery (*Grodzinski V. 2005, 274*).

Still, the administrative conditions did not allow him to do it. The Acquisition Committee would not give funds that could otherwise be spent on their own German paintings. Tschudi was in a difficult situation but he was able to find a way out. He decided to bypass this instance. Tschudi convinced the Kaiser that paintings that he wanted to buy could be taken as a gift. He told the Kaiser that Germans wanted to see these paintings in the museum and that they were even ready to pay for them. He cooperated with the bourgeois society. Its representatives agreed to donate funds for the purchase of paintings. Unfortunately, there was a flaw in Tschudi's idea. These bourgeois, who were ready to give money, were Jews and Kaiser was famous for his Anti-Semitic views. Tschudi had to look for fake patrons among the German aristocracy to present their acquisitions to the Kaiser. We know at least two persons that he founded: Georg von Siemens and Guido Graf Henckel von Donnersmarck (*Grodzinski V. 2005, 286*).

However, a peaceful cooperation between Tschudi and Wilhelm stopped in 1897. This year the exposition of the museum was renewed. New acquisitions were displayed on the first floor. On the same place where the paintings of Academists had been displayed before. These paintings were placed to a storage (*Sheehan J.J. 2000, 280*).

As a result, in 1898 Wilhelm pushed for the bill, which stated that the German museums were forbidden to accept private donations. To the contrary, in 1899 Tschudi gave a speech in which he reproached the dominant German artistic taste. In that speech he argued that historical painting was a political painting, and therefore had nothing in common with the true art (*Grodzinski V. 2005, 275*.)

Despite the fact that Tschudi had to return the old exposition, he had been working in the National gallery until 1909. All these years he was trying to buy modernist paintings. Tschudi's contribution to the art history was enormous. He changed the museum concept. The museum was deeply connected with aristocracy before his reforms. Tschudi shifted the focus and approved another kind of taste.

Nowadays we can see a great variety of art pieces in museums all over the world. This modern museum seems to reflect an international taste and each person can find something for himself. And that could hardly be imagined without such a person as Hugo von Tschudi.

On the other hand, we should always be aware of the back side. Who has the power now when aristocracy left? Is it a really free art that reflects the taste of all people or is it still sponsored by the small amount of rich people and their money?

THE REGIMES OF IDENTIFICATION OF ART AND THE POLITICAL RECONFIGURATION OF THE AESTHETICS

Abstract | For the philosopher Jacques Rancière there is no the 'art' without a specific identification regime that delimits it, makes it visible and makes it intelligible as such. A regime of the arts defines the specific ways in which a given epoch conceives of the nature and logic of artistic representation, puts certain practices in relation to specific forms of visibility and modes of intelligibility, specifies the ways in which the artistic expressions take place within society, what their functions are within social life in general and in relation to the other social activities in particular.

For proposes this approach, Rancière retakes the kantian idea of aesthetics in terms of 'a priori forms of sensibility', but not as a matter of art and taste, neither as forms of presentation of the objects of knowledge, but rather as a matter of time and space dealt as forms of configuration of our 'place' in society, as forms of distribution of the common and the private, that involve the assignment of someone within the common or their participation as part of a community. Is in this sense that we can find in his thought a singular and original reading of some inaugural texts of political philosophy such as the *Republic* of Plato and the *Politics* of Aristotle, as well as the aesthetics of the eighteenth century, especially the *Critique of the Judgment* of Kant and the *Letters on the Aesthetic Education of Man* of F. Schiller, among other outstanding references that acquire new possibilities of meaning and conceptual resonances of interest to think about the relationship between aesthetics and politics.

In this presentation we briefly resume the contents of the three fundamental regimes of the arts: the ethical, the poetic or representative, and the aesthetic, taking into account that these regimes are not strictly historical, but rather 'meta-historical' categories, because although they may determine and define certain periods of the 'art history', it is also possible to state that two, or even the three regimes, they can coexist in a specific time like ours, for example. A philosophical research that has both a historical and a political component which are aimed to reframe the traditional manner to consider the aesthetic conditions of political experience and the political dimension of aesthetics.

Index terms | *Aesthetics; Aesthetical politics; Distribution of the sensible; J. Rancière; Politics of arts; Regimes of the arts*

I never switched from politics to aesthetics. I always tried to investigate the distribution of the sensible which allows us to identify that we call politics and something that we call aesthetics.¹

Jacques Rancière

The three regimes of identification of the art

Aesthetics is assumed by Rancière, not as a theory about art in general or a theory of art that circumscribes it to the different effects it may have on sensitivity, but rather as a specific regime of identification and thought of the art, that is to say: “a mode of articulation between ways of doing and making, their corresponding forms of visibility, and possible ways of thinking about their relationships (which presupposes a certain idea of thought’s effectivity)”²

And, on the one hand, Rancière can be distinguished from *aesthetic practices* as ways of visibility of the practices of art, the place they occupy and what they ‘do’ in relation to ‘the common’ of a community, and on the other, *artistic practices* that are specific ‘ways of doing’ that intervene in the general distribution of ways of doing things and in the relationships that can be established with other ways of being and forms of visibility in a given social area. This is determinant, because that means that ‘art’ cannot exist spontaneously, naturally or predetermined, but exists thanks to a certain identification regime that delimits it, makes it visible and makes it intelligible as such, this is expressed for him in follows terms:

Founding the edifice of art means defining a certain regime of art identification, that is, a specific relationship of practices, forms of visibility and modes of intelligibility that can be identify their products as belonging to art or one art.³

Therefore, there is no art for Rancière, without a regime of identification and thought that allows distinguishing its forms as common forms. A regime of identification of art is one that puts certain practices in relation to specific forms of visibility and modes of intelligibility. In turn, each type of art identification regime allows the different arts of other human activities to be autonomized, while at the same time linking them to a specific historical order in which there are general ways of doing and a particular type of art. Occupations that are related to them in terms of artistic practices, because it puts them in relation to forms of visibility and specific modes of intelligibility. In this way, Rancière needs three regimes of identification of what has been called ‘art’ in the Western tradition: the first is the *ethical regime of images*, the second is the *poetic regime*, also called *mimetic* or *representative* and, the last (and in which we are currently) is the *aesthetic regime* of the arts.

We will approach each of these regimes and their characteristics in greater detail below, but before proceeding to specify them, it is important to clarify that these are not strictly historical regimes, but rather ‘meta-historical’ categories, because although they may reach to determine and define certain periods of the ‘history of art’, it is also possible to verify that two (or even the three regimes) can coexist in a specific time like ours, for example. And it is that although it seems that each of these regimes of identification and thought of art could be associated to a particular moment of the ‘history’ of art (in the way, for example, Hegel does in his Lectures on Aesthetics in where posits three moments of art as a manifestation of the ‘Absolute Spirit’ in three well-defined artistic periods: the symbolic, the classical and the romantic), for Rancière the inscription of the arts in a certain ‘distribution of the sensible’⁴ implies more well take into account the common elements from which each historical epoch conceives the world, insofar as it gives meaning to a certain social set.

The ethical regime of images

In the ethical regime, the origin, the truth and the use of the images are the three fundamental factors to be taken into account for their creation and evaluation, which prevents them from being identified as art. Therefore, in this regime the different artistic productions are not grouped or identified by the common denominator 'art', but rather are each subsumed by the value given to them in ontological terms, it is to say, by attributing to them linked characteristics, to a divine origin, and to consider that they are bearers of a transcendent truth, related to their being. In addition to its origin, the fate of the images is also assessed in terms of the utility assigned to them and the effects that are believed to be generated. Hence, in this regime are important issues related to their relationship with the divine or the sacred, the right of prohibition or authorization of creations of images, the statute and the significance that is believed to have, but also for its possible usefulness and destiny in the social body.

It is in this framework that, according to Rancière, it is necessary to understand Plato's proscription of certain types of images, and consequently of certain arts, insofar as he does not intend to subject the arts to the political, but considers that there are some of them that are 'true' because they are linked to knowledge linked to the imitation of valid models, and arts that imitate mere appearances. This origin, which allows the classification of images for Plato, also has a correlation with the use, or rather, with the educational purpose that images must have for him, as they must necessarily provide them with some instruction about moral issues and of assignment of roles and functions in the city to the youngest. For example, Books II and III of the Republic are very explicit and detailed in terms of the precautions that must be taken with the lies that can be spread with the contents of the works of Homer and Hesiod, which can be a bad influence for youth.

It is in this sense that I speak of an ethical regime of images. In this regime, it is a matter of knowing in what way images mode of being affects the *ethos*, the mode of being of individuals and communities. This question prevents 'art' from individualizing itself as such ⁵

However, it is also interesting to consider that the ethical regime could refer not only to the past, but also to modernity, because it could be related to the content of certain images linked to the vanguards, for example. According to this approach, one could mention an 'ethical' attitude in German realistic expressionism and many other avant-garde movements that possess an explicit 'political' content of denunciation, but whose political gesture only remains in the realm of images and does not concern the distribution of the sensible. In addition, this could be extended to a large set of images that seek to denounce or convince in political terms, without questioning the sensitive and material conditions in which they circulate.⁶

On the other hand, with this same perspective it is possible to understand the parallelism inherent in all of the attempts to deduce the characteristics of the arts from the ontological status of images. For example, the incessant attempts to derive the idea of the 'distinctive feature' of painting, photography, or film from the theology of the icon.

The representative or poetic regime of art

The second moment established by Rancière is the *representative or poetic regime*,

which distances itself from the ethical regime. It is it, which identifies the arts under the binomial *poiesis / mimesis*. In this regime it is isolated, under a pragmatic principle, an artistic doing in terms of imitations that are considered valid, appropriate, adequate or not. Are established divisions between the representable and the unrepresentable, distinctions are made between different genres of representation, as well as the principles of adaptation of the forms of expression to the genres and themes represented, among other functions:

I call this regime *poetic* in the sense that it identifies the arts – what the Classical Age would later call the ‘fine arts’ - within a classification of ways of doing and making, and it consequently defines proper ways of doing and making as well as means of assessing imitations. I call it *representative* insofar as it is the notion of representation or *mimesis* that organizes these ways of doing, making, seeing, and judging.⁷

However, here it is necessary to clarify that by *mimesis* Rancière does not understand a procedure that submits artistic productions to a general rule of imitation or similarity, but considers that it is rather the establishment of a new *regime of visibility* of the arts other than the ethical regime. And it is a *regime of visualization of the arts* insofar as it grants them autonomy, but - at the same - also a particular articulation between the distribution of the ways of doing and the social occupations that make the arts visible, and according to which there is a different correlation between the ways of making art (*poiesis*) with the ways of doing and the political and social occupations of a social set (*praxis*). Which makes that this representative regime, where the narration over the description prevails, the hierarchy of the genres according to the importance and dignity of the themes, the primacy of the art of the word, of the word in act, of the representation of the action on the characters, finds its equivalent in a hierarchical vision of the community.

It is about the establishment of a normative model of inclusion that is no longer going to ask about the origin of the ‘being’ of the image, or the relationship between the model and the copy as in the ethical regime, but rather about the conditions that make the imitations are recognized as belonging to a certain artistic expression, if meeting with the requirements that make its susceptible to acceptance and reception, that allows to distinguish between those that are appropriate, those that are valid or achieved and those that are not. Requirements that are based on several principles (thematic, expressive and technical-artistic), that legitimize them as they prescribe certain ways of doing specific for the creation or production (*poiesis*) of works of art ‘accepted’ and recognized as such, being the representation (or *mimesis*) the guide of those ways of doing, seeing and judging in this regime that may have its antecedents in the *Poetics* of Aristotle and that has its peak in the period that gives rise to the so-called ‘fine arts’ that arise in the Renaissance.

The aesthetic regime of art

The aesthetic regime differs from the representative regime in that the identification of art is no longer done by means of its specificity in the ways of doing, but by a characterization of a ‘sensible way of being’ that must distinguish from now on artistic productions:

The aesthetic regime of the arts stands in contrast with the representative

regime. I call this regime *aesthetic* because the identification of art no longer occurs via a division within ways of doing and making, but it is based on distinguishing a sensible mode of being specific to artistic products. The word aesthetics does not refer to a theory of sensibility, taste, and pleasure for art amateurs. It strictly refers to the specific mode of being of whatever falls within the domain of art, to the mode of being of the objects of art. In the aesthetic regime, artistic phenomena are identified by their adherence to a specific regime of the sensible, which is extricated from its ordinary connections and is inhabited by a heterogeneous power, the power of a form of thought that has become foreign to itself: a product identical with something not produced, knowledge transformed into non-knowledge, logos identical with pathos, the intention of the unintentional, etc.⁸

The aesthetic regime of the arts is what makes it possible to identify “art” in the singular and separates it from any relationship with the techniques, genres and hierarchy of themes:

The aesthetic regime of the arts is the regime that strictly identifies art in the singular and frees it from any specific rule, from any hierarchy of the arts, subject matter, and genres. Yet it does so by destroying the mimetic barrier that distinguished ways of doing and making affiliated with art from other ways of doing and making, a barrier that separated its rules from the order of social occupations. The aesthetic regime asserts the absolute singularity of art and, at the same time, destroys any pragmatic criterion for isolating this singularity. It simultaneously establishes the autonomy of art and the identity of its forms with the forms that life uses to shape itself.⁹

It is the of Schiller’s *aesthetic state*, which is pure suspension, where the form proves itself.¹⁰ It is also the conception of art as an activity that depends as much on a conscious process as on an unconscious one in the manner of the Kantian “genius” that ignores the law that allows it to create art, for example.

The important thing to highlight here are several things. In the first place, that the art, the definition of ‘art’, arose in the 18th century and that, therefore, previously this definition did not exist as such because we were not in a regime of identification that made it possible. There were different arts, but not a concept, an idea, that would agglutinate them. The other is that this is linked to a form of experience through which they are perceived as belonging to a common element: the ‘art’, a number of things very different from each other, either by their production techniques, their purposes or possible recipients. In this regard, it should be noted that for Rancière this is not due to a matter of ‘reception’, but rather because of a ‘fabric of sensitive experience’ within which works of art are produced:

These are totally material conditions -places of action and exposure, of forms of circulation and reproduction-, but also of modes of perception and of regimes of emotion, of categories that identify them, of thought patterns that classify them and interpret. These conditions make it possible by words, forms, movements, at to be felt and thought of as art.¹¹

In it, also operate the schemes of thought that allow that certain characteristics of a painting, a stroke, the acceleration of a musical rhythm, the silence between two words, a variation, are assumed as artistic events and associated with the idea of

artistic creation. Likewise, the reflections of art and aesthetics that make it possible to identify the existence of dissimilar and different activities as activities that have artistic characteristics to highlight. But it was above all with the emergence of museums, at the time when galleries of royalty opened their doors to the general public, when the art, in turn, was opened to the possibility of being appreciated and valued by anyone, and that anything could come to be considered as art: "Art exists as a separate world in the moment that anything can enter in it." ¹²

The aesthetic regime also implied a radical modification of the system of representation that previously prevailed in the arts, as it removed the pre-eminence of the dignity of certain themes linked to personalities and certain genres of representation (tragedy for the 'noble classes', comedy for the 'less favoured', historical painting against gender painting, etc.). Because in the representative (or classical) regime the genders, situations and forms of expression that suited the 'baseness' or 'dignity' of the subject or subjects to be treated were defined specifically, while in the aesthetic regime of the arts this correlation between the theme and the mode of representation is undone.

Thus, the logic of this regime of affection, perception and thought that Rancière calls the 'aesthetic regime of art', encompasses many things, not only examples of the so-called "fine arts" or "cultured arts", but also experiences linked to the 'minor arts', because with this heterogeneity its sought to establish a fusion between art and life.

Nevertheless, the most important thing, as far as we are concerned, is that with this approach to the art regimes what Rancière is doing is to modify the usual way of defining the relationship between art and politics. In the sense that he establishes that there is an aesthetics of politics, because the politics: "builds sensitive worlds by joining words and images to establish particular spaces and times"¹³; and, at the same time, resignifies what we know as art, when he affirms that arts conform an aesthetic of its own: "a cut-out of the places and the times, of the ways of exposing the bodies, the forms, the words, the movements and the images that build common worlds." ¹⁴

3 Jacques Rancière, *Malaise dans l'esthétique* (Paris : Galilée, 2004), 43. («Fonder l'édifice de l'art, cela veut dire définir un certain régime d'identification de l'art, c'est-à-dire un rapport spécifique des pratiques, des formes de visibilité et des modes d'intelligibilité que permettent d'identifier leurs produits comme appartenant à l'art ou à un art»).

4 Occasionally translated as the 'partition of the sensible', *le partage du sensible* refers to the implicit law governing the sensible order that parcels out places and forms of participation in a common world by first establishing the modes of perception within which these are inscribed. The distribution of the sensible thus produces a system of self-evident facts of perception based on the set horizons and modalities of what is visible and audible as well as what can be said, thought, made, or done. Strictly speaking, 'distribution' therefore refers both to forms of inclusion and to forms

of exclusion. The 'sensible', of course, does not refer to what shows good sense or judgement but to what is *aisthêton* or capable of being apprehended by the senses.

In the realm of *aesthetics*, Rancière has analysed three different 'partages du sensible', the *ethical regime of images*, the *representative regime of art*, and the *aesthetic regime of art*. In the political domain, he has studied the relationship between the *police*, a totalizing account of the population, and *politics*, the disturbance of the *police* distribution of the sensible by the *subjectivization* of those who have no part in it. (Cf. Rancière, *The Politics of Aesthetics*, 85.) (It is a definition of the trans. Gabriel Rockhill).

10 The fundamental thesis of Schiller is the ennoblement of the human character, raised in the nucleus of an education of man and humanity, for a truly rational state or society. This "aesthetic state" ideally conceived by reason can only be carried out by the moral man: one whose rational and sensitive faculties are not in contradiction. In this way, Schiller suggests a critique of enlightened reason (which is based on Kant), because it has not yet come to fulfil the ideal of a truly rational state, since such a reason has failed in practice but not in the theory. It is to be noted that Schiller starts from Kantian principles, to overcome them. His idea of synthesis, beauty, is based on his theory of *play*, a unitive moment in which the human being is free. From the reciprocal action of the *material or sensible drive* and the *rational or formal drive*, Schiller conceives the *aesthetic impulse or play drive*, principle of action of beauty. This *aesthetic impulse* encompasses the *sensible drive* and the *formal drive* in a dialectical movement that suppresses and conserves them at the same time. Schiller defines the object of *aesthetic impulse or play drive as living form (lebende Gestalt)*, beauty in the realm of experience.

HOW SENTIMENTAL STORIES (DO NOT) WORK IN MORAL ISSUES--A COGNITIVIST ACCOUNT OF RORTY'S SENTIMENTAL EDUCATION

Abstract | As a self-declared Minimalist Liberal, Richard Rorty sets a baseline for a liberal democratic society—"Don't be Cruel" but refuses to explain what is cruelty and why we should not be cruel, albeit a sensible answer to "how we can combat cruelty" is indicated. Rorty proposed that a sentimental education for the public would contribute to moral progress, and a distinction of the private and the public is supposed to be the precondition of this contention. In order to be sensitized to "the forms of pains, cruelty and humiliation," the readers are exposed to mainly two groups of literature: works by authors like Dickens and Orwell that arouse sympathy on the one hand, texts by writers such as Proust, James, and Nabokov that encourage redemptions of self-satisfaction on the other.

However, it is never easy to get the practice of this education right, and it bears on criticism either for "sentimentality" or for the practical issues of "education". As for the charges on sentimentality, a friend of sentimental education will have to show not only that a sentiment is not a sort of "cheap" emotion that one could have without paying for it, but also that sentimental literature does not end up with misrepresentation that deters intellectual readers. It requires scrutiny of the sentiment and literature as such, and probably, it calls for a cognitivist view that reveals a kind of moral knowledge akin to cognitive dispositions that might not be incompatible with Rorty's anti-foundationalist position.

We will confront a problematic Rortyan censorship when we consider the questions of what, how, and why to read in the practice of education. Although by siding with and criticizing Nussbaum, Rorty makes clear the specific moral significance of sentimental literature and saves it from becoming moral statements, one still has difficulties reading Proust and James in different lights for social hope and self-fashioning, as well as getting rights out of wrongs when attending to morally educative works with slight moral flaws. Two subsequent questions are 1) Is this censorship guided by an external moral criterion? 2) what does this moral sensitivity obtained in reading consist of? Both questions are essential to whether sentimental stories work or not, and how.

Index terms | *Cognitivism; Moral Knowledge; Rorty; Sentimental Education*

INTRODUCTION

A philosophical foundation is usually thought to be necessary for a political concern, albeit political philosophers who bear roughly the same label often share little common sense in the basic questions of what is, for example, Human Nature, Truth, the self, social welfare, and so forth, with each other, many often no more than that with philosophers from the rival camps. This is one of the reasons why Richard Rorty, a self-proclaimed "post-modern" philosopher suggested us to save politics from philosophy by letting

the philosophical foundation go on holiday. This view was manifested in his essay “The Priority of Democracy to Philosophy” (1988)¹, and the renowned debate between Rawls and Sandel had been taken into account. By claiming that when philosophy and democracy come into conflict, “democracy takes precedence over philosophy”, Rorty normally endorsed Sandel’s formulation of abandoning the metaphysical doctrine and attempted to accommodate the expandable “us” to the tradition of American democratic liberalism. In one sentence, Rorty’s Liberal Utopia aims at enlarging its citizenship as much as possible, in order for this the code for this Utopia is the more parsimonious the better. And it is noteworthy that the only common belief Rorty’s ideal citizens should share is “cruelty is the worst thing we do.”²

1. “Don’t be Cruel” and Sentimental Education

In order to sustain and enlarge this Liberal Utopia, liberals have to share some minimal beliefs, and these beliefs, as mentioned before, should not be metaphysical or beyond the reach of time and chance, and this is where Rorty thought he should modify Sandel’s idea of Minimalist Liberal and downsize it to a characterization of personality, i.e., liberal ironist.

It (*Contingency, Irony, and Solidarity*) sketches a figure whom I call the “liberal ironist.” I borrow my definition of “liberal” from Judith Shklar, who says that liberals are the people who think that cruelty is the worst thing we do. I use “ironist” to name the sort of person who faces up to the contingency of his or her own most central beliefs and desires—someone sufficiently historicist and nominalist to have abandoned the idea that those central beliefs and desires refer back to something beyond the reach of time and chance.³

On the one hand, according to Rorty’s application of Shklar’s literature, the characterization of liberal consists in the minimal common belief that “cruelty is the worst thing we do”. On the other, these liberals are supposed to be ironists at the same time, which is thought to be compatible with the belief of “don’t be cruel” as this belief turns out to be their “final vocabulary”.

While Rorty spent a couple of chapters to list out the benefits of being an ironist, he did not speak much of what could be seen as cruel and why we should not be cruel. As an influential critic of Rorty, Richard Bernstein, pointed out in “Rorty’s Inspirational Liberalism”⁴ (2003) that we would not find out “what really counts as cruelty and humiliation” in Rorty’s words because Rorty had been trying to persuade us not to indulge the metaphysician or theologian in our hearts by nominalizing the predicate “cruel” so to give sense to the noun “cruelty”. Bernstein agreed that this kind of questions “tempt us to think we ought to be able to give them philosophical answers. This is the kind of ‘theorizing’ that isn’t helpful for coping, and it is distracting.”⁵ It is for this reason that it might help very little by asking questions like “what is cruelty” or “why being cruel is wrong” as Rorty would try his best to dodge philosophical concerns or those questions that would end up with metaphysical commitment.

As a consequence, we might have to find the other way around to understand this code. We may learn something helpful from another critic Jean Bethke Elshtain’s theory that “Rorty wants us to embrace, not to debate, to draw us all under the big tent of ‘we liberal ironist’.”⁶ But the question is how to embrace or engage people into this tradition. One answer is by virtue of liberal education which is also advocated by one of Rorty’s heroes, Michael Oakshott, a well-known British conservative who made point of “to become by learning”⁷. Despite their contesting points of politics, both the right-wingers and left-wingers have thought pretty much of liberal education that could either engage people into certain political practice that is already there or give rise to “a greater human solidarity” where cruelty is eliminated. And it is through this understanding that

perhaps the reason why Rorty would exclude citizens like Nietzsche, Loyola, Foucault, etc., from his Liberal Utopia, is that he is literally unable to accommodate these happy torturers to the tradition of “don’t be cruel”. But what kind of methods or texts should be applied to this liberal education is a subsequent question. Rorty’s ideal of liberal education may appeal to what he termed as “sentimental education”. Rorty believes that “a better sort of answer is the sort of long, sad, sentimental story”⁸ that we usually learn from sentimental literature. Such as the works by Dickens and Orwell that arouse sympathy among the readers will change our moral intuition more effectively than moral philosophy does, and they thereby contribute to moral progress. However, many intellectual voices would doubt if this will really work.

2. Criticisms on Sentimentality and Two Groups of Educational Literature

Criticisms toward sentimental education can be seen as either go to “sentimentality” or go to “education.” When the issue of sentimentality is addressed, the problems of misrepresentation, of cynicism, and of detachment have remarkably drawn attentions. Mary Midgley underlies the question of misrepresentation in sentimental literature that “it distorts various expectations; it can make people unable to deal with the real world,”⁹ and it is possible that excessively idealizing the subject in sentimental literature might distract viewers, especially those elites, from moral invitation because this is how sentimental characters or plots seem “fake” and “cheap” to them. But Midgley is also aware of that “where misidentifying makes sense, it has to be possible to identify rightly,”¹⁰ which means that to say sentimental literature depicts human emotion wrongly, we should know how the right or appropriate emotion is like. We will have to infer otherwise that all kinds of sentimentality are morally flawed that being sentimental is itself wrong, or more, all kinds of emotions are inappropriate, which seems harsh and counterintuitive.

By quoting Oscar Wilde’s critical commentary of sentimentalist, wherein sentimentality is considered as “the bank holiday of cynicism,”¹¹ Michael Tanner argues that sentimental feeling increases the sense of “superiority” that one is not deserving. More, sentimentality suffers from the scandal of its intimacy with cynicism that drives it far away from moral progress as it “is connected with the sense of the developed feelings having lost touch with their origins,”¹² which is in contrast to Rorty’s expectation. But Tanner is not rejecting all kinds of emotions or developed feelings. Rather, he suggests us to go a “difficult way” which is “long, slow, time-consuming, painful and demanding of a degree of commitment that it is fearsomely difficult for most people” to own and understand the feelings and emotions that are “worth having”.¹³ This implies a scrutiny of feelings, emotions, and motivations for “to be a cynic is to reject any analysis of human motivation which appeals to depths and complexities”, but it might form a challenge to Rorty’s notion of “we liberal ironists” because being shown in this light, the emphasis on “final vocabularies” now seems suspicious as long as it exempts the feelings and emotions of “we liberal ironists” from scrutiny. But they do not have to be incompatible.

For one, as an implication of Tanner’s argument, there are appropriate feelings and emotions that are “unsentimental”, “typically deepened and made more secure by pondering and analysis”, and we could resort to Roger Scruton about how to achieve such appropriate feelings and emotions. One is encouraged, in Scruton’s suggestion, “to feel the right emotion, on the right occasion, toward the right object and to the right degree,”¹⁴ and unsentimental works of music and architecture are subsequently more appropriate than sentimental literature. This is not necessarily controversial to Rorty’s project since he only applies sentimental stories to the public and has always made room for self-creation in the private sphere, and both Tanner’s and Scruton’s proposals could cope very well with Rorty’s plan for the private sphere. But still, the question of how sentimental literature should be treated is yet to be combatted, nor is

it made clear that what role unsentimental works and appropriate feelings could play in the public sphere.

For another, while Rorty splits his project for the public and the private and designates distinct tasks to these two spheres that welcome different titles of literature, it does not mean that titles focusing on self-fashioning and unsentimental emotions, such as those writings by Vladimir Nabokov make no sense in the public sphere. It is according to Rorty that we can reconcile Nabokov and George Orwell by reading them on behalf of liberal politics, that “Nabokov wrote about cruelty from the inside, helping us see the way in which the private pursuit of aesthetic bliss produces cruelty. Orwell, for the most part, wrote about cruelty from the outside, from the point of view of the victims, thereby producing what Nabokov called ‘topical trash.’”¹⁵ It seems that there are normally two groups of educational literature in order to “reduce future suffering and serves human liberty,” wherein we have writers like Dickens and Orwell on the one hand, and Nabokov, Henry James, and Marcel Proust on the other. And it is by different means, that Rorty believes both groups, sentimental themselves or not, could work for the sentimental education for the public and work among different audience.

3. Practical Issues of Sentimental Education and Possible Responses

Different benefits of reading literature falling under the two groups are clarified in the works coming out after *Contingency, Irony and Solidarity*, such like “Heidegger, Kundera, and Dickens”¹⁶ and “Redemption from Egotism: James and Proust as Spiritual Exercises,”¹⁷ wherein a response to Martha Nussbaum’s view of literary education in *Love’s Knowledge*¹⁸ is made. Reading the group of literature written by Dickens and Orwell mainly draws us to the suffering of the victims, whereas engaging into the texts by Nabokov, James, and Proust can sensitize the readers to the forms of cruelty and egotism, and encourages the readers to pay more attention to the particularity of others. Neither of these goals could be achieved by philosophical statements rather than by reading novels, and it is in this sense that Rorty agrees with Nussbaum in the specific contribution literature could make to moral progress.

However, sooner or later, we will have to face up to the problems of censorship that confront Rorty and Nussbaum. For Nussbaum, it is how to get rights out of wrongs when attending to morally educative works with moral flaws. For example, how to treat Dickens discriminative views of women when reading in favor of his sympathetic writing of workers. For Rorty, it is how to read the same writer or even the same work in different lights for social hope and self-fashioning. For example, how to understand Nabokov differently and reconcile the different understandings. While Nussbaum promotes a progressive reading plan to obtain a more complete knowledge of human which is self-correcting, Rorty might have to turn to a moral criterion, such as a “final vocabulary,” that is external to reading itself. It is at this point that Rorty rejects Nussbaum’s cognitivist view of literary learning but cannot back up with a plausible justification or provide a better strategy.

I am inclined to propose a modest argument to reconcile Rorty and Nussbaum to which Vid Simoniti’s idea of style representation could lend. Simoniti claims that what styles represent is more a kind of cognitive dispositions rather than general propositional statements.¹⁹ If we apply this view to sentimental education, we would see some of these readings as adopting cognitive dispositions where the particular moral situation of others or ourselves, such as how one suffers from pain or how a seemingly harmless action is generating cruelty, can be better understood but does not necessarily add to a complete knowledge of human. This cognitivist formulation takes educational literature, sentimental or not, as sources of moral knowledge, which seems to be on behalf of Nussbaum’s contention. It also speaks to Rorty’s liberal ironist’s ear since adopting different dispositions is a crucial ability that sentimental education aims

to enable us, and the merit of a cognitivist view of sentimental education is that it contributes to moral knowledge even when it fails to work.

Dr. Tingwen Li, "I'm a lecturer in College of Humanities at Xiamen University in China, and my research interests are Art and Phenomenology, Analytic Aesthetics, Philosophy of Perception, Liberalism and British Conservatism. I have published 16 papers on national and international academic journals and made several presentations at some international conferences, and they are mainly based on my doctoral dissertation about contemporary phenomenological aesthetics in the English world, on my one-year-study of aestheticism at Kobe University in Japan and another one-year-program in aesthetic education and Liberalism at Cambridge."

Prof. Chunshi Yang, Professor Yang is an emeritus professor in College of Humanities at Xiamen University and used to be a vice-chair of the Chinese Society of Aesthetics. He has been focusing on the issues of aesthetics by virtue of phenomenological methodologies since 2000, with respects to Chinese and Continental European aesthetics. The process of modernity in China is also of his concern, to which he basically approaches through a broad reading and a scrutiny of modern and early modern Chinese literature, historical materials, and political thoughts. Professor YANG has more than 300 papers and 20 books published by first-class publishers in China up to now.

PANEL SESSION 12 | CONTEMPORARY AESTHETICS OF MUSIC

MELODY IS NO MORE: “RAGGED” RHYTHMS AND “TRACKS WITHIN TRACKS” AS AESTHETIC ELEMENTS OF MODERN POPULAR MUSIC

Abstract | Our research supported by the grant of the Russian National Science Foundation 18-18-00007 is devoted to the study of the new aesthetic elements of modern popular music. We have chosen to analyze the sixth album Kanye West “Yeezus”. It is important for us that the object being analyzed was a precedent phenomenon. It was the first among musical works with clearly expressed features of modern musical aesthetics, and also it was commercially successful. We analyzed how the Russian-speaking space took this album. Also we isolated elements inherent for the new musical aesthetics from the “sound canvas”, and described their functions. Based on the results we found out that music found a new vector of motion in the postmodern paradigm, and the polystylistics, expressed in the deliberate use of many figurative and historical plans within one composition, is the main element of modern musical aesthetics. Its main function is to create a permanent conflict that arises due to the “aggressive” merging of heterogeneous semantic and cultural layers.

INTRODUCTION

Modern popular music has been functioning in the paradigm of postmodernism for a long time. It is a complex and multi-level phenomenon. The commonality of mass culture and postmodern is noted, for example, in the works of G. Yu. Litvintseva (Litvintseva 2014). On the one hand, it demonstrates a number of features characteristic of mass culture such as desire for universality and, the primacy of commercial function, style diversity, internationality, broadcasting of archetypical images established in the mass consciousness, the use of postmodern game, meaningful deconstruction and “moderate” mixing of cultural codes inherent in different traditions. On the other hand, mass culture is distinguished by reliance on clearly defined style dominants and interrelated musical traditions. A. G. Belyukov identifies four basic traditions: African-American folklore, elements of Anglo-Celtic folklore, elements of Latin American folklore, and European academic tradition of the XIX - XX centuries. In his opinion, there is a special connection between the basic traditions, which ensures the development of musical culture from style to style, and the musical genre is the key carrier of this connection (Belyukov 2016).

However, in the modern musical picture of the world obvious tendencies to destructure the genre system are outlined, in connection with which the principle of continuity on the grounds of basic traditions ceases to be relevant in some cases. The transformations of the structures of popular music genres, which are the current trend in musical aesthetics, have changed the principles of translation of cultural dominants, caused their mixing, and therefore, a number of features can be found within the framework of European music that appeared in a “concentrated” form only

in the beginning of this decade in American, or even African music.

The key problem in the study of contemporary musical aesthetics lies in the phenomenon of the consumption of musical products during the radical transformation of musical structures. It is not completely clear what the audience is guided by when it comes to emotional-figurative perception of music, if the basic mechanisms of the effect of sounds on consciousness cease to be relevant.

According to Zettl (Zettl 2011), applied media-aesthetic analysis is not an abstract concept, but a process that considers the interaction between different media elements, and the perceptual reaction to them. One of these elements, in terms of musical aesthetics, is melody. It creates a logical combination of easily remembered sounds, readable by consciousness. It serves as the basis for the phenomenon of earworm or brainworm, the involuntary repetition of musical images (Liikkanen 2012). However, melodies more and more often perform secondary functions (creating arrangements, postmodern “game”) while rhythms become the “core” of compositions.

A number of researchers agree that aesthetics of form plays a key role in modern music. According to Kramer, B. (Kramer 2018) numerous streaming services provide users with individual musical proposals, thereby creating a new taste-forming paradigm, based not on the interaction of people and verbalized judgments, but on situational emotional preferences and aesthetics of form. This is also indicated by Hagen, A. (Hagen 2015), who claims that playlists that form the basis of music streaming services are constantly evolving and showcasing new ways of collecting music information through streaming services, as a result of which they constantly shape and adjust the musical tastes of their owners.

Edelmann, A. Mohr, W. J. (Edelmann, Mohr 2018) believe that the growing development of a more formal theory of culture over the past two decades is due to the fact that the audience has ceased to perceive meaningful concepts. Continuing this thought, it can be assumed that the audience listens exclusively to cells or clusters torn from concepts, but not the product as a whole. Absorbs the form, ignoring the content. Bennett, A. (Bennett 1999) exploring the empirical study of music in the UK in the aspect of the concept of the neo-tribes Maffesoli, wrote that the musical tastes and preferences of people in the coming decades will not be tied to any specific social or cultural settings. The basis of popular music will be bright, but rapidly disappearing precedents. At this moment, it can be said that this hypothesis has been partially confirmed. Rapidly changing and extremely fluid eclecticism almost completely eliminated any taste statics, which makes it more and more often heard that music circulating in the framework of postmodernism is becoming increasingly stagnant and not quite justified. In our opinion, it would be more correct to say that genre stratification, reducing the role of music journalism, the disappearance of “generational” genre forms that marked whole generations and the secondary nature of ideas, against the background of total domination of hip-hop music, is a consequence of attempts to overcome the crisis that already has a place to be for a long time. Experiments with the form of modern musicians, which by the way performed within the framework of postmodernism yet, often turn out to be paradoxically successful, even within those cultural fields where their failure would seem inevitable. In fact, such precedents allow us to talk about the emergence of a new musical aesthetics, the main feature of which is the dominance of rhythms over melodies in the general musical context. The main platform for such experiments has become hip-hop.

According to Nielsen for 2017, hip-hop became the most popular genre in the Americas, with a margin of 12% ahead of the total number of albums sold and listening to streaming services from rock and pop music, which every year lose their positions more and more (Lynch 2018). This trend is also present in Russia. One of the main

moderators of the largest network of music groups in the social network VKontakte, E: music, claims that users have become less disdainful about unfamiliar music associated with this genre, and the number of subscribers in thematic public pages is growing rapidly (Arni 2017).

METHODS

In this study, we used the methods of qualitative and quantitative content analysis as well as musicological analysis. Quantitative content analysis allowed us to determine the emotional coloring of the comments of the audience and the texts of the authors of posts on the social network VKontakte immediately after the release of the precedent phenomenon. Qualitative content analysis is used to determine what verbal techniques were used to describe the object of study. Musicological analysis allowed to isolate from the “sound canvas” elements inherent in the new musical aesthetics and to highlight their functions partially.

RESULTS

As a study material, we chose Kanye West’s sixth album “Yeezus” released in 2013. The work, called by the musician himself “protest against music”, subsequently established a new aesthetic model that became the dominant feature of modern pop music. Deprived of traditional mechanisms of broadcasting pop music aesthetics, the album occupied the first lines of the music charts of the United States, Britain, Australia, Denmark, Russia and New Zealand, and also turned out to be in the Top 30 of almost all world ratings, becoming “platinum”.

At the time of the release of the album, Kanye West was already a cult musician, whose works were included in the authoritative rating of 500 Greatest Albums of All Time by the American publishing house Rolling Stone. However, this album provoked a rather ambiguous reaction from both the professional public and fans. Russian editorial office of Rolling Stone gave it four stars out of five, but at the same time, did not write any reviews. Non-professional media on the social network VKontakte (having more than one hundred thousand subscribers at the time), - Fast Food Music, New Albums, E: \ music and Drugs And Booze also did not write any reviews or critique, limiting themselves to a few quotes from the musician himself (I just talked to Jesus, he said “what up Yeezus? I said Shit I’m chilling, trying to stack these millions”, https://vk.com/fastfoodmusic?w=wall-45172096_970), information notes with contextual information (Winner of 14 Grammy Awards, producer, director, actor and just one of the most successful rap artists, Kanye West. The new album with the “modest” title Yeezus and the track “I am God” is available for listening, https://vk.com/e_music?w=wall-23995866_54206) or by links to reputable musicians (The best album of 2013 according to Jack White. Awesome!, https://vk.com/drugsandbooze?w=wall-41970634_8283). It can be assumed that for the critical discourse at that time there were not enough applied tools (musicological terms) or word-shaped keys (means of artistic expression that can describe such music so that the audience becomes interested in listening to it).

Opinions of subscribers of the above public pages is divided. While some praised the work noting a unique sound in particular, unlike the popular music and an eclectic musical component, others noted mediocrity and “dirtyness” of sound, and Kanye West himself was accused of saying that all his fame was nothing more than a consequence of outrageous behavior against the background of the degradation of the musical content of his new albums, or the exploitation of outdated styles.

But after a couple of months, an eclectic mix of industrial, punk, trap, acid house and modern experimental hip-hop suddenly turned into a mainstream, shifting traditional

melodic, and seemingly universal, pop music. Among the main elements of the “sound canvas” of “Yeezus”, we can point out “ragged” rhythms, “tracks within tracks”, “aggressive” auto-tuning, intentional sloppiness, frequent rhythmic “breaks”, and the absence of traditional melodic audience “hooks” Polystylistics, which is an integral part of the musical culture of postmodernism, has long reached the stage when the “stitches” in the compositions became almost invisible, the boundaries between “own” and “alien” are blurred. However, in modern realities genre assimilation does not contradict the presence of collage effects created by quotations, but complements them, which is especially noticeable in “Blood on the Leaves” and the closing track “Bound 2”. In the first case, Nina Simon’s looped phrase from the bluesy standard “Strange Fruit” is distorted by autotune throughout the composition. In the second, a deliberately distorted musical soul-funk accompaniment (imitating lo-fi sound), belonging to the Ponderosa Twins Plus One group, deliberately mismatched with sharp industrial elements, vocal R&B pieces of singer Charlie Wilson, mid-century pop singer Phrases L and and the aggressive recitative of Kanye West himself. We should also mention the constantly changing rhythms crushing any melodies arising in the “musical canvas” without any transitions or preparation. The compositional elements described here are found throughout the entire album in one volume or another. It is possible to interpret their use in different ways, the synthesis of classical and modern or the collision of high musical style and modernist noises are only two of the possible ways. Despite such sharp oppositions, the comic effect is not created, moreover, often the sound is atonal and synthetic, filled with alarming artificiality. In our opinion, the sharp corners of stylistic contradictions are designed to destroy any stable images that arise when a particular musical element appears. It maintains a constant sense of cognitive dissonance. Subsequently, a similar scheme began to be used by musicians in various genres: from guitar instrumental music to all sorts of subgenres of hip-hop.

CONCLUSIONS

We concluded that the deliberate merging of many imaginative, semantic, historical and cultural plans is a key feature of modern musical aesthetics, and the postmodernist phenomenon of polystylism acquires a new life. With such a mechanism of creating a “musical canvas”, a feeling of harmony is created within the framework of the modern picture of the world, but there are a lot of contradictions when considering each of the elements separately, if the context is understood, a condition that cannot always be met by a mass audience. Perhaps, the answer to the question about the emotional-imaginative perception of music, with the deconstruction of the basic mechanisms of the effects of sounds on consciousness, should be sought not so much within the framework of music, as in the context of changes in the perception of time and space by a modern audience.

Demchuk Maxim is a assistant researcher of Chelyabinsk State University. The field of interests – musical aesthetics, music verbalization, transmediality, transformation of musical structures, cognitive aesthetics. Publications in Russian research journals, included in Russian Science Citation Index. Member of research group of mediaaesthetics, funding by RSF (18-18-00007). Master thesis on the subject «Elements of music review in online media as a manifestation of the verbalization of sound aesthetics». Master thesis is devoted to defining the mechanisms of accumulation and transmission of content of public pages in the Internet media, and functions of modern mass music as a media environment responding to current society needs and broadcasting of various cultural dominants.

UNDERSTATED SIGNIFICANCE OF FORM IN GRACYK'S AESTHETICS OF POPULAR MUSIC

Abstract | In the theoretical works of American aesthician of popular music Theodore Gracyk, the problems of aesthetic form of rock music have not been thematized as issues of special importance. This author does not devote a chapter in his book *Listening to Popular Music: Or, How I Learned to Stop Worrying and Love Led Zeppelin* to aesthetic problems related to the musical form. Moreover, Gracyk does not particularly emphasize the formal aspects of popular music compositions in chapters dealing with other theoretical issues related to popular music, such as the question of evaluating popular music compositions. In this paper I am primarily concerned with the reasons why understating the significance of form causes some problems in his aesthetic theory.

The lack of an explicit theoretical approach to the musical form of popular music can be viewed as the result of Gracyk's criticism of traditional aesthetic conceptions such as the formalist aesthetics of Eduard Hanslick. Since Hanslick developed his views on the dichotomy of aesthetic form and content in music focusing on the examples of classical music as a high art (while ignoring popular music pieces in his aesthetics), Gracyk disregard his conception as irrelevant to the problems of popular music. Furthermore, the importance of formal aspects of popular music is neglected in favour of emphasizing other aspects of popular music compositions that should be taken into account when evaluating these compositions aesthetically.

The paper shows that although Gracyk does not devote special attention to the issue of aesthetic form, the conclusions of this author largely depend on their understanding of formal characteristics of popular music. The way in which Gracyk understands aesthetic appreciation directly relates to the ability of the listener to experience aesthetically the formal aspects of the composition of popular music.

“ACTIVE LISTENING” THESIS AND ITS CONSEQUENCES ON LISTENING TO ROCK MUSIC

In his book *Listening to Popular Music: Or, How I Learned to Stop Worrying and Love Led Zeppelin*, Theodore Gracyk approaches the problem of the aesthetic form of popular music indirectly. He is doing this by analyzing the theoretical conceptions in which the reception of music is genuine only if listening is an activity that concentrates on the formal structure of a musical piece. The aesthetic reception of music is achieved if a listener is approaching a composition actively and consciously, which means he is exclusively focused on formal aspects of a composition (Gracyk 2007, 135). If a listener didn't manage to devote his whole attention to the structural base of a composition, than he hasn't been "listening" to music the right way, but solely "hearing" the aural characteristics of a musical work. Although this understanding of a listening to music is attributed to several aestheticians including Eduard Hanslick, Edmund Gurney, David Prall and Monroe C. Beardsley, when explicating the consequences that arise from the illustrated theoretical perspective when it comes to the listening of popular music, Gracyk usually refers exclusively to Hanslick's aesthetic conception in the book "On the Musically Beautiful".¹

The most important segment in Gracyk's interpretation of the thesis of "active listening" is his analysis of the ways in which it could challenge the aesthetic reception of popular music. Taking into account that the aim of the advocates of this thesis was not to question the possibility of a genuine aesthetic experience of popular music, Gracyk believes there are at least three negative consequences of this conception as far as listening to popular music is concerned. I will briefly present these consequences in the following section and point out the way in which they are related to the problems of the aesthetic experience of form in popular music compositions.

As the first consequence of the "active listening" thesis, Gracyk emphasizes the problem of the knowledge allegedly needed for an adequate reception of popular music. If genuine aesthetic reception of a popular music piece "always requires *conscious* exercise of critical categories concerning musical form" (Gracyk 2007, 139), than it can be brought into question whether listeners of popular music actually listen to the compositions of this kind. Gracyk responds to these conceptions by showing that listeners of the rock music do comprehend the main characteristics of the compositions they listen to, so that their listening to this style of music does not require any special knowledge for proper aesthetic reception. For example, this aesthetician believes that listeners of rock music already hear when the same melodies reoccur in different songs, the identical parts of the song are repeated in different compositions, or certain ways of creating melodies are used by the composer, such as the frequent appearance of so-called blue notes (Gracyk 2007, 139).

Although these arguments eliminate the need for conscious knowledge or proper skills for listening to rock music, with them Gracyk still does not dismiss the traditional aesthetic notion of "active listening" – on the contrary. As can be seen in Gracyk's own examples, the listener of rock music is expected to aesthetically experience the formal aspects of the composition he is listening to – to perceive the basic characteristics of the melody of these compositions, but also to recognize the special formal devices in this kind of music, such as the presence of blue notes. The possibility to experience aesthetically such formal aspects of a composition can be considered exactly what Hanslick expects from the listener of classical music in certain sections of his book "On

the Musically Beautiful“ (Hanslick 1891, 40-41).

Another negative consequence of the traditional aesthetic notion of “active listening“ is that every genuine aesthetic experience of popular music would be reduced to perceiving the formal structure of the composition listened. According to Gracyk, the traditional aesthetics of music believes that a listener needs to “extract a pure sound structure“ from the “total aural experience“ to experience a musical piece adequately (Gracyk 2007, 139). This includes neglecting both the characteristics of the “concrete performance“ of the composition and other aspects of a music piece that do not contribute to the formal unity of the composition, such as the lyrics of the vocal composition. Gracyk’s main concern here is the role of lyrics in a particular musical composition: when we exclude the lyrics from the aesthetic experience of a popular music tune, “[o]ne twelve-bar blues is remarkably like another“ (Gracyk 2007, 139).

However, emphasizing the importance of the aesthetic experience of a formal structure need not be done by dismissing the significance of other aspects of a composition. Interestingly enough, although Hanslick considers the aesthetic reception of musical form the most important aspect of the aesthetic experience of classical music, he does not think that the lyrics of classical music compositions (or “libretto“, to be precise) would in some way distort and jeopardize the aesthetic experience of this composition – the opposite is the truth. Hanslick himself stressed out that the lyrics („poetry“) are “enhancing the power of music“ (Hanslick 1891, 45). In addition to that, Gracyk’s argumentation assumes that the lyrics of a popular music composition do not contribute to the very structure of a listened piece. But having in mind that the lyrics usually provide a listener with the basic orientation in the arrangement of a song – telling them which part of a tune is verse and which is chorus – it is doubtful that any of the above mentioned traditional conceptions in the aesthetics of music will completely ignore the lyrics, and the same goes for the contemporary analysis of popular music. In the section dedicated to the aesthetic form of hip hop music in his famous text “The Fine Art of Rap“, Richard Shusterman examines the structure of a hip hop song exactly by talking about lyrics – by describing the relations between stanzas and refrains in a song that belongs to this genre of popular music (Shusterman 2000, 233-235).

Finally, the third consequence of the traditional aesthetic notion of “active listening“ on the reception of popular music is very similar to the second one. Gracyk argues that the active reception of a popular music composition leads to ignoring the entire “expressive force“ of popular music, so that rock music composition will not get any aesthetic qualities via the very sound of a distorted electric guitar and powerful drum beat. (Gracyk 2007, 140). Just as in the case of the previous consequence, these sounds are marked as “nonstructural“ and thus disregarded in the aesthetic experience of a popular music composition. It is obvious that rock music will lose much of its charm with this formalist intervention. Still, this does not need to be the unavoidable consequence of stressing the importance of the formal and structural aspect of a composition when it comes to its aesthetic value. Hanslick himself often emphasizes the role of a instruments’ timbre in the aesthetic experience of classical music (Hanslick 1891, 39, 41-42, 67).

After examining several other problems related to the illustrated consequences, Gracyk conclusion is that “active listening“, as traditional aesthetics of music views it, can not be restricted to grasping the formal structure of a composition. Instead, he promotes the pluralism of genuine receptions of popular music. Our listening practice

varies depending on the genre of music we are listening to, and “active listening” of the formal structure of a musical piece is just one practice among other methods of listening (Gracyk 2007: 150). So far, Gracyk’s “democratization” of various listening habits doesn’t mean dismissing the “active listening” thesis at all. But it seems that Gracyk’s analysis of “active listening” in this chapter of the book *Listening to Popular Music* is not limited to this conclusion. After considering the consequences traditional aesthetics’ thesis has on the reception of popular music, Gracyk also points out that “applying the skills of analytical listening to a simple popular song can result in sheer boredom” (Gracyk 2007: 142). Unlike in the “democratic” conclusion already mentioned, Gracyk here not only disqualifies “active listening” as a way of listener’s reaching out for the aesthetic merits that one popular music composition can provide, but warns a popular music listener that “active listening” could distort or disrupt his aesthetic experience of a popular music piece. Does this mean Gracyk does not recommend this type of listening to popular music?

If the “active listening” implies reducing the aesthetic experience of popular music to formal aspects of compositions of this kind, then I agree with Gracyk that it should be avoided altogether. But the analysis of his views on the consequences of the “active listening” thesis showed that this is not the case. Affirming formal aspects of popular music composition does not necessarily means disregarding other aesthetically relevant aspects of a listened music piece. We can just as well approach the popular music compositions with the intention to aesthetically experience their formal structure without ignoring the non-structural and expressive aspects of it. In fact, as I will try to show in the next section of this paper, aesthetically experiencing the formal characteristics of a popular music composition is exactly the practice Gracyk praises as the most trustworthy way of achieving the adequate aesthetic evaluation of a popular music composition.

THE ROLE OF FORM IN GRACYK’S VIEWS ON THE AESTHETIC EVALUATION OF POPULAR MUSIC

In chapter “Aesthetic Principles and Aesthetic Properties”, Gracyk presented the reasons why aesthetic evaluation of popular music composition should not be driven by theoretically formulated aesthetic principles. Instead, he is proposing two “competencies” as groups of habits a listener needs to develop when approaching a composition that belongs to a certain genre of popular music. Using the terminology of music theorist Robert Hatten, Gracyk distinguishes stylistic and strategic competencies that encourage aesthetic evaluation. Stylistic competencies provide a listener with the ability to perceive those characteristics of a composition that are telling her to which music genre this composition belongs to, while strategic competencies supply her with the expertise of identifying those characteristics of a piece of music that make it outstanding (Gracyk 2007, 77).

Gracyk explains how these competencies govern the aesthetic evaluation of popular music by analyzing three different descriptions of the aesthetic experience of a certain blues compositions: first encounters with a blues song by a musician William Christopher Handy and a novelist Dorothy Scarborough, as well as Bob Dylan’s first time listening to the recordings by a blues musician Robert Johnson. While I will not analyze these written testimonies of listening to the blues separately, I will briefly describe Gracyk’s theoretical motivation behind his interpretation of these various experiences. Handy’s description of the first blues songs he heard in a train and at a dance event

in Mississippi, Gracyk regard as an example of acquiring the stylistic competencies needed for the further aesthetic evaluations of a blues compositions. In contrast to the Handy's testimony, Scarborough's views on "that peculiar, barbaric sort of melody called 'blues'" Gracyk interprets as her failure to obtain stylistic competencies and think of the observed musical characteristics as the aspects of a distinct music genre, and not the signs of the negative aesthetic value. Finally, in Dylan's praise of a subtle and unique Johnson's musical interventions to the standard blues song structure, Gracyk detects not only that Dylan is applying stylistic competencies in listening to Johnson's song, but also that he has acquired strategic competencies that go beyond indicating the main features of a blues song.

Although there are notable differences in these descriptions of the aesthetic experiences of blues compositions, it is striking that Gracyk's analysis of them is almost exclusively concerned with the ability of these listeners to grasp and adequately interpret the musical form of the compositions listened. Gracyk is stressing out how Handy's own journey of acquiring stylistic competencies of the blues started when he first experienced some of the formal characteristics of a blues song, such as repeating the lines of a verse three times. The acquiring of them was certainly completed when Handy identified other "basic elements of the blues" – Handy marked other formal aspects of this music such as "variation of a pentatonic (five-note) scale, with flattened thirds and sevenths" and "rhythmic syncopations" (Gracyk 2007, 79). Moreover, Gracyk's interpretation of Scarborough's testimony shows that this novelist did not manage to recognize the formal structure of a twelve-bar blues song, which led her to conclude that this new music "likes to end its stanza abruptly, leaving the listener expectant for more" (Gracyk 2007, 80). Citing Dylan's own analysis of Johnson's songs, Gracyk is speaking about musical form himself, emphasizing that "Dylan hears a mastery of form and sophisticated, disciplined songwriting" (Gracyk 2007, 83).

Despite his doubts that "active listening" could end in "sheer boredom" when it comes to listening to popular music, it seems that in the chapter "Aesthetic Principles and Aesthetic Properties" Gracyk is promoting exactly that kind of listening to popular music – a stylistically and strategically competent reception of musical form. If we draw the consequences from Gracyk's analysis of stylistic and strategic competencies, it follows that not only this type of listening would not distort the aesthetic experience of popular music, but also that this is the only kind of aesthetic reception that leads to "perceptual and imaginative habits required to appreciate the music" (Gracyk 2007, 85).

CONCLUSION

This examination of the role of musical form in Gracyk's own theory of aesthetic evaluation of popular music gives reasons to think that the experience of the aesthetic form has a greater role in his aesthetics of popular music, although this is not explicitly stated. In addition to this, it seems that Gracyk's criticism of the "active listening" thesis hasn't brought into question Hanslick's theoretical conception, because this criticism hasn't actually been directly linked to what the traditional aesthetician stated in his own theoretical writings. While emphasizing the understated significance of form in Gracyk's aesthetics of popular music, I tried to show in this paper that there are important theoretical connections between traditional aesthetics of music and contemporary theories when it comes to dealing with the aesthetic experience of

popular music.

Currently he is working on a PhD thesis on contemporary aesthetics of music, which is his main field of research interest. At the Faculty of Philosophy, University of Nis, he is conducting seminar on aesthetics, contemporary philosophy and epistemology.

WHY DID THE COMPOSER BEGIN TO MAKE THE VISUAL ART? : THE AMBIENT MUSIC AND SOUND ART OF YOSHIMURA HIROSHI

Abstract | This paper aims to examine how a musician began to make sound art in the visual art context. I will pick up the case of the composer YOSHIMURA Hiroshi (1940-2003). He has been active in the field of the experimental music in Japan since the 1970s. He is the first generation of the musicians in Japan who has made the ambient music (“Nine Post Cards” in 1982), the sound design for the specific architecture (Kushiro city museum in 1983), and the sound design for the particular outdoor environment (time tone for the commercial facility in Nagano in 1984). At the same time, he has also been influential in the developmental history of sound art in Japan as he has curated the important sound art exhibition series called Sound Garden in the late 1980s and the early 1990s.

Why did the composer YOSHIMURA Hiroshi has organized the exhibition series of Sound Art in the visual art context?

To think about it, I will do research on the aesthetics and activities of YOSHIMURA Hiroshi and explore some contexts around him in the 1970s and 1980s Japan: the thought of soundscape, the import of the ambient music, and the changing attitude of music education and the ethnomusicology, and so on. Next, I will compare his activity with some musicians who have inclined to make the visual sound artworks: now I plan to pick up John Cage, Brian Eno, Bill Viola, FUJIMOTO Yukio, and so on.

After those steps, I would be able to examine one of the aesthetics of the contemporary music in the 1980s Japan and to describe the characteristics of the developmental history of sound art in Japan.

This is the case study of how the experiment of contemporary music turned into the experiment of sound art in the visual art context. Initially, this study aims to trace one part of the developmental history of sound art in Japan, but this study will finally contribute to examining the intersection of music and the visual art and to elucidating the mechanism of when music has merged and mixed into the visual art.

Index terms | *ambient music; experimental music; Brian Eno; the intersection of music and visual art; sound art in Japan; Sound Garden; YOSHIMURA Hiroshi*

1. Introduction

This paper aims to examine how a musician began to make sound art in the visual art context. I will pick up the case of the composer YOSHIMURA Hiroshi (1940-2003). He has been active in the field of the experimental music in Japan since the 1970s. He is important not only because he is one of the first composers in Japan who has made the ambient music and the sound design for public spaces but also because he has curated the important sound art exhibition series called Sound Garden in the late 1980s and the early 1990s.

Why did the composer YOSHIMURA Hiroshi has begun working in the visual art context in 1980s Japan? To think about it, I will examine the overall aesthetics and activities of YOSHIMURA, explore some contexts around him in the 1970s and 1980s Japan, compare him with some examples, and propose my consideration.

This paper is the case study about the experimental composer who has turned into the visual art context, but this study will also contribute to examining the intersection of music and the visual art.

2. The aesthetics and activities of YOSHIMURA Hiroshi

Let me summarize the activities of YOSHIMURA Hiroshi in each decade.

2.1. The activities¹

The 60s: apprenticeship

In the 1960s = in his twenties, we can find some seeds for his avoidance away from the traditional western art music and his interests towards the experimental music after John Cage. He has composed some indeterminate and improvisatory composition, created some graphic scores, performed the Fluxus-like event influenced by the experimental musicians such as John Cage and KOSUGI Takehisa, and so on [Figure1].

The 70s: the developmental stage

In the 1970s = in his thirties, he began to engage in post-Cagean experimental musical practices. He participated in *Taj Mahal Travellers* of KOSUGI Takehisa in 1974 until 1979 [Figure2] and in the show of KOSUGI Takehisa as a performer. Since 1977 he began to work with SUZUKI Akio on many occasions. As YOSHIMURA, SUZUKI, and KOSUGI have performed together at many places very often through the 70s and 80s, they were regarded as a threesome in the avant-garde music world in Japan².

Also, he began his mail event in 1973. The mail event is that YOSHIMURA asked his friends to write some words, visual images, or scores on the paper about the subject of 'WAVE' and filed them [Figure3]. This enterprise led to the compositions included in the LP we will see the next and would indicate his interest not only in the motif "Wave" (just like KOSUGI Takehisa) but also in the visual art context (in that he adopted the way of mail event just like the way of Fluxus artist).

The 80s : *Music for Nine Post Cards* and *Sound Gardens*

In the 1980s = in his forties, YOSHIMURA became YOSHIMURA who has been known in general in two terms: he composed the ambient music and organized the exhibitions in the context of the visual art.

In 1982 he released the first LP of ambient music in Japan, "*Music for Nine Post Cards* [sic]" from "Sound Process" label founded by ASHIKAWA Satoshi³, of which pieces have

been played at HARA museum in Shinagawa because YOSHIMURA had hoped and asked the museum to do so [Figure4]. Moreover, in 1983 he wrote the ambient music for the interior room of Kushiro City Museum, which is the sound design for public spaces. These activities reflected well the situation around environmental music and the thought of soundscape in 1980s Japan³.

More important, he began organizing the exhibition in the context of the visual art world. In 1984 he organized the exhibition “*Installed Sound*” at Roppongi Striped House Museum of Art, which led to the series of the exhibition *Sound Garden* 1-6 (1987-1994) [Figure5-1, 5-2, 5-3]⁴. I have already discussed Sound Gardens in detail elsewhere (NAKAGAWA and KANEKO 2017).

After the 90s: his mature days

In the 1990s = his forties, his activity got more publicity than ever, not limited to the small circle of the avant-garde music world. He continued organizing the exhibitions, went abroad to show performance, published the books (YOSHIMURA 1990, 1994, 2002, 2003), gave a lot of public lectures, began teaching at the university, and so on. He seemed to reach his mature days.

2.2. The internal logic of the composer

So let us get back to our question. Why did the composer YOSHIMURA has begun working in the visual art context in 1980s Japan? Below is his explanation (YOSHIMURA 1990b: 157).

“The city is losing a connection with an ecological system and asks sound and music to provide the enriching soundscape. However, music becomes a kind of noise in today’s ordinary soundscape and does not be listened to carefully./ That is why I have looked for the relaxed space where we can enjoy sound without bothering anything and have organized the exhibition *Sound Garden* at Roppongi Striped House Museum of Art.”⁵

He describes the exhibited artworks as Sound Art.

“When you observe the boundary line between sound and music, you will find the field called ‘Sound Art,’ which expands not only in the field of sound but also in the visual world. Sound Art extracts the undifferentiated chaos as it is.”

So he describes Sound Art as “inspiring people to think with the free mind which would be the foundation of Art and to have a playful mind across the disciplines of the genres.”(160)

In short, because there is the demand for the enriching soundscape, he has looked for “the relaxed space where we can just enjoy sound without bothering anything” and prepared such a place as the exhibition of sound art, which would open your mind to the foundation of the art. Let me express his internal logic this way: YOSHIMURA has developed his musical intention and interest towards and outwards the exterior space (rather than enterprising the temporal expansion by making the relationship between sound on the staff notation) because the spatial extension gives him the means to reach the foundation of Art. That is why he began working in the visual art context which gave him the occasion to handle with space (music has never given him).

3. Comparison

Then, why in the 1980s Japan? Also, how different from other examples? As I have discussed the former elsewhere⁶, this paper concentrates on the latter. Below is just a

rough sketch of the discussion: comparison and theorization. I will be speaking about this issue more in detail in this coming July 2019.

3.1. Comparisons with three artists

For the avant-garde musicians in 1980s Japan, the ambient music of Brian Eno⁷ and the thought of soundscape were very influential⁸. Also, as already mentioned, YOSHIMURA was often grouped with the other experimental artists of the same generation: KOSUGI Takehisa and SUZUKI Akio.

1) Brian Eno (1948-): the spatiality and the thought of soundscape

YOSHIMURA acknowledges the influence of Eno's *Obscure* label (1975-1978). He describes the label as blurring the boundaries between arts (music, painting, design, architecture, and so on) and evaluates it as trying to understand the value and the importance of Art from the perspective of our ordinary life (YOSHIMURA 1994: 99). *Sound Garden* for YOSHIMURA may be said to be *Obscure* label for Eno.

The ambient music of Brian Eno functions as a kind of environment, sometimes for the specific site such as *Music for Airports* (1978)¹⁰. YOSHIMURA had the precedent when asking his composition to be played at the art museum and making the music for the specific site. However, each musician differently approaches spatiality. In early 1980, Brian Eno has begun to make multimedia artworks with light and sound installation [Figure6]. He was recognized as a kind of multimedia artist in 1980s Japan¹¹. On the other hand, YOSHIMURA does not have to create such type of object or installation with light and sound maybe because he was influenced by the thought of the soundscape and had interested more in interacting with the environment rather than making the environment (see Figure 5-3)¹².

2) KOSUGI Takehisa (1938-2018): the experimental tradition and the thought of soundscape

KOSUGI Takehisa (1938-2018) began making sound installation around 1980. *Interspersion for 54 sounds* (1980)¹³ [Figure7] is one of the earliest examples. This installation develops and deviates from KOSUGI's experimental musical practice based on his belief that every audible sound is the phenomenological realization of the ubiquitous existence called 'Wave.' 'Wave' is "the electric wave which is not visible to an eye and which an ear does not hear,"¹⁴ which exists all over the world, which we cannot see, hear, touch, nor perceive. This artistic vision is one of the variations after Cagean experimental tradition, which presumes something ubiquitous inaudible but becomes something perceivable by way of some mediation (technology, careful listening, performing, and so on). We could interpret the sound and sight of KOSUGI's sound installation as the expansion of 'Wave' and his experimental musical practice.

On the other hand, YOSHIMURA did not seem to have such a conceptual connection with that experimental tradition but got more profoundly influenced by the thought of soundscape. This may result from a different decade when each developed each own artistic vision.

3) SUZUKI Akio (1941-): the similar sensibility but different background

On the contrary to the case of KOSUGI, it seems that SUZUKI has the similar sensibility with YOSHIMURA because both have made experimental musical instruments [Figure8] (you can see a soundtube of YOSHIMURA in Figure5-3)¹⁵, did performance (sometimes together), and made graphic score (not necessarily for the performance), and put the

importance on the act of listening with interacting with the environment.

Space in The Sun (1988) by SUZUKI is the legendary sound art work [Figure9]. However, it does not provide any sound, nor is it even the participatory listening event, but it presented the act of listening by the artist alone as Art. This is the artwork intensifying the act of listening thoroughly. Also, as we have seen, the reason why YOSHIMURA began the exhibition of sound art is that he has wanted to listen to the sound thoroughly.

However, both has a different background. While SUZUKI has started from the context of visual art and intruded in the context of sound art, YOSHIMURA has departed from the world of music for the visual art context.

3.2. Consideration

I argue that YOSHIMURA got interested in interacting with the spatiality of sound and music from the perspective of a composer (not as a visual artist) who were a little behind Cagean experimental tradition. This argument is also the answer to the question “Why did the composer begin to make visual art?”

4. Tentative conclusion: the passage from the field of music to a sound culture

In the article discussing the emergence of Sound Art, Carmen Pardo explains the transformation, development, or derivation from music to Sound Art as the shift of attention in the field of music making from ‘the relationship between time’ to ‘the relationship between space’ (Carmen 2017). Carmen traced the shift as the “passage from the field of music to a sound culture” (39) with reference to the avant-garde composers such as John Cage or Max Neuhaus, who began creating the artworks from the perspective of sound in space (not only in time). Here Sound Art is the operating concept to examine the development of sonic practice and contemporary music in the 20th century which the traditional musicology cannot deal with well.

From what have been said, I would argue that, in this framework, YOSHIMURA is positioned on the music end of this transformation. That is, we can regard YOSHIMURA as positioning at the beginning of Sound Art in Japan and at the music end of “the passage from the field of music to a sound culture.” Therefore, we may expect that there would be some artists at the sound art of that passage or other artists positioning at the music end but profoundly influenced by Cage, and so on.

(Endnotes)

- 1 For the description below, I refer to the exhibition catalog (YOSHIMURA 2005).
- 2 So I heard personally from SUZUKI Akio in Sept. 16th, 2017.
- 3 ASHIKAWA Satoshi is also influential on the contemporary music scene in Japan, not only through his music but also through his activities as a writer and as a curator of the record selection at *Art Vivant* of SEIBU museum by ASHIKAWA. Much has been written about him in Japanese, but we need extensive research on his activity.
- 4 This situation led to the important anthology of *Wave Notation* (1986), which was published on occasion for the posthumous writings of ASHIKAWA Satoshi (1953-1983). It included some articles by the prominent researchers and artists and indicated how 1980s Japan has received environmental music and the thought of soundscape.
- 5 YOSHIMURA curated *Sound Garden 1-6* with the assistance of some other artists. Each exhibition contained 15–25 artworks, and some of the exhibitions included performances in which the artworks constituted musical instruments; in certain cases, visitors could touch and play the artworks. A total of 53 artists participated in these exhibitions, with over half of these artists having attended or recently graduated from Tokyo University of the Arts' Faculty of Fine Arts or Faculty of Music. Artists from the Department of Crafts and the Department of Sculpture—mainly young artists born in the 1960s—made up the majority of these. Aside from Yoshimura, few composers or musicians participated, and most were younger than him. These young artists were invited to participate irrespective of their achievements in the field.
- 6 And he continues, “It is the place where you can find, encounter, play, or be inspired by artworks with sound. You can call such artwork as ‘the visual art using sound’ at “the exhibition of sound.””
- 7 There are a few contexts in 1980s Japan: the import of the thought of soundscape, the import of the ambient music, and the changing attitude of music education and the ethnomusicology, and so on. I have discussed this issue elsewhere (NAKAGAWA 2016, 2017, 2018).
- 8 Ambient music was invented in the 1975 by Brian Eno. In his words, “Ambient music must be able to accommodate many levels of listening attention without enforcing one in particular; it must be as ignorable as it is interesting.”
- 9 I have discussed the reception of him at this time in NAKAGAWA 2019.
- 10 His first ambient album was *Discreet Music* (1975), released from his Obscure label (1975 - 1978). His first manifest ambient album “*Ambient 1: Music for Airports*” was released in 1978 from Polydor Records.
Eno has released 4 albums with the subtitle “Ambient” between 1978 and 1982:

"Ambient 1: Music for Airports" (1978), "Ambient 2: The Plateaux of Mirror" (1980, with Harold Budd), "Ambient 3: Day of Radiance" (1980, with Laraaji), "Ambient 4: On Land."

11 Eno came to Japan in 1983 as a visual and sound artist who was featured in the art journal *Bijutsu-techo*

12 Before participating in rock 'n' roll band, Eno was an art school student in UK, influenced by the experimental tradition such as John Cage or Cornelius Cardew (Scoates 2013). That is, it can be said that, while YOSHIMURA has departed from the context of music for the visual art context, Eno has started from the context of visual art and intruded in the context of avant-garde music by the way of popular music. This comparison also needs further research in the future.

13 This installation was created for the exhibition *Für Augen und Ohren* in Berlin

14 KOSUGI Takehisa. "Tekunoroji To Ongaku (Technology and Music)" (in Japanese) in *InterCommunication17* (summer 1996) Tokyo: NTT Publishing Co. Ltd.: 90.

15 In 1981 YOSHIMURA made his experimental musical instrument or sound object, "soundtube" [figure: soundtube].

WORKS OF MUSIC AND CONTEMPORARY AESTHETICS – “DEATH OF THE WORK” OR “DEATH OF THE AUTHOR”?

Abstract | The present study aims to analyze contemporary views on musical work that are derived from aesthetic and music-theory thinking. The music work, understood as a symbolic network of temporal and spatial, structural and meaning-related relationships, has undergone historical development in the fields of both serious and popular music and jazz. Several qualitative twists and turns have their origins in the changing of the music art paradigm in the 20th and 21st centuries. The philosophical contexts of the new situation were linked with the search for the definition of art and, consequently, resulted in the need to create new concepts for individual products and expressions of music. The original understanding of the musical work was based on a classicist-romanticist tradition in which it represented something that was stable, complete, recorded, bounded in time, yet open in terms of intention and interpretation (Z. Lissa, R. Ingarden, J. Levinson). The revision of this current understanding was required not only due to the emergence of popular music and jazz, but also due to this avant-garde music, open works, moment-form music (Stockhausen), and electroacoustic and computer compositions. The conceptual innovation in the second half of the 20th century can be considered a major shift in the paradigm. This shift mainly involved experimental music, fusion of various kinds of genres, types and material, including improvised music, and its share in it. What can and should not be considered a musical work (“death of the work”) is a matter of general definition. What can be considered as an author and what is only an endless follow-up, a dialogue with the past, a loan, or even plagiarism and non-creative adoption (the “death of the author”), leads to the question of active perception that formed the basis of avant-garde and experimental music, yet it is not so important for a general listener (popular music).

Index terms | *works of music, art music, popular music, jazz music, openness, improvisation, concept*

1 Introduction

The goal of the present paper is to delineate the present understanding of a musical work and of other musical expressions drawing on its present treatment by music aesthetics, musicology, musical creators, organizers of music performances of various styles, performers, arrangers, or music teachers. The partial aim is to touch on the penetrating themes of musical aesthetics and musical ontology, summarizing the significant benefits of musical ontology for the area studied. I make use of its outcomes only in the scope and form that do not interfere with musical practice and that may add a philosophical dimension¹ and rational solutions to the present discussion.

Music ontology deals with what a musical work is, how it is present, what the nature and conditions of its existence are, whether it exists as a material thing or merely as an abstract, mental object, and so on. Music aesthetics and musicology extend these considerations so that a musical piece, as well as musical expressions, no longer considered a musical work (non-work, anti-work) can be defined or specified more accurately. The latter are expressions of music that share certain features – material, structural, acoustic – but they are not functionally designed to function as a work. However, there are still musical expressions and/or musical products that only pretend to be music; or due to a lack of clarity, intensity, complexity, identity, creativity and originality, they only contribute aesthetically worthless and artistically insignificant products to the field of music art.

In this context, I deal with the paradigmatic changes in 20th-century art as transfigurations that have only to a small extent been projected into the awareness and knowledge of contemporary musical ontology, which is still and often blamed for being ahistorical. I adhere to Lisa Giombini's (2017) view of "historical ontology", which is based on the concept of the prominent music philosopher Lydia Goehr and on her seminal work from the early 1990s (Goehr 1992). Such a concept of the field is the result of a logical requirement to enrich the discussion by a historical approach explaining developmental milestones², thereby avoiding much misunderstanding or short links in ahistorical ontological considerations.

I consider it important to include not only philosophical insights into music, but also findings based on considerations of musical aesthetics and conceptual innovations based on the needs of live music practice. For this reason, at the end of the discussion, I suggest to categorize musical works, expressions of music, and musical products in order to offer a clear conceptual distinction. This is perhaps the way to prevent applying the tag of a musical work to works that are inconsistent within the basic concept of the term. Another partial aim is to enrich the discussion through the achievements of opinion systems of Central European authors (Czech, Slovak, Polish, such as Z. Lissa, J. Fukac, I. Polednak, J. Kresanek, P. Faltin), who represent our domestic tradition and offer original solutions³.

2 Paradigmatic changes in 20th-century music as a source of re-evaluation of the concept "work-hood"

Musical development of the 20th-century showed a clear departure from the original traditional values of musical works, and introduced the variability of approaches and methods that music aesthetics used to reflect this trend. A previously neglected music element – timbre⁴ – became foregrounded, the finished work was no longer the only ideal, and the mere *process* (from a defined structure to a concept) and *an open form*

(the composition is completed on the stage depending on the current possibilities of interpretation and reaction of the audience) started to gain ground. Regarding the changes in the 20th-century music paradigm, according to Václav Kramář (2014, 435), we can define five important areas that could be majorly impacted: new compositional techniques and new forms of art; improvisation and the creation of the so-called cover versions (mainly in jazz and popular music); globalization and world music; mass culture and industrialization; appropriation and sampling.

New compositional techniques have made the definition of the musical work even more relative, they broadened its meaning and/or meant that the term started to include deviations from the traditional definition: definitive form vs. open work (or work in progress); restricted time duration vs. unrestricted time duration (infinite duration); termination of the composition process versus process-ness (live-electronic, performance); fixed codified form vs. instant or open form; repeatability versus disposability as the unrepeatability of the act (event, happening); thoughtful composition vs. inventing (non-musical originality, creativity, and exploitation of the technique); melodiousness vs melodic amorphousness (negating melody with emphasis on the timbre); thematic work vs. athematic style (rejection of tradition); the world of tones and musical sounds vs. new, non-musical sounds (incorporated into musical contexts); the traditional relationship of the word and music vs. the de-lexicalization of the word in order to use its sound qualities; harmonic construction vs. other sound structures (clusters, etc.); metro-rhythmic construction vs. rhythmic amorphousness as a rhythmically unstructured flow; traditional notation vs. concept in the form of verbal instructions (new symbolic forms of recording, recording of physical parameters and their units); rationality vs. irrationality (intuition as the essence of musical creation or improvisation); the act of composition vs. improvisation (especially in jazz, but also in the works of contemporary art music, aleatoric music, etc.).

From now on, a musical work should not only bring aesthetic effect and result in an aesthetic interaction, but also directly call to action, and make recipients perceive it as a musical event experienced at that moment. Developing modern technologies also played an important role. A crucial moment seems to be the penetration of digital technologies into mere creation, which has raised questions about the very essence of musical work and music (music as an anthropinum vs. music as a result of the use of algorithms, probability calculations, finished audio and rhythm sets). In terms of auditory (tone and timbre hearing) and apercption options, during reception, a major change in listening to recorded music occurred: the technical quality of the recordings, the reduction of some parameters due to data transfer, etc. have contributed to an undesirable decrease in the technical quality of music. After avant-garde, post-modern poetics brings one more unfavorable moment influencing the perception of the very essence of the “work-hood” of the musical work – it is the overuse of citations that, albeit put in new contexts, have a negative impact in that the sense of relevance is becoming lost. Finally, there is a phenomenon called appropriation that represents the general migration of musical themes, sections, etc. from older works to newer ones, or even the non-creative adoption of significant elements or style elements (collage, palimpsest).

In the field of popular music, a considerable change has been brought by the transformation of music compositions, especially songs, to musical products (commercial focus, market value, the music industry as a business). The new element is the fact that the works have gained the character of mass production⁵, where not

only hits but also artists, stars, idols are “produced”. The compositional principles have been enriched by the principle of sampling, i.e. the taking of sounds or parts of the sound recordings, the use of ready-made samples prefabricated for these purposes, the use of existing recordings in other compositions, typical of creating electronic dance music. A very non-creative product, being on the border of plagiarism, is so-called mash-up. Especially in the last decade, grave criticism has been launched against the large increase in the quantity of recordings that recycle hits from the past; the focus on one’s musical creativity disappears and the authors abandon the joy of discovering new compositional solutions⁶ (in the aspect of melody, as the mere essence of a hit, rhythm and harmony).

In relation to the artistic and aesthetic criteria (set for the production of popular music), particularly negative phenomena are plagiarism (as to a great extent non-original work) and amateurism (sample and technical means can be used also by an artistically non-gifted and musically uneducated person). According to Kramář (2014, 443), exactly *“this, among other things, makes the criteria of the uniqueness of the art work average and blurry”* [my translation]. Regarding the identity of the created music products, certain issues are also visible in the so-called world music, the fashion affair of the end of the 2nd millennium, which also conceals the concept of the uniqueness and identity of the musical works. The boundaries of this genre are blurred, diversity and openness (content, form of expression) are, on the one hand, manifestation of creativity based on a dialogue between distant musical cultures; on the other hand, there is room for many pseudo-artists. They use this exotic musical material as something that may sound unique, new and interesting, but their own creative contribution is minimal; or they can even come to the point of copying the style, melos, rhythm, the whole essence of the genre, and sometimes even mere songs.

This general sketch of the paradigmatic changes of the 20th and 21st centuries also has its philosophical and ideological-aesthetic background that is explored in the following reflections through the prism of musical ontology and musical aesthetics.

3 Musical work from the point of view of musical ontology

The emergence of the concept of a musical work, the development of the theoretical considerations in its definition, the degree of inclusion of the reception in its nature, its position during the development of music styles, has its genesis. Musical ontology as a philosophical discipline or, in terms of western science, a part of the philosophy of music, deals with the questions of the forms of existence of music art and a musical work, the possibilities of its inclusion among the objects of this world, objects that are either abstract or mental, dependent or independent of human consciousness. As a science, it explores the possibilities of creating categories of works, their classifications, as well as the possibilities of exploring the identity of a musical work. It usually means the degree to which certain conditions are met, so that the work is still the same in the next and further presentation. Moreover, it also considers it important to tackle its relationship to music practice, i.e. what role the notion of a work-concept plays in aesthetic perception and in aesthetic appreciation of music.

The notion of the essence and the meaning of art is not constant and unchangeable, so in the context of all the changes in which we exist, we must be aware of its dynamics. According to Lydia Goehr, a music philosopher, the notion of a work-concept appears as late as in 1800.⁷ According to her approach (Goehr 1992), J. S. Bach did not write musical works, rather he was a craftsman; yet, since the days of L. van Beethoven,

when the wider population had access to concert halls, the era has come that music (practiced and considered a cultural activity) has undergone a major ontological transformation: instrumental music has acquired a new status of artistic form – self-sufficient and autonomous, supported by romanticism aesthetics. The musical work has become something that can exist for and beyond a single presentation, persists in time in text form (notation, score), and has gained a high degree of objectivity⁸.

The most significant revolution in the transformation of musical art and subsequent conception of the musical work, however, remains the period of the 1960s, as the time of the established and crystallized avant-garde (the Darmstadt circuit and the musical experiment). The aesthetician and semiotician Peter Faltin (1992) speaks of “ontological transformation,” as a change in the understanding of a work of art in relation to its changed meaning. In traditional art, an artistic work fulfilled the role of mediator between man and the world. In the mid-1960s, the situation changed, new material was to guarantee the autonomy of music: *“Music wants to be – just like a human being – a part of the world, and not just a statement about it.”* (Faltin 1992, 176; my translation). At that time, material and composition were no longer just a means of expression; rather, they become the reason for creation, which establishes a special kind of identity between work and reality. The work becomes a matter of its own, it becomes its own purpose of work – it transforms ‘the work as a representation’ to ‘the work as being’ (a work itself becomes the reality instead of only being the representation of the reality).

According to Faltin (1992), the acoustic material (material exempt from the idea is the only idea of music) becomes the object of music; music starts to include things, predetermined sound objects (e.g. collage technique by M. Kagel). The absolute identification with material as the sole legislator for the meaning of music is at the same time a definite negation of the difference between the subject (artist) and the object (work). *“It is necessary to give up either the work or the artist, or it is necessary to cease to think in these terms”* (Faltin 1992, 178; my translation). Marcus Zagorski (2017), like Faltin, considers it of fundamental importance that the focus shifted from form development (composers have abandoned their ability to shape the musical course within the musical forms) to material extraction, stating that *“categories relating to the overall course of the form – were in the 1950s synonymous with the term ‘material’”* (Zagorski 2017, 22; my translation).

Changes in the ontological status of the work and in the glorification of the material went hand in hand with the musical experiment. The so-called “performative turn”, having its origin in ready-mades, Dadaism, surrealism, first happenings and events, gave the old work-concept, work as a creation the last major blow. In Reinold Schmücker’s (2010) view, this turn has triggered voices meaning that it is no longer possible to define art as a permanent creation. It seems that the only possible solution is to delineate the concept of a musical work broadly enough so that it can include also musical expressions in which the art/artist expresses itself/himself (herself) through *live action*, which does not lead to the creation of a musical work as such; moreover, it even used to raise questions like: Is it still art? What kind of object is a work of art? Is it still a work of art? How do we aesthetically evaluate it? In these cases, our standard definitions no longer work and the result is that we fail to evaluate it.

4 Musical work from the perspective of musical aesthetics

While musical ontology is systematic and ahistorical in nature, which is embedded in

metaphysical reflections by art philosophers⁹, aesthetics reserves its domain in the field of exploration; this forms the basis for the artistic or aesthetic qualities of works of art and their concrete instantiations. It is, therefore, an independent discipline with its own methodology, at the centre of which is aesthetic evaluation, the identity of the musical work and its adequate presentation, as well as aesthetic expertise and aesthetic experience.

However, it cannot be said that musical ontology has no influence at all on examining significance, interpretation, aesthetic value of musical works and of their presentation. While categorical questions do not have great aesthetic relevance, the same cannot be said about the identity of the musical work. These questions are closely related to the issue of authenticity of the presentation (is the presentation still the intended work?), thus to the examining of the extent to which we qualify the given presentation as authentic. Thus, it also represents a search for criteria based on which it can be judged what kind of aesthetic and artistic qualities is essential to the identity of the work (complying with record-notation, instrumentation, principles of style interpretation, etc.). For aesthetic evaluation of the performance, the issue of identity is a key issue.

The musical work (entity), understood as a symbolic network of time-spatial, structural and meaning relations, has undergone historical development both in classical music and in popular music and jazz. The philosophical contexts of the new situation were linked with the search for the definition of art, and consequently resulted in the need to create new concepts for individual products and musical expressions. The original understanding of the musical work was based on the classicist-romanticist tradition in which it represented that what was stable, complete, recorded, and bounded in time, though open in terms of intention and interpretation (Lissa 1982, R. Ingarden¹⁰ 1973, Levinson 2011). The revision of this current understanding was required not only due to the emergence of popular music and jazz (first to extensively revise it was T. W. Adorno; 1997) but also its avant-garde and experimental forms and the overall increase in coincidence, indecision and improvisation in both classical and popular music.

Music aesthetics defines a musical work as a deliberately produced, usually composed, musical object¹¹ that is meant to be, ultimately, presented; an object with the following determining characteristics: the existence of a record of the object structure (notation, recording), finality, boundedness in time, uniqueness, stable authorship. The musical activity presented to the listener becomes a work only when the aesthetic and artistic function is predominant; both ontologists (realists) and aestheticians consider this the basic premise. In this context, its other qualities related to aesthetic and artistic evaluation, such as identity, authenticity, integrity, aesthetic intensity, formal complexity and unity, are taken into account here. It should be emphasized, however, that this is a purely European category of work that is valid for a limited number of works (opus) of several centuries, now no longer absolutely, with regard to new compositional techniques, experiment, conceptual art, or sound-art.

One of the first theorists who in the 1960s drew attention to the need to revise the term musical work in relation to non-opus and newer music was the Polish aesthetician Zofia Lissa (1982). As one of the first people in our thinking environment, she gave an exhaustive definition of the term, but did not point to the need to expand the concept¹². Lissa (1982, 44–49) has creatively reconsidered the conception of her teacher Roman Ingarden¹³, which has resulted in the definition combining ontological and functional criteria: the intentionality of the artistic object; its individuality; being composed and

integrated; temporal finiteness; work stability; focus on the reception; fixation of records primarily by notation.

In the second half of the 20th century, in the Central European space, Zoffia Lissa, Jaroslav Volek, Jan Mukařovský, Ctirad Kohoutek, Vlastimil Zuska, Ivan Polednak, Peter Faltin, Jozef Kresanek, Norbert Adamov, Ladislav Burlas, Renáta Beličová, and others were dealing with the terminology of the musical work. They approached the issue from the perspective of their field of expertise (philosophy, aesthetics, general theory of art, theory of music, semiotics, copyright, receptive music aesthetics, and theory of music pedagogy).

5 Against expanding the term musical work – alternative concepts for “unclassifiable” forms of music expression

The redefining of the concept of a musical work cannot be done without clarifying the current understanding of the notion of *music art (music)*. A productive one seems to be the expanded definition of the concept of music offered by the aesthetician Renáta Beličová (2009); it takes into account the fact that the musical culture has grown into an auditory culture and, in particular, it is that that is now the object of aesthetic exploration: “*Music is such a sound structure, the individual sound features of which permit the author’s intention (the author’s intent towards music) and which is listened to as music (the listener’s intent towards music)*” (Beličová, 2009, 371; my translation). Music activity today is understood not only as the creator’s or performer’s activity, but also as the recipient’s activity, although much more likely in the field of classical music imposing certain demands (intellect, experience, etc.) on listening. In popular music, the perception of music does not require any extra mental activity and aesthetic reactions; it is enough to “consume” it, to have it nearby, or to respond to it, especially by physiological reactions, movement, and so on.

For the result of imaginative composing (that can be recorded), we primarily use the well-established concept of *musical work* (or music piece, composition, song, etc.). However, we are surrounded by a lot of music to which this term does not relate appropriately: nursery rhymes, chants, music in school, melodic and rhythmized ritual shouts in certain religious rites, improvisation (folklore, daily church practice, jazz), DJs scratching sounds, rap music, electronic dance music, music based on available templates and schemes, conceptual compositions, and the like. Since not every artistic creation has to acquire the status of a work of art, for the above mentioned, Poledňák (2006, 160) proposes the term *musical object* (my translation; all that is a particular realization of music), *musical expression* (my translation; related to human activity as “producing” music – composing, improving, interpreting – rather than to the result itself).¹⁴ As a contradiction to the term musical expression, sometimes the term *musical product* appears; here, it is the result that is emphasized, not the process.

It is important to realize that in order to know music, or audial, culture, we need to look for new, more adequate concepts, as well as optimal models of the interpretation of music in terms of musical work (opus) and the music that lacks the status of musical work (non-opus), even such sound reality that cannot be regarded as art (non-art).

6 Conclusion

The term “musical work” has several layers. Its first and original meaning (within the classical definition) is closely related to the conscious and planned activity, following

traditional patterns and rules (or their creative disruption). The second meaning is work as a result of creative work, which lives its life outside its creator's will, depending on social conditions and interpretation possibilities. After all, in the times of recording and preserving any musical expression, it also has a third meaning. If the musical expression is of non-musical-work nature (event, process, improvisation, etc.) it is something that is "here and now" – irrespective of its ontological status – but, at the same time, it is ready for a potential (recurrent) reception, which partially brings it the status of "work".¹⁵

At this time, we cannot speak about a set of types of music products as being finite, closed or one within which it is possible to list all constituents. What is still a piece of music and what is not ("death of a work") is rather a question of definition in general. What can still be called authorship and what is merely a noncritical succession, borrowing, but also plagiarism and non-creative takeover, is another blow that the current approach to creation and production can inflict on the nature of the work as an individual's creative result. There is also still a notable stream of receptionist approaches highlighting the reception as the last stage, at which the work is complete and real only in the listener's consciousness based on his/her mental activity. This echoes the often paraphrased, yet vague¹⁶, statement of Roland Barthes' "death of the author"¹⁷, aimed at the sphere of active perception that avant-garde and experimental music drew on, and that postmodern literary approaches (according to their model, also receptive musical aesthetics and musical ontology of idealistic orientation¹⁸) developed theoretically. However, they did not notice that, for example, the listener of mass production (of popular music) does not think this way, does not usually complement music mentally, rather he/she reacts to it physiologically and psychologically, uses it for inclusion into social contexts, or uses a wide variety of its features (except for aesthetic and artistic).

The fictitious "death of the musical work" and "the death of the author" were used in the present paper as initiatory metaphors motivating reflections on the nature of the changes in musical art. These changes remain an important object of theoretical disciplines (musical ontology, musical aesthetics) with the perspective of a mutual transfer of rational conclusions between them, musical practice and applied areas (music education, copyright, music criticism, etc.). Therefore, it is worth pursuing conceptually precise systematic examination.

Definitely, expanding the concept of a musical work to other and more recent musical expressions is not a way to facilitate orientation and effectively use the term. On the contrary, it is much more rational to use solid classification criteria for creating new categories for non-music-work musical expressions, and for music-like products, which, however, are not intended as music, and should therefore be labelled as sound products and/or non-art. Otherwise, we will induce the terminological "death of the musical work", and we will not avoid ontological misunderstanding.¹⁹

7 Notes

Rather, I think it is important to clarify the extent to which ontological reflections are present in the musical-aesthetic thinking and in solving the problems of musical practice.

² "The object of ontology is timeless, while the material of history necessarily rises and falls with the passing of time" (Giombini 2017, 238).

³ These authors remain "unreadable" for Western music aesthetics due to the non-existent

translations of their works.

⁴ The main building blocks of traditional music were musical ideas (themes, motifs), the components of melody, harmony and rhythm, finality and repeatability of the work, guaranteed by its recordings.

⁵ Certain acoustic and arranging templates serve literally as prefabricates for the production of similar musical products that have proven worthy in the standardized songwriting production.

⁶ See more in Cafourek and Poledňák (2007).

⁷ The central theme of Lydia Goehr's book (1992) is an argument supported by history, namely that the reasons for talking about music using the term 'a musical work' are much weaker than ontologists believe.

⁸ If we adhered to Goehr's (1992) belief, we could say that *musical work* has been present for only about two centuries in the form that corresponds to the standard definitions.

⁹ Categorical and classification issues are primarily solved there.

¹⁰ Roman Ingarden has created one of the fundamental definitions of a musical work as an intentional spiritual object, opposed to the variants of its particular presentations (differing in detail). The intentional object (always the same) basically exists only as potentiality.

¹¹ Cf. Fukač and Vysloužil (1997, 152–153).

¹² "If this term is, wrongly, used too widely to include all musical expressions in space and time, it raises confusion in the classification of musical phenomena and even more confusion in their assessment." (Lissa 1982, 45; my translation)

¹³ Ingarden (1973) considers the musical work as an intentional object, fixed in the notation record as a scheme which, with all its features, is realized only in the form of individual interpretative and receptive concretization, which implies the variability of some of its features. This variability does not eradicate the identity of the musical work.

¹⁴ Giombini (2017, 316), in principle, speaks of only two categories – *musical works* and *musical phenomena*.

¹⁵ An excellent example is cult jazz recordings that have become classic and have received the status of "works".

¹⁶ To critique this perspective, see e.g. Trillo (2018), Reicherová (2010). "The doctrine of the death of the author is a bizarre exaggeration of the recipients' role at the expense of the authors. This doctrine must be refused." (Reicherová 2010, 349; my translation)

¹⁷ "[W]e know that to give writing its future, it is necessary to overthrow the myth: the birth of the reader must be at the cost of the death of the Author". (Barthes 1977, 148)

¹⁸ These attitudes are originated in the philosophy of G. Collingwood and B. Croce.

THE BEAUTY OF SILENT MUSIC: CONVERSION BETWEEN JOHN CAGE AND YUANMING TAO

Abstract | A work by American musician John Cage was performed by a pianist at a concert in 1952, sitting in front of the piano for 4 minutes and 33 seconds. The music was called 4 minutes and 33 seconds. According to his sitting time. This music is sensational, like Duchamp's masterpiece *Urinating*, causing the audience to think about the music itself: what is music, what is art. It is not unique, but has its counterpart. In the history of China, according to Xiao Tong's *Zhaominwenxuan*, more than 1500 years ago, Tao Yuanming, the great poet of the Eastern Jin Dynasty, had the allusion of playing a unique guqin without strings while he drunk. And this anecdote was praised by the descendants. Through comparison, although the two men's music is both silent in physics, the expression of significance is different. Although Cage was influenced by Eastern culture, he is interested in *The Book of Changes*, use the experience of Yang Yin and Bagua for creating this silent music, like Chinese proverb "no sound is better than sound", but he emphasized music itself; Tao Yuanming, under the influence of metaphysics in Wei and Jin Dynasties, he preferred to discuss Taoism with music, use music to express his inner feelings, not to express what is sound, just enjoy in it. Tao seems to have reached the level of Chuang-tzu, can hearing Sounds of nature. The two kinds of music have their own characteristics, but they do not exclude the possibility of cross-cultural communication. In this comparison, cultural horizons have been effectively transmitted.

Index terms | *John Cage; Tao Yuanming; silent music; modern art; Chuang-tzu; Taoism*

John Milton Cage Jr. (1912-1992) is a modern American pioneer. His pioneering music works are more than 100 pieces. He is widely circulated in the world and his reputation is world-famous. Tao Yuanming (352 or 365-427) is the first poet in the history of Chinese literature to write a large number of drinking poems. He is famous for describing the pastoral nature, and poetry is widely known. Both of them played silent music, which was popular in art history. However, behind the same surface, there may be have different ways.

I.The Music of Silence in 4 Minutes 33 seconds

The *4 minutes and 33 seconds* played in 1952 is a masterpiece of the famous American experimental music in the 20th century. The music score is blank . Cage said frankly that his ideas of creation were influenced by the thought of Lao Zi and Zhuang Zi in China. The idea of “ Great music is faintly heard” in Lao Tzu gave him great inspiration. He tried to play music in a silent way to express a musical aesthetic thought of “Great music is faintly heard”. The repertoire itself is an appreciation of the “big voice” used to appreciate silence.

From Duchamp in the 20th century, modern art began. Du Shang used the urinal to impact the traditional art world, breaking the traditional linear relationship and causing thinking, and began to think about what is art. Cage broke the tradition with this piece of music, dispelling the boundaries between music and life, sound waves and melody, and has the characteristics of post-music and post-traditional.

In the heart of Cage, music does not have to achieve any obvious purpose, so that the audience can enjoy the joyful melody. On the contrary, the silence for 4 minutes is enough to express the meaningless existence (the meaningless communication can not be determined by one voice or not).The audience can't help but wonder a lot of questions, such as “Do you hear music?”, “Is this music?” and so on, so the artistic meaning of *4'33*” is similar to that of Duchamp’s *Spring*. Exploring the art itself, the traditional aesthetic experience of art is useless here.*4'33*” not only has the characteristics of western modern art, but also the Zen thoughts of the East, the Taoist thoughts, trying to express a different form of music than usual.

Cage believes that one voice itself cannot be regarded as thought, but something that needs to be explained with another voice, or something else. This makes music playing have other characteristics. Under this uncertainty principle, the theme of music becomes uncertain, and the timbre, rhythm and so on cannot be precise. A variety of artificial factors make music works easy to degenerate into notes collage, like pop art, but the shortcomings of the music itself are lacking. Cage dealt with this problem with *4'33*”. It dispelled the control of music by human beings, and musicalized the sound off. For Cage, his music creation is more deeply influenced by the “Zen” of Eastern philosophy. He feels that Zen is the motive force for his further development of his creation. He once said, “If I don’t combine with Zen, I doubt if I can do all I can.”¹

II.Tao Yuanming’s Stringless Guqin Performance

Tao Yuanming’s Stringless Guqin performance was first published in the *Song Shu·Yinyi Zhuan*² of Shen Yue (441~513 years):Tao does not understand the rhythm, however, he plays the stringless Guqin.Every time he drinks and drinks happily, he begins to play it to express his spiritual state.Whether rich or poor friends come to visit him, he treats him with wine. If Tao Yuanming is drunk first, he will tell the guests that he is drunk

and you can leave by yourself. Xiao Tong's *Zhaominwenxuan of Zhaoming*³ also has the same record.

In ancient Orient, Lao Tzu of Taoism had the idea of "Great music is faintly heard"⁴. (*Tao Te Ching*, 41th Chapter) There are two meanings in the "big sound". First, the music is silent, natural and simple. It will not change from beauty to ugliness. It is static, eternal beauty and absolute music beauty. The second is that "The things of this world come from Being. And Being come from Non-Being." (*Tao Te Ching*, 40th Chapter) Non-Being itself is the home of Being, so it reflects that "Non-Being" is the highest artistic conception.⁵

Chuang Tzu is later than Lao Tzu, he put forward three artistic conceptions of "piping of huanman", "piping of earth", "piping of Heaven".⁶ (*Discussion on Making All Things Equal*) Piping of Heaven is the highest enjoyment of music and comes from Nothing (Non-Being). All natural voices and human voices are included in it. In the Eastern Jin Dynasty, Tao Yuanming, as an intellectual elite, was deeply influenced by the metaphysics of Wei and Jin Dynasty, which was based on Laozhuang thought. Tao Yuanming enjoys himself after drinking, make music moves from man-made to nature. This is his understanding of the piping of Heaven (sounds of nature). This is the most beautiful musical experience.

From the formal logic of language, as early as in ancient Greece, Plato wrote the dialogue between Socrates and Scipios. They argued endlessly, and finally came in the proposition that "Beauty is difficult."

However, from the perspective of understanding and feeling, Beauty can be discovered and described, just like Chuang Tzu's description of the piping of human, piping of earth, piping of Heaven. The concept of beauty is difficult to explain, but it can be felt, so that the concept of beauty is not so difficult. On the contrary, it is open and free, only relying on its own performance, which is also the aesthetic significance of Chuang Tzu's piping of Heaven. In Chuang Tzu's own words: Heaven and earth have their great beauties, but do not speak of them. (*Knowledge Wandered North*)

Chinese aesthetics is more focused on the artistic experience than on the physical analysis of the works. Most of its aesthetic thoughts are described in terms of specific art forms. It pays more attention to the artistic state, such as painting, calligraphy, gardens, etc. It can be said that this is a special aesthetic culture unique to traditional China.

III. Comparison of beauty

Understanding 4'33" requires understanding the concept of "Nothing", and the process of understanding is similar to the practice of Zen Buddhism. In his own music learning process, Cage is from "Something" to "Nothing." In his youth, he focused on his own music practice, beginning to learn the interval, and then interested in the tone. As the study progressed, he began to use noise, and finally walks into the use of silence. In the eyes of Cage at this time, the exaggeration of society is no longer true. On the contrary, silent music has eternal value, "at least independent of life, time and Coca-Cola."⁷

Cage believes that art is about making something in the mind and reminiscent of "nothing." Only when the soul is quiet, all the possible paths in the world will appear in front of people. "Nothing" has also become a kind of ideological state pursued by Cage.

It can be understood as accepting, bearing, and the most beautiful state of the art. In this way, we can have a slight understanding of Cage’s artistic creation. He meets with newly developing modern art, but remains silent on it, independent of the wave of an artistic revolution.

Some people think that Tao makes a pretense. In fact, Tao Yuanming is proficient in music. It is only through the means of music to enjoy a state of mind, a kind of harmony between man and nature, hearing the piping of Heaven, away from the world. It is very similar to Cage’s pursuit of thought.

However, Cage’s 4’33” is ultimately based on the creation of sound, or a kind of sound music, but no sound is emitted, and is different from Tao Yuanming’s spiritual realm. The author believes that on the one hand, Tao Yuanming plays the piano not for performance, but for spontaneous artistic behavior, and his realm is more pure. Cage’s “nothing” artistic conception still has audience factors. Heidegger’s concept *Das Nichts nichtet* may refer to this kind of music, “nothing” excludes all “something”, and something that exists. Or, Tao Yuanming’s silent music likes an idea. Cage’s silent-themed music creation seems an “invention” or a kind of “liberation”, which brings more creative space and aesthetic thinking to western music and art.

THE CATEGORY “BOUNDARY” AND ITS METHODOLOGICAL SIGNIFICANCE FOR CONTEMPORARY AESTHETICS OF MUSIC

Abstract | The beginning of the twentieth century opened the era of global changes in the musical art. The sound, the artistic organization of acoustic material, the laws of composition was subjected to revision. Changes of music art necessitated the search for adequate methods for its study. The category of “boundary” becomes of special methodological importance among the concepts of modern music science. There was a shift of focus from the question “ “where do the boundaries lie?” to the question “what is the boundary?”.

As a cultural universal, the border is based on the dialectic of division and connection, isolation and dialogue. Simultaneously it is a zone of ordering and a zone of chaos. The dialectical nature of the boundary allows it to become a space of search, experiment, creativity.

Music shows increased sensitivity to “limits”, “boundaries”, “shatterings”, “transitions”. It is the sphere in which the role and significance of the border are revealed in all its diversity and completeness.

The special sharpness and paradox of the problem of boundaries in music, is determined by the following factors.

- First of all, the music itself arises overcoming the border from silence to sound. There is also a reverse process: the conversion of silence into music, which resulted in the “emancipation” of silence and quietness.
- The natural condition for music is also its “isolation” from noise: a musical sound is created under the influence of aesthetic and semiotic criteria. At the same time, the search for new expressiveness determines the continuous process of penetration into music of noise effects.
- Boundaries are manifested at all levels of music: consonance and dissonance, horizontal and vertical, regulation and improvisation, completeness and openness of form. These oppositions find a “refutation” at all levels of music: at a certain stage of its development, music comes to the emancipation of dissonance, fixed pitch loses its dominant meaning even in Western tradition, “dissolving” in the layers of electronic sounds and sound fields of sonoristics; overcoming the task of the text finds its embodiment in aleatory.
- Bidirectional character is typical of external contacts of music too. These are its relations of isolation and dialogue with other forms of art, as well as with everyday life, science, morality, religion and politics.

Studying the mobility and openness of the boundaries of music allows us a deeper understanding of the nature of metamorphoses that are characteristic of the modern period of its development.

Index terms | *aesthetics of music; dialectics of boundaries; music art; a cultural universal; the modern period of development*

On the centuries-old path of searching for a reliable definition of music and all processes taking place in it and related to it, an extensive and multidimensional terminological apparatus was created in the art studies. Nevertheless, not only local problems have remained unresolved today, but even the question «what is music?», «it would seem, the question has been resolved a long time ago», turned out to be «a new burning and acutely debatable»¹.

The beginning of the twentieth century opened the era of global changes in the musical art. The sound, the organization of acoustic material, the laws of composition were subjected to revision. Involvement in a single cultural space of all eras, genre-style paradigms, continental and ethnic traditions, the discovery of new sound horizons - all this demanded from the music science, which is puzzled by the creation of new methodological tools, access to the most remote areas of knowledge. Due to the unprecedented artistic practice, the process of terminological search referred art critics to higher mathematics, computer science, probability theory, botany, zoology, virology, etc.

It is noteworthy that the main focus of these searches was the fixation of various limits, transitions and intersections. In philosophy, cultural studies, literary studies category “boundary”, which is explicitly or implicitly but invariably present in the tools of modern science, becomes actively popular. Despite the wide divergence in the research vocabulary, however, the boundary problem remains actual and new to science. Approbation of the boundary problem confirmed important circumstance in various spheres of art studies: at the same time, the border allows preserving genetic memory of art and to keep the continuum formation in identifying the specifics of modern artistic realities. The key role of the boundary in art is obvious. The history of artistic experience fully confirms the rigidity and mobility, closeness and permeability of the boundaries. In a sense, the artistic process is the continuous creation of barriers and the crossing of territories, the establishment of limits and destruction linguistic, genre and style borders. Borderiness as a natural artistic quality thinking determines the attitude of tradition and innovation, “own” and “alien”, “high” and “grassroots”, art and its imitation.

The creative process itself reflects the constant “stay” on the border of the idea and its materialization, the creation of a literary text and its interpretation. The interaction of art with other “neighbouring” spheres of culture (science, religion, morality, politics, everyday life) is also subordinated to the mechanisms the existence of boundaries. Metaphors “frame”, “threshold”, “fence”, “barrier”, “brink”, “limit”, fixing the boundary and border, become dominant in the characteristics of the realities of artistic experience. The prospects of art analysts, that have been discovered through the identification of the role the border, led to a fundamental shift in the focus of attention from the question “ where are the boundaries?/ “where do the boundaries lie?” to the question “what is the boundary?”.

M. M. Bakhtin was the first to turn to the study of boundaries in verbal artistic creativity outside of topology and geopolitics. He determined its ubiquity and penetrability in culture. “There is no internal territory in the cultural area: it is all located on boundaries, the boundaries are everywhere, across every moment of it, systematic unity culture goes into the atoms of cultural life, as the sun is reflected in every drop of it. Each cultural act essentially lives on boundaries: this is its seriousness and significance <...> ”².

Further, this topic has become one of the most significant in works of D.S. Likhachev, Yu. M. Lotman, German philologists M. Schmitz-Emans, G. Plumpe, Russian researchers N. T. Rymar, V. G. Zusman and others. Yu. M. Lotman in the late fundamental work "Inside the thinking worlds" calls the boundary "cultural universal" and devotes a special section to it.

The primary meaning of the boundary is associated with such concepts as "isolation", "limit", "separation", "discrimination". These qualities became the starting point for the definition of the boundary by Yu. Lotman: first of all it is "the feature on which the periodic form ends". This space is defined as "our", "own", "cultural", "safe", "harmoniously organized", etc. It is opposed by "their-space", "alien", "hostile", "dangerous", "chaotic"³. M. Bakhtin writes about separation, detachment, isolation (the author's ability to take a position "out of" life) as the basis for the creation of artistic form. In his opinion, this is the main condition for the creation of an aesthetically significant object ⁴.

One of the original functional forms of boundary-isolation is a frame that provides the autonomy of artistic work and separates it from the reality. The frame informs the artwork of an important quality of autonomy, provides its internal semantic and structural isolation. According to G. Simmel's definition, it plays the role of «guardian of the boundaries of the picture» in painting. In music, the frame is manifested in thematic, tonal, rhythmic, dynamic, etc. closure.

However, "the idea of the boundary that separates internal space from the outside, gives only a primary, rough division"⁵. In the structure of the border, its openness and "passability" are no less significant. Various "territories" that boundary each other are mutually dependent, they inevitably enter into a dialogue. Due to the combination of closure and openness, the boundary phenomenon can be represented as a kind of "zone" in which cross-mixing, interaction and intergrowth occur. When Yu. Lotman described the relationship between the Romans and the barbarians, he noted that the boundary inevitably gives rise to the creation of "creolized systems"⁵. There are also characteristic boundary spaces in art-zones of "crealization", in which linguistic mixing, conjugation of species, genre and style patterns are taking place. Creolized zones are unpredictable, but also productive.

As we can see, a reliable definition of the boundary is inseparable from the awareness of its volume, mobility and nonlinearity. It is bidirectional: the dialectic of the border consists in the unity of separation and connection, distinction and dialogue-meeting. It is simultaneously a natural stabilization factor, but also is a "zone of chaos", which leads to the destruction of order.

The boundaries are "fractal, similar in relation to each other. They are brought together by a symbolic nature"⁷. Perhaps that is why the topological and geopolitical characteristics of the border are not only acceptable, but also productive for studying them in projection on art. Spatial-temporal, moral, aesthetic, existential meanings of limits, transitions, intersections are opened here.

In the terminological toolkit of musical science, the boundary has good prospects. This is largely due to the characteristic of the music particularly acute and paradoxical problem of the boundary. This concerns not only the aesthetic and technological change in the art of music, which Yu. Kholopov in scale compared with the collapse of the Ancient World. The reasons for the significance of the category are deeper. They

are rooted in the nature of music.

First of all, let me remind you that the concept of “music” is polysemantic. The multiplicity of meanings it possesses allows us to speak about music not only as a form of art. Immanent artistic interpretation is only a small part of what we call music. Understanding of music as a metaphor of poetic, mental, spiritual, has become no less deployed. It is sufficient to mention the symbolist understanding of music as a “center of gravity of the arts” among many examples (A. Bely). And finally, the interpretation of the universe (Pythagoras, Kepler, Schopenhauer, etc.) as the sound of universal harmony, sends us to a metaphysical understanding of music.

Let us leave aside the study of the boundaries immanently artistic, metaphorical and metaphysical in music and turn to the art of music, which can be represented by the genesis and logic of self-determination as a special experience of the boundary. As art, that is primarily addressed to the rumor, music arises from overcoming the boundaries of silence and sound - separation silence and statements. However, there is also a reverse process along with “isolation”, the establishment of a “frame”: the transformation of silence into music, the consequence of which was the “emancipation” of silence. The characteristic statement of the pause, not only as an independent musical language element, but also silence as a dominant (or the only) means inherent to the authors with different style settings (E. Schulhoff, J. Cage, A. Schnittke, S. Gubaidulina, A. Pärt).

It is also obvious that there is a clearly outlined separation from noise in music: musical sound (regardless of cultural and typological differences) is created under the impact of aesthetic and semiotic criteria. At the same time isolation music from noise is not absolute. Sound effects are established in music history as an effective form of composer utterance, which has unlimited expressive possibilities. Along with the noise experiments of A. Onegger, A. Mosolov, L. Russolo, J. Antheil, R. Lieberman and other composers can be mentioned Symphonic poem for 100 metronomes D. Ligeti (1962), which originally had the glory of a scandalous work, but was later realized as deeply philosophical composition. The poem was performed at a concert on the day of the composer’s funeral and became a symbol of overcoming the boundaries of mortal and eternal.

The dialectic of “rigidity” and “mobility” of the boundary permeates all levels of a musical work: its language, composition, concept, drama. After a long journey, the unification of fixing a musical text over the course of the twentieth century becomes relative (its boundaries are “randomized”) and loses the generally accepted regulations, leading to individualization of notation systems. Aleatoric experiments of J. Cage, K. Shtokhazen, P. Bulez “open” the boundaries of the text, in which the task gives way to chance.

The “borderline” nature is manifested in various genre-style paradigms of music. It is revealed to us even in texts, which are presented as a model of classical architectonics. Let’s turn to the paradigmatic fragment - “Joke” from the suite for flute and orchestra of I.S. Bach. The first sixteen clock construction, seemingly, is an example of perfect completeness. The isolating and structuring functions of the boundary-frame are presented here as classically flawless. However, please note that classical squareness here is not strictly maintained $[(2 + 2) + (2 + 4) + 6]$. The evidence of the homophonic-harmonic structure of the texture is “broken” by the imitation of the flute theme in the orchestra (7th bar). Stable auditory impression of completeness of the construction

is combined with tonal openness of modulating construction (h-fis). The “badinerie” (“joke”) remarking, as well as the scherzo nature of the music, paradoxically enters into a dialogue “dialogue” with the minor color of the play.

Similar examples of polyfunctionality of the boundary can be found in abundance in the compositions of J. Haydn, W.A. Mozart, L. van Beethoven. But if in the opuses that reflect the classical aesthetic paradigm, the “frame” dominates - the isolating and ordering role of the border - then we see a different “picture” in works that embody the principles of non-classical paradigm.

The nonclassical paradigm of musical art is dominated by the functions of dialogization and chaos characteristic of the boundary. Rethinking the boundaries and overcoming the traditional “limits” that occurred in music over the last century, has acquired the character of an imperishable process. Among many others, mention should be made of the aleatoric experiments of C. Shtokhausen, J. Cage, and P. Boulez. Yu. G. Kohn accurately records the tendency of the boundaries to be randomized in the aleatorica - not only a separate work, but also the possibilities of music as art. The researcher notes that “the aleatorica makes the polysemy inherent in any music almost limitless”⁸. As it is known, Pierre Boulez offered the musicians to perform his compositions in one concert several times, thereby deliberately emphasizing the principle openness of the borders in reading the musical text.

Noting the different “behavior” of the boundary in the musical works of the classical and non-classical paradigm, we should not present isolation and chaos as functions of the boundary that replace each other. The fundamental property of the boundary as a “cultural universal” consists precisely in its bulk and non-linearity, which reflects the dialectic of constructive or destructive, ordering or randomizing aspects.

Indicative in this regard, the play for the solo flute “Voice” (1971) by the leader of the Japanese avant-garde Toru Takemitsu. At first approximation the composition is represented as an experiment to overcome sound, articulation, composition, and dramatic boundaries. The play continues sonorous experiments of E. Varese, O. Messian, J. Cage, C. Stockhausen. Takemitsu’s favorite instrument - flute (sounds in many of his works as a solo and ensemble instrument) is unusually interpreted: along with “contemplating” a separate sound, the flutist must simultaneously sing, speak, breathe loudly, whisper. The language of “Voice” is complicated: frequent switching of intonations, change of tempo, extremely wide pitch range - present serious difficulties for the performer. The composition is complicated by elements of instrumental theater: facial expressions, gestures, walking on the stage and hall.

Musical notation is also far from traditional: there is practically no traditional notation, no division into bars/measures, no durations.

At the same time, behind the non-classical openness of the composition there are fastening and “closing” factors in it. The poetic text of Suso Takiguchi’s haiku (“Who goes there? Say, transparency, whoever you are”) sounds in the play twice in French and once in English. Obvious reprisalness is found, and although verbal and musical reprises are not the same, the composition is completed with the initial intonation (without the poetic text). Undoubtedly, haiku plays the role of a “frame” of a work.

Detailed comments of Takemitsu (13 points of remarks) in which he formulates timbre, tempo, dynamic, articulation regulations have clarifying meaning.

Researchers point out explicit parallels with A. Schoenberg's «Pierrot Lunaire»

(“grotesque eccentric, mysterious and eerie picture of loneliness”⁹, which can also be represented as ordering function of the boundary. As you can see, small musical fragments of the cops belonging to different epochs fully confirm the dialectic of openness-closeness, orderliness and chaos characteristic of the border.

Returning to the problem of the search for modern terminology in contemporary aesthetics of music outlined in the beginning of the article, the following should be noted: updating the conceptual apparatus only makes sense when it opens up new aspects in a previously developed artistic space. Further study of music, which is realized as the quintessence of the experience of the boundary (in its entirety of its functional forms), not only opens further paths to understanding the specifics of the art of sounds, but also provides new substantiations for the plurality and heuristic openness of artistic creativity in general.

“LISTENING” AS THE APPROACH TO THE DISCLOSEDNESS OF THE THERE— APPLYING MARTIN HEIDEGGER’S IDEOLOGY OF ART TO THE SOUND CONSTRUCTION OF MUSICAL WORKS

Abstract | This thesis aims to use Heidegger’s ideology of art as its philosophical basis, to contemplate the sound construction of musical works, to interpret the models of “listening” based on the levels of its sound construction, and ultimately to return to the analysis of musical works based on “listening” practices.

Accordingly, this study uses research models based on the ideology of “things,” “equipment,” and “artworks” in Heidegger’s philosophical theory. This work applies these ideas to the field of musical aesthetics, in order to access the sound as “things,” the musical material as “equipment,” and musical works as “artworks,” respectively. Besides addressing issues with these aforementioned concepts, this thesis also conducts an in-depth analysis of multiple musical works in order to validate my views and thus derive a methodology for interpreting musical works in the field of existentialism. Specifically, this project focuses on the following three aspects:

1. Things, equipment, and artworks

This research is inspired by Heidegger’s art classics *The Origin of the Work of Art* and focuses on exploring the origin of artworks. Later, the thesis applies the research methods from artworks to the field of musical aesthetics.

2. Sound as things, musical material as equipment, and musical works as artworks

After introducing Heidegger’s ideology of art to the field of musical aesthetics, the thesis clarifies its research object—musical work from an existentialist perspective—that could be divided into three categories: sound as things, musical material as equipment, and musical works as artworks. Therefore, the purpose of this thesis is oriented to the work per se, focusing on the sound construction of musical works.

3. “Listening” as the approach to the disclosedness of the there

Music listening, first and foremost, involves hearing the “sound”. It is after the explanation that the sound of art can be appreciated. As a result, the significance of this research topic lies in how listeners achieve the disclosedness and realize the essence of musical works.

Through a comprehensive survey, this project draws multiple conclusions. First, it frames musical works as “entity” on the sense of ontology. Second, it demonstrates that it is necessary to incorporate the intentional projection of the subject and understanding of sound structure. Finally, this project accesses the Being of beings of works—i.e., the there of disclosedness and clearedness.

Index terms | *Listening; Martin Heidegger; Musical works; Sound construction; The origin of the work of art*

I. Seeing as the approach to the disclosedness of the there

The title of this paper refers to Heidegger's words that come from *Being and Time*—"we must, of course, guard against a misunderstanding of the expression 'sight'. It corresponds to the clearedness characterizing the disclosedness of the there."¹ In order to get a deeper understanding of Heidegger's term, I made the following supplement. "Look" means "to ascertain by the use of one's eyes, or to exercise the power of vision upon."² The definition of "look" refers only to the appearance of things. However, "see" means "to perceive by the eye, or to perceive the meaning or importance of,"³ and in the context of Heidegger, "seeing not only does not mean perceiving with the bodily eyes, neither does it mean the pure, nonsensory perception of something objectively present in its objective presence. The only peculiarity of seeing which we claim for the existential meaning of sight is the fact that it lets the beings accessible to it be encountered in themselves without being concealed. Of course, every 'sense' does this within its genuine realm of discovery. But the tradition of philosophy has been primarily oriented from the very beginning toward 'seeing' as the mode of access to beings and to being. To preserve the connection, one can formalize sight and seeing to the point of gaining a universal term which characterizes every access as access whatsoever to beings and to being."⁴ So the definition of "see" refers to our access to the essence of things. If the general "look" is only to see the entity, then "see" is an existential form that can reach the entity and the entity *per se*.

Dasein⁵ is the core concept of Heidegger's philosophical theory comes from the questioning of Being. The existential structure of Dasein essentially consists of a general unfolding realm. This realm defines the overall structure of Being. Heidegger has a very famous adjective for the unfolding realm of Dasein, i.e., *gelichtetheit*. This term is often translated as clearedness. It means making something soft, free, light and open. It describes the expanded realm of Dasein. So clearedness is the open context of all *anwesenheit* and *unwesenheit*, that is, the development of Dasein, so it corresponds to "see".

In this paper, I employ Heidegger's concept of "see" to analyse the sound construction of musical works, and derive a methodology applicable to the interpretation of musical works, that is, "listening." By applying the concept of listening—which is comparable to seeing—to musical works, this paper addresses to the Being of music, that is: "listening" as the approach to the disclosedness of the there.

II. The sound construction of musical works

1. Sound as things

Heidegger's existentialism theory starts from the questioning of Being. According to his mode of thinking, the musician, as the creator who created the musical works, uses his own craft to compose the music. Musical works, however, have more sublime meanings than general sound, because they not only have the general thingly character but also signal additional meanings. From his point of view, the thingness is the carrier of the existence of musical work, and the musical work is constituted by the material carrier and its manifest sounds. In musical works, this thingly feature obviously refers to the sound *per se*.

For example, the well-known American avant-garde composer Stockhausen has used a lot of noisy voices in his work "*Hymnen*": whistling, shouting, talking and so on. If we

listen to these sounds in isolation, they are undoubtedly some natural sounds. However, when the composer arranged the sounds and combined them in the overall sound, the work actually crossed over the artificial creative factor. As a result, the sounds lost the original effect of natural sounds—the whistle is no longer a reminder sound of the traveller, and the applause is no longer considered to be a sigh of cheering. The sounds in this musical work create a unique effect. It is creatively arranged throughout the sound. Meanwhile, Stockhausen’s use of various kinds of voices make us consider the meaning of such sounds when they occur outside of music.

Therefore, the distinction between the sound in the work and the sound of the objective world lies in the creative factor of human beings. As a question of existence, people not only create the thingly feature of musical works, but also further question the meaning behind the real sounds, and the manifestation of equipment existence.

2. Musical material as equipment

The sound is the foundation of the existence of musical works and the thingly element of musical works. However, music is not just a sound but a combination of the higher level of sound, such as motives, melody, chords, rhythm, and their compositions, which are created by musicians.

The relationship between sound (thing) and material (equipment) is the following: the single sound is the basis of musical material, and musical works contain numerous materials. The more typical musical materials are theme, motive, melody, harmony and rhythm. In the works of the 20th century, some materials can be pitch, chord, tone or even a single interval relationship. Obviously, the richness of musical materials is determined by the diversity of some thingly factors involved in its integrity. For this reason, listeners tend to concentrate on the higher level materials such as a chord or melody when they listen to a musical work. A musical piece contains one or several main musical materials, which are the recurring “sounds” in the musical works that the subject (listeners) can directly grasp given the emotion under the perceptual intuition experience after the intentional projection of the musical works.

I will take the following work as an example to illustrate the specific characteristics of materials in musical works. *Le Gibet*, the second of three parts in *Gaspard de la Nuit* that was composed by Ravel in 1908. In this work, the motive 1 (B^b), rhythm type entered slowly and steady, as the background sound of the basic pedal, paving the whole work.

The musical terminology that Ravel uses to mark this gesture is “Sans presser ni ralentir jusqu’à la fin”, which means it has a steady pace and volume through the piece until the end. According to the poem, some scholars believed this sound was resembled the bell coming from the walls of a city. I think this interpretation referred to the atmosphere created by this particular sound as the virtual environment. Obviously, this interpretation is derived from the “actual environment” described in the last section of Aloysius Bertrand’s poem⁶. Other scholars gave this dramatic trajectory a deeper trope. They argued that the composer, as a narrator, was telling the fate of this virtual actor—a hanged man of the narrative archetype in the poem, viz. the hanged man on the gibbet is going to end, everything is attributed to fate.

I agree with the opinions stated above. As the initial order, Motive 1 is spiritually tense, repressive, and would likely be interpreted by a listener as negative. Throughout the

entire piece is a B^b octave ostinato (motive 1), imitative of a tolling bell, is a distinctive and constant tone that is heard as the notes cross over and dynamics change. I remembered that Freud once said: "Repetition is a behavior pattern that is very close to disappearing. When the same action recurs, people eventually lose the feeling of change and their feelings about the passage of time." For this work, as a listener, my imagination (virtual observing agency) is the hanged man on the gibbet dragged by the shackles wrapped around his ankles and walked forward step by step... had to face the endless trial... every step matches every sound of the bell. This is a struggling sound. This kind of virtual actant carries the actual meaning of death. The desire to repeat is actually the desire to be completely still, or in other words, eager to die. Therefore, I think that Ravel hopes this bodily movement has not presented the corpse of a hanged man of the gibbet, but a deep reflection on life and death as experienced by self-narrating virtual agent of a hanged man on the gibbet.

In summary, musical material is not a simple sense of sound, but a kind of unnatural (artificiality designed) sound. It is based on creativity, which contains a means of expressions such as imitation and symbolism. So, in general, the musical material is a creative and expressive sound. Whether it is classical music or modern music, they have not been able to leave this basic principle. In this way, the creativity and expressiveness of the materials here correspond to the usefulness and reliability of Heidegger's concept of equipment.

3. Musical works as artworks

"The setting up of a world and the setting forth of earth are two essential features in the working-being of the work."⁷

Setting up a world: intentional projection of subjects

Heidegger believes that "to be a work means to set up a world." A stone has no world, plant and animal likewise have no world, but a peasant woman has a world. Reviewing Heidegger's poetic exposition of Van Gogh's *"Pair of Shoes"*, we can see that in real life, the farming shoes are only the equipment, while Van Gogh's masterpiece *"Pair of Shoes"*, as an artwork, has created another world that only human beings possess. It reveals the true connotation that hidden behind these shoes: the hardship, misery life and destiny of a farmer woman struggling on the barren land, her infinite attachment to the earth, her inner anxiety, sadness, joy, hope, and longing...

When we listen to musical works, the sound, with the information of the external world of music and the connection of people's subjective consciousness, portrays an imaginary world in people's minds. The sound is trying to reproduce the object (that is, the external world of music), while the object reproduced in music does not exist independently in real time and spaces. The listeners' experiences are not equivalent to the existence of real things in the real world. The reduction and compounding of objects only exist in the listener's thinking activities (here the object can be an emotion or an event). Music cannot be equated with the "being" of the real world, but can only produce a similar "being" in the listener's thinking activities by relying on the relationship between the external world and subjective consciousness. Therefore, we only have to continuously invest in the intention of musical works, so that the intuition experience can be filled and expanded continuously. Finally, the real world of musical works can be revealed.

Setting forth the earth: the sound structure form of musical works

The existence of works is the conflict between world and earth. The establishment of the world is an open field in which the work opens the truth. At the same time, the earth is the thingly character of works. In Heidegger's words, works create the earth, and this kind of manufacture is to set itself back into the earth, that is, to make materials return to the original appearance. In *"Pair of Shoes"*, the main materials are pigments; in the Greek temples, the main materials are rocks; in musical works, the main materials are different combinations of materials—sound.

The individual sounds are composed as different materials, such as motives, themes, melodies, harmony and so on. The combination of different orders of materials can also form different sounds, such as the arrangement of horizontal order and the construction of the vertical stack. In this way, the arrangement pattern of the two-dimensional space greatly strengthens the motive force of the music structure.

It can be seen that the form that is obtained by the combination of different orders of materials is not the material itself. "These forms can be extremely individual, unique to the work, or common, and inherent to many different works. But more or less formulated."⁸ Although the form is formulated, different combinations of orders can produce different meanings. Therefore, when a material is compounded with another material, whether it is a stacked combination in the vertical direction or a sequential combination in the horizontal direction, its meaning always changes, and the result is a completely new overall meaning. Just like the earth has a duality in artworks: it recedes itself as a base in artworks, meanwhile brings these retreated things back into the openness of the world. This is what Heidegger once said, "to set forth the earth means to bring it into the Open as the self-secluding."⁹

At this point, we can see that the clearedness is not the ultimate place for all musical works. Only the genuine musical works can show their unconcealedness-clearedness realm. It is the characteristic of clearedness in genuine musical works that can deeply impress us. Only when the work reaches its own apex can it reach into the clearedness, and the clearedness is the fundamental boundary between the genuine works and ordinary works.

III. Listening as the approach to the disclosedness of the there

Heidegger's philosophy perceives music as the entity, rather than turning music into the cognitive object. Then, in the relationship between people and music, the experience is more important than cognition. This is significant because whether there is a distinction between subject and object in musical aesthetics is a question worth considering. In theory, aesthetics is different than cognition. Traditional epistemology regards a person in cognition as the subject and cognitive objects as the object. The dichotomy of subject and object divides the two by dialectical thought and then the thought wanders between them. When applied to music theory, people are regarded as subject and music as object. Therefore, there are endless theories to explain the relationship between people and music.

For the study of music history and music analysis, this method seems reasonable. However, in the specific practice of musical aesthetics, the division of subject and object will inevitably lead to confusion between "sound" and "heart". The main question is, which is the subject or the object in musical aesthetics? The answer is vague. Once

the music enters the listener's ear and causes the listener's emotional response, the listener also enters the field of music understanding. Because "understanding is always attuned."¹⁰ At this time, the music is no longer like a tree in a distant mountain as an object that does not affect people's consciousness, and people are no longer the subject that can arbitrarily decide musical meaning. The two form the horizon of Daisen because of their understanding. In this realm, there is no division of subject and object, no rational reflection, only emotions drive to understanding; that is, the most clearedness realm of musical aesthetics. Only this understanding constitutes pure aesthetics, and only after this understanding, all rational reflection and cognition become possible. Thus, the understanding of music is an ideal musical aesthetic realm, in which people and music could exist in the way of understanding.

If we use Heidegger's "see" to express aesthetic experience, the purpose of this kind of perceptual experience is to grasp the music in a "seeing" way and afford us a comprehensive way of seeing them. This kind of understanding precedes the relationship between the subject and the object, before the rational reflection and the existing experience. It is just a purely constitutive dynamic to "see" and "understanding" in order to access the pure aesthetic horizon—"the disclosedness of the there."

Yuxi Liu is a Ph.D. candidate in musical aesthetics from Shanghai Conservatory of Music, China. Her research specialty is philosophy of music. She earned her B.A. in piano performance (2011), and M.A. in musical aesthetics (2016). Her master thesis was rooted in Martin Heidegger's ideology of art as the philosophical basis, contemplating the sound construction of his musical works. She used to be a visiting scholar of the department of philosophy at the University of Texas at Austin (2018). Currently, she is working on her doctoral dissertation centered on Kierkegaard's musical aesthetics conception. Besides her primary interest, she is also researching contemporary music in China, and serving as a staff writer for the Music column of *Wenhui Daily*. Outside the academic world, she enjoys playing Guqin and appreciating the Gamelan music.

PANEL SESSION 13 | CONTEMPORARY AESTHETICS OF VISUAL ARTS

EPHEMERAL POETICS: BETWEEN THE AESTHETIC AND THE CRITICAL. FOCUS ON THE EXHIBITION OF CONTEMPORARY JAPANESE AND POLISH ART

Abstract | With the social situation rapidly changing in recent years, an increasing number of contemporary artists are responding by producing works closely related to current social issues. In the former Communist bloc countries in particular, incisively critical and powerfully expressive work is being ever more widely produced by young artists, who have inherited approaches from predecessors that tenaciously pursued creative activities in an environment where every aspect of daily life was politicized, enduring the severe circumstances of enforced Social Realist aesthetics and restrictions on freedom of expression under the postwar Communist regime.

In this paper, I will discuss the critical nature and distinctive aesthetics of emerging and mid-career artists in Poland and Japan, while focusing on the *Celebration: Japan-Poland Exchange Exhibition* to be held in Japan and Poland in May and June 2019. The countries have quite different histories and cultural backgrounds, and at first glance artists from the two countries may seem to have little in common, but there are intriguing similarities to be found.

Of particular note is the critical and political nature, and the ephemeral and poetic quality (expressed in Japanese as *mono no aware*), shared by artists from both nations. While Polish art is characterized by biting social opposition, accompanied by skillful and ironic critiques tempered by a humorous yet tragic aesthetic sense, Japanese artists are noted for keen sensitivity to subtle changes, expressed with sophisticated techniques and sensitive emotion, and concealing a sometimes subtle and sometimes bold critical gaze directed at modern society, as well as probing into the essential nature of existence. In this paper I will examine these characteristics in detail, while exploring the significance and potential of art in contemporary society.

Index terms | *contemporary art; Japanese contemporary art; Polish contemporary art; ephemeral poetics; critical*

INTRODUCTION

With the social situation rapidly changing in recent years, an increasing number of contemporary artists are responding by producing works closely related to current social issues. In the former Communist bloc countries in particular, incisively critical and powerfully expressive work is being ever more widely produced by young artists, who have inherited approaches from predecessors that tenaciously pursued creative activities in an environment where every aspect of daily life was politicized, enduring the severe circumstances of enforced Social Realist aesthetics and restrictions on freedom of expression under the postwar Communist regime.

In this paper, I will discuss the critical nature and distinctive aesthetics of emerging and mid-career artists in Poland and Japan, while focusing on the *Celebration: Japanese-Polish Contemporary Arts Exhibition* to be held in Japan and Poland in May and June 2019. The countries have quite different histories and cultural backgrounds, and at first glance artists from the two countries may seem to have little in common, but there are intriguing similarities to be found.

Of particular note are the critical and political nature, and the ephemeral and poetic quality (expressed in Japanese as *mono no aware*), shared by artists from both nations. While Polish art is characterized by biting social opposition, accompanied by skillful and ironic critiques tempered by a humorous yet tragic aesthetic sense, Japanese artists are noted for keen sensitivity to subtle changes, expressed with sophisticated techniques and sensitive emotion, and concealing a sometimes subtle and sometimes bold critical gaze directed at modern society, as well as probing into the essential nature of existence. In this paper I will examine these characteristics in detail, while exploring the significance and potential of art in contemporary society.

MONO NO AWARE

Mono no aware is a concept difficult to define or translate, and is often left in the original Japanese in translations, as it is here. It was regarded as an aesthetic ideal in the court literature of the Heian Period (794-1185), and refers to certain emotions elicited by *mono* (things or objects). The heart is moved, in a refined and graceful manner, by a sense of *aware* (melancholy) at the transience of all things. It came to be associated with the aesthetic ideals, developed in tandem with the tea ceremony in the late Muromachi period (the early 16th century), of *wabi* (the beauty of imperfection) and *sabi* (serenity evoked by aged and weathered things).

This aesthetic can be seen in the work of Ryosuke Imamura (b. 1982 in Kyoto), who is concerned with changes perceived in the mundane course of everyday life and has consistently exhibited works to high acclaim that appeal to multiple senses, with motifs like sunlight through leaves reflected on the surface of a puddle, the sound of someone practicing the piano in the distance, and the fragrance of osmanthus heralding the arrival of autumn. Imamura got the opportunity to stay in Warsaw for a year with a grant from the Pola Art Foundation, and explored the Polish cityscape, focusing on its many and varied neon signs, incorporating them into works with poetic messages. These works convey beauty and transience, as if the text of the signs emerges from the depths of Warsaw's long, quiet winter to glow for a moment and then fade away. They have a distinctive, emotionally resonant poetry as contemporary art that inherits the tradition of *mono no aware*. Viewers who stand for a long time in the venue with these humble works will find their senses more keenly attuned. The experience is akin to familiar ones from everyday life, but its essence is refined and abstracted, and we become more conscious of minute differences. Although the works never speak loudly, they linger long in the mind, and the ephemerality of things in constant flux, the joy and sadness of existence are engraved on the heart. Theirs is a quiet but powerful, radical

force. His solo show *At the Place That Is Not There* at eNarts in Kyoto in autumn 2018 recalled the foggy nights he experienced in a foreign land (Warsaw) with white smoke that gathered like mist, emitted at regular intervals from pipes distributed around the venue, and moving images and small objects here and there, inviting the view to join Imamura on a journey to “the place that is not there.”

In the video installations of Yuriko Sasaoka (b. 1988 in Osaka), strange and intense characters (sometimes puppets, but with the artist’s face added to create composite images) perform comical actions. The viewer hesitates to laugh at these, as he or she notices the suspicious and threatening shadows lurking, and the emotions are caught in a kind of limbo, while the eyes and mind are transfixed. Here we have not tranquility but a colorful, flashy charm that holds nothing back, yet there is still an air of sadness and resignation and shadows of transience, and these ambiguous qualities heighten the appeal. Is it some kind of sympathy for pathos, impermanence, or sadness that hides underneath the festive, humorous spectacle? While rooted in the impermanence of all things, the works convey a positive will to live alongside others in an absurd world. In *JAPEDONIA*, produced during a stay in Macedonia, Sasaoka asked Macedonian people about their images of their own country, of Mother Teresa (an iconic figure from Macedonia), and of Macedonian cuisine, and recorded their responses. She translated these questions and answers into English with automatic translation software, took the mistranslated results and translated them again into Japanese, and then posed questions, now quite far removed from the originals, to Japanese people. The chain of mistranslation produces an unexpected dialogue. The piece intriguingly raises fundamental doubts about the nature of communication and whether it is even possible.

What of the work of Hyslom, a unit formed in 2009 in Kyoto? They consistently engage, with tireless stoicism, in “play,” according to rules they have devised. While enjoyable, this play constantly treads on the edge of danger, and the works are suffused with threatening yet captivating suspense. While daunted by this threat, the viewer gradually comes to experience the repeated actions as ceremonial. At times it looks like a desperate and innately dangerous endeavor. However, they are not waging an ongoing campaign of action to some end, but performing pure and non-purposeful action for action’s sake, sailing toward an unknown destination. Because of this very purity, they strike us like monks willingly practicing severe ascetic training.

Sasaoka’s curious video works, their inherent poignancy and radicalism, and their underlying sorrow and humor, also convey the power of irrationality to recover our human nature in an increasingly dehumanized late-stage capitalist society. Imamura’s skillful and delicate spatial interventions sharpen the viewer’s senses, fighting against the invisible tide that sweeps the individual in the direction of dangerous groupthink, and giving us chances to do what we seem to do less and less these days: stop and think.

A CRITICAL GAZE

Karolina Breguła (b. 1979 in Katowice, Poland) graduated from the Leon Schiller National Higher School of Film, Television and Theatre in Łódź. She works in media including photography, video, installations, and happenings, keenly and delicately analyzing her subjects while engaging widely with the community, and is highly lauded for comedic works with a tragic edge. She consistently addresses various issues of community and shared memory, and in Japan has participated since 2017 in the annual Tatsuno Art Project in Tatsuno City, Hyogo Prefecture, where I serve as artistic director. In the 2017 Tatsuno Art Sketch, she presented her operatic musical *The Tower* humorously depicting the utopian visions of, and disillusionment with, modernist architecture, and the various problems of apartment blocks. Also, she and local residents held a

filmmaking workshop called Sketching Stories and created a short film entitled *Drifting*, inspired by a story about poet and Tatsuno native Rofu Miki, who was separated from his mother as a young child and every day continued to wait for her return at the foot of a mountain, based on a script on the theme of waiting created with residents. In the 2018 Tatsuno Art Project: Hybrid Orbit, she presented the video work *Office for Monument Construction*, metaphorically portraying the establishment of virtual spaces as homes for people who are losing their identities and seeking comfort after the demolition of structures. In 2019 she is scheduled to present *Square*, produced in Taiwan. *Square* more directly addresses a sense of looming crisis and anxiety, and while bizarre and allegorical, asks the viewer how we ought to act in the age of crisis. In its adoption of a quiet but firm critical stance, it can be said to carry on Poland's avant-garde traditions, but at the same time we can see confusion and hesitation against the backdrop of reversals and confusion of value systems in the post-Cold War era, and while its ambiguity challenges the viewer to think, the quality of the gentle, fleeting and beautiful images conveys the impermanence of all things and a sense of *mono no aware*.

Łukasz Surowiec (b. 1985 in Rzeszów) has exhibited videos and installations that deal with social and political themes in a manner linked with everyday life. At the seventh Berlin Biennale in 2012, where the artistic director was Polish compatriot Artur Żmijewski and the theme was "Forget Fear," Surowiec presented the project *Berlin-Birkenau* in which he brought to Berlin hundreds of birch tree seedlings that had naturally grown on the former site of the Auschwitz-Birkenau concentration camp. These were planted in Berlin's parks and other places connected to the Holocaust and the transport of Jews to the camp, such as Grunewald Station, platform 17 (from which 55,000 Jews were forced into freight cars and taken to the camp in October 1941). Also during the Berlin Biennale, he visited the Kunst-Werke venue and gave away seedlings to visitors on the condition that they promise to plant them. The trees connect Auschwitz-Birkenau and Berlin, acting as a living archive and a monument to the pain and trauma of past atrocities. The tree planting in a city recalls the *7,000 Oaks* project Joseph Beuys initiated in 1982 at Documenta 7 in Kassel, but while the oak trees encourage dialogue with nature as people observe them growing up, and aid people in thinking about environmental issues, Surowiec's birches take on more historical and political import and are also more fragile and transient, hinting at a dark historical legacy. Also, with scope for trees to be planted in people's private spaces, not only in public or monumental places with historical significance, this project intervenes more extensively in daily life.

Robert Kuśmirowski (b. 1973 in Łódź) is currently based in Lublin and active internationally. He is known for stunningly skilled and realistic 1:1-scale reproductions of places and things from the past that have largely disappeared from the public conversation. *Unacabine* (2008), shown at the New Museum in New York, was inspired by a series of bombings in the US, and consists of a replica of the cabin in Montana where Polish-American Theodore Kaczynski (a.k.a. the Unabomber), a brilliant mathematician and homegrown terrorist, hid out in solitude. At the time Kaczynski shocked the world with these bombings, the targets of which included airlines and universities, mailing bombs along with letters of protest against the excessive consumerism of present-day society, and his high intelligence and single-handed perpetration of so many crimes made them even more shocking. With this work, we can vividly imagine the claustrophobic cabin interior and time spent in increasingly deranged isolation as a crazed and ruthless Kaczynski holed up alone to make bombs and write letters. In 2009 at the Barbican Centre, Kuśmirowski transformed the entire gallery into a concrete entrenchment from World War II, and visitors walked through the eerie, dimly lit space haunted by the ghosts of war. Kuśmirowski is noted for the humor of his critiques as well as the consummate skill of his reproductions. In *Travelers*, the exhibition marking

40 years since the opening of the National Museum of Art, Osaka, he replicated an artist's studio and staged a one-day performance where he covered himself with mud and posed inside a picture frame throughout the day. When he was resting with his eyes closed, his upper body indeed looked like a statue, but he was occasionally seen to move or open his eyes, and it is not hard to imagine the astonishment of viewers who happened to find their gaze meeting that of the work of art.

SUMMARY

In this paper I have briefly examined some qualities of Japanese and Polish artists and their works, especially those appearing in this show. In the past, I have discussed a feature of Polish art, which I call "applied fantasy," that emerged during the country's troubled history. It was crucial that people support one another and share their wisdom in order to stand up and fight again, unbowed no matter how many times they were beaten down. The penetrating insight and humor, and the pathos from which they are inseparable, are actually values held in high regard in the small island nation of Japan, and found in traditions nurtured here over many years. Although the Polish sensibility and critical gaze, cultivated over the course of a long history, may on the surface differ from those of Japan, there are similarities to be found, especially between works by artists of the younger generations. Meanwhile, the aesthetics of defeat and the taste of tragedy, the sensibilities of *mono no aware* – described as the poetics of the ephemeral, celebrating the beauty of something all the more because we know it is transient, of the moment, destined to vanish – and sympathy for the underdog, support for the weak and the disadvantaged, thought of as distinctly Japanese, are also cited as characterizing the works of Polish artists. Poetic emotion that celebrates loneliness, and a critical spirit that incorporates humor, are seen in the work of artists of both countries, and in that sense they are truly "far, yet close."

Akiko Kasuya, born in Hyogo, Japan in 1963. She is a Professor at Kyoto City University of Art. She studied aesthetics at Jagiellonian University, with the Faculty of Philosophy, in the Institute of Aesthetics (Krakow, Poland) from 1989 to 1991. She graduated from the Kyoto University Graduate School of Letters Division of Philosophy Doctoral Program in 1991. Kasuya has worked as part of the National Museum of Art, Osaka (NMAO) Curatorial Department from 1991. Her major exhibitions at NMAO include *Art and The Environment* (Geijutsu to Kankyo, 1998), *Mirosław Balka—Between Meals* (2000), *A Second Talk* (Ima Hanaso, 2002); *Positioning-In the New Reality of Europe* (Tenkan Ki no Saho, 2005); *Still/Motion: Liquid Crystal Painting* (EkishoKaiga, 2008); *Homage to Kantor – Theater of Death* (Shi no Gekijo, 2015); *Tatsuno Art Project 2011-2018* etc. Major Publications: *Contemporary Art of Central Europe* 2014; *Polish Avant-garde Art: Applied Fantasy for Survival*, 2014.

BLACK FEMINISM AND THE FEELING OF THE SUBLIME IN THE PERFORMANCE *MERCI BEAUCOUP, BLANCO!*

Abstract | This paper presents a criticism of the performance *Merci Beaucoup, Blanco!* by Michelle Mattiuzzi and the self-reflection on it published in the 32nd Biennial of São Paulo – “Uncertainty alive” (2016), entitled *Written Performance Photography Experiment*. To this end, we emphasize, besides the formal aspects of the performance event, aspects of the history of racist thought in Brazil and the official historiography concerning the black population in order to contextualize the feelings of pain and horror that permeate both the personal experience of the artist and her performance. Then, the elements of this performance that can incite feelings of pleasure in the observer are analyzed, such as the resistance of the black woman and her political representation in the field of art and culture. Finally, in order to conclude the possibilities for the fruition of this work, we take as reference, besides the artist’s text, certain constituent arguments of the concept of the feeling of the sublime, as presented by Edmund Burke, Immanuel Kant and Jean-François Lyotard.

Considering an analogy with the aesthetics of the sublime, it is argued that despite *Merci Beaucoup Blanco!* gravitate in the atmosphere of horror, pain and shock, arousing feelings about the racial violence and racial discrimination still existing in Brazil, these performance of a black woman against racist oppression also constitutes an act of resistance of the artist, capable of arousing feelings of pleasure in their watchers. The public then moves from shock, pain and horror to contentment about the political consciousness of race, gender, and class.

In *Merci Beaucoup Blanco!*, the artist shows herself in a harmonious acceptance with her black body attributes, in order to subvert the claims of whitening and Eurocentric stereotypes, which insist on subduing black women in Brazil. In this sense, Michelle’s performance refers to a positive reconstruction of the black identity in the imaginary of the Brazilian population, no longer represented by the supposed inferiority, passivity and incapacity. Therefore, it is intended to give visibility to the stigmata, to break with the Eurocentric beauty standards and with representations of subaltern behaviors, which still falls on the black woman in Brazil.

BETWEEN ART AND LIFE

This text refers to the performance *Merci Beaucoup, Blanco!* of Michelle Mattiuzzi in the midst of risk and unpredictability in the “here and now” of the performance event and the possible “psychosocial influences and motivations”¹ that constitute the modes of feeling and “representing, poetically, feelings, aspirations and frustrations that could be understood as part of the life experience”² of black women in Brazil.

We will begin with a brief description of the “rite” proposed by Michelle, particularly, the actions discussed in this text, they are: the act of the artist to paint herself with her own hands entirely of white ink and the moment she removes the needles that are holding the metallic mask fixed on her face. Accordingly, the analysis refers exclusively to the video documenting the performance that is part of the collection of the Videobrasil Cultural Association (SP), produced in Vienna in 2017.

At the beginning of the performance *Merci beaucoup blanco!*, the artist Michelle Mattiuzzi is naked and sitting on her back on a round wooden swivel seat. She’s breathing through three perforated round metal structures. These structures are stitched together and it’s tied to the artist’s hair by three red ribbons. This type of mask alludes the torture performed during the enslaved period. One of the ribbons is placed in the height of her nose, it passes between the eyes and is fixed by two needles on her forehead. The other two ribbons leave the height of the mouth, one on each side of the face, and are fixed by two needles on her cheeks.

Sensually caressing her body, the artist paints herself with white ink with her own hands. Then, she walks towards a seat and stands up on it, extending her arms in a horizontal direction. Following that, she begins to untie the ribbons attached to the dreadlocks. Carefully, and with enough composure, she takes the needles from her forehead. She then removes the needles attached to her cheeks. At this moment, we see her whole face for the first time and there are three needles spiked vertically, closing her mouth. She removes the needles slowly and her head hangs back, demonstrating dizziness and pain. The blood runs down her forehead, her eyes watered and the performance ends.

According to this description of the performance, there is no rational and logical narrative with beginning, middle and end, that focuses on certain content or message to be transmitted. Instead, collage is used as a structuring axis, that is, “juxtaposition and collage of images not originally close”³. In other words, using mainly her body, Mattiuzzi overlaps images distant from each other, unlikely to be experienced in the daily life, which possibly determines the strangeness to the public. However, such distance from everyday events does not cause a break between art and life, “on the contrary, it will enable the stimulation of the sensory apparatus for other readings of the events of life”⁴. Thus, in the actions unleashed by this performance, there is a rearrangement, a rereading, a “reconstruction of the world”⁵ with the purpose of subverting it. Let’s remember that, “the artist recreating images and objects remains being who does not conform to reality. He never takes it for granted. He aims through his alchemical process of transformation, arrive at another reality - a reality that does not belong to the everyday”⁶.

The consciousness of the uninterrupted physical and psychological racist violence directed at the black population motivated the performance *Merci Beaucoup Blanco!* The critical sensitivity with which the artist understands her own experience and the solidarity given to other black women in situations of vulnerability overflows in the

performance field. Hence, when Mattiuzzi paints her entire naked body in white, she brings out the feelings around the oppression experienced in a society which ideals focus is whitening part of the Brazilian population or the Black population's extinction. It refers to the experience of being black in a society which aesthetic and moral standards are determined by the dominant white ideology. In this conception, it's understood that black people should try to be similar to white people, in other words, they should become white⁷.

By wearing the metal mask, the artist revisits the pain felt by Anastasia⁸, who would have lived in the eighteenth century among many other brave black warriors. It is noteworthy that, in the process of creating this performance, Michelle claims that black women in miserable conditions on the streets of Salvador, where she currently lives, would also be a motivation for her presentation⁹.

Finally, when Michelle removes the mask in *Merci Beaucoup Blanco!*, she faces the racist violence and, although her face bleeds and her body shows fatigue, she exhibits some relief in the enjoyment of the resistance. There is also some manifest contentment in the autonomy and courage to represent herself from the understanding of her history and ancestry with the purpose of developing her artistic, intellectual and moral potential as a black woman. In this performance, the artist shows herself in a harmonious acceptance with her black body attributes. Her acceptance also subverts the whitening and Eurocentric stereotypes which insist on subjugating black women in Brazil. The artist affirms that the actions in the performance are "micropolitics of resistance"¹⁰ that free her "from rejection of her own body, which means to go" [...] "at full speed in the will to live to reexist"¹¹.

THE RECEPTION OF THE PERFORMANCE *MERCI BEAUCOUP BLANCO!* FROM THE SUBLIME AESTHETICS

Even though *Merci Beaucoup Blanco!* gravitates in the atmosphere of horror, pain and shock, precisely to bring to the surface the feeling about slavery violence and racial discrimination — still existing in Brazil — the performance of a black woman against racist oppression constitutes an act of resistance of the artist. Consequently, it incites feelings of pleasure in its observers and this feelings are in accordance with the aesthetics of the sublime. The public would then move from the shock, pain, and horror to the contentment about political awareness of race, gender, and class in the country.

The feeling of sublime is understood by Burke as "anything that is in any way capable of inciting ideas of pain and danger, that is, anything that is in any way terrible or related to terrible objects or acts in a manner analogous to terror" with the potential to produce "the strongest emotion that the spirit is capable" ¹². Among the greatness capable of arousing the sublime sentiment, Burke enumerates: the deprivation of something, the obscurity — the lack of an integral understanding of some imminent danger — the vastness of the phenomena observable in nature, the power that imposes itself to unveil human fragility, difficulty, magnificence, among others. These are the causes of the astonishment that suspends the reasoning and the action of the individuals affected by such greatness. However, if pain and danger do not constitute a "decidedly imminent threat" to the subject, enjoyment of delight may occur.

Kant continues the argumentation about this feeling by claiming that it is incited by the force and rapturous greatness of nature, so that, the subject feels subjugated to such power. Faced with these phenomena, it would have a conflict between the faculties of imagination and reason because of the impotence of the imagination in the face of the immensity and the force with nature shows itself. Thus, the limit of this faculty is experienced in the attempt to apprehend the form of the phenomenon in its multiplicity and power. In experiencing human fragility, the subject then resorts to reason, which in its turn will be independent and superior to the senses and nature. There is therefore the possibility of pleasure,

it is a pleasure that arises only indirectly, that is, it is produced by the feeling of a momentary inhibition of the vital forces and by the immediately consecutive effusion and stronger of them [...] Hence, it is also incompatible with attractive, and while the mood is not simply attracted by objects, but alternately also always again repelled by it, the pleasure of the sublime contains not so much positive pleasure as much more admiration or respect, this is deserves to be called negative pleasure¹³.

Thus, the feeling of the sublime refers to the certain disposition of spirit determined by the greatness and strength of natural phenomena and is based on the human rational capacity. However, in order to achieve enjoyment, the subject must be safe and there must also be a development of his faculties of knowledge in the culture and moral ideas, because, “in truth, what we, prepared by culture, call sublime, without development of moral ideas, will present itself to the uncultured man simply in a terrifying way”¹⁴.

In addition, still according to Kant, for this feeling we could require an agreement in society. Hence, if when you see the performance *Merci Beaucoup Blanco!* you feel the agitation of the contradictory feelings of pleasure and displeasure, analogous to the aesthetics of the sublime, you can require the consent of others to this judgment. It is because, from the notion of the transcendental subject, everyone is conceived to be endowed with the faculties of knowledge: imagination and reason required for the reflection judgment of the sublime.

In this critique, the phenomenon capable of unleashing feelings analogous to the sublime would be the “rite” constituted by the actions proposed by Michelle in *Merci Beaucoup Blanco!* To use Burke’s terms, this performance is inscribed in the aesthetics of the sublime symbolizing the deprivation of justice, peace, and solidarity brought to view by the metallic mask pinned with needles to Michelle’s face alluding to the tinfoil gag used in the period of slavery. Furthermore, the artist’s attempt to cover her body with white paint, which, as already mentioned, refers to the hegemonic domination of Eurocentric and by the pain experienced by the artist removing the needles from her face contribute to the same inscription in the aesthetics of the sublime. “Therefore, all that is terrible to the vision is equally sublime”¹⁵ by unveiling the ideas of pain and danger, according to Burke’s arguments.

Facing the exposition to violence committed against the black woman in the slave period and nowadays, which is perceptible in the actions of this performance, the public is haunted. According to the Kantian perspective on the faculties of knowledge that determine the sublime feeling, facing the “rite” proposed in *Merci Beaucoup Blanco!* we experience a certain failure of the understanding and the imagination by not conceiving the actual necessity of this unreasonable cruelty dispensed to the other. As a result, we experience terror and impotence. The passage from these feelings of

terror and shock to the pleasures regarded as negative, admiration and respect, occurs when the subject uses reason and consciously perceives the possibilities of transposing racist oppression through their political position in society. Let us remember that for the enjoyment of negative pleasures, the development of the faculties of knowledge in the field of culture and morality is indispensable, otherwise the observer does not transpose the feelings of deprivation and danger.

According to Lyotard's perspective ¹⁶ on his critique of Barnett Newman's paintings from the aesthetics of the sublime, *Merci Beaucoup Blanco!* propitiates an event, an "occurrence" which happens specifically in the aesthetic experience, that is, in the time experienced in particular by the observer facing the performance. It is an "instant that 'falls' or 'arrives' unpredictably"¹⁷ which in its turn would indicate a sense for the feeling; thus, "the agitation between life and death"¹⁸, being that "this agitation is your health and your life"¹⁹ or "a new way of feeling life"²⁰. Regarding the fruition of his work, Michelle argues:

I found myself in "Merci Beaucoup, Blanco!" Experiment in art performance - my black presence naked - make my body pass through for all and, thus, I finally reconstitute myself: I want to become a body, no matter what it may result. *Rejection, exclusion, purging, trauma, inferiority, oppression, horror, shock* [...] My body as a black woman, my marginalized body surrounded by these ideas and they, each in its form, contribute to the definition of my social existential precariousness, although the *indefiniteness* is sometimes one of my main characteristics; exactly the one that allows me the subversive use of the senses of existing in capitalism as a compulsory migration²¹.

The feelings of "rejection, exclusion, purgation, trauma, inferiority, oppression, horror, shock", mentioned by Michelle as possible feelings incited by performance, constitute feelings of displeasure, analogous to the aesthetics of the sublime, as we have shown. In these comments by Michelle, it is also worth mentioning the aspect of the indefiniteness as an existential characteristic of her and of her presentation. The indefinite or "indeterminate" to use Lyotard's terminology, is associated with silence, recovered from the aesthetics of the sublime of Longinus, that is, "the sublime is the echo of the greatness of the soul"²². In this perspective, the sublime is not enunciated by words, but still we feel something:

This gross admiration is the meeting with the naked thought, the thought in itself, the great thought. We can hear it somehow resound in the silence. He is strong enough to make himself heard without a voice, for his own greatness²³.

In the case of performance, the muted black body would be able to expose its greatness and strength through the contradictory feelings of displeasure and pleasure aroused in its public. In the face of the performative "rite", the observers would feel so full that they could not even reason about what they see. The feelings that affect them, in an "irresistible" way, precede any reasoning about possible messages to be deciphered²⁴. In *Merci Beaucoup, Blanco!* the message and the messenger are summed up to Michelle's body, which simply indicates the meaning to the feelings experienced, in particular, by the observers. Therefore, what we consume is the "occurrence" of the performance which is the artist's naked black body. Her body overflows imbued with her history, ancestry, gender and traverses the public with a terrifying force, capable to provoke a new way of feeling and thinking life.

FLOWERS AND FEMININITY OF THE BRIDAL MYSTICISM: REPRESENTATION OF THE BRIDE OF THE SONG OF SONGS

Abstract | The Female representation is often accompanied by flower representation. The tradition of female representation with flower originates in the thirteenth century, when the Virgin Mary was interpreted as the bride of Christ in the bridal mysticism of the Song of Songs. This presentation aims to clarify from Gothic to Pre-Raphaelite Brotherhood and American Modernism the femininity of flower and female representation in relation to the bridal mysticism. The Song of Songs of the King Solomon in the Old Testament of the bible was the resource of the bridal mysticism as a song in praise of love of the bridal couple and the beauty of the body of the bride. The woman in the Song of Songs was understood as the bride of Christ and the Virgin Mary. Lily, lily of the valley, grape, rose, fig, palm or peony, for example, is used to represent the characteristics of the Virgin Mary as the bride of the Song of Songs. What is particularly important is the image of the Virgin Mary as the garden of heaven. The womb of the Virgin Mary was thought to symbolize it and the pure beauty of her womb realized the mystery of incarnation. The scenery of the Ghent altarpiece by Van Eyck completed in 1432 could contain the motives of the symbol of the bridal mysticism of the Song of Songs, which suggests the Virgin Mary, the Virgins or Eva as the brides of Christ. The crown of the Virgin Mary consisted of the flowers of the Song of Songs, symbolizes this most. Primavera by Sandro Botticelli in 1478 is known as the scenery of floras which implies love and marriage. The Venus is considered to be also the Virgin Mary in the harmony of the Christianity and the paganism. The floras in it could also be interpreted to be the symbol of the bridal mysticism. This presentation points out this tradition in modern and contemporary pictures of Pre-Raphaelite Brotherhood John Everett Millais, Dante Gabriel Rossetti or American Modernism Georgia O'Keeffe: Ophelia engenders a tragic atmosphere and the flower of O'Keefe emphasizes sexuality. It reflects on the issue of contemporary Femininity through the history of flower and female representation. It also considers the theological background of the characteristics of the Virgin Mary which were transformed into sceneries, closely related with the medieval hermeneutics of the bible to interpret image in multiple ways.

Index terms | *American Modernism; Bridal Mysticism; Pre-Raphaelite Brotherhood; Sandro Botticelli; The Song of Songs; The Virgin Mary; Van Eyck*

Flowers have represented brides since ancient times. They have been utilized as nuptial iconography and are often endowed with their own special significance. The female image is also often accompanied by the representation of flowers. Christianity incorporated a theological symbolic depiction of flowers in relation to the Virgin Mary. The bridal mysticism of the Song of Songs formed the center of this symbolism pertaining to flowers when Mariology flourished in the twelfth and thirteenth century.

According to Margarethe Schmidt, the Old Testament Song of Songs was especially significant in the High Middle Ages as a resource for the representation of flowers: “The artists of late Gothic were also decisively influenced by the increasing importance attributed to nature and the observation of nature, the thought and vision of the mystics and the changed importance of the veneration of Mary by the reinterpretation of the Song of Songs of Solomon.”¹ She also notes that “No other interpretation has as decisive a character as the Song of Songs has shaped the idea of time and influenced the imagery.”²

This paper aims to clarify that the tradition of the depiction of the female figure with flowers originated in the High Middle Ages, when the Virgin Mary was interpreted to be the bride of Christ in the bridal mysticism of the Song of Songs. It also elucidates and overviews this tradition in the various representations of the Virgin Mary in the paintings of Van Eyck and Sandro Botticelli. Further, it observes the transition of the signification of the female image accompanied by flowers in the modern and contemporary art of the Pre-Raphaelite brotherhood of John Everett Millais, and Dante Gabriel Rossetti, in the American Modernism of Georgia O’Keeffe, and in the work of contemporary Japanese artists Yayoi Kusama and Mika Ninagawa. More, the paper reflects on the issue of contemporary femininity through the history of the use of flowers in representations of femininity. It also considers the theological background of the characteristics of the Virgin Mary that were transformed into scenes closely related with the medieval hermeneutics of the Bible to interpret the image in multiple ways.

The Song of Songs of King Solomon in the Old Testament of the Bible is the primal resource pertaining to bridal mysticism. It is a song in praise of the love of the bridal couple, extoling the beauty of the body of the bride. The woman in the Song of Songs was understood to be the bride of Christ, the Church in general and the Virgin Mary in particular. As Mariology flourished in the twelfth and the thirteenth century, the flowers of the Song of Songs also began to symbolize the Virgin.

Numerous flowers and fruits are mentioned in the Song of Songs: lily, lily of the valley, grape, rose, apple, pomegranate, palm or peony, to name just a few. These blooms are used to represent the characteristics of the Virgin Mary as the bride of the Song of Songs. The text of the Song of Songs contains the following references to flowers and fruits:

- The lily is an important symbol of the bride (“I am the flower of the field and the lily of the valley” Song of Songs 2,1, “Like a lily among thorns so my friend among daughters” Song of Songs 2,2, “Your navel is a finely wrought bowl never lacking drink your belly like a heap of wheat fortified with lilies” Song of Songs 7,2);
- the lily of the valley (Song of Songs 2,1) or the “lilium convallium,” especially symbolizes the Virgin Mary as the bride of the Song of Songs indicating her humility and her preparation for being mother of Savior³;
- the lily among the thorns (Song of Songs 2,2) as the bride was modified to “rose among thorns” and this flower was primarily related to the Virgin Mary in the high

and late middle ages, when the virtues of Mary were increasingly reflected in the rose and the new interpretation of the Song of Songs contributed significantly to this manifestation⁴;

- only in the Song of Songs is the apple mentioned in the Bible, and the lovers praise each other and compare each other to the apple tree and to the smell of apple impressively (“Like the apple tree among trees of the woods so my beloved among sons under the shadow of the one I had loved I sat and his fruit sweet to my throat” Song of Songs 2,3 and, “I said I will go up into the palm I will gather its fruit and your breasts will be like clusters of grapes of the vine and the fragrance of your mouth like apples” Song of Songs 7,8);⁵
- the bridegroom praises the beauty of the bride in the Song of Songs, comparing her to the pomegranate (“Your lips like a band of scarlet and your speech is sweet like grains of pomegranates so your cheeks besides that which lies within” Song of Songs 4,3 and “Like the skin of a pomegranate your cheeks besides your hidden things” Song of Songs 6,6) and to the tree of the pomegranate (“Your emissions a paradise of pomegranates with the fruits of the fruits trees cyprus with nard” Song of Songs 4,13),⁶ which became increasingly important in depictions of Christ, Mary, and Ecclesia with the increasing appreciation of the Song of Songs in medieval mysticism;⁷
- the bridegroom marvels at the palm-like growth and appearance of the bride of the Song of Songs (“Your statue is likened to a palm and your breasts to clusters of grapes” Song of Songs 7,7)⁸

As the complexity of the symbolism of these flowers of the Song of Songs increased in Christian iconography, the image of the Virgin Mary as the garden of heaven became particularly significant (figure 1). The source of this image in the Song of Songs reads, “A garden enclosed, sister my bride a garden enclosed, a fountain sealed” (Song of Songs 4, 12). The womb of the Virgin Mary was thought to symbolize this garden and the pure beauty of her womb realized the mystery of the Incarnation. According to Simone Widauer, the images in the Song of Songs that relate to the bride are also seen in Marian parables and poetry.⁹ The motif of the Virgin Mary as garden from the Song of Songs can also be observed in other art forms.

The garden of the heaven was represented on the ceiling of Christian churches. The ceiling of St. Michael’s Church in Bamberg was renewed in ca. 1610 and it is a well known example. According to Werner Dressendorfer, Maiglöcken represents the characteristics of the Virgin Mary as the bride of the Song of Songs (figure 2).¹⁰ As previously mentioned, this flower was once called “Lilium convallium,” and is called the lily of the valley in the Song of Songs.

These flowers are also represented in the sculptures that adorn churches and cathedrals and are often especially used to reference bridal mysticism. For example, the west portal of the St. Elisabeth’s Church in Marburg is filled with flowers and greens (figure 3).¹¹ There is a round stained glass in the chancel of the church that shows St. Elisabeth imitating the supreme bride Virgin Mary as the bride of the Song of Songs.

The scenery of *the Ghent altarpiece* by Van Eyck (figure 4) was completed in 1432 contains floral motifs that symbolize the bridal mysticism of the Song of Songs and suggest the Virgin Mary, the Virgins, or Eva as the brides of Christ. The Virgins are accompanied by lilies. The crown of the Virgin Mary, which consists of the flowers of the Song of Songs, symbolizes this mysticism the most.¹² The picture illustrates partly the Holly Wedding of the Song of Songs and the Apocalypse.¹³ Only in the panels below the Virgin Mary and Eva, we can see palm tree, the symbol of bride in the Song of Songs

(7,7) that might indicate them as the brides of Christ.

Sandro Botticelli's *Primavera* (figure 5), painted in 1478, is known as the scenery of florals that implies love and marriage. The theme of encounter of the lovers in the garden and connection of love and spring is influenced by medieval tradition of the Song of Songs.¹⁴ The Venus is considered to also be the Virgin Mary, harmonizing Christianity and paganism. The flowers in the painting may also be interpreted as symbols of bridal mysticism. The motif of the arrow of love emanates from the Song of Songs ("You have wounded my heart, my sister bride, you have wounded my heart by one of your eyes and in one hair of your neck" Song of Songs 4,9).¹⁵

Further down the centuries, the artists of Pre-Raphaelite brotherhood in the nineteenth century illustrated many female representations with flowers, as we can see for example in *Ophelia* (figure 6), imagery of famous Shakespeare's heroine floating on the water with flowers by John Everette Millais. The influence of books by John Ruskin helped the Pre-Raphaelite brotherhood return to medieval tradition. Dante Gabriel Rossetti of the Pre-Raphaelite brotherhood also painted the bride of the Song of Songs in *The Beloved (The Bride)* (figure 7). His painting can be characterized as poetic fantasy and decorative tendency,¹⁶ and that extends to the imagination of medieval tradition as well. The bride is in the middle of procession, two women holding pink lilies. Rossetti is thought to have taken his inspiration from the Song of Songs and inscribed on the picture frame two verses from the Song of Songs ("My Beloved is mine and I am his" Song of Songs 2,16, "Let him kiss me with the kisses of his mouth: for thy love is better than wine" Song of Songs 1,1). Pink and pale yellow roses in a golden chalice in front of the bride recalls the praise of the bride of the Song of Songs as the "rose of Sharon (Song of Songs 2,1)."¹⁷ Debra N. Mancoff pointed out the inspiration of Franz Xaver Winterhalter's *Queen Victoria with Prince Arthur* (figure 8) as the Song of Songs. It shows the terrestrial paradise "garden enclosed (Song of Songs 4:12)," a praise of the bride of Song of Songs, honoring maternity by the nineteenth century.¹⁸ Dante Gabriel Rossetti's *Ecce Ancilla Domini* (figure 9) illustrates white lily of "lilium candidum" symbolizing purity and beauty of the Virgin Mary as the bride of the Song of Songs, prominently following the medieval tradition.¹⁹

The tradition remains alive in western contemporary art, with the flower turning into a representation of sexuality in the art of American modernist painter Georgia O'Keeffe (figure 10).²⁰ At this juncture, I would like to introduce the depiction of flowers in relation to love in the contemporary art of two important Japanese artists. Yayoi Kusama painted flowers as well, she illustrates icons of her love for art and for her love for herself (figure 11).²¹ Mika Ninagawa focused on artificial flowers that are strewn on graves (figure 12).²² Her photographs show the vividness of this motif emphasizes the strong relationship between death and love.

The above description evinces the importance of the Song of Songs as a source of bridal mysticism that assigns flower motifs to the characteristics of the Virgin Mary. It discusses the transformation of the representation of flowers as attributes signifying the bride in the medieval paintings of Van Eyck and Sandro Botticelli and traces the transition of the female image accompanied by flowers in the modern and contemporary paintings of the Pre-Raphaelite brotherhood or John Everett Millais and Dante Gabriel Rossetti and the American modernist Georgia O'Keeffe as well as in the art of contemporary Japanese painters Yayoi Kusama and Mika Ninagawa.

Aya Nakama is doctoral candidate in art history at the Graduate School of Human and Environmental Studies, Kyoto University. From April 2019, she will be Research Fellow of the Japan Society for the Promotion of Science Research Fellowship for Young Scientists (Postdoctoral Fellow) at Tokyo University of the Arts. She studied at Friedrich Alexander University Erlangen Nuremberg and University of Bologna, and was invited fellow at Zentralinstitut für Kunstgeschichte, Munich. Her research focuses on medieval art history, especially German Gothic sculpture in the cathedrals and the representation of the Virgin Mary from the viewpoint of the Bridal Mysticism of the Song of Songs of the Old Testament. She published articles on the thirteenth-century sculptural program of the Bamberg Cathedral.

THE AESTHETICS OF NOSTALGIA IN CONTEMPORARY CHINESE ART

Abstract | Contemporary Chinese artists maintain a connection with traditional culture and philosophy. Xubing uses Chinese characters and woodblock prints; Cai Guoqiang uses fireworks, Chinese dragons, and other historical images; Zhang Xiaogang uses standard pictures of the past oriented from the Cultural Revolution. Their art has a common and insistent trend of returning back to its original cultural memory and resource, a trend that can be called nostalgia in the middle of high pressure modernization. Is this nostalgia a regression, or is it an innovation by trying to extract helpful parts of traditional culture? Is this nostalgia just a repetition of calls to keep tradition that have been made since the beginning of 20th century, or is it a way to mix contemporary with Chinese culture to get some entirely new results? The paper believes in the latter. Many contemporary artists refuse to use the brush (water and ink) in the traditional way; they would rather let ink spread spontaneously to form certain shapes on the rice paper. Traditional materials and ideas become essential agents for quite a number of contemporary artists. With walking mirrors reflecting the image of the sky to a church, and the image of the church to the sky, Zhang Yu shows that the human and nature become one, which has origins directly from Chinese philosophy. The mixture with tradition saves Chinese contemporary art from being a repetition of conceptual art in New York or of works already advanced by the art market. In this sense, nostalgia is a gate that leads to resources and treasures still surviving from past. It helps to steady in the face of cultural influx. The phenomenon of nostalgia is world-wide popular in the fashion business, film making, and so on. But there are certain special features in the way of looking-back shown in Chinese contemporary art. It is bonded to the long exiting habit of artists, for thousands of years, of going back-to-the-ancients, as well as a strategy for resisting the impact of western art and retaining Chinese cultural identities in the global world. The trend of nostalgia can be regarded as a *kunstwollen* in Chinese art. As a fact, contemporary art is no different when it looks back to ancient artistic sources and shares the same appreciation of nostalgia with its precedents. It is not the skills and forms borrowed from the new global age but the aesthetics of nostalgia that makes contemporary Chinese art show vital differences from others.

The Aesthetics of Nostalgia in Contemporary Chinese Art

Contemporary Chinese artists maintain a connection with traditional culture and philosophy. Xubing 徐冰 uses Chinese characters and woodblock prints; Cai Guoqiang 蔡国强 uses fireworks, Chinese dragons and other historical images; Zhang Xiaogang 张晓刚 uses standard pictures of the past oriented from the Cultural Revolution. Their art has a common and insistent trend of returning back to its original cultural memory and resource, a trend that can be called nostalgia¹ in the middle of high pressure modernization. Is this nostalgia a regression, or is it an innovation by trying to extract helpful parts of traditional culture? Is this nostalgia just a repetition of calls to keep tradition that have been made since the beginning of 20th century, or is it a way to mix contemporary with Chinese culture to get some entirely new results? The paper believes in the latter.

1. Tradition in contemporary art

Traditional materials and ideas become essential agents for quite a number of Chinese contemporary artists. However, contemporary artists reject the traditional way of using the brush (water and ink); they would rather let ink spread spontaneously to form certain shapes on the rice paper. Wang Tiande 王天德 composed his artwork Menu of Ink and Wash(1996) to express his sensitive reflections on Chinese culture hidden in food and feast. The artwork is a set of round table and chairs wrapped by ink-casually-applied rice papers, with ink-brushes as chopsticks, cinnabar-marked ancient poem book as a menu and dishes, cups and vessels wrapped in the same ink-paper on the table as well. The set looks like imitating a typical Chinese banquet scene, though no real table for a feast in history or at present has been decorated in that way. It is a representation of the fashion people treat each other and the rules and standards valued in traditional Chinese catering culture. Wang's installation is simple and easy for the audience to get the point, as learning how to write better with ink is a basic and consistent training of Chinese literati. Those who had better writing skill were more possible to become one of the members of higher political and social class in national bureaucracy system, which would complete the ideal pattern of life style in the belief of typical Chinese. Another artist Zhangyu 张羽 is also inspired by ink and wash. In his installation work Shangmo 上墨 (Filling ink) (2013), hundreds of white porcelain bowls were filled one after another by the artist with traditionally-made ink used in calligraphy and painting. The moisture in the ink exposed in the air eventually vaped, left the dark dry ink in the bowls to make a large assemblage of black bowls. The artwork may be regarded as a metaphor that people are able to feed themselves when they owe enough "ink" or knowledge. His another work Meet 遇见(2017) was quite different. With lots of walking mirrors set around Luce Memorial Chapel in Tunghai University Taipei reflecting the image of the sky to the church, and the image of the church to the sky, Zhang was aimed to explore the spaces where people pray and where god live and how they met in the mirrors. Though in this performance Zhang applied no ink or wash or other traditional materials but moving mirrors carried by people running around a modern church, it also makes dialogues with tradition in an interacting way. The audience saw the church moving in the mirror like viewing a handscroll of landscaped slowly opened up. Ancient philosophers, from the Confucianism to Daoism and later on Zen practitioners hold a common viewpoint that human and nature are one carrying the same rhythm of time and space. The mirrors moving outside the church surprisingly indicated this idea as well by putting the

images of the sky and human's architects in one big picture before the audience. With over thirty years of artwork created with visible or invisible ink, Zhang successfully transfers the traditional materials and languages into a new art mechanism under the global contemporary context.

2. Active cultural identification

The mixture with tradition saves Chinese contemporary art from being a repetition of conceptual art in New York or of works already advanced by the art market. Most Chinese artists have spent some time, long or short, professionally or as amateurs, on indulging into the traditional artistic training before they decide to be a contemporary artist. Most Chinese contemporary artists are obliged to fulfil the cultural retrieve mission by inheriting and rebuilding the time-honored history and glorious tradition through the certain characteristics they demonstrate in their artworks. The question concerned is when they are triggered by the inspiration of the past and how they transfer the ancient wisdom into their present artwork. It seems quite natural for them to find out the similarity and connection between the modern abstract art and the archaic literati painting and calligraphy. The inclination of pursuing abstractionism in Chinese traditional art has a long steady history which goes way back to the beginning day of decorative art till the later artworks with ink-and-wash. Through centuries, artists conceive and construct nature into their artwork, such as mountains and landscape, bamboos and plums, birds and horses, characters and ideographic symbols, gardens of delicate rockery and lakes, which are all abstraction or analogue from the nature. Chinese art system respect abstraction and symbolization so much that it does not end up into thorough emptiness or pure concept, but a state in between concrete and concept. Some critics generalized this kind of art representation with the term "I-Xiang 意象(ideo-imagery)", through which the creation of artworks proceeds. This ideo-imagery approach of creation is no doubt inherited by present Chinese artists through intentional learning or unconsciously environmental influence. With their culture-featured artworks, the contemporary artists get the world to see their works and the passion and inspiration of the culture context in them.

In this sense, nostalgia is a gate that leads to resources and treasures still surviving from past. It helps to steady in the face of cultural influx. Chinese contemporary artists learn a lot from western art movement and New York art market. The First exhibition of Robert Rauschenberg in Beijing 1985 was actually the blasting fuse of Chinese contemporary art, which pulled the opening curtain of the diversity of new art exploration, including installation, performance, and conceptual and other experimental way of making art. Suddenly stimulated artists were eager to catch up with the outside world to resist the feeling of being outdated. However, only those who managed to find the balance between new taste and old memories stand out in the cultural influx. Whatever form or manner artworks may take, they need to carry the significance to touch the audience. This core request for the charm of art has to be offered by cultural reflection rather than merely artistic techniques. Xubing impressed his audience with a heavenly book with handmade woodblock engraved with coined characters, while Zhan Xiaogang with repeatedly repainted old full-face expressionless family photos mostly seen in the revolution age. The old things here is not only the objects for one to be nostalgia with but, to the most important, the objects which can trigger the public memory, affection and reflection of the past. As always, contemporary artists let people face social and political problems under the surface of artistic elaboration or in this case under the nostalgic objects.

3. Nostalgia in artistic creation

The phenomenon of nostalgia is world-wide popular in fashion business, film making, music, architecture and so on. We have photo albums loaded with old memories; old songs are so popular in broadcasting that it becomes a regular column in the ordering-list. What lives were like before and what happened in the past are the most welcome topic people talk to each other at big gatherings. There is a popular song named "yesterday once more". Normally the memories of the past in the nostalgic context are golden and good, as Linda Hutcheon describes nostalgists, "Nostalgic distancing sanitizes as it selects, making the past feel complete, stable, coherent, safe...in other words, making it so very unlike the present."² But why wouldn't the bitter feelings in the past prevent us from the desire to go back to the old days? Scott Alexander Howard discussed a typical kind of nostalgia called Proustian nostalgia, which "do not involve regarding the past as a time preferable to the present, in any respect to the experience", and "is analogous to emotions directed at artworks."³ The type of nostalgia indicates its aestheticized features. In fact, there are specific idiocracy in the way of looking-back proceeded in artistic creation. Nostalgia in art creation is spontaneous in individual while based on collective consciousness, triggered when one's cultural knowledge and awareness build up to a certain extent. It is as natural as the instinct for artists to use the impulse to search for helpful resources that he learned in childhood. Nostalgia in art creation is not an ephemeral or fleeting emotion as a memory type of Proustian nostalgia but a consistent habit of mature artists, who take tradition culture once flourished and successfully survive from the past to intervene with contemporary art in one way or another. As in the case of Proustian nostalgia, artists do not argue that there was a better past than present. Nostalgia helps them to create culture implicated artworks, which offer them reliable artistic hometown instead of yearning for the past time in reality. They are not inclined to argue the past preferable to the present or going back to the past. The artwork applies the elements from the past cultural connotation, which is an approach for the audience to think over contemporary life and make reflections in their minds.

4. Nostalgia in Chinese art history

The trend of nostalgia can be regarded as *kunstwollen* in Chinese art. As a fact, contemporary art is no different when it looks back to ancient artistic sources and shares the same appreciation of nostalgia with its precedents. The nostalgia complex is a collective will for Chinese artists through the history. Whenever they need energy and new blood to enrich their brain, they go to the inspiration of the ancient. The aesthetics of nostalgia in art creation in different era shares the same purpose and pattern of reinventing the past. In early China, returning to the ancients might come with the ritual and ancestor-worship need, later on it turned to meet the requirement of being elegant and erudite, or to the present day to meet the need of being oriental and culture-reflecting. Riegel's *Kunstwollen* basically means an artistic form or some fundamental spirit of an age as the will of art, in this case *kunstwollen* of nostalgia refers to the continuous impulse of the Chinese artists to returning to the archaic where their spiritual hometown lies and where their artistic inspiration comes from. It is bonded to the long exiting habit of artists, for thousands of years, of going back-to-the-ancients, as well as a strategy for resisting the impact of alien culture and retaining cultural identities in the global world. In 5th century B.C. Confucius said he would rather live back to the founding period of Zhou dynasty than in his own

time for lots of the old rules and regulations were broken by the descendants of the period of vassal states. In 9th century Tang dynasty the ancient prose movement advocated by literati called for a written style of prose back to the Confucius's era. In 14th century the painter and critic Zhao Fengfu 赵孟頫 wished to paint with the line and color in a way as elegant as in Tang dynasty. Wu Hung edited a book on Chinese art history named "reinventing the past",⁴ in this book he argued that returning to the past as a long-existed fashion in Chinese art history at least includes three meanings: returning to the ancients, returning to the antique and returning to the archaic. He also pointed out that the modern architecture designer and architectural history researcher Liang Sicheng 梁思成, who participated the design of Central Museum of Republic China, was an excellent example to show that returning to the past actually means reinventing the past, with a retrospective gaze to the past, artists reconstruct the past, and smooth the gap between ancient and present to create a contemporary work with unique combination to the tradition. As nostalgia integrates sadness with pleasure when looking back, contemporary artists blend their cultural memory with the changing reality in daily lives to formulate a new possible standing point to face the international art wave. The precedents on art history have offered experience and theory of many kinds, among which the most frank one was Shitao 石涛 in 17th century. He said, "Ancients' mustache and brows could not grow on my face, ancients' heart and organs could not grow in my body. I have to express what my body feels and what my eyes encounters."⁵ Shitao speaks out quite the same idea of contemporary artists, who have to confront the conflict of eastern and western culture and keep creative and innovative in transferring traditional sources into modern forms.

5. Conclusion

It is not the skills and forms borrowed from the new global age but the aesthetics of nostalgia that makes contemporary Chinese art show vital differences from others. Those artworks equipped with the retrospective idiocracy indicate that artists are taking the effort to express their cultural attaching, intellectual reflection and contemporary transformation of the native art tradition.

WONDERING ABOUT THE CAUSE: ON PHOTOGRAPHIC PHENOMENOLOGY

Abstract | It has been widely accepted that a photograph provide a unique feeling to its viewer. This subjective feeling of viewing photographs is called photographic phenomenology. In the philosophy of photography, authors have described the nature of photographic phenomenology as the feeling of perceptual or quasi-perceptual contact, feeling of proximity or intimacy, etc. However, since photographic phenomenology is a subjective and private feeling, I suggest that, rather than labeling what kind of the resultant feeling it is, we should focus on the way or process photographic phenomenology is produced.

The aim of this article is to formulate an algorithm of photographic phenomenology. First of all, I classify former explanations about photographic phenomenology as media-focused account, background-belief focused account, and occurrent-belief-focused account and I critically review those accounts respectively. Through this, I illuminate what kind of factors are combined and how they are related to each other in producing photographic phenomenology in a viewer's mind.

Considering all the factors and conditions necessary to produce photographic phenomenology, I construct the algorithm model of photographic phenomenology which includes at least following factors; a viewer's background beliefs about the situation, her background beliefs about the photography, her seeing in the surface of the photograph, and her wondering about the cause of the photograph. I argue that the last factor, wondering about the cause of the photograph, is an important element of photographic pictorial experience and that it makes photographic phenomenology distinctive feeling, especially contrast to the phenomenology of pictorial experience of handmade pictures.

Consequently, I suggest a new perspective on photographic phenomenology; it would not be restricted to the feeling of proximity. What matters is not features of resultant feeling are but whether the certain feeling is produced by a legitimate process of photographic phenomenology. And what gives photographic phenomenology its unique feature consists in the cognitive aspect, which is 'wondering the cause', of its producing process. Therefore, I claim that sometimes photographic phenomenology might be a feeling of 'distance' derived from the viewer's cognitive, not perceptual, activity.

Introduction

It has been widely accepted that photographs provide a unique feeling to their viewers. This feeling of seeing photographs is called 'photographic phenomenology', which is a subjective feeling provided by photographic images peculiarly, in contrast to the one given by handmade pictures. In analytic aesthetics, authors have attempted to describe the nature of photographic phenomenology. Mainly it has been clarified as the feeling of perceptual or quasi-perceptual contact or the feeling of proximity or intimacy.¹ However, since photographic phenomenology is such a subjective and individuated feeling, it seems that the primary task of theorizing photographic phenomenology is not to label what kind of the resultant feeling it is but to investigate the way photographic phenomenology is produced.

Accordingly, the aim of this paper is to clarify how photographic phenomenology is invoked. First, I classify former explanation as background belief-focused account, and occurrent belief-focused account and critically review them respectively.² Through this sifting work, I will sort out factors and conditions to be satisfied to produce photographic phenomenology and thereby formulate an algorithm of photographic phenomenology (APP). Lastly, I will reinterpret photographic phenomenology depending on the APP I suggest.

Sifting the Established Accounts

Background belief-focused Account

One way to explain photographic phenomenology is to appeal to the nature of photographic media; it can be explained that photographic phenomenology is produced because of the unique nature of photographic media. One of the most influential works in media-focused accounts would be Kendall L. Walton's Transparency thesis.³ But going into detail of the debate on transparency thesis is not a thing to do here. Setting aside refutations dealing with logical or practical problems of the transparency thesis itself, the most important point here is that photographic phenomenology is a completely subjective feeling. So it seems not proper to explain photographic phenomenology depending on the mind-independent nature of photographic media.⁴ We should scope on the subjective aspects like viewers' beliefs or attitudes to investigate photographic phenomenology fully.

When we bring to a focus on the viewer's subjective aspects, her background belief about photography would come into our scope. For instance, Mikael Petterson analyses photographic phenomenology as being produced by the background belief held by viewers.⁵ In short, His 'depictive trace thesis' claims that we have a feeling of proximity as photographic phenomenology because of our background beliefs or a certain mode of experience about photography. It would be worth to notice that he says having such beliefs or experience is the very reason we have the phenomenology regardless of whether the belief is true or false; that is, his thesis regards the very subjective aspects of viewers as a central element of photographic phenomenology, therefore, it seems to overcome the vulnerable point of the media-focused account.

Let us summarize his thesis briefly. He contends that we have three kinds of beliefs or experience of photography. First, we generally believe that photographs are traces of something. And a trace (or the belief that something is a trace of something else) in general gives us a feeling of proximity. Second, he says, we generally believe that photographs provide better epistemic access to their subjects than other kinds of images do. Photographs have 'a relatively dense natural dependence' on the subjects. Hence they give us richer and better visual information about their subjects, and we generally believe or expect them to be. This background belief about the epistemic

merit of photography provides viewers the feeling of proximity.

Third, we generally experience photographs as depictions. That is, we see things in photographs. He argues that this 'seeing-in' is a quasi-illusionistic experience or quasi-ordinary visual experience. As seeing something usually occurs in the spatial proximity of it, seeing the photographic image-seeing in the photograph-causes the quasi-illusion which seems that the photographed event occurs in the spatial proximity. He says this feature of photographic experience gives the feeling of proximity.

As we see, it is obviously the advantage of the background belief-focused account that it can explain the subjective aspect of photographic phenomenology. I agree that the proper explanation of photographic phenomenology should consider about viewers' background belief, but I am less sure about the content of the background belief Pettersson suggests. It is reasonable that we see photographs as traces of something and as depictions. But when it comes to the belief about the epistemic merit of photography we can say something different.

I think that the belief about the epistemic merit of photography is too unreliable to be a theoretical ground for explaining photographic phenomenology. Viewer's background belief about the epistemic status of photography is changing as our social practice is transforming. On the one hand the better epistemic tools like moving images or virtual reality are coming, and on the other hand, the easy and simple tools for modifying photographs like photoshop program or photo apps become more and more popular. Consequently, it seems that the reliability of photography becomes more and more doubtful. We do not expect or believe photographic images to be a better epistemic tool than other kinds of images as much like before.

I know it is not a philosopher's job to examine whether this background belief is being actually held or not, so I admit that I cannot ascertain the situation determinatively. However, insofar as my supposition is right, if we still have photographic phenomenology despite the change or even extinction of the belief about the epistemic merit of photography, then it might not proper to explain photographic phenomenology depending on that belief. And this situation also should be considered when we formulate an appropriate APP.

Occurent-belief Account

Dan Cavedon-Taylor explains photographic phenomenology depending on the individual and occurrent beliefs viewer having at the very moment of looking at a photograph. More specifically, he focuses on the "etiology" of those occurrent beliefs.⁶ He argues that photographic phenomenology is a feeling of "quasi-perceptual contact"; it means that photographic phenomenology is similar to the feeling of ordinary perceptual contact with the real world because there is a common feature between seeing photographs and ordinary seeing.

This common feature, he says, is *the way* viewers approve contents of each experience as beliefs. In both cases of seeing photographs and ordinary seeing, according to him, we assent contents of those visual experiences in a psychologically immediate and non-inferential manner. We normally do not suspend the judgement of whether the contents of photographic pictorial experiences are reliable or not; we once see photographs as photographs, we believe their visual contents unless there is a counterevidence, and the same can be said to the ordinary seeing. This kind of cognitive attitude, we might call it "immediate assent", is the common feature between two kinds of seeing. And this common cognitive attitude gives similarity between the phenomenology of ordinary seeing and photographic seeing.

I am sure that the occurrent belief-focused account obviously has theoretical merits, but it seems to have some limitations. First of all, I suggest that the cognitive attitude of assenting contents immediately does not result in photographic phenomenology necessarily. Cavedon-Taylor claims that photographic phenomenology could be contingent and that we can have the feeling even from the handmade paintings insofar as the cognitive attitude of immediate assent is held. It is reasonable that we have photographic phenomenology from some hyper-realistic paintings like portraits of Chuck Close. But there is an alternative (and more credible) way to explain this phenomenology. Considering some kind of informative paintings like botanical illustrations give us a counterexample to the Cavedon-Taylor's argument. When we look at botanical illustrations, while we assent the content of seeing these illustrations, we do not get the feeling of quasi-perceptual contact to the plants.⁸

The reason some hyper-realistic handmade painting provide photographic phenomenology is not the viewers' cognitive attitudes of immediate assent but the mistake of viewers. When viewers look at the portrait of Close, viewers might mistake it for a *photograph*; that is why they have photographic phenomenology.⁹ Under this analysis, we can see facts that the background beliefs of viewers about what kind of images they are looking at effects photographic phenomenology of them in an important way and that photographic phenomenology could be contingent to the belief of a viewer.

An Algorithm of Photographic Phenomenology

After examining existing accounts of photographic phenomenology, I believe now we can formulate a proper *algorithm* of photographic phenomenology rather than determine what kind of resultant feeling it is. I have found out that we should consider a subjective aspect of the phenomenology; that we should consider a contingency of the phenomenology; and that we need more reliable background belief about photography than the one about the epistemic merit of it. Also I have argued that a viewer's background belief about the kind of image they are seeing also should be considered.

Considering all these factors and conditions, I suggest an algorithm of photographic phenomenology model. My APP model includes at least four factors; Background beliefs about the kind of image viewers see, background beliefs about the photographic media, viewers' seeing in the surface of photographs, and their wondering about the cause of the photography.

First, the background belief about the kind of image is the belief that a viewer herself is looking at a photograph rather a handmade picture. The existence of belief determines the whole existence of photographic phenomenology; that is, when a viewer does not have this belief, photographic phenomenology would not be produced.¹⁰

Second, the background belief about the photography is necessary to produce photographic phenomenology. We have seen that the belief about the epistemic merit of photography is unreliable so that we need to find an alternative and more fundamental belief about photography. I suggest that it could be the belief about the ontological commitment of photography. That is, the belief that photographs in general imply the belief about the existence of photographed subjects, or putting aside, the belief that photographs are traces of something exists or has existed.

Third, viewers should see in the surface of photographs when they get photographic phenomenology. This is a pictorial experience of the surface of the photograph; viewers need to see photographs as depictions, as what they are.

Finally, viewers are wondering about causes of photographs when they have photographic phenomenology. This factor is a cognitive attitude of the individual viewers who are seeing photographs as photographs. If viewers have the background belief about the kind of image they see, and the background belief about the photographic media which is ontological commitment, It seems very natural that viewers would wonder about the cause of the photograph during they are seeing in its pictorial surface.

I want to emphasize that this wondering is not about what the photographs depicts but only about the cause of photographs. Clearly the cause and the depicta of a photograph could be the same one but they also can come apart. An also, It does not matter whether the final answer of wondering about the cause is true or false. My claim is that wondering about the cause itself is matter. This cognitive attitude as wondering is peculiar to the photography because, in general, the belief about ontological commitment is peculiar to the photographic media. Therefore, this cognitive factor makes photographic phenomenology distinguished from other kinds of phenomenology.

Conclusion

In short, I claim that when we see photographs as photographic images we become to wonder about their causes. If viewers have proper background beliefs about the photography, it is appropriate to think that they already have cognitive attitudes of wondering about the cause implicitly or explicitly when they are looking at photograph. This cognitive attitude is peculiar to looking at photographs so this factor makes the phenomenology different from other kinds. Moreover, depending on what the viewers wonder when looking at photographs, the phenomenology could be variable or contingent.

Furthermore, through formulating APP as above, I suggest a new perspective on photographic phenomenology; that photographic phenomenology would not be restricted to the feeling of proximity. When certain viewers do not get the answer from wondering causes of photographs, they might have the unique feeling of ‘remoteness’ rather than closeness. I suggest that this feeling is also a legitimate photographic phenomenology. My point is that the peculiar feature of resultant feeling is not a decisive criterion of photographic phenomenology. What matters is whether the feeling is produced by a legitimate process, or algorithm for photographic phenomenology.

- 7 Cavedon-Taylor, “Photographic Phenomenology”, 75.
- 8 I have asked about this counterexample to Dan in personal, and he has answered that

in botanical illustration case we assent to the pictures only conditional upon background beliefs about the reliability of either their maker, the place they are displayed in or the general type of picture. He agrees that we do form beliefs from botanical illustrations but this forming is mediated by those background beliefs, whereas photographic phenomenology is unmediated belief formation. I am with him in that certain background beliefs should be considered explaining phenomenology of pictorial experience, but I am less sure that background beliefs he mentioned have to do with experience of handmade pictures only. It seems that the same kind of background beliefs are also involved when we see photographs.

9 Though it is caused by false belief, this phenomenology qualifies as proper photographic phenomenology as I have said above.

10 Notice that it does not matter whether the viewer is looking at photographs in actual. As we have seen before, photographic phenomenology is a completely subjective feeling. Therefore the existence of belief of a viewer is enough to produce photographic phenomenology whether it is true or false.

ARTISTS' IDENTITY THROUGH THEIR PERSONAL NARRATIVES

Abstract | One's identity can be realized through the narratives she makes of her life in general and her opinions on different topics. As Paul Ricoeur believes, narrative identity contains harmony and dissonance and mediates our identity and our very being. Artists' personal narratives on different topics (related to art) shows similarities and differences with elites in any society who find themselves to be involved with art and artistic institutions in any way. In the present study we have interviewed fifty persons who find themselves related to the group of artists and make money by any artistic media. The interviews were transcribed, summarized and then the general patterns were elicited to come up with four groups of intellectual clichés. The first group was the most frequent patterns among the artists with about 20 items, the second group of mentioned viewpoints was about 6 items, the third group had 13 items, and the last group that showed the themes of the artists had 7 items. The result showed that most artists being interviewed thought they are introvert persons, have problems with connecting with society, viewers don't understand them very well, they have especial emphasis on themselves, art is a means of expression for their ideas and feelings, they have come from idealism to realism in art market. Also, we found out that; however, artists believe they have problems with their social relations; few artists chose social and political themes for their artworks. In the second group of patterns we found out that personal enjoyment, gender awareness, knowing oneself, finding one's identity and desire for social relations are among the most frequent. Among the least mentioned patterns were social and political considerations, society and viewers' satisfaction.

Index terms | *Artists; Identity; Personal Narratives; Intellectual Clichés*

INTRODUCTION

In Society now a days it is expected that each artist that works in every Field of art, is follow a spesific goal; and naturally each goal requiers some tools, in this article identity is considered at the highest Category of the list. Identity represents philosophy and deep thinking in the intelectual line of the creator's work. This is the originality and identity of the work of art that purifies it; Human identity has individual and social aspects, the main objective of this research is to achieve the mental stereotypes of artists and understanding their identity through their personal narratives that has been studid identity, is part of the main elements of human personality that (seeks to objectify its subject in dealing with the world others and themselves)

in terms of identity and understanding as well as reflection of identity in the creator narrative thinking, ideas and goals have been expressed in which the creator of any work, whether it's an artistic or non - artistic, has created something that always been a narrative statement. in arts, these narratives appear. in diverse ways for example the painter is also relying on that narrative, trying to show his identity through his art work.

Identity, from the begining of human civilization, has occupied the mind of man and now it is one of the most important concern for contemporary human beings. So that Currently it is the core of many Socio logical and social psychology theories and researches. The process of social change has grown so fast and profound that the most original sphere of human life (cultured has also fallen in to it) consist of that and Put people in a serious cultural metamerphosis, so that the previously learned culture is about to disappear.(kanzo: 1991,176)

In the meantime, factors that lead to the prominence of identity are: The need for self-esteem, The motive of Collective selfesteemi, sele-awareness motivation, self-adaptation motivation; The motivation to be effective. (Janakinz : 2002,89)

The other factors that human bings need in order to objectify their identity is language; the formation of thought and the Creation of language gradually led to the emergence of a category of story telling. After the evolution of human though, philosophers were asked if this story telling of human beings could be a way of Knowing the inner identity of man kind.

It should be noted at the outest that the underlying basis of all these explanations. is the constant perception of how history works as a narrative and explanation about that is why the Cause has an immediate priority on the Effect.

Such as the example that is expressed by wallace Martin's book (2007) in (theory of the narrative): The cause of creation of (SH) is (S). not more, like befor (B) or (K); Relying on this principle that you can not imagine anything without Causation, in line with his purpose we can have this impression that. more overs, in all cultures and all times, (the story) has been instumentalin pointing out the goals, tendencies and conflicts of mankind and showing its efforts to achieve its goals and solve its conflicts. (Bruner 1986,80 In Paul Ricoeur opinion one of the most fun damental perceptions is the Inarrative perception and story). (Ricoeur. 2004,139)

Flannayan from the university of Duke, a research professor of consciousness writes: ((Evidence strongly suggests that hamuns use a narrative form in all cultures to value

their identity. we are ancient Storytellers)).

and also Jerome Bruner have a strong belief In his book (The Real Minds, Possible world's) he says: ((man is intrinsically a storyteller's being)). also plan for the iden that basically we have two types of thinking or mental function; Scientific - Logic and narrative Thinking (Bruner 1986,40).

Since the creation of art is a reflection of the artist's harrative thoughts, The identity that has shaped through the continuity thinking and shows itself to the audience. Relying on the definition of narration, it is taken from a unique way of expressine on any subject that comes after multiple thoughts and studies The thing that makes every artwork in the history of that subject matter different is its narrative which is its proprietary language. This proprietary language that is specifically intended to express itself, an artist who tries to introduce his work with that. in this situation, we can achieve the shaped mental stereotypes according to the narratives that tell the story, and we can conclude in the area of identity with those identifiers.

In this article, we have tried to find common Patterns and stereotypes between these narratives through the personal Stories and narratives that artists put Forward in response to interview questions and then we put them in several Categories and classified them.

RESEARCH METHODOLOGY

A study of the statistical society of the 50 artists arranged by male and Female artists who have studied in various fields of art and they earn money through these specialties, considering the position of an artist in his interaction with himself and Society. The process of this interview was in depth and intimate with any artist who through his statements found the stereotypes in these interviews. Several questions have been raised during this process; questions such as: Definition and expression of yourself and your internalities as narrative; how to connect with the community and the audience and also the way of earning money and finally describing a single collection or singles art work that has experienced the most sense of your closeness and satisfaction with it.

COLLECT AND AN ANALYZE

The information of Statistical society has been studied; Divided into four Categories. Among the individual mental Stereotypes, the stereotypes of the first category are those who Common among many artists. The second category is a topic that most artists have not addressed but for some it has been very importante. In the third category, we will see more different topics First and second categories and the reason for this is the difference between the individual identities of the artists and He impact that they have on He environment and society. A next are the stereotypes of the fourth Category; we see a lot more important and closer to the main goal of this research. These are stereotypes of which only one or two people have been set to it among the interviews; But at the same time they have had the most impact in terms of quality. After recognizing the theoretical definitions of identity and familiarity with narratives, also questions raised with artists, after recording the interviews we found some forms that mentioned mental stereotypesto which are the most repetitive one in Table (1). After modeling step we get to 42 Forms that are the reppetitive and the important ones in case of quality and all of them are classified basedon quantity.

Table 1- Mental cliché

First Groupe
<ol style="list-style-type: none"> 1. Introverted character (Self - knowledge)(1) 2. Importance of audience perception(2) 3. Protesting the lows understanding of the community about art.(3) 1. 4. Limited to the side of the audience(4)
Second Groupe
<ol style="list-style-type: none"> 1. The importance of community-Based experiences(5) 2. Mental conflicts and isolation preferences(6) 3. Insufficient income(7) 4. Communicate hard with the Society(8) 5. The desire for social communication(9) 6. Art as an integral part of life(10) 7. Enjoy the art area(11) 8. The motive of cognition and inner talent in art(12) 9. High importance of the artists Social Facet(13)
Third Groupe
<ol style="list-style-type: none"> 1. Art as a therapy and an inner need is(14) 2. Importance of the correct definition of gender(15) 3. Importance of general audience pereception from art(16) 4. Disregarding the social traditions(17) 5. The importance of achieving definitions of own identity(18) 6. The decline of idealism to realism(19) 7. Protesting at low art valuation in the gallery(20) 8. Expressing and rational and critical communication in the face of society(21) 9. The importance of reaching a common language between them selves and the audience(22) 10. The importance of understanding the periphery through art(23) 11. Effective role of art studies showing personal experience(24)
Fourth Groupe
<ol style="list-style-type: none"> 1. The importance of showing personal experience(25) 2. Choose feelings over rationale(26) 3. Ideal attitude(27) 4. Unaware recognition by art(28) 5. Separation from religion(29) 6. The importance of satisfaction of society aviewers and audience(30) 7. Trying to reform the ideas(31) 8. The importance of environment schildren and future(32) 9. Knowing the wiewers and audience as a techer(33) 10. The idea to be worldwide(34) 11. Viewers and audience aware(35) 12. The values in art(36) 13. The importance of reaching the personal expression from society(37) 14. The importance of present time(38) 15. World wide view(39) 16. Trying to improve the community's look to art(40) 17. Attract sponsors(41) 18. The importance of art progress(42)

CONCLUSION TABLE OF PATTERNS

Interviewing 50 artists we came up with some narrative patterns or we may call them intellectual cliché, through which artists have defined or understood themselves. It is extremely interesting to note that most artists, based in Mashhad the second biggest city of Iran.

had 5 common patterns in their interviews. Most artists claimed that they are **introverted** and have problems in their **social communications**. Therefore, it is not surprising that another very common narrative among artists was that their viewers or **audience** have very limited knowledge or in most cases not educated as they had expected in the field of art. However, most artists emphasized on the fact that viewer or audience is quite important for them. Another most common narratives were related to the **functions** of art. Most interviewees claimed that they use art for the **expression** of their feelings and ideas and also to find ways to get to **know themselves** better.

In the second most frequent narratives we heard from the interviewees we found that artists have two groups of stories; personal and social. In the personal narratives they emphasized that they enjoy artistic experiences, they believed they have kinds of talent in this field, and art is inseparable part of their life and career. In social narratives, artists believed that society doesn't have positive view toward art and artists and people are not educated enough so artists have problem communicating with people; however, artists need social experiences.

In the third group of narratives we have again about 11 items regarding the stories of artists that seem to be more diverse than the last two groups but surely with fewer frequency. Three narratives were related to the functions of art like using art as a therapy, using art to reach a universal language and finally using art to find better understanding of our environment. Another common stories in this group were related to the themes artists had chosen for their artworks like gender awareness, attention to public audience, revolutions against conventions of society, and finally reaching the authentic identity. Finally, we can mention the role of Galleries and other art institutions in the price of artworks.

the last group involves the least mentioned narratives . and can be called the most important. in the fourth group we have 18 items which they are. Common between 1 or 2 artists. these items Can not be classified according to the quantity because we do'nt have sufficient repetition. artists have deep and wide Looks people who cares about an anoare development and growth. artists who try to be worldwides consent about society and get their ideas from society the main question in this article is that can we reach a high quantity algorithm and cliché? and according to the interviews and answer seems to be yes.

CONCLUSION

Human identity is so complex part of his being. He deals with this over time and is trying to come to me today trying to identify and knit his identity and story in any way. Art has long since been one of its own foundations, and in itself, it is human; in this paper, the statistical society was studied, in which all 50 artists worked in various artistic fields, and thus earned it Have also been busy.

Most of them have been involved in the field of drawing and graphic design, as well as artists from other artistic fields such as photography, sculpture, musical arrangement, dress design, musical movement design, performance actor, and ... Also collecting this information. They made After asking questions about the importance of reaching the narratives of importance in artistic life, I looked at them and then they came up with common patterns that were the answer to the main question of whether the artist's personal competition could be divided into a series Patterns and subtle huts. Then all of these patterns were categorized and categorized in the table.

KENTRIDGE DOES ROME. PUBLIC ART AND MEMORY

Abstract | The paper aims at discussing the topic of memory in contemporary art by analyzing the case of a huge site specific artwork, 550 meters wide, *Triumphs and Laments*, that the artist William Kentridge created in 2016 along the banks of the Tiber River in Rome. In the fragility of its forms, this kind of public art plays on the precariousness of the sense of historical memory and on the need for its continuous activation. The extraordinary strength of this work is linked indeed to the awareness of its impermanence, giving it a peculiar vitality, and is connected to the activation of the sense of memory in all of us.

Index terms | *William Kentridge; Rome; Contemporary Art; Public Art; Memory; History; Precariousness.*

I would like to talk about the topic of memory in contemporary art by examining the case study of an impressive and emblematic artwork whose fragility and the contingency of its forms plays on the precariousness of the sense of historical memory and on the need of its continuous activation. The extraordinary strength of this work depends indeed on the awareness of its impermanence, which gives it a peculiar vitality, and is connected to the activation of the sense of memory in all of us.

We are talking about *Triumphs and Laments*, the impressive site specific artwork that the South African artist William Kentridge realized in 2016 along the banks of the Tiber River in Rome. It is a 550-meter long decoration, like a frieze, developing between the Sixtus Bridge and Mazzini Bridge, where 80 figures up to 10 meters high, emerge like great dancing shadows from the cleaning of the biological patina accumulated over the years on the white marble of the walls, illustrating thousands of years of the Eternal City's history.

The technique used is similar to that of the stencil, commonly used in Street art, but works by subtraction using the pressure washer instead of the paint. Like a reverse Graffiti, removing the dirt accumulated over the years on the white travertine, the drawings have emerged by contrast, like shadows which then into other shadows will return. It is indeed a work destined to disappear over time, of course, when the atmospheric agents, rain, river water, and smog will once again cover the cleaned wall, erasing irremediably the images.

Kentridge has chosen to work with an organic, living, naturally fragile material, destined to reabsorb the work in a process, which is a metaphor of our constitutive caducity. In an interview with an Italian newspaper on the occasion of the presentation of the work, Kentridge said: «My figures will vanish until they return to darkness. For me it is important that they do not remain, it is part of the meaning of my project: a procession from darkness to light with return to darkness. The world is the place of provisional and transformation» (“La Repubblica”, Sept. 16, 2015).

At first glance, this self-destructive tendency of the work, expressed directly by its author, leaves us confounded, producing a sense of disappointment and loss, also because it contrasts sharply with the massiveness and magniloquence of the artifact: a long cartouche over 500 meters long, similar to the one surrounding the Trajan Column (by which the author says he was inspired), patiently conceived, designed to the last detail and gradually realized, where the history of Rome unfolds without any chronological order.

It is a work «too big to remain», says Kentridge, and adds: «it would be a too definitive declaration of what the history is. Instead an important component of the project is its provisional aspect» (La Repubblica, April 10, 2016). In another interview about another work the artist realized in Turin, he reiterates this concept by saying: «I love the idea of temporariness of the artwork. I absolutely do not imagine that something I do can last forever» (“La Repubblica”, August 24, 2017).

On the other hand, it is exactly this temporary character, this awareness that the work will disappear within a few years on which depends its fascination, the eternal fascination of precarious and historical things like life itself, but also the possibility that, as an impressive intervention of public art, it lives in the exchange of people and favors the human relationship, interacting with the constantly changing public, thus allowing the work to live and re-live in the temporal horizon of each of us.

Because this ephemeral work of art, in which the images flow along the river as history flows along its embankments, does not tell just the history of the eternal city reconstructed by its author, with its “triumphs” and its “laments,” its glories and

disgraces, but it also stages our history, with all its ambiguities and limitations. As in a large world stage, the shadows and contradictions of Western history are condensed in some way on the banks of the Tiber (even Freud knew this very well, since he was both attracted and terrified by Rome). A history often marked by violence and oppression, by victories and defeats, which the plastic figures of Kentridge try to reconstruct, but they need our continuous work of excavation and in-depth interpretation to return the meaning from time to time.

Moving along the course together with this procession of drawings we ourselves are then called to recognize the meanings, which are never given once and for all, but must be continually reconstructed, recreated, starting from our sensitivity and our experiences in the fragile structure of our history. Because, as Kentridge (2014) writes in his recent and beautiful book on drawing: «The meaning is always a reconstruction, a projection, it is not a building, it is something that must be done, not just found». In this sense, he states in a very suggestive manner, «Walking is the prehistory of drawing».

It is no coincidence that the artist has not provided any explanatory caption of the work, not only to free up interpretation, but also to further encourage exchange and interaction, with the work itself, but also among the spectators themselves.

If for a moment I can speak of my own experience, living near that tract of river where the work is located, I often go for a walk along its banks and I confess that it happened to me several times to talk to strangers, trying to decipher the meaning of those figures in procession, reconstructing the events, commenting on the alterations, or more simply taking inspiration from these images of the past to end up talking about the city nowadays.

Perhaps this also happened in the past, in front of the enormous ephemeral apparatuses of Baroque Rome or, even earlier, in the processions of ancient triumphal painting, equally ephemeral, in which the military glories of ancient Rome were celebrated, as the archaeologist Salvatore Settis (2016) conveniently recalls in an essay contained in the work catalog.

Rome, indeed, has always been the epitome of the ephemeral and this obligates us to reflect together not only on the fragility and on the various fortunes of the city, which also proclaims itself “eternal,” but also on the *triumphs* and *laments* of all of us, which are equally unstable.

What more could you ask for in an ephemeral artwork like this by Kentridge, which can become an instrument of knowledge, but to perform the function of reconstruction and transmission of history, avoiding any form of rhetoric while being able to activate new modes of communication between author and viewers, starting from a shared historical-iconographic heritage? What else is the meaning of public art if not this? Perhaps even the very meaning of art in general.

In this way the work becomes a kind of theater of memory, personal and collective, in which the fluidity of the drawing dissolves History with a capital H in the individual histories of each of us, with our own successes and failures, forcing us to rewrite it continuously. The artist himself does not know the meaning of the whole history (how could he?), and he is not able to give us all the answers. He always needs our participation (as is evident in the image where we read “quello che non ricordo”: “what I don’t remember”).

As he writes in his book on drawing (2014), recalling the Platonic myth of the cave, he is, like us, immersed in darkness. But, like us, he knows he must tend towards the light:

«Let us be neither the prisoners in the cave, unable to understand what we see, nor the omniscient philosopher who returns to the cave with all his certainties. Let us dwell in the middle land, the space between what we see on the wall and the shape we invent behind the retina».

Now, in this space in between where we are, there is no absolute glory, no triumph, there is rather all the human relativity of time and history, imprinted as a shadow in the inner image of each of us. The material itself of the figures on the Roman wall is as fragile as history, also because triumphs and laments, glories and successes, do not last forever.

The figures are immense, solemn, chasing each other and influencing each other – to the point that no singular or linear vision is possible, and it is necessary to look at them awry and from a distance, almost in their simultaneity as a movie – but from the figurative point of view there are no triumphal images. For example, Mussolini on horseback is riddled with bullets; the winged victory crumbles in several parts; the Bernini sculptures, the busts of popes and emperors are transported on the carts as spoils of war; the dead bodies of Remus and Pasolini lie murdered on the ground, while the body of the Italian politician, Aldo Moro, killed by the terrorists in the Seventies is thrown into the trunk of a car; the prisoners raise their hands in surrender, blindfolded, and ready to be murdered or deported like the Roman Jews.

Thus, on the Roman Lungotevere, a kind of virtual stage of the world, is performed the eternal relativity of time and history, and it is no coincidence that all this happens in the form of that peculiar multimedia apparatus that Rosalind Krauss, in her essay *Reinventing the Medium* (1999), has defined as a “palimpsest.” The American critic, indeed, inserts Kentridge among those few artists capable of “reinventing” languages in the “Post-media age,” able to give new forms and new functions to those techniques that seemed obsolete, such as drawing.

The peculiarity of the South African artist is precisely that of crossing different media (drawing, painting, theater, sculpture, and animation cinema) and renewing them from within through their continuous overlapping and contamination. His famous animation films, such as *Drawings for Projection* (1989-2003), where he uses both the charcoal drawing and the 16 or 35 mm film, all transferred, projected and slowed down on video, are the result of these inserts that develop on a single sheet where the artist creates, draws, adds, subtracts and deletes figures and characters, all recorded by the camera. Animated drawing is in fact the artist’s favorite technique, a powerful expressive form, made of images that change rapidly at the speed of thought, where the hand and the mind are directly connected. It is an ancient technique, pre-verbal and pre-cinematographic, which is well suited to represent pre-modern realities, such as the colonialist one of South Africa, often expressed by Kentridge’s work.

From this point of view *Triumphs and Laments* is a perfect example of transmedia palimpsest, so to speak, in which processes of drawing, painting, sculpture, animation cinema, and shadow theater are intertwined, in a continuous process of metamorphosis, which generally recalls the time of cinematographic development involving both its figures and the observers.

It is a long animated drawing that emotionally moves a shared imaginary under the attentive eye of the spectators, combining different technical devices and breaking each chronological sequence, mixing art and history, reality and imagination, splendor and misery, all reinforced by images produced by the black and white technique of the shadow theater.

Also with this work, William Kentridge succeeds in recovering decisively artisan

processes that seemed to be finished, in front of the incessant pervasiveness of new technologies, turning out to renew them profoundly without falling into an auratic and regressive dimension.

In this sense, in the digital age and in the context of multimedia globalization, drawing for Kentridge does not mean nostalgically rediscovering the lost purity and authenticity of the drawing's art, but rather finding out what is more lively and animated in it, catching its becoming and thus bringing it closer not so much to painting, which tends to crystallize in some way, but to cinema, which tends instead to fluidify. In the drawing, indeed, we find the image together with the process that generates it, the gesture together with its reflection. With Deleuze it could be said that in drawing, as in cinema, both "image-movement" and "image-time" are present. Thus, drawing is the becoming of the image, the time of the image and at the same time the image of time.

After all, the cinema, its techniques and its narrative modalities, are at the center of all of Kentridge's poetics, as is evident also in the great Roman palimpsest, where the tribute to two great masters of the cinematographic art is explicit: Rossellini, with the film *Roma città aperta* and Fellini with the film *La dolce vita*. In this sense, the artist's way of representing Rome coincides with the way in which cinema itself did it.

As it stands, the very nature of this enormous Roman work is deeply cinematographic, a true writing of shadow (*skiagraphia*), we could say, a play of shadows, alternating full and empty spaces. From this point of view, for Kentridge, drawing is a way to leave a trace in the shadows of time, it is a way to mark time, to remember, and filming is a way to keep track of drawing-time.

With its huge shadow figures the Roman palimpsest transfigures its fragile matter, transforming it into the sculptural power of drawing, into the expressive strength of theater and into the image-movement of cinema. In this way, Kentridge, the thoughtful master with a beautiful hand, profoundly renovates the technique of drawing, which with him becomes perhaps the liveliest language to grasp the spirit of our fast times.

If now it is true, as Walter Benjamin wanted, that "the true image of the past passes fleetingly," it becomes now an effort *not* in mummifying history, embalming it in iconic snapshots, but actually in *drawing the time*, because in the age of digital media, in drawing ☐ Kentridge writes ☐ «the events and history do not disappear, but are transposed into a series of discrete signs. The world is undone to be rebuilt from the beginning».

This is how Kentridge's drawing, full of talent and thick with history, moves inside the dark repository of the past to draw fragments and hybridize them with his imagination, inviting us simultaneously to do the same, as in a Warburgian *Atlas of Memory*, personally recreating our history and devising our imaginary atlas.

In this sense, in conclusion, the great Roman project of Kentridge does not represent a monument to the caducity of historical memory, nor a form of embalming our historical and cultural heritage. Rather, for its extraordinary capacity to place itself in the here and now of people's lives, to become the matter and form of knowledge, to drive us to share with others the aesthetic experience of our place and time, this ephemeral intervention along the river represents a great operation of public art, which has its roots in an historical repertoire and a visual culture that belong to everyone, and that for this reason will not stop having its effects on the present and the future, even when the work will be swallowed up by the long shad

PRIVACY IN ARTWORKS

Abstract | Individuals' privacy is supposed to be secure from any individual or state control and access. Privacy Right seems to be quite controversial in different countries while it has been approved by United Nation. The definition of privacy is different from culture to culture, mostly its limits being defined by state's rules and public's expectations. Being heavily interwoven with culture and the public, some artists took the idea in their creative works of art. Contemporary artists have thought about this concept in their works challenging the limits and borders of privacy. In the present paper we intend to review the literature considering the relationship between artworks and privacy; and did our best to devise a kind of categorizations of privacy in artworks to be able to detect the theme of privacy, focusing on the works of Tracy Emin. Supposedly, we managed to make a conceptual chart describing different possible spheres of privacy. Based on this chart generally artworks may work on this concept conceptually or figuratively. In the latter case, *embodied identity* is the first condition for the work to be regarded as related to the theme of privacy. In such cases artworks may *show* body in private places, actions or *reveal* private information. In conceptual artworks, artists may *challenge, prove* or *deny* the concept of privacy.

Index terms | *Privacy; Artwork, Embodied Identity; Private Information*

Introduction

Every person within itself has a personal territory that no one other than himself/herself has the right to enter this territory. The right to privacy and privacy is one of the citizen's right which means that they are immune from the access and psychological of the physical and private information of individuals. Privacy protects not only the freedom and independence of individuals against their fellow members and the media but also is a tool to defend the security and liberty of individuals against governments. Nowadays the advancement of technology and communications the rapid transmission of information and the widespread extension of government's surveillance over people's life haven't left any privacy of individuals more than before. Therefore, its urgency and importance are felt more than ever before.

On the other hand art as a means of expressing the artist is formed in relation to the artist himself/herself and the society. Like other social issues, privacy also effects the arts and the creation of artwork. In contemporary art, there are actions between privacy and artwork. Therefore, the question is what is the significance of this effect and how is the relation between privacy and artwork?

Although in the social sciences and law, privacy has been much dealt with and has roots in philosophical, social and psychological discussions, but in the field of art studies, there is less of the link between privacy and the creation of works of art. In this research, we used the descriptive-analytical method to explore this relationship and familiarity with how we represent privacy in the artwork, we also try to find a pattern by providing a category of examples of privacy in art through which we can, we recognize works of art that have been created in the field of privacy.

Privacy

The right to privacy, including the right to a citizen which is necessary in order to respect the individuality, liberty and preserve the materials and spiritual integrity of the people of society. We have these from the oxford legal culture in the definition of privacy: "The right to a private life", "The right to be left alone", As provided in article 8 European convention on Human Rights reflected¹. The statement by the European commission for legal Affairs at the meeting of the international commission of Stockholm in 1967; the right to privacy is the right of everyone to live with the least interference of others, some of which must be the life of individuals against it supported are:

Interference in private life ,housing and family, interference in physical and mental integrity or mental and intellectual freedom ,intimidation of the person's prestige and credibility, subjection unauthorized disclosure of the person's life that causes it, use of the name, identity or similarity, spying , unconditional involvement with personal correspondence , disclosure of information that someone has received or given as a result of business confidence , the use of private correspondence , private writings or private oral statements².

Privacy encompasses a wide range of social and psychological philosophical discussions. Although there is a universal acceptance of the right to privacy, accepted by all courts and supported by important international documents, but the laws of most countries in the field of privacy, they are not in a good position and do not have clear rules to support this right. The issue of government's surveillance and access to information of individuals is very controversial and the definition of privacy varies from culture to culture and their limits are determined by the domestic laws of the countries and the conventions of each other society. But it can be said that the obvious features of democratic society recognizes and respects individual rights and freedoms and the right to privacy has been recognized as a right and its protection is necessary to protect

the material and spiritual integrity of individuals in any society.

Privacy and Art

In the contemporary period the artist's human and social concerns are superior to the form and technique and the artist's concepts are of particular importance. Some contemporary artists are intertwined with culture and society, they rise for social actions and privacy is one of the most important human rights issues in their work. We have reviewed the works of many contemporary artists in order to understand the finding privacy, appears to be it can be found in contemporary art in two ways:

A. A type of works is actual concept of privacy. Artists in this category have challenged the concept of privacy in their works. They are generally in the works of the concept and place of privacy in the contemporary period and its violation by individuals as well as expansion of government's surveillance over people's lives and access to personal information of individuals have been criticized. A good example of this kind of artistic work by Stanza British artist who portrays the issues raised in the modern society specially surveillance with the use of modern technologies. In her/his view, we are in prison because of the CCTV cameras and wireless sensor networks³.

Also a film called 'Look' by American director Adam Rifkin, using videos recorded by surveillance cameras installed in public places, such as banks, petrol stations, car parks and ... which shows that we do things when we do not think we are being monitored and seen⁴.

Also the performing of the "Circle" by an Iranian artist Esha Sadr, performed in the Tehran's museum of contemporary art in 2015 showed the offensive of others displayed the privacy of an individual in an interaction that was conducted with the audience, She shows in this performance that the determination of the individual's private realm is largely done by him/herself and can include different boundaries⁵.

B. The other category includes works whose subject matter is to show the privacy of individuals (Actual) and have a recognizable identity for the audience in such a way that some artists deliberately display their privacy or others in their artwork and by generalizing their private life issues or others the meaning and value of privacy have been challenged. Our criterion is to select the works in which there are issues that are either related to the body of person, including (the display of naked body), (the body in a private place), (the body in an action with others) and (the body in a private action). or in relation to the disclosure of personal information by the creation of an artwork. This information contains mysteries, thoughts and feelings that are usually hidden from others. We have shown the privacy of artwork in one category in the chart below:

Figure 1. The chart above is showing the privacy representations in artwork (author)

Our focus on the second category, the works which subject matter is the display of the privacy of the individual or the real people in this category, the effects of recognizing the identity of a person who issues private matters is a prerequisite for the placement of artwork in the domain or privacy and it is also very important for the artist's intention to display privacy. Therefore, the works of Nude Art used in the human model to create the artwork are not privacy, because the identity of the individual or individuals does not play a key role and they use the body of the individual or individuals as human examples to represent human situations. For a better understanding of how this chart works, "My Bed" is analyzed. "My Bed" is installation by famous British artist Tracey Emin, which her major reputation is due to the deep link between her work and her personal life.

Tracey Emin

Tracey Karima Emin British famous London born in 1963 with Turkish and Cypriot roots have a sophisticated life and childhood. In a poor family and bankruptcy and in the fact of his father's permanent absence, she grew up with her mother and her twin brother in Margate and the experiences of this city are the main source of inspiration for her work. These experiences are include abusive childhood, been raped at age 13 and period of sexual immorality in addition to two abortions, one of which has severe complications⁶.

The main features of Emin's work are the implantation of a kind of autobiographical art called art of confession, Outi Remes in his/her dissertation titled 'The role of confessions in British art' refers to Gillian Wearing, Richard Bingham and Tracey Emin as the three contemporary British artists who used confessions as an artistic inspiration and it seems that the role of confession in the work of Emin is more severe⁷. Tracey Emin uses her confession to produce the truth. Her expression in representing the bitter events of life itself and turning them into a work of art and commitment. Emin names her works: Living Biography. Including her works that can be pointed out to (Everyone I have ever Slept with 1963-95),(my bed) ,(I've got it all) ,(got to kiss my soul),(why I never became a dancer) ,(To meet my past). Here we briefly examine the artist's privacy in "My Bed".

Privacy in My Bed installation

This controversial and famous work (My Bed) has arrangement included a dirty underwear, cigarette butts, empty vodka bottles and contraceptives are surrounded with. This arrangement was nominated for the Turner Prize in 1999 and was exhibited at London's Tate modern Exhibition⁸.

Sleeping means being sedate and unaware of the surrounding environment. Jean-luc Nancy the French philosopher emphasizes that deep sleep is completely non-social act and that a person is not aware of him/herself and his/her physical acts. So sleep can be considered as a state of privacy⁹. So in this work we witness a scene in which a private action has been (taken to sleep) in a private place (Emin's bed) without the artist herself present. In addition, the existence of objects such as condoms, used underwear, body liquids, represents a scene of sexual relations that may have experienced Amin. Sex is generally formed in our mind by at least two people, therefore, in this work Emin's physical privacy is shown in public in action with others in fact the audience senses him/herself within a private moment of Emin's life, which is probably this affair does not occur in a framework other than this artwork.

Figure 2. My Bed.
Source:www.m.Theartstory.org

This work refers to a particular part of Emin's life in which distress is evident. For Emin, this disgusting experience turned into a driving force to find creative output¹⁰. Some believe that this work was like a key to getting women's experiences to the level of artistic expression and many of the taboos related to the body, eliminated gender and shame. This work includes the most important tensions and ambiguities which is the characteristic of Emin's works. It reveals the effect of heavy depression, the bed, which brings a warm relaxation and relaxation becomes a place where rejection of abuse and loneliness can be seen. In this way one of the personal spaces and painful life of Emin became public. By continuing the media streams about this art work the issue of deep intimacy of 'My Bed' the discussion of work turned into a discussion about its creator's lifestyle¹¹.

The following table shows existence of privacy examples in Emin's works.

Personal information				body				My bed
Personal properties	secrets	emotions	Beliefs and thoughts	Private place	Action with other	Private action	nudity	
x		x		x	x	x		

Figure 3. A study of the examples of privacy in the artwork (author)

We had research about the other contemporary artists according to this table and due to the writing (space) limitations in this article we did not include them. Therefore we can use this table to check the artwork for the presence or absence of examples of privacy.

Conclusion

From the study of the artwork it can be seen that some contemporary artists transform artwork into the deepest social and human issues by employing different media and using their creative power and they transmit personal interpretations of social issues as an artwork to the audience. Privacy is one of the topics of interest to these artists which have been dealt with by two different approaches. Some of them have created works with a critical view that their themes are mainly a violation of the privacy of individuals by the government and society. The others deliberately display their privacy or others seeking to break down the norms defined by the community and sometimes provide new and personal interpretation of privacy.

During the research process, we achieved a graph that seems to be used as a model for identifying the various fields of privacy in the artwork.

Farzaneh Abdollah Zadeh Moghadam (1991) is a painter, with a bachelor degree in painting from the University of Neyshabur and master's student at the Ferdows Institute of Mashhad. Her Master's Research Topic under supervision of Prof. Dr. Majid Heydari is "The relationship between privacy and contemporary artwork". She is a visual artist who mostly well known for her painting artworks. She's a teacher, painter and also an associate of the Center for the Intellectual Development of Mashhad Children as well an art critic. Her latest artistic activities are: 2015, solo exhibition in neyshabur, Iran; 2016, memorial tribute of Hakim Omar Khayyam art workshop, Iran; 2017, group painting exhibition in Mashhad, Iran; 2018, the 14th Dubai Fine Art gallery's International Festival of Art in Dubai; 2018, Conceptual Art exhibition in Mashhad, Iran. For her the next step, she looks forward to continuing education in Ph.D. in Art Research.

Majid Heidari (1980) is assistant professor at Ferdows Institute of Higher Education, Mashhad, Iran. He is the Head of Visual Communication Department. He has PhD in Philosophy of Art and writes on Aesthetics with focus on Islamic art. As a researcher he has several papers on Iran's Aesthetics, the Tension between Islamic Mysticism and Scholastic Theology in Aesthetics, the Role of Rhetoric in Islamic Aesthetics, Persian Painting and Narrative, and Visual Metaphors. He normally finds the theoretical framework of his papers in Pragmatism and Philosophical Hermeneutics, and puts especial emphasis on narrative truth and narrative identity in research projects. As a writer he published one collection of short stories "*The Infrastructure of the City*" and believes stories are one of the main ways to reach the truth.

RETHINKING LANDSCAPE AS A FORCE IN FLUX

Abstract | This paper intends to sketch out how the understanding of landscape has changed today, using painting as an interpretative tool. As this paper argues, the contemporary sense of landscape is considered through historical, political, social, cultural, and aesthetic facets. Differentiating from the Kantian notion of landscape architecture as an aesthetic category in the domain of visual arts, it has achieved multiple layers of meaning, rather than only referring to gardens and agricultural areas. The extent of landscape began to change in the nineteenth century due to industrialization, exploration of new territories, and the development of technology, botany, and geography. Since the twentieth century, the concept has included immaterial constituents in addition to technological, cultural, and social developments. It has become a social construct as an expression of ideas, memories, imagination, and feelings. Pointing to an active and flowing system, rather than a static and visual one, today, landscape is grasped as an interdisciplinary and collaborative production. It defies distinct urban zonings and proposes ambiguity, vagueness, and contradiction, as it expands the issue through the concepts of anti-landscape and non-landscape. Anti-landscape indicates marginalized and unsuccessfully man-modified lands, whereas non-landscape describes unused and neglected lands.

This paper traces the shift of landscape as a dynamic force in the paintings of a Turkish artist, Yıldız Arun. Her works on landscape, anti-landscape, and non-landscape reflect immateriality and immanence as a dynamic and interactive system. In her paintings, landscape emerges as an affective field of an internal order with a capacity to produce affects and sensations in Deleuzian sense. It becomes a force field, which flows into a multiplicity of intensities, revealed by layers of colors, lines, and brush strokes. The juxtaposition of spirituality and materiality turns her canvases into generative fields of multiple encounters affected by each stroke. As this paper shows, landscape does not point to a pre-defined, extrinsic, static, and visual area, but a force field in flux, with a capacity to produce potentials, reciprocal relations, and immanent affects.

Index terms | *Landscape architecture; anti-landscape; non-landscape; landscape painting; visual arts; artist*

INTRODUCTION

This paper argues that the contemporary sense of landscape is considered through historical, political, social, cultural, and aesthetic facets. It aims at sketching out how the understanding of landscape has changed today, using painting as an interpretative tool through the recent works of the contemporary Turkish artist, Yıldız Arun. Her works mostly focus on nature, space, and metaphysic issues; yet this paper merely analyses her works on landscape, anti-landscape, and non-landscape, which are the expressions of dynamic and interactive systems and reflection of immateriality and immanence.

A BRIEF OVERVIEW OF LANDSCAPE IN RELATION TO VISUAL ARTS

The conception of landscape in relation to visual arts has shifted throughout the centuries and across geographies. The most ancient landscape drawing that has ever been created was placed in the proto-city of Çatalhöyük in Turkey as a Neolithic drawing or in the Chauvet-Pont d'Arc Cave in France as cave drawings (Nomade et al. 2016; Schmitt et. al. 2014). In the Eastern context, Chinese landscape paintings and gardens have been closely and historically associated (Wang 2009, 137,139). In the fifteenth century, landscape in visual arts became an expression of ideas, thoughts, beliefs, and feelings, and appeared simultaneously with a new type of garden design and urban lifestyle (Antrop 2013, 13,14). Until the seventeenth century, landscape was mostly used as a backdrop for portraits and epic scenes. In the seventeenth century, particularly in the paintings of Nicolas Poussin, landscape was depicted autonomously as a subject and a poetic narrative by means of numerous allegories (McTighe 1996, 3-9).

The theory of the picturesque in the eighteenth century changed Poussin's understanding of harmonic landscape and shifted the relationship of landscape and visual arts by merging beauty (in terms of composition and order) and the sublime (in terms of vastness and roughness) (Gilpin 2000, 821-823,857,861). William Gilpin developed the concept of the picturesque in his 1768 treatise, "Essay on Prints," with regard to the ideal beauty of a landscape painting. As a visual ideal and aesthetic effect, the presence of a picturesque landscape was dependent to being perceived by viewers (Gilpin 2000, 857-860). Gilpin's contemporary Immanuel Kant tackled landscape as an aesthetic category in the domain of visual arts, considering it as only pleasing to the eye. As he elaborates in his 1790 treatise, *Critique of Judgment*, landscape gardening as the art of beautiful arrangement (of flowers, grasses, shrubs, trees, ponds, and so on) belonged to the domain of painting, which was regarded as a beautiful art. Natural beauty, which consists of the beauty of form, colours, and sound, preceded artificial beauty; yet they had a close relationship. Gardens were beautiful since they imitated art, whereas the art of painting was considered beautiful as long as it resembled nature (Kant 1911, 161,187-188). His ideas were manipulated by Frederick Law Olmsted (1997) in the nineteenth century, as he transformed landscape gardening into landscape architecture. He also handled landscape as a social device of democratisation.

The Prussian geographer and explorer Alexander von Humboldt's naturalistic explorations paved the way to the holistic perception of landscape. He emphasises the human and cultural aspects of landscape, which he also considers as mentally healing, rather than its aesthetic qualities (Nicholson 1995). On the other hand, the approach of Paul Vidal de la Blache, the French geographer, is more literary and historical, although he grasped landscape as a holistic unity like Humboldt. He emphasised the importance of local society and its life style in organizing the landscape, thus leading to the regional differentiation due to the fragmentation of culture, settlement patterns, and social territories (Claval 2004, 11).

The Enlightenment and Industrial Revolution represent a turn towards rationality and

technological upheaval. Being against the effects of industrialization and mechanical reproduction on visual arts, artists and designers used botanical nature as an important standpoint. Artists depicted naturalistic landscapes that show it as a creation of God, and represented alienation due to developing industrialisation, as seen particularly in the works of Caspar David Friedrich and William Turner. In the nineteenth century, the extent of landscape began to change due to industrialisation, exploration of new territories, and the development of technology, botany, and geography. In the first half of the nineteenth century, a variety of concepts were included in the conception of landscape in the USA, ranging from land to the worldwide circulation, networks, and economies of merchandise and people (DeLue 2008, 3,5,10). From the mid-nineteenth century, the importance of landscape began to increase in Europe in relation to the development of botany, zoology, history, geography, as well as industrialization, colonisation, and economic globalization (Antrop and Van Eetvelde 2017, 14). In the early twentieth century, due to the beginning of losing nature and traditional rural landscapes, movements for protecting nature, landscapes, sites, and monuments were initiated in numerous Western countries. For landscape, within this context, this was the beginning of being accepted as common heritage and establishing laws for protection (Antrop 2013, 14,15).

UNPACKING LANDSCAPE TODAY

Since the twentieth century, the concept has also included immaterial constituents in addition to technological, cultural, and social developments. The coalescence of land, technology, and vision paved the way to merging of experience and representation (Elkins and DeLue 2008, 32). The contemporary understanding of landscape is considered through historical, political, social, cultural, and aesthetic facets. It has a different meaning for different regions: In the USA, it is seen as a configuration of spatial patterns and ecological processes, whereas in Europe, a more holistic and interdisciplinary approach emphasises it as a common heritage that contains narratives and symbolic values (Antrop and Van Eetvelde 2017, 24). Having achieved multiple layers of meaning, rather than only referring to gardens and agricultural areas, landscape has become a social construct as an expression of ideas, memories, imagination, and feelings. Pointing to an active and flowing system, the contemporary understanding of landscape is grasped as an interdisciplinary and collaborative production.

Land art of the mid-twentieth century and environmental movements at the end of the twentieth century, which were initiated by architects and artists, paved the way to exploring the potentials of transforming ruined and abandoned industrial sites, and to producing new kinds of parks on brownfields, along waterfronts, on rooftops and in garbage dumps (Merkel 2007, 37). The contemporary understanding of landscape thus defies distinct urban zonings and proposes ambiguity, vagueness, and contradiction, as it expands the issue through the concepts of anti-landscape and non-landscape. Briefly, anti-landscape indicates marginalized and unsuccessfully man-modified lands, whereas non-landscape describes unused and neglected lands.

It may be argued that anti-landscape is in contrast with landscape: Landscape is considered as beautiful, natural, useful, and harmonious, whereas anti-landscape is seen as ugly, urban, useless, and chaotic (Häyrynen 2014, 147). Yet, the aesthetic qualifications of anti-landscape is so relational and dependent on the viewer that it can also be regarded as appealing and attractive. Its contrasting and conflicting features pave the way to experiencing it through the tension of limitation, fear, curiosity, failure, and disturbance. The representational character of anti-landscape may vary by different cultures and societies, but generally, it can be said that it emerges as four different forms: Firstly, as in the depiction of the desert in the Bible, landscape can obtain a negative cultural meaning. Secondly, as in Chernobyl, it can occur through the failure of a cultural projection and material reality. Thirdly, as in science-fiction

worlds, it can remain radically other and non-responsive to human ideas. Fourthly, as in the American-style suburb, which negates both city and countryside, rather than combining them, it can emerge as a failed transformation of landscape due to ideological contradictions (Bigell 2014, 131). Elsewhere, Riuttavuori in Finland is also given as an example of anti-landscape, since it lacks social and cultural relations, practices and exchanges, and builds on the discursive landscape of memory (Häyrynen 2014, 154,155).

Non-landscape, on the other hand, is a spatial concept, which indicates that a community does not have any relation to an area. Non-landscape is also called as “nonecumene,” which associates with a land that is “not ours,” meaning, not owned, controlled, or used by a community. The conception of non-landscape differs in every period and culture, ranging from a variety of terms, such as wilderness, wasteland, no-man’s land, and non-place. For example, wilderness is not regarded as non-landscape anymore in industrialized societies; yet, the variety of non-places has increased by now due to mobility and placelessness associated with modernity (Bigell and Chang 2014, 100-102).

LANDSCAPE IN CONTEMPORARY PAINTING

Arun’s paintings, within this context, are used as case studies, because they unveil what lurks beneath the apparent. They render the invisible forces, potentials, and dynamics of landscapes visible. Accordingly, as Deleuze (2004, 56) argues, “In art, and in painting as in music, it is not a matter of reproducing or inventing forms, but of capturing forces. For this reason no art is figurative... The task of painting is defined as the attempt to render visible forces that are not themselves visible.” Through juxtaposition and superimposition of colours and contours, Arun does not represent objects and figures *per se*, but captures sensations through ambiguous possibilities of networks and relationships. She gives way to the emergence of landscape from within the canvas and with a capacity to transmit affects and sensations. Deleuze (2004, 34) defines sensation in-between subject and object, referring to instinct, event, and in contrast to the ready-made and the cliché. Arun sees landscape in the process of “becoming” *ad infinitum*, ready to shift between anti and non-landscape, which reveal the nature of our urban, social, and cultural milieu.

In her paintings, landscape becomes a force field, which flows into a multiplicity of intensities, exposed by layers of colours, contours, and brush strokes. In “Loneliness” and “Silhouettes,” the flow of modulations reveals invisible forces that act on different directions (Figure 1; Figure 2). Shapes and depth give birth to each other in order to produce the ever-changing landscapes. Deleuze (2004, 145) unpacks modulation as “the relations between colors – which at the same time explains the unity of the whole, the distribution of each element, and the way each of them acts upon the others.” The traverse of invisible forces also occupies the surfaces of the paintings, “Chaos” and “To the Village,” by means of modulations (Figure 3; Figure 4). Manifesting the interactions of environment and creatures – human beings and animals –, they compose landscapes through traces – vivid ones that expose experiences and perceptions, and faded ones that turn into memories and dreams – since every interaction with our environment leaves a temporary or permanent trace. The juxtaposition of immateriality and materiality, transmitted through superimposed layers of colours and contours, turns her canvases into generative fields of multiple encounters as expressions of dynamic and interactive systems.

Landscapes always have the possibility of transforming into anti-landscapes, as elaborated in the previous section, with a sense of the uncanny concealed under its surface. The uncanny, or unheimliness (*unheimlich*), is developed by Sigmund Freud (2003, 124) and situated around the issues of identity and otherness. He defines

the uncanny as the reappearance of the familiar and the repressed in a peculiar and frightening way (Freud 2003, 152). The sense of the uncanny in cities, as elaborated by Anthony Vidler (1994, 4), is associated with the feeling of the alienation of the individual in all aspects of urban life. The modern notion of the uncanny is initiated through heterogeneous crowds and new architectural scales, and triggers the sense of individual security, spatial and temporal fear, and disorientation in the city (Vidler 1994, 4,6). Arun's painting, "The Rhythm of New York," liberates the uncanny through the sense of getting lost in the crowds and the "rhythm" of the city, as much as the act of dissolving one's identity and soul in urban landscape (Figure 5). Through the dynamism and tension of the painting, intensified with the colour red, it is difficult to differentiate the urban landscape from passers-by.

Arun's painting, "The Protector of the Last Tree on Earth," is a critique of humanly altered barren lands (Figure 6). In contrast to the dynamism and hopefulness of her many other paintings, a large portion of the canvas transmits the timelessness and vastness of anti-landscape. While she evokes the possibility of an inhumane and greenless world, she also explores the allegories of maternity, life, and hope by pointing to the protector figure in the front. She thus transmits the dichotomy of contrasting forces that act on the canvas by means of the *sgraffito* technique and a collage of marbling art. This painting can also be considered as the implication of paintings such as "Shanghai," "Industrial City," and "Marina Bay" (Figure 7; Figure 8; Figure 9). These three paintings allow a reading of both contemporary urban landscapes and anti-landscapes. The urban landscape of "Shanghai" uses contours and brush strokes to expose the problematic relationship of urbanisation and greenery. It seems as if the skyscrapers and the colourful topography trigger the formation of each other under the nebulous sky, making it hard to distinguish where one ends and the other begins. In the "Industrial City," the smoke and dirt of the urban landscape obscures the city and turns it into a blurry cloud of smudged colours. Likewise, in "Marina Bay," the expression of speed as a fundamental element in the contemporary urban landscape renders the painting ambiguous. It looks as if the scene is a view from a fast-moving car in the city, where people, buildings, cars, lights, and other actions and spectacles superpose, so that they all blend as a single entity. On the other hand, the network of high-tech infrastructure, or "electrified landscape" as defined by David Nye (2007, 72), has the potential to transform into an anti-landscape. Blackout temporarily turns the "landscape of light," which is an intrinsic part of our daily life, into a dysfunctional environment. Since anti-landscape refers to an uninhabitable land, Nye (2007, 73,76-77) argues that a blackout as the cause of a paralysed space is also an anti-landscape. These three paintings also point to how our post-industrial urban landscapes have changed over time by situating residential uses into historical business districts. This new development of landscaped residential districts also pave the way to the rehabilitation of anti and non-landscapes, such as non-used waterfronts, derelict and old industrial areas, as well as using these landscapes for marketing and city branding that attract drivers and passers-by (Shane 2007, 28). Being called as the "network cities," these urban landscapes that allow flexibility propose multicentred, heterotopic, and mixed-use cities that also emphasise local ecology, urban parks, and agriculture (Shane 2007, 35).

Arun's paintings, "Forbidden Lives" and "Metamorphosis," explore the aesthetic potential of wastelands, leaving aside the clichéd view of these alienated zones as gloomy and bleak badlands (Figure 10; Figure 11). Wasteland is defined as a polluted area or an empty space of waste in relation to industrial areas in particular (Moya Pellitero 2009, 100). Wastelands as non-landscapes tend to evoke monotonous and quiet or depressive feelings in paintings. On the contrary, in her paintings, Arun intends

to express the essence of these non-landscapes.

In “Metamorphosis by the Sea,” the creature’s transformation is channelled through the decomposition of the figure (Figure 12). The transition of vivid colours and the mixed techniques of acrylic painting and marbling art, make the painting seem as if, along with the creature, the non-landscape is in the process of mutation, as well. “Volcano Burst,” another non-landscape painting, uncovers the aesthetics of the volcano, ready to burst out at any second (Figure 13). The occurrence of volcanos in nature and visual arts finds its formulation in Kant’s concept of the sublime. Producing the feeling of respect, representing power, and elevating nature to a place beyond our reach, the sublime triggers the sense of impressiveness and fearsomeness simultaneously (Kant 1911, 96,119,123). In Arun’s painting, the stretching of modulations composes large fields of colours, on which the non-landscape of lava, rocks, and gas is loosely formed.

Artists, when they confront with nature, perceive landscapes with their hidden languages. Instead of a direct communication, they create a new language of relations via space-time, harmonies, contrasts, and so on. In this regard, Arun’s paintings create a language of new expressions that re-mythologise landscapes with strong contrasts.

CONCLUSION

Through a case study, this paper unfolds the shift in the understanding of landscape as a dynamic force in order to evaluate its emergence as an affective field of an internal order with a capacity to produce affects and sensations in Deleuzian sense. It shows how the depictions of landscape, anti-landscape, and non-landscape reflect immateriality and immanence. The understanding of landscape has undergone into many stages. At some points, different disciplines considered landscape in different contexts and contents. However, there are still common points – like human experience – and terms such as non-landscape and anti-landscape that allows inter-disciplinary work. To sum up, landscape today does not point to a pre-defined, extrinsic, static, and visual area, but a force field in flux, with a capacity to produce potentials, reciprocal relations, and immanent affects.

A CRITICAL HISTORY OF VISUAL NEUROAESTHETICS – FROM S. ZEKI TO H. LEDER

Abstract | The purpose of this study is to examine the achievements and limitations of the neuroaesthetics led by Semir Zeki. Specifically, this study first seeks to distinguish Zeki's research into two periods: the earlier and the later works; then, the theoretical and practical aspects of his research results will be examined systematically. Finally, the key difficulties inherent in his works will be critically reviewed. Through this process, I seek to examine the entirety of Zeki's neuroaesthetics, which has been discussed in a fragmentary manner, and to review its problems in a comprehensive manner. In addition, this paper offers Helmut Leder's study as an alternative to Zeki's approach by accepting the aesthetic position of John Dewey as a philosophical criterion of neuroaesthetics. This study will hence show that the second-generation neuroaestheticians are finally overcoming some of the issues inherent in Zeki's research.

As an expert in visual perception of the brain and an accomplished neurobiologist, Zeki defined neuroaesthetics as 'neurobiologically-based theory of aesthetics,' and claimed that a complete theory of aesthetics has to understand the brain's neural activity. Zeki's exclusive view is being criticized not only by philosophers, but also among the neuroscientists who had proposed an integrative approach by combining various fields of studies. Zeki accepts the essentialist theories of traditional Western philosophers in the context of neurobiology assuming that experiences of beauty and art contain a unique and single essence. Zeki further attempted to define such essence by subverting it to a specific neurological correspondent in the brain. However, Zeki's position seems to present an extreme form of reductive naturalism closely related to limitations inherent in his neuroaesthetics.

Thus, in this study, Dewey's non-reductive naturalism, which emphasizes the variety of the elements and contexts of beauty and the experience of art, is presented as an alternative to Zeki's philosophical stance on neuroaesthetics. Additionally, I contend that Leder's cases of neuroaesthetics researches can be considered as practical alternatives to Zeki's neuroaesthetics approach. Leder can be classified as a second-generation neuroaesthetician who is pursuing interdisciplinary research with scholars from wide array of academic backgrounds. Leder proposed a 'Model of Aesthetic Experiences,' which perceives the aesthetic experience of art as a complex, multi-stage psychological process and analyzed its various components. Under his integrated view, Leder overcomes Zeki's extreme reductionism by announcing the diverse natures of aesthetic experience and the differences in its neural basis. Leder's approach demonstrates a possible contextualist approach in neuroaesthetics.

1. Introduction

The purpose of this study is to examine the achievements and limitations of the neuroaesthetics led by Semir Zeki. Specifically, this study first seeks to distinguish Zeki's research results published from 1994 to 2017 into two periods: the earlier and the later works; then, the theoretical and practical aspects of such research results will be examined systematically. Finally, the key difficulties inherent in each of the works will be critically reviewed. Through this examination process, I seek to examine the entirety of Zeki's neuroaesthetics, which has been discussed in a fragmentary manner from a single point of view, and to review its problems in a comprehensive manner. In addition, this paper offers Helmut Leder's study as an alternative to Zeki's approach by accepting the aesthetic position of John Dewey as a theoretical and philosophical criterion of neuroaesthetics. This study will hence show that the second-generation neuroaestheticians are overcoming some of the issues inherent in Zeki's research.

Neuroaesthetics is a field within contemporary empirical aesthetics that approach the questions of aesthetics from a scientific view. Neuroaesthetics, which was first proposed by Zeki and later formalized as an independent discipline, is known as a new field of study born out of the rapid development of neuroscience at the end of the twentieth century. However, the history of neuroaesthetics is actually older and its direct roots lie in the tradition of experimental psychological aesthetics that Gustav Fechner had initiated in the late nineteenth century. Early neuroaesthetics took the form of a descriptive approach that viewed nature of beauty and art in a speculative way based on previously discovered scientific facts. Conversely, the trend of experimental research based on direct observations using neuroimaging technology gradually came to the fore from 2004.

2. Semir Zeki's Neuroaesthetics

Zeki's neuroaesthetics can be divided into the earlier descriptive study, publications for which were concentrated in the period between 1994-2001, and the later study based on experimental methods using functional magnetic resonance imaging (fMRI) devices after 2004. Zeki's earlier neuroaesthetics defines the concept of visual art based on the brain-art parallelism in neuroscience on the functional similarity between the visual brain and the visual art, and focuses on elucidating the neural basis of the perceptive experience of visual art. According to Zeki, all visual art is expressed through the brain and must therefore obey the laws of the brain, whether in conception, execution or appreciation of art. In other words, all visual art is "the product of the visual brain". It is produced by the intensive involvement of the visual brain (neural structures in the visual cortex, responsible for vision) among the whole brain area. The visual brain extracts necessary visual information from the outside world, and stores it in the neurons and processes it. Here, the visual information needed by living things is the unchanging "constant and essential" information. Zeki calls this principle of visual brain, which actively acquires such information from the changing world, "the law of the visual brain". However, as Zeki has previously stated, visual art, the product of the visual brain, performs the similar function as the visual brain, because it is naturally dependent on the underlying law of visual brain. In this perspective, Zeki claims that the function of visual art is synonymous with the function of the visual brain, i.e. the construction of representations of those "constant and essential" properties of scenes and objects that enable a perceiver to categorize, and so recognize them in perception.

Based on this conception, Zeki studied the correlation between the essential features

of the objects represented in individual visual artworks and the physiological functions of the visual brain that enable the artists or viewers to perceive them. He noted the function of the single cells in the visual brain which are needed to perceive the individual visual elements such as color, line, or movement that the artist used to represent the essence of the object or situation through his work. Zeki explained that the single cells located in different parts of the brain (ex. V1-V5 area) are specialized for processing colors (V4 area cells), lines (V3 area cells) or movements (V5 area cells) and so on. In this way, the visual brain is functionally specialized. So Zeki claimed that the neural basis involved in perceiving visual elements expressed in various visual artworks is different.

Zeki's earlier research can be seen as a preliminary quest for the foundation of neuroaesthetics. It is not a full-scale aesthetic study as Zeki himself had mentioned, but, rather, a brain research that has been piloted to offer a detailed description of the functional specialization of the visual brain in relation to the perceptive experience of art. Zeki's later neuroaesthetics, however, is dedicated to the exploration of neural basis of aesthetic responses - such as the emotion of beauty, ugliness or sublimity - from the arts. Zeki used actual artworks including paintings, musical works, and photographs as main stimuli, and conducted experiments to observe the neural activity in the brain while the subjects watched each piece of artworks by using the fMRI device. Consequently, Zeki claimed that beauty is a quality in the body that correlates with the neural activity within the medial orbitofrontal cortex (mOFC), which led to Zeki proposing his "Brain-based Theory of Beauty." Until recently, Zeki had focused on building empirical grounds to demonstrate his theories by conducting multi-dimensional experiments, which he designed by further refining the hypotheses related to the correlation between aesthetic experience and the mOFC.

3. Critical considerations on Zeki's Neuroaesthetics

As an expert in visual perception of the brain and an accomplished neurobiologist, Zeki had defined neuroaesthetics as 'neurobiologically-based theory of aesthetics,' and claimed that a "complete" theory of aesthetics has to understand the brain's neural activity, thereby emphasizing the need for research in neuroaesthetics. On the one hand, Zeki's such view is based on his theoretical and philosophical assumptions that all human activities, including experiences of beauty and art, are fundamentally derived from neural activities of the brain. On the other hand, Zeki can be deemed to base his exclusive view on excessive trust on neuroscience and misguided distrust to philosophy. Zeki's such exclusive view, which denied the validity of the existing philosophical aesthetics, is being criticized not only by philosophers, but also among the neuroscientists who had proposed an integrative approach by combining various fields of studies. Furthermore, Zeki accepts the essentialist theories of traditional aestheticians, such as Plato, Hegel, Burke, Kant, and Bell, in the context of neurobiology and assumes that experiences of beauty and art contain a unique and single essence. Zeki further attempted to define such essence by subverting it to a specific neurological correspondent in the brain. However, Zeki's position seems to present an extreme form of reductive naturalism, which is closely related to the theoretical and practical limitations inherent in his neuroaesthetics.

The key issues of each problem are as follows. First, Zeki declared that aesthetic theories should be based on biology to be "complete", therefore, neuroaesthetics will replace the existing philosophical aesthetics. This claim is based on the prejudice that emphasizes the superiority of biology by separating philosophy and science into

fundamentally exclusive relationships. Second, Zeki has proposed an extreme form of reductive assumptions by arbitrarily reinterpreting the viewpoints of traditional aesthetics such as that of Plato, Kant, and Bell, who have reduced the beauty and the nature of art to a specific essence. In other words, in order to identify the essence of aesthetic experience and art, Zeki attempted to elucidate the experiences associated with beauty and art by relating them to specific neural correlates of the brain. However, Zeki's extreme form of reductive assumptions, which focus on the neural units of the brain, are problematic in that they can not adequately capture the unique nature of beauty and the aesthetic experience.

4. Helmut Leder's Neuroaesthetics

In this study, Dewey's non-reductive naturalism, which emphasizes the variety of the elements and contexts of beauty and the experience of art, is presented as a theoretical and philosophical alternative to Zeki's theoretical and philosophical stance on neuroaesthetics. Dewey's naturalism begins with Darwin's evolutionary biology, which recognizes humans as an animal species, adapted to nature. His aesthetic theory has a common denominator with Zeki's naturalism, in that it regards human aesthetics and artistic activity as a natural adaptation activity of life creature. Dewey, however, rejected the assumptions that there is a unique essence in art and aesthetic experience, and that it can be reduced to a single element such as a particular form of object, as argued by Burke and Bell, or a special human mental state, as claimed by Burke and Kant, from traditional Western aesthetics. It can be argued that Dewey's theory of aesthetics hold the philosophy of non-reductive naturalism in contrast to Zeki's theory, in that it emphasizes the inter-relationship of various contexts and components surrounding the aesthetic experience. Therefore, I consider that Dewey's aesthetic position is valid as an alternative to Zeki's reductive assertions of neuroaesthetics.

Furthermore, I contend that Leder's cases of neuroaesthetic research, which theoretical assumptions are based on Dewey's perspective of non-reductive naturalism, can be considered as practical alternatives to Zeki's neuroaesthetics approach. Leder can be classified as a second-generation neuroaesthetician who is pursuing interdisciplinary research with scholars from wide array of academic backgrounds including art historians, cognitive psychologists, and neurophysiologists. In 2004, Leder and his colleagues proposed a 'Model of Aesthetic Experiences,' which perceives the aesthetic experience of art as a complex, multi-stage cognitive and affective process and analyzes its various components and their interactions. From this integrated view, Leder overcomes Zeki's extreme reductionism by announcing the diverse natures of aesthetic experience and the differences in its neural basis, which varies according to its surrounding context. In other words, Leder's approach demonstrates a possible contextualist approach in neuroaesthetics based on non-reductive comprehension to beauty and art.

According to Leder's model, not only the nature of aesthetic experience in art changes according to various contexts surrounding the work of art and the viewer, but also the corresponding neurological response changes. Here Leder distinguishes the meaning of the context largely into 'semantic context' and 'physical context'. The former refers to factors such as prior knowledge, interests, preferences of the viewer, and the title, source, or authenticity of the artwork. By contrast, the latter refers to the locational elements where experience actually occurs, such as art museums, art galleries, or laboratories. In the experimental inquiries of Leder's contextual neuroaesthetics, EEG, EMG and eye-tracking techniques were used to demonstrate empirically the effects of

different contexts on aesthetic experience in art and its neural correlates.

For example, Gartus & Leder's Eye Tracking Experiment (2015) proved that the time and liking of the artworks vary greatly depending on the context (museum vs. street). As another example, Kirk et al.'s (2009) fMRI experiment showed that the expectations drawn by labels indicating information about whether a picture is a collection of art galleries or randomly generated by a computer are significant for the aesthetic preference for the picture and its underlying neural bases. These findings are noteworthy in that they can not be identified through introspective or behavioral observations, as assessed by Chatterjee.

Leder, like Zeki, maintains a reductive methodology based on decomposition and quantification, but escapes the traditional decontextualizing method of empirical aesthetics, which removes the various contexts of experience in order to establish universal laws of art and beauty, by emphasizing the importance of context. Above all, Leder's contextual approach is to understand the organic interaction between the organism and the environment and to pay attention to the various properties of the art experience, rather than to reduce the human experience to a single factor. This suggests that non-reductive approach by means of contextual point of view can be applied to neuroaesthetics research, even though in a restrictive way. In other words, Leder's case shows the possibility that neuroaesthetics can contribute to solving questions in aesthetics, especially those related to the context of aesthetic experience in art, without completely abandoning the reductive methodology of decomposition and quantification. Contextual approach in neuroaesthetics is more likely to provide a plausible and important aesthetic significance compared to Zeki's approach, which adheres to seek the universal nature of aesthetic experience in art in light of its neural underpinnings.

5. Conclusion

This study is not intended to underestimate Zeki's neuroaesthetic research achievements or to completely deny the effectiveness of Zeki's reductive approach. This study is aware of that Leder's approach remains to be examined more strictly, whether it can serve as the best alternative to the limitations of Zeki's inquiry. However, I am making sure as a concluding remark that the ultimate purpose of this paper is to make a historical overview of neuroaesthetics by critically examining the neuroaesthetics of Zeki, who has been continuously leading neuroaesthetics research since formulating the neuroaesthetics as a formal academic field in 1999.

Jisoo Kim is pursuing a Ph.D. in Art History at the University of Vienna. Her research project focuses on the aesthetic concept of 'resonant space' in modern and contemporary visual arts with an emphasis on the empirical understanding of the perception of empty space. In her research, she is adopting interdisciplinary methodologies ranging from art history to phenomenology, East Asian philosophy and experimental psychology. Jisoo Kim has received a Master's degree of Aesthetics at Seoul National University, and Bachelor's degree of French Language and Literature at Yonsei University in Seoul. She has worked at the Victoria and Albert Museum in London as a selected scholar supported by the Korea Foundation's Global Museum Internship Programme.

ON THE “PRE- DRAMATIC” OF DRAMA — PHENOMENOLOGICAL REDUCTION OF DRAMA

Abstract | What is drama? This problem has long been defined in philosophical or artistic concepts, leading to a state of chaos in the nature of drama (“Dramatic”). It is mainly because the concept itself is hard to get rid of the constraints imposed by language. Drama has become non-drama, and “Dramatic” has become “non-dramatic”. How should drama be considered? All the existing definition of drama should be suspended in a phenomenological way. Besides, it should return to the intuitive state which is most close to the drama itself, that is, what drama is (people act to people), and return to the original state before drama in time, that is, pre-drama. This is the question of how drama should be. Based on the “*Theoria*” rationality of ancient Greece, drama came into being under the ideological background of seeing truth in the form of “*Theorein*”. Starting from Aristotle’s Poetics, the key to restoring the original form of drama is to clarify the core issues at the beginning of drama (the relationship between human action, imitation, insight into truth, and naked-eye viewing). The primitive nature of drama is embodied in its existence as a perfect being, which is to approach human nature by imitating human action, and then to realize the clarity of drama itself. The dramatic nature of drama is based on the pre-dramatic nature of drama, that is, the poetic nature of drama: drama appears to us in a state of self-clarity from the beginning to the end, accompanied by “Poetically Man Dwells”. Conversely, the pre-dramatic nature of drama influences people’s thinking about the nature of contemporary drama and theatrical performance, especially the stage play.

1. How to Think about Drama

What is drama? What are the reasons for the birth of drama? What happened before the drama as art? The above questions about the nature of drama can be summarized as two key words: “dramatic” and “pre-dramatic”. Dramatic, that is, what is drama; Pre-dramatic, that is, what is the nature of drama. As long as after reflection, the content in the sense, intuition and representation at first will change.¹ When really beginning to think about drama, we must find a way that can be as close as possible to the drama itself. Based on this way, drama can be as it is, otherwise it will become “non-drama”, that is, this way can let us most vividly intuitive dramatic and pre-dramatic of drama. From the starting point of view, pre-dramatic is more thorough than dramatic in its original level. Along the way of thinking back to the pre-drama, the nature of drama (origin or essence) can be truly manifested.

Drama originates from pre-dramatic and belongs to dramatic. According to a general definition of drama, drama is an art in which actors directly face the audience to perform something that can arouse the aesthetic feeling of drama, which is not the most intuitive sense of the nature of drama, and even ignores the pre-drama as an important premise. Everything originates and develops from its origin. The appearance of things does not depend on other external things. Otherwise, it is to look for the origin of things outside of things. The origin outside things will only lead to things sticking to the rules and standing in isolation. In other words, things are not what they are. Therefore, the thinking of the nature of drama must go back to the original drama itself, and the thinking of drama has been accompanied by the pre-drama of drama from the very beginning. As a result, the elements of the construction of drama have to be “suspended”, and drama has become a kind of “suspension” (something given to itself²), that is to say, the past which is not transferred by human subjective consciousness or objective reality is suspended - because they have finally become some kind of psychological experience: “Understanding in all its unfolding forms is a psychological experience, that is, the understanding of the subject, whose opposite is the known object”.³ Based on Husserl’s phenomenological theory, if drama is grasped through this true “essential intuition”⁴, then it should be able to show “absolute self-awareness”⁵, because “not only individuality, but also generality, general objects and general situations can achieve absolute self-giving”⁶. The so-called “phenomenon is essence” - intuitive phenomenon is something that cannot be different from its appearance. But in fact, this “essential intuitive” method or process is still questionable, because there must always be an experiential subject involved and how can this experiential behavior achieve a priori? Phenomenological restoration is a very useful method to explore the nature of drama, but at the same time, it must be based on the pre-dramatic thinking of drama.

The thought about pre-dramatic means that the differences between actors and audiences, stage time and space, performance behavior, audience behavior, performance content, artistic concepts and so on in drama may conceal the nature of drama, because they are only elements of drama as art which are not born before drama. Therefore · it is impossible to really reveal the nature of drama. In this regard, it is necessary to return to the topic of why drama was born. Because, at least, there is such a firm fact that drama cannot be separated from people, whether it is drama or pre-drama, without people there will be no meaning of existence. Then, the most intuitive representation of drama can probably be expressed as “people act for people to see”. Further speaking, through the means of acting or imitating, people

create the relationship between seeing and being seen among people, including the characters involved in the development of drama to the present: writer, director, actor and audience. What does this relationship initially symbolize? Why can drama be a concrete medium of this relationship? What position does “imitating” occupy at the beginning of drama? How can “imitating” tell the truth more clearly than reality itself?

2. Drama and Imitation

(1) Drama

Human beings created and enjoyed drama, and then they constantly recognized and generalized drama. When the eastern and Western cultures did not intersect, they both created such a similar spiritual form based on human beings (If it was recognized as an art form for the time being, drama itself would be enveloped by art). From the perspective of human primitive history, “Human experience follows roughly the same path; in similar cases, human needs are basically the same; as the brains of all races are the same, the role of mental laws is also the same”⁷. Then, every kind of spiritual form reflects some common needs of human beings, and drama is no exception. According to the general understanding nowadays, drama is a relatively complex and comprehensive art form. There are two meanings about the word “comprehensive”. Firstly, a great deal of artistic forms such as music, dance, myth, epic, painting, etc. before the birth of drama have been created by human beings. Secondly, drama has developed on the basis of these spiritual forms. Consequently, the occurrence of drama and human understanding of drama are all parts of human self-awareness. To know drama is to know oneself. Existing as human beings themselves, how can drama itself reveal human beings in a way different from other forms of art? What are the essential characteristics of drama? “Each kind of art has its own unique language which must be learned separately.”⁸ Above all, it is necessary to return to the birthplace of drama - Ancient Greece.

From the historical point of view, any kind of spiritual form inevitably contains the attribute of human beings, which is the symbol of the times and society. On the eve of the drama’s birth, ancient Greece was approaching democracy, holding one national celebration after another. Drama was preparing in such a fertile field, which showed that drama was closely related to democratic and free folk custom from the beginning. From the introduction of the song and dance performances of toasting god into Athens by tyrant Pisistratuo, the formation of dialogue, action and even conflict through the combination of two actors by Aeschylus, and the addition of three actors by Sophocles. Then drama first appeared. It can be seen that drama as a national performance is closely related to the Dionysian celebration. Starting from etymology, the word theatre originated from the ancient Greek word theatron, meaning “the place to see”, that is, providing the people places to watch something like drama. The ancient Greek theatre is always in the open air, and according to the needs of the viewers, it adopts simple setting, a strong sense of space and three-dimensional design. Drama often compared with theatre in English, also comes from ancient Greek word dran, meaning, “to do”, that is, to witness what has happened. The audiences are arranged in a reasonable space with various ingenious designs, and eventually can watch the performance well. Thus, from the beginning of ancient Greece, drama was a form of communication based on “seeing and being seen”: it was neither blind (born incomplete or staying in darkness) nor superficial, but a direct insight into the nature of things. The “see”, based on the rational thought of the ancient Greek theory (Theoria), is the most intuitive way

for the ancient Greeks to recognize the world and themselves, that is, to return to the whole being, as described in Dana's book *Philosophy of Art* about the environment of ancient Greece: "In the blue Aegean Sea, the star-studded dolomite islands are very beautiful. Sparse and mysterious forests, cypress, laurel, palm, green lawn, scattered grapevines grow on hills covered with small stones, beautiful fruits grow in the garden, and some grains grow in valleys and hillsides. There are a variety of things for eyesight and entertainment sense, but seldom food to satisfy people's physical needs. In such a place, people with simple life who are slim and lively live in the mountains full of fresh air."⁹ In such an incomparably transparent space, that is, in the orderly and complete world relative to chaos¹⁰, human beings' coexistence achieves an almost perfect primitive state, forming the most direct connection through "seeing and being seen". With the birth of drama, the relationship between "seeing and being seen" is not limited to the real life of "providing enjoyable eyesight and entertaining sense" as time goes by, but includes at least two events or two worlds: one is that the performers fulfill the events in the fictional world; the other is the performers communicate with the audiences in the real world. The two events coexist in the same space-time. In other words, the performers (the persons being viewed) and the audiences (the viewer) are in two worlds at the same time. The audiences participate in drama like Festival celebrations, sharing the festival atmosphere with the performers, getting similar views with the god and acquiring the clarity from the god. As an event of imitative action, drama reveals to a certain extent the essence of the traditional drama paradigm, that is, "drama has no past and future, only instantaneous and immediate action"¹¹. The nature of action is to show, meaning that in the "whole being" (as Aristotle said, events consist of the beginning, the middle and the end) they converge to themselves and become "phase" (eidōs¹²). For drama, the performer concentrates on his own appearance and clarity, while the viewer only lives with the actions, because the viewer only watches and preserves the "phase" in the presentation, and then he gets the clarity. Therefore, drama firstly focuses on the orderly action of human beings, and then human beings.

To sum up, drama with action events as its core contains three indispensable elements: the viewer, the person being viewed and the place where they both are. In addition, drama, as an event, appears in real time and place, showing that the occurrence of drama is also based on the script. However, the script is not just simple words, but more importantly it is still the real action. In short, theatre is a form of insight into truth composed of people (performers and audiences), place and script.

(2) Imitation

The first complete and systematic exposition of drama was described in Aristotle's book *Poetics*. There is no doubt that *Poetics* is the pioneer and cornerstone of European drama theory. In chronological order, it can help people approach the nature of drama at the beginning of drama. It should be noted that Aristotle's dramatic theory also occurs within the framework of his aesthetic thought: poetry is the imitation of reality. It can be seen that the imitation of drama and poetry is closely linked with each other. There is the meaning of "creation" in ancient Greek poetry (*Poiesis*), which is the specific result of "poiein" and plays the role of a poetic narrator. Action is a quite common verb in ancient Greece, and it can reveal the nature of poetry to the greatest extent under its collocation with poetry. Aristotle believes that epics, tragedies, comedies, Dionysian hymns, and most double-pipe and harp music are in fact imitations¹³. The difference between them lies in "the different media, objects and ways of imitation"¹⁴. Like Dionysus and Apollo hymns, drama (tragedy and comedy) also uses various media such

as rhythm, song and verse. The difference is that the former is used simultaneously, while the latter is used alternately¹⁵. The term “used alternately” here simply refers to the use of songs for singing and rhymes for dialogue. This reflects the flexibility of drama as a poetic imitation in the use of media. The word “mimesis” has appeared more than 80 times in Poetics. To a great extent, it can be used as the core concept of poetry to understand the nature of poetry, that is, the nature of drama: nature of human. As the two reasons¹⁶ for the birth of poetry originated from human nature, Aristotle believed the object of imitation must be the person in action, and that the character of human is showed in action, that is, character is formed by action¹⁷. For instance, comedy imitates the worse and tragedy imitates the better¹⁸. This kind of work imitated by the action of characters is called *dramata*¹⁹. Imitation is the instinct that human beings are naturally different from other animals. People already have it when they are young, and people always have pleasure in it. On the one hand, we are looking; on the other hand, we are seeking knowledge, and then we can conclude that something is something²⁰. Obviously, the nature of things is manifested by “seeing” accompanied by knowledge-seeking behavior. Based on human imitative nature, innate sense of tone and rhythm, and ability to “see”, qualified people soon made poem and then created drama. Poetry, which imitates human action, is divided into two kinds: hymns and satires, because actions of human can be distinguished between noble and inferior. According to this difference in poetry, some satirical poets became comic poets and some epic poets became tragic poets, because comedy and tragedy are more great and valued than Satirical Poetry and epic poetry²¹. Poetics holds such a high esteem for drama that it even surpasses poetry (lyrics and epics), which just confirms the theoretical rationality under the background of “seeing and being seen”. On the basis of imitation, drama began to acquire the dramatic nature that is different from poetry and gradually show itself.

Today, a variety of dramatic imitation theories about many contents such as witchcraft imitation, God imitation and secular imitation are all objective non-dramatic expressions at the root, being contrary to the purpose of “imitating human action” in drama. The shift about imitation means that the real drama (or theatre) is not confined to people, that is, it no longer takes self-clarity as its sole purpose. The development of drama is no longer based on people (although drama still serves people), and the nature of drama is no longer a pure mode of communication, but more reduced to an object of thought or pleasure. The change in theatrical thinking (drama evolved into a dramatic reflection of life) is debatable. To grasp the nature of drama, it should go back to the relationship between drama and human self-clarity and its pure relationship, especially based on human tragedy, because “tragedy is superior to epic poetry and can achieve its purpose better”²². In other words, tragedy is closer to human nature than epic.

(3) Tragedy

Tragedy is the core type of drama that embodies the nature of drama. Compared with epics, tragedies are limited by time and are not purely rhymed. The medium of tragedy is rhythmic and tonal language distributed in different parts. The way of imitation is to imitate the actions of characters, not to narrate them, and then to “purify” (*katharsis*²³) them through pity and fear. According to the role of “purification” in tragedy, Aristotle believes that people should have compassion and fear that must be both moderate: those whose emotions are too strong or too weak can develop moderate emotional habits by watching tragedies.

From the perspective of composition, tragedy mainly consists of six components: story, character, talk, thought, opsis and song-making²⁴, in which story, character and thought are the objects of imitation, talk and song-making are the medium of imitation, and opsis is the way of imitation. First of all, the most important element is the story (the soul of tragedy), that is, the arrangement of events. Because tragedy is based on imitating human action, life and happiness (human happiness and misfortune depending on action²⁵), not on imitating human; the purpose of tragedy is to imitate an action, not human character, and human character is determined by its personality, not action. "A tragedy without action is not a tragedy, but a tragedy without character maybe a tragedy"²⁶. Although not good at using other elements, as long as the plot is properly laid out, tragedy can produce tragic effects²⁷. When two invisible elements of the plot - Peripeteia²⁸ and Anagnōrisis²⁹ appear simultaneously, they can make people feel *Psuchagōgei*³⁰. The plot also has a formative component, that is, suffering, as the basis of emotion, is the action of destruction and pain. Secondly, the character in action shows the choice made by the character. If there is nothing for the speaker to choose or escape, then such words have no character³¹. Thirdly, thought is the ability of people to say what they can say and what is appropriate at that time. Fourth, words are expressed through words. Whether rhyme or oral, it is used for communicating by language. Fifth, songs have functions beyond words, because they are more pleasant than words. Finally, the image (Opsis³²) of "Kosmos³³" must be one part of the tragedy. The overall meaning of "orderly image" is that the visible features of drama (including stage scenery, costumes, the entrance and exit of actors, etc.)³⁴ are systematically placed on the stage for the first time. The above six elements constitute both tragedy and drama in essence.

From the point of view of occurrence, how to arrange events properly is the first and important thing in tragedy. Tragedy is the imitation of a serious, complete and long-term action³⁵, which can give people a vivid impression. Completeness means that the event has its head, body and tail, and is in a perfect structural layout connecting the preceding and the following. Length means that the length of the plot is limited to easy memory, and its limit is appropriate as long as it can satisfy the orderliness of the plot. Like other imitative arts, the plot of events imitates only one complete action. The actions of events are unified and they cannot be deleted at will, otherwise the integrity will be changed. If such a part is dispensable and does not have a significant impact, it is not an organic part of the whole³⁶. It can be seen that tragedy is to describe the complete things that may happen according to the law of probability and the law of necessity. In addition, tragedy emphasizes that the imitation of action can also arouse fear and compassion. In this regard, the creator (poet) of the plot should pay attention to the following points when arranging the plot: (1) unable to make good people from prosperity to adversity; (2) unable to make bad people from adversity to prosperity; (3) unable to make extremely bad people from prosperity to adversity. None of these situations can arouse fear or compassion. The tragedy lies in showing that ordinary people (not very good, not very fair)³⁷ are in deep trouble because they have made mistakes³⁸. It can be seen that tragedy starts from human nature from the beginning to the end, and it is always born for normal guy. So how can the feelings of fear and compassion caused by tragedy be presented? Opsis and story both can cause such feelings, especially the later. Tragedy cannot give human all kinds of pleasure, but only one pleasure it can give us³⁹. Tragedy is essentially the clarity of human nature itself, which is a way of life in the world (as Heidegger said: life in the world, eventually leading to death). The characteristics and contents of tragedy to its root embody the "dramatic" and "pre-dramatic" nature of drama, which refer to the nature of drama

and the poetic nature of drama respectively.

3. Dramatic and Pre-dramatic

(1) Dramatic: Nature of Drama

The concept of “dramatic” has always been controversial and confusing. The English annotation of “theatricality” in the Encyclopedia of China about Drama Volume is theatricality⁴⁰, and the viewpoints cited by O. Schlegel and William Archer are both with obvious literary color, thus shading the nature of drama theoretically. George Baker in the United States believes that “dramatic” involves three aspects: (1) the theme of the drama; (2) the structure of the drama that arouses emotional response; (3) stage presentation.⁴¹ He further compares novelists and dramatists: they both start with “common elements, namely plot, characters and dialogue. If they are good at distinguishing from their stories or characters what may be emotionally interesting to others, that is, they have the so-called ‘sense of drama’”.⁴² This is a discussion of theatricality from the perspective of theatrical composition and implementation techniques, but it is still not entirely back to the drama itself. Gustav Freytag believes that “dramatic” is “those intense inner activities which condense into will and action, those inner activities which are aroused by an action... actions and intense emotional activities are not dramatic in themselves.”⁴³ This is only a description based on subjective psychological characteristics. Hegel also mentioned the concept of “dramatic” by his discussion about “dramatic poetry”: “The real dramatic lies in the inner words in the struggle of various purposes and the separation of characters’ personality and lust. It is in these words that two different factors, lyric and epic, can penetrate into drama and achieve real reconciliation.”⁴⁴ This is a character-based approach, which limits drama through human beings, eventually failing to make the drama truly self-manifestation. In fact, “dramatic” is often called “dramatic characteristics” along with other features of drama (such as comprehensiveness, theatre, etc.), which is the crux of the dramatic chaos. Dramatic can never be simply summarized as the aesthetic features (or artistic features) of drama, but the nature of drama. Therefore, we should “admit the simplicity of drama and strip away all the non-essential elements of drama”⁴⁵, and dramatic can only be truly exposed if it is fundamentally free from the framework of object examination, that is, to return to the pure source of “seeing and being seen”.

In the analysis of hymns and satires, the concept of “dramatic” was first used in Poetics. Aristotle believed that Homer, who wrote serious poems, was a real poet because only his imitation was perfect and dramatic. Dramatikas⁴⁶, as an adjective expression of dramata, refers to action in a broad sense. Specifically, “mimeseis dramatikas” is the imitation of action. So action is undoubtedly the core of drama. Moreover, action is the action of ordinary people. The dramatic nature of drama is to embody the same actions of people. “Stanislavsky illustrates this supreme function of action with extremely clear and accurate formulas: ‘Action should be taken on stage. Action and initiative are the basis of theatrical art.’”⁴⁷ Therefore, the essence of drama is to imitate action (no action, no tragedy) and then to imitate the person in action. But not all actions are dramatic. Among them, there are mainly two kinds of situations that can embody dramatic: (1) the plot is arranged, focusing on a complete action with the beginning, the middle and the end; (2) the characters in the action are represented by imitation. Stanislavsky further explained that “through action and the noblest task”⁴⁸, that is, dramatic realization needs to meet the logic of action - action to achieve goals. Why does this logic of action come into being? In other words, how did the nature of drama

come into being as a given fact? This can only return back to the significance of drama for human before the birth of drama, that is, why drama appears to human beings and self-expression, which is called “pre-drama” of drama.

(2) Pre-dramatic: Poetic Quality of Drama

Drama or theatrical concepts are emerging in endlessly. Nowadays, people usually regard drama as a comprehensive art composed of characters, stage, music and language, or as an object of artistic creation and appreciation, or as an object of research and analysis. These thoughts do not regard drama as drama itself, but rather as non-drama. To think about drama, it should be to return to drama itself, the human itself, and the more conscious non-objective creative activities of human beings.⁴⁹ Drama is a kind of poetic way for people to live and in the world from its birth. Dramatic is the nature of drama that has already been formed. Pre-dramatic is the poetic nature of drama leading the birth of drama. Just as Heidegger’s phenomenological interpretation of “Poetically Man Dwells”⁵⁰, that is, to go back to the beginning of thought, it is the most primitive and intuitive self-expression. Then in the place where thought occurs, the truth of existence, nihilism and existence should be explored. The history of traditional metaphysics inquires about the existence. If the thought itself does not think about existence, it not only forgets existence, but also forgets nothingness, because it only exists. As a result, the truth of existence should be concealed from the shelter, and all things (including drama) emerge from the darkness. In another words, truth is non-truth, meaning the origin of self-concealment. Heidegger has made a vivid exposition on “Holzwege”⁵¹ as a labyrinth: nihilism has become the stipulation of “the thing of thought”, “it has to stay at the same identity that has been pursued all along”, “the thought that has been thought is the existence in the sense of being; the thought that has not been thought is the existence of nihilism. It is the one who gives thought to what has not been thought of”⁵². The pre-dramatic nature of drama is just the unthinkable existence that drama needs to be thought about. Thus, the poetic nature of the drama means that Holzwege opens itself up by virtue of its own refusal. Poetry is regarded as a kind of creation in Poetics, which further understood as acceptance by Heidegger, because the poet is ultimately only a hearer, that is to say, listening to language speaking itself (calling the convergence of heaven, earth, man and god). Man’s existence means that man lives on the earth (constituted by heaven, earth, man and God) and engages in various activities. Man, as a person who can and must die, only when he appears in this world can all things show their existence. People’s residence is human existence, so-called poetry is to let people live as a measure (Vermessung): people in the world accept rather than give the scale of belonging to measure his essence.⁵³

Drama, as a way of people’s life, intuitively integrates many factors, such as body movements, language, and music and stage props, to make people enter the world of drama. The world of drama is a creative transformation based on acceptance: coming from the routine life in the world and being beyond the world. Man existing in the world of drama shows his own existence. Drama reveals the nature of human existence, which is implied in the pre-dramatic nature of drama. Man presents his complete image through the performer’s “being seen” and audience’s “seeing”; Man presents his own situation through plot setting; Man presents his own voice through performer’s voice; Man presents his own language through drama’s language; Man presents his own thoughts through drama’s thought... meanwhile, drama reveals itself by revealing human beings: as a manifestation of existence, existence has its own poetry, which originates from existence and reaches truth. “Drama as an artistic work

of poetry"⁵⁴ has become one of the ways of poetic activities, and the unprecedented thought of drama (pre-dramatic) bears the turn of poetry. The essence of art is that the truth of the existence is embedded in the works by itself⁵⁵, and truth is only established in the conflicts and fields opened by the truth itself.⁵⁶ Hence, drama becomes the manifestation of existence itself. The occurrence of the dramatic world (thought, unthought and un-thought in thought) is the proof of the existence of human beings and their entry into a clear situation. The pre-dramatic nature of drama determines that drama is poetic in nature. In other words, drama is based on the pre-dramatic nature of drama. Obviously, "What is drama?" is no longer the most important proposition. The pre-dramatic (poetic) nature of drama itself is the focus we need to pay attention to today - "Poetically Man Dwells". Starting from the poetic nature, the poetic drama world is the real world. The question is how do we get into this poetic theatrical world? In the first place, the drama itself should be presented to us in a clear way. In the second place, the elements that constitute the drama need to be reproduced in a concrete and intuitive method, which is also an important topic that modern drama needs to face directly.

THE AESTHETICS OF RELATIONS

Abstract | The paper will juxtapose the modernist, contemporary and post-contemporary general conceptualization and aesthetic appearance of art / artwork, focusing on the question of its autonomy and/or heteronomy. We can understand the three conceptualisations as intertwined insofar as they are largely established in mutual relations, for instance: contemporary art is established through the critique of modernist autonomous artwork or modernist formalist interpretative models during the 60s and 70s as well as during the 90s, post-contemporary art is established on the basis of the critique of contemporary art, etc. conceptualization of modernist art / artwork will mainly draw from the tradition of the so-called aesthetics of form as well as the *autopoietic* image of artistic creative activity (that can be traced to romanticism), while conceptualization of contemporary art will be primarily reconstructed on the ground of the intersection of the textual and pragmatist model of thinking about cultural phenomenon. The paper will, on the one hand, try to expose the difference between the two, focusing on conceptualizations of their modes of production of meaning (modernist *autopoiesis* as producing the meaning of the artwork by, through and of itself, versus contextually determined meaning of an artwork within conceptualizations of contemporary art), and on the other expose a general aesthetic appearance of the two based on the differentiation of avant-garde and dialogical aesthetics (Grant Kester, 2004). From there on, paper will focus on the so-called affective turn in theory and show some radical differences in how it occurs within the conceptualizations of contemporary and post-contemporary art that were established during the last ten years. In the final part I will reflect on some similarities and differences between the notion of autonomy of art within the conceptualizations of modernist and post-contemporary art that can be largely connected to the fact that modernist conceptualizations of aesthetics of form are focused on the transcendental component of an artwork (for instance the sublime form as a form of exceeding the form), while the conceptualizations of post-contemporary art, which draw from the theory of the affect, are focused to the 'level of immanence'.

Index terms | *avant-garde aesthetics, dialogical aesthetics, modernism, autopoiesis, contemporary art, post- contemporary art, affective turn*

The paper will juxtapose the modernist, contemporary and post-contemporary general conceptualization of art and aesthetic appearance of an artwork. Even though the three can be understood as intertwined because they are (historically) largely established in mutual relations, we will focus on their intertwining as well as their specifics in terms of the basic epistemological terrain on which art enters the Western tradition of knowledge and power (epistemology, ethics, politics), namely the terrain of aesthetic education (understood in the broadest sense). Specifically in the context of modernity, basic terrain of aesthetic education can be related to the spectrum of ideas how art and aesthetic experience effects, or rather, prepare one for moral action and/or desirable form of knowledge. The “and/or” in this case indicates the fact that in the formative context of the modern concept of art at the beginning of the 19th century, justifications of desirable forms of knowledge can hardly be distinguished from those of moral behaviour. However, as long as both are connected to art and aesthetic experience, we can identify sketches of the two lines that will be differentiated later on, namely the line that connects aesthetic and art with ethics and morality, and the one that connects aesthetics and art with epistemology and knowledge. As the paper will try to show, the shift from (proto)modern art to modernism can be seen in proximity to the shift of focus of aesthetics and art from ethics to epistemology, while conceptualizations of contemporary art actualize the relation of the two with ethics. The latter is also the basis for specific ideas regarding forms of aesthetic education and through it the aesthetic appearance of art as well as conceptualizations of modes of meaning production (through art).

In the formative context of modern conceptualizations of art, important transformations in this connection can be identified based on the transformation of aesthetics as a theory of aesthetic judgement into a theory of artistic production. We could say that this shift, as Peter Osborne suggests, coincides with the reflections of Romantic art within the tradition of philosophical idealism to proper Romanticism marked with the loss of a thing in itself and consequential autonomization of the place of declaration.¹ In the narrower field of knowledge on art, this shift is the reason why modes of legitimation of the autonomy of art change: “It is no longer autonomy of a type of judgement (Kant), of the illusion of self-determination (Schiller), but of a certain kind of production of meaning in the object, an autopoiesis, distinct from both *techné* and *mimesis* (Novalis, Friedrich Schlegel).”² The emerging autopoietic image of artistic creativity as the basis for modern and modernist image of an artwork can be most directly traced in Schlegel’s concept of transcendental poetry that refers to itself and explores its own conditions of possibility,³ and is closely linked to his notion of irony as an aesthetic process in which the act of artistic production is directly inscribed in the product itself (the idea of the synthesis of *praxis* and *poiesis*).⁴ However, for our current purpose, Fichte’s conceptualization of aesthetic education may be more informative. In brief, Fichte focuses on the reflection of the artistic creative process where the productive power of imagination is exposed, since it represents the foundation for reaching the transcendental standpoint⁵ as well as the ability to liberate ourselves from (directly in the experience given) actuality.⁶ (Proto)modern articulation of the artistic creative process therefore claims that the artist chooses from the given, but does not operate in a vast modus of transformation/deformation and, accordingly, creates a duplicate of the given. He transforms/deforms the given,⁷ knits it into a new semantic whole, a self-referential system of signification and thereby creates a conversion of the given (*retournement*), an imaginary reality within an imaginary reality.⁸

At the beginning of the 20th century, protomodernist images of artistic production, for instance the one by Charles Baudelaire in reference to Constantin Guys⁹ or the interpretations of a creative process of Paul Cézanne Heidegger suggested,¹⁰ were further deepened by avant-garde artistic movements. In the context of the latter, a strong materialistic line based on the affirmation of materiality, self-sufficiency of an art media can be identified along with some sort of an “artistic religion” based on a move from materiality to the supersensual escorted by the image of the artist as a mystic and visionary (Malevich). However, since our connection between modernism and Romanticism is based on a thesis about the shift of aesthetics and art towards epistemology within the framework of “Romantic epistemological intervention”, the specifics of modernism can be most suitably identified in the context of production of meaning about an artwork. For instance, within the tradition of the aesthetics of form during the first half of the 20th century, aesthetic ideas manifested within art will be defined, ie. the ideas which do not apply neither to Kantian forms of sensuality (time and place) nor categories (forms of reason) since they, in the strict sense, do not concern objective reality, but rather sensual independence of men. Generally speaking, we could say that modernist art tries to achieve sensual independence (of men) through the medium of sensual (experience): a sensual supersensual (if we borrow from Marx’s reflection on commodity fetishism). Regardless of direction and approach, we could also say modernism is marked by the image of an artwork as a design of a poetic world that produces meaning by, through and of itself—either by negating constraints with the existing order and therefore the imperative of consensus that shape aesthetic and formal norms, or the established ways of art production¹¹ or through the means of nominalism (autonomization of the place of declaration).

During the process of moving towards what will become commonly known as “contemporary art” from the second half of the 1990s onwards, the primary object of critique was precisely the modernist idea of the autonomous artwork: for example, criticism focused on the idea that meaning is stored within an artwork as well as the corresponding spectrum of hermeneutic interpretative approaches based on a more or less clear distinction between an art object and subject. In this regard, the key theoretical reference represented a wide range of contributions from which a heterogeneous discipline of cultural studies and their reception theory have been formed since the 1980s. Generally speaking, the reception theory focuses on the analysis of the process, conditions and effects of social mediation of cultural texts, whereas the text itself is largely understood as a means of communication.¹² Analyses of cultural and social phenomena as communication tools since the late 1980s, in short, shift from the textual to the pragmatic model of thinking about cultural/social phenomena where the text itself loses its status of the exclusive source of meaning, while the production process and context as well as (aesthetic) experiences of readers are established as new objects of analysis. Gradual deconstruction of autonomy, solidity and clear borders of cultural texts draws from earlier poststructuralist and semiotic claims (death of an author, open work etc.) and also marks the possibility of equalization between communicator and recipient, which can be perceived in the light of digital technological communication and reproduction.

However, since we only wish to outline the differences between modernism and contemporary art in terms of aesthetic education, we can draw from the general aesthetic appearance of the two by differentiating between avant-garde and dialogical

aesthetics as proposed by Grant Kester. The avant-garde aesthetics of an artwork is, according to Kester, based on the idea that an authentic artwork presupposes a certain independence both from the artist and the viewer, whereby it communicates precisely through this independence and inconsumability, most often in various forms of aesthetic alienation.¹³ When Kester tries to outline the dialogical aesthetics of an artwork, which is characteristic for a large part of contemporary art as well, he also identifies it in the pre-modern period, where art was closely connected with morality and played an important role in everyday life: for instance, it was an integral part of aristocratic and bourgeois salon gatherings, anticipating the ideals of the bourgeois public sphere. The transition to the avant-garde aesthetics during modernity was supposedly marked by the change in how artists were positioned in relation to their consumers, in their refusal of the bourgeois imperative of utilization and instrumentalization, their increasing sympathy for or identification with the revolutionary working class, and by the changes that have affected both the role of art and the social, political and economic circumstances during the 19th century, i.e. free market of artistic goods. All of the listed transformations in positioning of art and artists in social processes is therefore a basis for establishing methods of “aesthetic didactics” in the way of “aesthetic alienation”, mentioned conceptualizations of art’s negative positioning to the world as well as its ability of revealing the appearance of reality/ideology.

In connection to this, the fundamental question arises: What type of productional circumstances marked contemporary artistic actualization of dialogic aesthetics, for instance during the 1990s in relational aesthetics or later in participatory art and some new media interactive artworks? General aesthetic appearance of dialogical contemporary art after the so-called “social turn”¹⁴ could be analysed precisely on the terrain of aesthetic education in connection to socio-political circumstances since the 1990s. If we ignore the fact that the “social turn” in contemporary art was mostly explained in connection to the analysis of alleged side effects of neoliberalism,¹⁵ where art was legitimized as a generator of the social, conceptualizations of contemporary art were also an important generator of a new moral register of art criticism.¹⁶ Such a moral register of art criticism stems from the past claims on political, emancipatory, revolutionary potentials of art, but in large part appears in the political and ethical field of identity politics and their theoretical legitimations (that have been, according to Nizan Shaked, the basis of contemporary art since the transition from conceptual art to conceptualism in the 1970s).¹⁷ More precisely, theoretical legitimations of identity politics, particularly since the 1990s, were based on the recognition of differences, protection of fundamental freedoms, questions of (subjective) conscience, respect, justice, consensus and dialogue at the micro-social level, in brief: on the basic liberal-humanistic field where structural social inequalities are supposedly achieved primarily through aesthetic education (susceptibility, sensitivity, tolerance, sense of community) of individuals. Identity politics as the dominant theoretical basis underpinning a large part of “dialogical” contemporary art therefore also indicates the shift away from the modernist ideal in transcendental or general standpoint towards a contemporary particularistic ideal, while embedded knowledge imperative within contemporary art criticism can be seen as a symptom of autonomization of the statement from the place of its declaration (which had previously guaranteed its authority) within the current “age of digital reproduction” as well as some sort of an attempt to ground it.

In the last ten years, contemporary art and its (self)limitation on aesthetic experience

and by it the present time was perhaps most originally analysed by conceptualizations of an “exit from contemporary art” to the post-contemporary (art), if we borrow the formulation by Suhail Malik. Conceptualizations of post-contemporary art are often derived from new theoretical approaches, such as OOO, speculative realism and media archaeology. In addition, they also derive to a large extent from the reflection on the current state of affairs regarding political action offered by accelerationism, insisting on the thesis “that the only radical political response to capitalism is not to protest, disrupt, critique, or détourne it, but to accelerate and exacerbate it’s uprooting, alienating, decoding, abstractive tendencies,”¹⁸ i.e. from the diagnosis of the death of politics as such. All of the above references of post-contemporary art and its critique of contemporary art could also be analysed in the context of the so-called affective turn in theory since the 1990s inasmuch as key differences of the two can be highlighted on those grounds. In the framework of contemporary art, the affective turn often presents a certain revision of the humanistic tradition, for instance a shift from (art) history towards memory studies (that can be seen as a nostalgic actualization of the oral tradition of narration in “the age of digital reproduction”), and in connection to post-contemporary art’s conceptualizations, it in theory usually appears within the anti-humanistic framework. In other words, the affect is understood in the original Spinozic sense and is, as such, not limited to (human) experience, it eliminates transcendence and focuses on the “level of immanence”.

For the purpose of sketching the key difference between the two, it is nevertheless perhaps best to compare post-contemporary art with modernism, for instance the modernist aim for the transcendent standpoint and its methods of aesthetic alienation with the post-contemporary aim to eliminate aesthetic experience as such and demonstrate “that there can be a knowledge of what has never been experienced”.¹⁹ However, since our basis for comparison is the terrain of aesthetic education, we could highlight the difference between the modernist research of medium (medium-specific modernism) and the post-contemporary media archaeology. Modernist research of the medium can be understood in connection to Kantian critique, i.e. the exploration of conditions of possibility as a precondition of autonomy, purification of the media, or, as Osborne (at least indirectly) suggested, in continuity with the research on the ontology or art (that at some point led to conceptual art). In contrast, media archaeology, where “archaeology” is largely understood in the Foucauldian, i.e. anti-humanistic context, explores the medium and/or immanent logic and specificities of machines, for instance the time of the medium that is radically different from that of the human. It is precisely this that allows us to locate contemporary aesthetic contributions, which draw from OOO as well as (speculative) realism, and try to analyse the artwork as it appears in itself, which forces us to ignore the institutional and symbolic components of art (as a status) so extensively highlighted by contributions in proximity to contemporary art. However, insofar as conceptualizations of post-contemporary art are derived from the accelerationistic diagnosis of politics in techno-capitalism, they nevertheless do not eliminate the basic terrain of aesthetic education and, accordingly, also remain fundamentally anthropocentric or even humanistic. They are therefore largely driven by a critique of the inevitable impotence of contemporary critical (aesthetic) art in relation to the current social (systemic, network etc.) organization and stage of capitalism that is to an ever smaller extent determined by the individual and his experience, and to a lesser degree linked to the present time.²⁰ According to that, conceptualizations of post-contemporary art either limit themselves to an artwork in itself in order to grasp new insights into materiality (for instance focus on sound art) or actualizes alleged

political potentials of art which could enable re-opening of the (in contemporary art missing) future tense.

PERCEPTION: BEING ART IN VIRTUAL REALITY

Abstract | With virtual reality (VR) technology, artwork becomes a process rather than a definite object, the perception of receiver could be the process of Art, and has been of unprecedented importance in art creation. It is VR that really gives receiver an identity of “creator”, and the completion of VR art becomes inseparably bound to perception of receiver, in so far, it could be woven as strands into an activity that calls the VR artwork into play. It is only through the process of receiver’s perception that the artwork could enter into its changing visions. During the whole process, perception of receiver may be everywhere, and VR becomes a psychological state to describe the perception of receiver happened in the process of art reception. On one side, full body immersive in VR broaden the esthetic perception in artwork, but on the other side, there will be lack of emotion and thought in some degree, so the conflict between full body immersion and imagination remains to be mediated in present VR art.

Index terms | *virtual reality, perception, immersion, imagination*

The role of receiver's perception

Compared to traditional art forms, virtual reality art appears many new features, which have been reduced to "3I". The first two of "3I" are interaction and immersion, but the third one is still in dispute. For Grigore Burdeaan and Philippe Coiffet, it is "imagination"[1]. In <Virtual Reality> Heim substituted "information intensity" for "imagination"[2]. No matter in which argument, immersion and interaction are dominant features. Whether immersion or interaction is relation to perception of receiver. In virtual reality art, perception of receiver participates the creation of artwork, and partly decides artwork's contents and forms. From the point of art history, perception of receiver has unprecedented position. In this sense, virtual reality art develops its own personalities.

Theory of esthetic experience took the perception of receiver into account, but it wasn't the important part. As esthetic experience, receiving process has been known as criticism (comment) and appreciation. Reception and production are two independent courses, that reception follows the art production. Receiver could influence the author's work, but the influence would be so limited. In this sense, audience plays a very limited role in art theories.

Aesthetics of reception broke the limitation, and began to emphasize the reception and influence, it considered that many literary theories lack the reader in his genuine role. By distinguished text from literary work, Jauss and his company redefined the concept of reader, "a role as unalterable for aesthetic as for historical knowledge: as the addressee as the reader for whom the literary work is primarily destined." [3]

The perspective of the aesthetics of reception convert passive reception into active understanding, giving reception a new identity. But this theory is totally about literature history, even though it tries to bridge the gap of author and reader, the process of reception and production are not merged into a whole. On one hand, receiver's effect seems to be abstract, sometimes what is called receiver just as the author himself. On the other hand, although receiver's influence has been admitted, it is not enough to be regarded as "creator".

It is virtual reality that really gives receiver an identity of "creator", which is in administration of artwork. Completion of virtual reality art become inseparably bound to perception of receiver, in so far, perception of receiver could be woven as strands into an activity that calls the virtual reality artwork into play. It is only through the process of receiver's perception that the artwork could enter into changing visions.

The change of interface has been inceptive of virtual reality.

Interface: From virtual-reality to human-virtual reality

In 1992, the 1st VR international conference was held in Montpellier, with the title of "Interfaces for Real and Virtual Worlds". Interface here was used to describe the joint of virtual and reality. In Heim's words, interface is the second stage of the marriage of human and machine[4].

In virtual reality art interface involved two kinds of relations, one is between artwork (virtual) and real world, the other is human and artwork, what has been changed is the second relation.

Considering relation of artwork (virtual) and real world, realism in visual art history would be investigated. According to realism, representation of physical world would be a rule of art production, artists devote themselves to gain the extreme likeness between imitated matter and representation (artistic image). In ontological sense,

objects that artists imitated were real, the appearances that the viewers saw were virtual, thus the degree of imitation was the relation between virtual and reality. Take <Mona Lisa> as example, woman in painting was virtual, prototype behind her was real, and the interface seems as Da Vinci's artistic creation.

This relation between virtual (artwork) and reality constitutes a significant esthetic topic, terms such as "represent", "imitate", "reproduce", "depict" were used to describe the effect on real world, and theorists insist the border between "thing-in-itself" and "presentation".

The other is between human and artwork. Material matter of artwork may be the relation between them.

Virtual reality art has not changed the first kind relation, artist's esthetic pursuit is to revive realism to the extent that it produces immersion, a kind of deep illusion. The gap of artwork and real world still exists, what has been changed was receiver's perception. It is the receiver feels real, not the object really exists. Zeuxis's grape made an illusion that viewer took it as real grape, illusion disappeared when viewer realized the existence of canvas. Canvas, photographic paper, screen, et al., those material matters are interface between receiver and artwork. It is this kind of interface that virtual reality artists try to change.

In fact, the change of relation between human and artwork simply indicates the change of human's position, in virtual reality environment, receiver can "enter in" artwork, the word "in" manifests that receiver is not a onlooker outside the creation, but an experiencer and even an participant in artwork creating.

Form of Art: Process of perceiving

When the environment of artists and receivers has been changed, when the process of producing and receiving has merged, the artwork was no longer as it used to be. New art forms indicated new expressing object, and touched the essence of art eventually.

It is interface between virtual and reality composes the form of art, in <Aesthetics> Hegel used "perceptual manifestation or appearance of idea" to describe artwork. For Croce, the task of an artist is to invent the perfect form that they can produce for their viewers, since this is what beauty fundamentally is—the formation of inward, mental images in their ideal state. Susan Lange analyzed relations between emotions and art forms, endowing each art form with a special emotion expression.

These arguments discussed several art forms, but it is still difficult to define the form of virtual reality art. Different from most kinds of art, the form of virtual reality art is not settled "matter" which has been completed before reception, it seems as a dynamic process which has been completed by artist and receiver together. In this process, perception of receiver is not only the trigger mechanism but also the form of art.

Perception of receiver is no longer the appreciating reaction, but the trigger mechanism of artwork creating, and the expressive object of virtual reality artwork. In virtual reality

art world, everything begins at perception, finally ends with perception.

In brief, the process will be described as follow:

Figure 1. The process of virtual reality art

Impulsion: at the beginning of this process, the artist should make the environment of artwork, this environment may be different from space-time in reality, in which time is non-linear, and space could disappear. When he plan to construct this environment, the first step is to considerate reception of receiver. Because receiver should has an impulsion to act in this environment, so the environment must be congenial to receiver's perception, in this sense, receiver's perception will be starting point of artist's creating activity.

For traditional artist, miscellaneous external impressions will be formalized through the artist's mind, thus call out the form of artwork. For virtual reality artist, perception of receiver has the same importance as artist's mental image, the presentation of virtual reality artwork based on receiver's perceptive ability.

Activity: when impulsion brings out the receiver's activity, receiver will choose the possible ways to act in the environment. The process of virtual reality art need receiver's activity in different ways. Types of activity are multiple, in the early days, interactive modes in virtual reality art were very simple, receiver simply need to change their viewing angle, then the view will be changed. Then modes evolved into the change of body gesture. When receivers moved their heads or waved their hands, the contents of art would change accordingly, these movements initiate the following vision. In the virtual reality artwork <The night café>, the view of room based on the receiver's head movement. In a way, contents of art are more like the result of activities. Now, virtual reality art mainly used body posture or human voice to initiate the act, and mental control seems to be the trend, perhaps when mental control come true, the artwork could be called really virtual reality.

Presentation: gesture and voice call out presentation, perception happens when receiver appreciate the presentation, then next impulsion could be generated. In such process, every successive part flows, without seam and without unfilled blanks, into what ensues. In some degree, receiver could decide the appearance of virtual reality artwork in part. During the whole process, perception of receiver may be everywhere. In so far, virtual reality becomes a psychological state to describe the perception of

receivers happened in process of art reception, so the form of art becomes intangible.

As long as perception of receivers becomes a part of art creating process, virtual reality art seemed highly individualization. There is an adage “One thousand readers, there are one thousand Hamlet”. According to different readers’ interpretation, <Hamlet> itself had never been changed. But virtual reality art developed another meaning, for different receivers, being different artworks, each receiver could partially own authority of artwork. In 2015, some artists from Guangzhou made an interactive installation called <Unnoticed moment>[5], the final presentation based on receiver’s face, through a special instrument, receiver’s facial expressions converts into a series of successive scene thus every receiver could have a individual vision which symbolized his life.

The conflict between body perception and imagination

Immersion and interaction have long history in art world, but they developed different meanings in virtual reality artwork.

From the above description, there need receiver’s systemic perception in virtual reality art, which including all the forms of human perception, such as visual, auditory, body perception, and so on. This systemic perception present in the whole process of virtual reality creation, and based on sensation.

When reading novels or looking paintings, immersion of receiver happened in the realm of consciousness, such as visual optical illusion in Zeuxis’s grapes or emotional illusion in realistic novels, all these illusions exist in receiver’s consciousness, which cannot be acquired by sensation immediately. The form of virtual reality visualized the imagination, body immersion shorten even take away the distance between artwork and receivers. When receiver turns to be “experiencer”, the perceptions could happen through receiver’s sensation directly.

Full body immersive could be the condition of interaction. Different from esthetic perception in general, perception in virtual reality is peculiarly and dominantly sensible.

On one side, full body immersive broaden the esthetic perception in artwork, but on the other side, there will be lack of emotion and thought in some degree. Like Steven Johnson pointed out that traditional film could expressed the emotion more effective than holographic movie[6]. Although “3I” emphasize imagination, most present virtual reality artworks did not avoid the conflict of imagination and body immersive. More than a decade ago, Heim thought the immersive experience in virtual reality should be acquired not only by looking, but by mental control, it could put mind into a state like philosophy[7]. Although this aim has not been realized at present, the constant efforts of artists and scientists show bright prospects in the future.

SAINT PETERSBURG FASHION DESIGNERS: THE AESTHETICS OF CREATIVITY AND THE FEATURES OF STYLE

Abstract | This work presents one of the aspects of the author's PhD thesis which is dedicated to the study of the phenomenon of Saint Petersburg style. The goal of the present study is to characterise the creative work of several Saint Petersburg fashion designers and to differentiate them by the aesthetics of their creativity.

The methodological bases of this research include the following approaches: axiological (fashion and costume are considered as the system of values); sociological and cultural (explore the systems "fashion-society", "fashion-culture" and rank persons as the consumers); art-historical (identifies the correlation and interaction between the works of pictorial art and the fashion items); hermeneutical (contributes to understanding of the ongoing processes in fashion industry) and methods: comparative-typological and empirical.

During the research the author: examined literature sources and historical records which are written by famous Russian art historians and present the biographies and creativity of fashion designers who live and work in Saint Petersburg (some of these designers are the original residents of Saint Petersburg, and some of them arrived in this city from their native towns, so therefore their artwork is of special interest in the context of our research); get acquainted with the creative work of Saint Petersburg fashion designers who include both renowned designers and emerging designers who own relatively young brands and studios and have the short history of professional activity; carried out the review and analysis of the fashion collections of the considered designers; conducted interviews with Saint Petersburg fashion designers (these interviews were focused on the designers' lives and creativity in Saint Petersburg, their inspiration which is generated by Saint Petersburg; we also considered the peculiar properties of the city residents' style, their perception of the everyday life and their demands which they have as the consumers of fashion garment and as the carriers of Saint Petersburg style.

The following results were obtained: we differentiated Saint Petersburg fashion designers by the aesthetics of their creativity according to the conducted analysis of their artwork, the interviews and the explored materials written by the other authors about artwork of these designers; we showed that the phenomenon of the contemporary Saint Petersburg style in costume is organically linked to the other nonlinear semiotic systems such as architecture and visual art.

The presented work forms part of the study of Saint Petersburg style in costume and contributes to the research of Saint Petersburg style in general.

Index terms | *Aesthetics of costume; aesthetics of creativity; art history; contemporary fashion design; Saint Petersburg style; style of the city; visual arts*

INTRODUCTION

IN my previous research I considered the topic “Saint Petersburg as a source of inspiration for fashion designers”, and within the framework of that research I analysed how our designers felt the impact of the city, which spots inspired them most and how this inspiration was reflected in their art.

In this context I also analysed the impact of our city’s greyness, cloudiness, coldness and moderation. Saint Petersburg is famous for its northern climate and rainy days – the days, when all you want is to hide in your room or to get lost in one of the numerous coffee houses looking out the rainy windows.

All this is often reflected in the aesthetics of creativity and in the features of style of many designers who live and work in Russia and particularly in Saint Petersburg. For example, we can see such sentiments expressed in the simple silhouettes along with the muted tones in fashion collections created by Stas Lopatkin (figure 1) and Peter Starostin (figure 2).

But besides that, it is the fact that Saint Petersburg is famous not only for its cloudy northern temper but also for its bright, freedom-loving, creative and very stylish people. Saint Petersburg is often called the Cultural Capital of Russia; this city amazes its residents and tourists with magical beauty of its architecture and different landmarks and breathtaking views. A lot of talented and passionate people, cultural figures and artistic personalities live in Saint Petersburg. Also, this city is very famous for the numerous representatives of different subcultures and the so called “freaks”.

Of course, the aforesaid designers (Stas Lopatkin and Peter Starostin) have created bright and colourful collections and models of clothing, in addition to the two presented here. And in my present study I would like to consider this opposite side of the creative work of Saint Petersburg fashion designers: here I would like to focus on the bright, eccentric collections with a lot of colours and unusual decorative elements.

The two Saint Petersburg fashion designers – Vladimir Bukhinnik and Liza Odinokikh – are the key figures of the current study.

THE BRIGHT SIDE OF SAINT PETERSBURG

Vladimir Bukhinnik

Vladimir Bukhinnik is a Russian fashion designer who creates his collections and demonstrates them at St. Petersburg Fashion Week until the present day. He is not a native citizen of Saint Petersburg: he was born in the closed city of Dneprodzerzhinsk (Ukraine) and, after finishing school and graduating from the sewing college, Vladimir went to work in the factory. There he was noticed, and then he was sent to Leningrad (the name of Saint Petersburg from the end of January 1924 to the beginning of September 1991) to take courses¹. And he has been living and working in this city ever since.

It is in this context, therefore, that Vladimir Bukhinnik is especially interesting for us as a prominent figure of Saint Petersburg design.

Vladimir is also a theatre artist: he worked, for example, as a costume designer for Roman Viktyuk Theatre in Moscow. Roman Viktyuk is one of the legendary names in Russian theatre². In 1997 Roman Viktyuk and Vladimir Bukhinnik were working on a play “Salome” in Belgrade, Serbia: the actors of the Yugoslav Drama Theatre were in this play³.

Vladimir’s love of the theatre is reflected in his fashion collections. His shows are always full of brightness, originality and fun.

Sofia Azarkhi is a Russian artist, stage designer and the author of numerous articles on the art of costume; she is also the author of the monograph “Stylish People: Introduction to the History of Modern Artistic Gestures”. As the website of Ivan Limbakh Publishing House says,

“...Taking as an example the best designers from St. Petersburg the author examines the diversity of approaches to the creation of clothing. At the same time this book is about St. Petersburg itself, its aesthetic tradition, art trends and cult figures of the 1990s – the time of ‘Storm and Stress’ in Russia – as well as about the inseparability of fine arts, fashion and politics⁴.”

The author begins her fascinating narrative with a story about the legendary Leningrad House of Models of Clothing, where she used to work (the House was the largest design company of north-western Russia, which developed the samples of clothing for the sewing enterprises of the Soviet Union), and continues it with stories about iconic designers and artists of our city.

This book includes, among others, the story of Vladimir Bukhinnik.

“...He ‘wetted out’ the dryish Saint Petersburg aesthetics, brought the southern health into the city’s sickly ‘necrorealistic’ atmosphere, warmed the mental climate⁵,” that is how Sofia Azarkhi writes about Vladimir’s creative activities in Saint Petersburg, describing his work and career in a separate chapter of her book.

Looking at Vladimir’s works, we can state that he loves to shock his audience a bit, and he works in an expressive manner (figures 3, 4).

Vladimir Bukhinnik is also fond of teaching. Now he is a leading teacher at the Fresh Fashion Intensive Design School, which he co-founded together with his colleagues. Vladimir and his students presented their collections at St. Petersburg Fashion Week of the season Fall-Winter 2018-2019, where the audience was surprised with the interesting and fresh solutions once again.

Liza Odinokikh

The next fashion designer whose creative work I have considered in the present study is Liza Odinokikh. Liza’s fashion collections consist of feminine, comfortable models of clothing in the “It Girl” style and are loved by the Russian fashionistas⁶.

Here I would like to pay special attention to the three Liza’s fashion collections which were inspired by the Russian national culture and art.

The first collection which I have considered is the collection of Fall-Winter 2014-2015 (figures 5, 6). As Liza’s website says, this collection was inspired by Russian fairy tales or to be more precise, by the illustrations created by the famous Russian artist Ivan Bilibin:

“...The designer was inspired by the atmosphere of Ancient Russia, its versatility. The main character is a Swan Princess, but with a modern twist. She wears a turquoise coat, evening dress, quilted kaftan made of velvet, embroidered with pearls, she complements this outfit with knitted gaiters and a cap as headgear.

Sport chic is a key theme of the collection, the mix of evening and sport parts of the wardrobe. Different materials were used: wool, silk, velvet, leather, faux fur, brocade, linen⁷.”

The second considered collection created by Liza Odinokikh is the collection of Spring-Summer 2015 (figures 7, 8), in which designer's inspiration was the story of "Mistress Into Maid" by the famous Russian poet, playwright and novelist Alexander Pushkin, and also hand drawn post cards with flowers of the early twentieth century:

"Imagine: you wake up early in the morning in the village and go out into the street," says about the mood of the collection Liza. "The air is still cool, damp; the sun rises, illuminating the fields of wheat; the day promises to be hot. You feel faint smells of dew and flowers...".

In the spring collection, the designer conveys the image of native wildlife and unique natural beauty of Russian girls. Collection features bright colors and a floral theme. Traditional natural materials were used: cotton, wool and lace⁸."

The Russian theme is also reflected in Liza's collection of Fall-Winter 2016-2017 (figures 9, 10). In the press release Liza says, that this collection "is filled with colors and the intelligent mix of fabrics, images and styles; the movement in the new era and the memories of two and a half decades of the new Russia":

"...Combining incongruous, the heroine will inevitably come to the image, which is called 'Russian kitsch'. <...> The collection as a whole is a modern and refined Russian kitsch, flashy fashion of the streets inspired by free from the prejudices and rules 90's. Today Liza's character is in love with life, fun and noisy company⁹."

So here we can see that whilst using the Russian national culture and art as a source of inspiration Liza, however, creates highly modern and suitable for the everyday life models of clothing and outfits. Inspired by the Russian history and national traditions, her art is a quintessence of the past and present: it is dedicated to a young woman who is inspired by her native country, who loves its culture and enjoys a modern life full of a lot of interesting activities.

At the same time, whilst being interested in the Russian theme and reflecting it in the collections, Liza is in love with Paris; we can see this in her other collections, which were inspired by the image of the French lady. Liza's work with the French theme makes us think about historical changes in Russia and reminds us about those times when Peter the Great (Peter I) "cut a window to Europe" by founding the city of Saint Petersburg in 1703.

In the collection of Fall-Winter 2016-2017 Liza used even the traditions of the aristocratic English hunting costume.

So we can conclude that Liza Odinokikh is a many-faceted designer; she is inspired by different cultures, and she integrates these different cultures masterly and with great taste.

CONCLUSION

ACCORDING to all the facts I have learned and fashion collections I have analysed, it could be said that Saint Petersburg style is polymodal. The designers' inspiration comes from the different, often polar sides of the existence of our city, but the designers continue having common features which I tried to demonstrate in my work. We could characterise the motivation and values of the creative work of different artists and designers and identify some kind of the "designer aesthetics".

TOWARDS AN ANTIOPTICAL CONCEPTION OF MATERIALITY

Abstract | The aim of this text is to develop the concept of antioptical visual arts production, drawing on the notions of sensitive experience, normative opposition and the uncanny regime of the artist's own will, inscribed in some twentieth-century visual arts works. A key concept, the uncanny, is linked with some aspects of the Kantian's sublime and the Adorno's ugliness concepts, trying to explore their implications about the condition of matter and its ways to show itself in the optical representation. Addressing to this relationship, the text attempts to conceive the term of antioptical production as a condensation of autonomous creative subjectivity, creative perversion and enjoyment of the artists' self. This research tries to determine to what extent the representation of the visible, thought as a referent of the visible and optical appearance of the world, has suffered the attacks of some critical thought that diminishes the Kantian's sensitive and aesthetical experience, as well as subversive practices that lessen the comprehension of the world as a system of appearances. This last term –the appearance– is understood here as an aspect of some kind of visual order, emerging from an "aesthetical normativeness" based on an optical or classical adequacy, which are given in the visual arts production of the last century. The aforementioned idea constitutes a veiled assumption: the avant-garde, thought as a rupture of conventions and an affirmation of different kind of transgressions claimed, throughout these negative features, the affirmation of the artist as a sort of negative and oppositional autocratical demiurge. Some works of art did take account about this issue, and explored to what extent organic and unconditioned materiality of some contemporary artists represented some sort of metaphors about the irreducible condition of material things, urging to give up the predominance of any kind of optical order.

Index terms | *Kantian's notions about sublime; Adorno's concept of The Ugly; Uncanny artist's regime; Optical/Disoptical production; Creative perversion; Subversive aesthetics.*

INTRODUCTION

Today, many pieces of art deal with intense emotions and sensations: aggression, horror, disgust. The common feature is the confrontation of human being with our material body.

Some productive strategies in contemporary art, which precisely employ bodiness, often include images opposing to conventions. It has confronted previous artistic styles and movements with practices questioning how they represent different issues. For instance, some works of body art and performance, in which we can find several traces of violence against corporeal surfaces.

Perhaps this is an aftershock¹ of a more complex phenomenon, which happened with the rise of The Avant-Garde. At the beginning of the twentieth century, the art movements that appeared seemed to take the precedents images for subverting them, to re-think about the present age, most of the times denying conventions. The artists seemed to be setting their own regime of signs.

Many of these disruptions expose themselves as ruptures and violent clashes against a normative order. That organization was established either from the artistic institutions, culture or even from the “common sense” of Twentieth-Century audience. This scenario was not extraordinary. The rupture was and is now a regular condition since The Avant-Garde made its transgressions to destabilized customs and values.

Apparently, these practices should expand horizons, as much as they confront traditions. However, once this programmatic task was fulfilled: why a range of the Twentieth-Century visual arts continued and indeed deepened these acts of subversion towards tradition?

To understand what already has said, this work begins establishing a premise. The production of art images represents a revealing subjectivity inner-impulse inscribed in a visual order. This can be defined as a mandate or a system of concessions and interdicts of art images linked to their temporal and cultural context.

Thus, this work proposes some extreme artistic productions of the last century as sensitive and psychical commotions of subjectivity. This includes an intellectual and even physiological rejection from part of the audience. However, it is also necessary to suspend our judgment, in order to verify as far as these shocking manifestations could provide contents that transcends displeasure.

The fundamental objectives of this reflection are two. The first, to base the notion of Anti Optic production as a concept, including modalities of sensible overflow, normative opposition and the establishment of a proper order in artistic practices. The second, is to evaluate how the visual production of the twentieth century displays a psychic destructive and self-destructive energy which menaces the integrity of the subject.

THE ORDER OF THE VISUAL

The order of the visual can be think as relationships that occur under an internal structure of individuals –normed from a perceptual configuration– that allows to reconcile the judgments of reality based on the phenomena and objects of the world. It is what Rudolph Arnheim classifies as different cognitive abilities that visual perception could produce even from itself.²

It would be this order, based on a formal law, mentioned by Adorno,³ which would limit the exposure of subjective experience to certain effects that images of art can produce. And, precisely, the images of art connote a particular archaic moment, in which that order of the visual allows them to radiate a protective-negotiating power with the forces of the invisible.⁴

Abolished that moment of the energetic transmission of the mythical-religious, there remains another moment, in which subjective experience is confronted with the real. In this confrontation, art would protect the subject from a reality that can overload it with intensity.

The radical existence of images of the real strive to be present in the subjective consciousness as forms of control and domination. It is an intuition that is not new at all, but a sensibility trajectory of which this study tries to focus on, and that has to do with the emergence of forms of denomination of subjective experience before the images of current art.

These images contain and guide senses that expand towards different areas of experience, connoting meanings of high complexity. Therefore, the knowledge of the world does not end in the image.

Several scenarios in which art deployed as a system of appearances, do not always take into account a connection between the different spheres of subjective experience. Thus, the artistic images reflect different modalities of appropriation by the vision.

OVERFLOWING SIGHT

The Sublime is considered part of postmodern condition of art.⁵ The Sublime has diverse connotations. One of them is its excess that surpasses the sensory capacity of the subject. It is a force located outside the individual, apprehended by the sight. Romantic art gave this conception, which portrayed a threatening nature as much by its power as by its size in the pictorial representation.

Someone who shows the most canonical definition in what refers to the modern sublime is Edmund Burke⁶. Here, the Sublime possesses an imaginative power, which awakens from the subject towards existence under the figure of a volitional pleasure.

At first, as terror before the threatening and a later delight before the suppression of such a menace. The above differs from the transcendental position of Kant. Knowing sustains on what we do not see, but what we access through the actions of intuition and intellect. Both make up a subjective sensitivity that can be understood through its schematism. In this way, the Sublime is the grandiose, the monumental and what exceeds the perceptual capacities of the observer. The Sublime, by transcending the vision, puts into suspension the ordering of the optical-perspectivist representation inherited from the Renaissance. For Kant, the sensitivity deduced from the Sublime corresponds to a first faculty of knowledge, being the ability to account for the representations that derive from form and materiality.

The constitution of judgments establishes a middle term between the intellect, thought as theoretical reason and intuition, defined as the practical reason. Judgments constitute a substantial part of Kantian thought to explain the way taste operates as a

way of knowing marked substantially by disinterested pleasure's concept.

The transcendent sensibility is at the antipodes of materiality. From here, the referential painting could overcome: it was not to point out an external reference to the subject, but to install, in the viewer, certain logics of appreciation of destruction in a sensitive space of potential threat and contemplative delight.

In the Sublime's case, the effect of terror was given by the visual sensation and the bodily intuition of the threatening. The relief represented by "feeling safe" thanks to distance –with Burke-, or the construction of reason –in the Kantian version- correspond to an intellectualization of the image that the Sublime allows. This made up an intellectual operation of subjective defense. Therefore, the Sublime "hinges on a relation between perceptual and imaginative excess and rational containment".⁷

OPPOSING OPTICAL ORDER. THE UGLINESS AND THE UNCANNY

The Sublime opened the path to embodying new ways to incorporate other kind of appearances in the context of visual arts based on beauty. Though this last one was the main focus of first aesthetic age as a discipline, the sublime opened another points of view about it.

Portraying ugliness was an expansion of sensibility, that incorporates the possibility of opposing the norm and visual order. Karl Rosenkranz characterizes the negative condition of the concept of the Ugly, identifying the imperfect, the natural, the spiritual and the artistic ugly, among other attributes, from which postulates a pleasure in the contemplation of ugliness.

Ugliness is an absence of form, the incorrectness regarding a canon, the deformation, the vulgar, the disgusting that opposes to the Beauty. It dilutes the desirable form of cultural convention based on optical perception. For Adorno, the Ugly is a presence in a much earlier temporal context, which survives and is present in the most recent space of artistic creation (the archaic). Founding part of Beauty, the Ugly is a trajectory thrown towards the annulment of the being. Beauty integrates the ugliness into the order of the visual, despite its negativity.⁸

One can think that the negativity of the Ugly would not be possible without the antecedent of the Sublime. Especially because it was about the recognition of a marginal sphere of the aesthetic reflection of that moment. Freud examined, also on the margins, the unconscious psyche and those forces of what "belongs to the order of the terrifying, of what excites anguish and horror".⁹

1390

The Uncanny put in words the threat of castration, the presence of a double, the inexplicable repetition understood as drive impulse. It was what the surrealists tried to unveil through their strategies of shock, with the buried goal of making emerge an impulse of annihilation.¹⁰

If Kant found in the intellectualization of terror the germ of the Sublime, Freud made a different movement: explore in the intellectual uncertainty that gives rise to a sense of strangeness and threat. Both were constitutive of the Uncanny,¹¹ which acquired for itself the unconditional representation of what could be ugly for the visual order of the time in a way as much or more threatening than the sublime announced. Here, we can say that civilizing impulses that shape and sift the constitution of appearances repress

the internal tensions that threaten the integrity of the self.

ANTI-OPTICAL MATERIALITY

Art images contain different past contexts survivals, working on the unconsciousness in a “collective-iconic” sense that connect them in a supra-temporal way. The contemporary transgressive art¹² tends to subvert material conditions that constitutes the traditional media.

Giving up conventional matter, these kind of productions set divergent ways to compound images. Contorted bodies, smashed surfaces, dripped matter as body fluids... while the representational code is shattered, convulsion and deformity arise as unconditioned materiality.

Let us think for a while in the optical image as that pictorial window displayed in painting, building the perspective as a means of representation. This definition should allow us to postulate in optical representation as an image related to something and, therefore, to a “surface” that reflects a physiological, subjective and cultural consensus.

The term “optics” refers to a knowledge that explores the way in which the retina receives images, both from the surfaces of objects and from the phenomena of the world, through the action of light. With this premise, a logic of stimulating sensations, a hierarchizing of the modes of appropriation of the vision directed towards exteriority is fundamentally indicated. In those last terms, the Anti Optical Production disconnects to them, in order to establish its own way to apprehend the real.

The Anti Optical Production contains a relative feature and an absolute one. And that is because there are different inner energies inside the term. The first kind of these energies is attempting to link artistic practices from different periods. They differ among themselves in terms of their procedures and possibilities when representing something that leak through the formal condition of images.

The Sublime, the Ugly and the Uncanny have some components and tensions that denotes this leakage. Even though these concepts differed in terms of their objectives, they are manifestations constituted by a similar kind of force. Sometimes, this sort of energy is revealed into the representation under the sign of a threat, as in the Sublime; or more aggressive and violently, as the deformity seen in the Ugly and the castration anxiety in the Uncanny. The points of rupture evident in these forces are not the same. That is its relativity.

On the other hand, the absolute feature of Anti Optical Production exhibit itself through the destructive energies that underlie its being. The aforementioned tensions acquire different physiognomies and ciphers, due to restrictions that different contexts impose. However, in the antinormative and destructive intensity of Anti Optical Production, different ways of challenging the normative interdiction of formal law are condensed.

If an artist becomes the absolute owner of her/his anti-normative way to create her/his work of art, this can confront emergent creation to the optical-formal expectative built by centurial traditions. This can head to radical transgressions about how to represent the artist’s subjectivity. Unrestricted creativity can lead to establish a perverse way of thinking creation.¹³ The Anti Optical Production implied in some kind of visual arts transgressions can be a way to think about how the matter used in conventional media

can enclose destructive ways questioning formal predominance of the optical order.

IMPLICIT AND EXPLICIT VISUAL METAPHORS IN GRAPHIC POSTERS

Abstract | Metaphor has enjoyed great amount of attention in the last decades; however, very few researchers studied visual metaphors systematically. Classic Persian Rhetoric (Elme Badie) has developed many terms regarding the categorizations of literary terms like simile and metaphors that rarely been introduced to English language. One of the most important distinctions in this regard is implicit and explicit metaphors. By explicit metaphors we mean those metaphors in which vehicle is mentioned (or in case of visual metaphors shown) intending the tenor. And by implicit ones we mean metaphors in which tenor is mentioned (shown) plus the conditions of vehicles (implying it). We intend to introduce these two kinds of metaphors with two different posters from Iranian graphic designers. Through this distinction, we hope to find descriptive and interpretive potentiality to analyze creative pictures and also introduce two kinds of metaphors based on the categorizations done in Elme Badi.

Index terms | *Metaphor; Implicit; Explicit; Visual; Graphic Poster.*

Introduction

There are several possible approaches to metaphor. *Phenomenological view* finds expression a basic and wide category of our lived experience and much beyond linguistic expression. Few expressions are at our hands to directly signify our lived experience to limited range of vocabularies; therefore we need metaphors to progress from “already-known” to “not-yet-known”¹. *Substitution theory* believes that metaphor is a word substituted for another on account of the resemblance or analogy between their significations. *Comparison view* asserts that metaphor consists in the presentation of the underlying analogy or similarity. *Interaction theory* claims that metaphor is the result of the interaction of two thoughts of different things active together and supported by a single word². Cognitive approach to metaphor finds metaphor as a kind of understanding or experiencing that takes one thing in terms of another. In other words, our thought processes are principally metaphorical and these metaphors enable us to understand our communication, argument, time and many other concepts needed for daily life³. In Larger perspective, visual metaphors are considered to be new ways to approach cultural analysis and a democratic exercise of questioning and thinking together of subjects like identity, art processes and art objects derived from experience⁴.

Paul Ricoeur believes that “The historical paradox of the problem of metaphor is that it reaches us via a discipline that died towards the middle of the nineteenth century”⁵. This statement seems to be both true and wrong for Persian Rhetoric. It is true because Persian Rhetoric also became a dead discipline since it failed to expand itself beyond the mere categorizations of figures of speech and has never connected its topics with philosophical, social or political discussions. It is wrong because through its development it made some important advancements regarding the terminology and specific categorizations that can’t be found in English Rhetoric.

Persian Rhetoric (Elme Badie; a science of innovations mainly literary or semantic ones) has passed through four main stages; localization, interpretation and imitation, Indian Style and finally Contemporary Scholastic. In the first stage, localization, Arabic Rhetoric was translated into Persian; in the second period terms and categories were established in Persian language. In the third phase, Persian Rhetoric enjoyed literary elaborations just like Indian Style. And in the last period, scholastic books were written. The main developments were done in the first period in which many new categorizations and terms were added⁶.

In fact, Persian Rhetoric was interested in aesthetic and logical categorizations in Persian literature rather than the skill of persuasion⁷. That is why Elme Badie in Persian means semantic innovations or new

arrangements or eloquent and strenuous speech whether in text or poem.⁸

As a result, there is a basic difference between Persian and English Rhetoric. While the former seems to be very general in terms of categorizations and terms, the latter proved to have much more detailed approach in classifications of figures of speech. While English Rhetoric is realistic and naturalistic, Persian Rhetoric seems to be idealistic. As an example, in metonymy while in Persian Rhetoric we see classifications like *relation* and (and many different kinds of) *indication*, we can’t find such terms’ equivalents in English. Also, there seems to be diverse types of Simile in Persian Rhetoric, some say about 289 types while in English we don’t have such diversity⁹.

As a result, we suppose that based on unique (in some cases) categorizations and classifications of Elme Baide, we can reach better understanding of visual metaphors. In the following, after comparing the classifications of metaphor based on Persian

Rhetoric and Perrine's, we come to a clear definition of implicit and explicit metaphors and use the same framework for the analysis of visual metaphors. Also, we use a specific model for the process of our analysis¹⁰.

Metaphor in Persian Rhetoric

In Persian Rhetoric there are two major types of metaphors; Implicit and Explicit. In the former, the tenor (or as in Persian it is said *resembler*) is mentioned with some conditions to imply the vehicle (Persian equivalent is *resembled*), and in the latter the vehicle (resembled) is mentioned implying the tenor (resembler). In English Rhetoric, as Perrine claims, we can distinguish 4 Forms of metaphor "Under the assumption that in all metaphors the concepts likened to each other are expressible as substantives, there are four possible forms of metaphor. In the first, both the literal and figurative terms are named; in the second, only the literal term is named; in the third, only the figurative term is named; in the fourth, neither the literal nor the figurative term is named"¹¹.

Form 1 is the same as Simile in Persian Rhetoric that has countless categorizations and extensive terminology. But, basically in both English and Persian the main criteria to categorize metaphor is the fact that whether tenor/resembler or vehicle/resembled are mentioned in the text or not. We can simply conclude that from pair of resembled/resembler if resembler is mentioned it is implicit, and if resembled is mentioned it is explicit; on the condition that the other one being implied from the context, clues or conditions.

Visual Metaphors

We can distinguish between two different approaches toward metaphors. We can see metaphors as any kind of *relations* between two literary or pictorial elements, relations like homospatiality, juxtapositions, sharing a context etc. This approach reduces metaphor to logical relationships and decreases the aesthetic values. In fact, this approach shrinks an artistic metaphor that is made to be enjoyable, into alienated meaningless parts. The other approach is that we see metaphors based on some kind of *semantic similarity* between two elements whether we call them tenor/ vehicle, focus/ frame, source/target, or resembled/resembler. In such an approach we indicate the aesthetic value of metaphors and unfold the meaning generated by the metaphor to fill a semantic void.

In Persian Rhetoric, metaphor is considered to be only one of the possible relations between the original meaning of the word and its figurative one, i.e., comparison. There might be relations like cause and effect, mood and place, universal and particular, proximity and companionship, comparison etc. In case the relation between the literal and figurative meaning is that of *comparison*, then it is considered to be metaphor. Consequently, metaphors are simply classified into implicit and explicit ones, and metaphors are considered to be quite limited field while other relations between literal and figurative meanings are being studied or classified in other terms (mainly Majaze Morsal) Persian Rhetoric surely took the second approach to metaphor and excluded all relations between literal and figurative meanings and classify them as types of figurative use of language called Majaze Morsal. And only relations based on similarity are called metaphor and therefore there remains two kinds of them; Implicit and Explicit. Majaze Morsal in Persian means *free literary trope*.

There is a very good study in visual metaphors "Interpreting Visual Metaphors: Asymmetry and Reversibility". In this paper, *source* and *target* are used instead of literal and figurative, and researchers attempted to analyze how the target is determined in a visual metaphor, how the direction of feature transfer is determined, and whether

visual metaphors are more symmetric than verbal metaphors. They came up with two cases in different pictures; pictures showing two concepts explicitly (whether in juxtapositions, context or fusion) and pictures showing one of the involving concepts explicitly (once source is explicitly depicted, and once the target is explicitly depicted)¹².

The fact that in Persian Rhetoric we only have implicit and explicit metaphors, and classifying other relations as *Majaze Morsal* (any other relations but similarity), seems to be better for a single fact; our methodology in understanding pictures should match our purpose. If we understand any kind of relations between literal and figurative meaning as metaphor, we would move away from artistic and aesthetic evaluations and get closer to logical reasoning that is related to truth value. Therefore, Indurkha¹³ doesn't consider metaphor (specifically), in terms of Persian Rhetoric, but considers any logical relations between two pictorial elements or as they assert target and source.

In another research, Negro¹⁴ tries to find a reliable procedure for identifying visual metaphor in all sorts of contexts. He believes that we should firstly find the representational meaning of the image. In this respect we should identify visual units, select the elements, and find the relationship between them in order to be able to interpret and describe the picture. The second step is to determine the symbolic meaning of the picture. In the present paper, we have used, Negro's suggestion to detect the metaphors; the visual metaphor identification procedure (VISMIP).

Examples of Implicit and Explicit Visual Metaphors

Figure 1 shows the redesign of an original Kiarostami's movie poster, *Where is the Friend's House*, by Morteza Momayez¹⁵. The movie is one of the most seen movies of Kiarostami telling a very simple story of a conscientious schoolboy's quest to return his friend's notebook in a neighboring village, since, should his friend fail to hand it in the next day, it is likely he will get expelled. Hence this film has been seen as a metaphor for the sense of civil duty, about loyalty and everyday heroics¹⁶. The very famous scene, unusually long, is being portrayed in this poster to show the boy who is climbing the mountain to reach his friend's house. It is worthy to mention that a contemporary Iranian poet, Sohrab Sepehri, has a very famous piece with the same name as Kiarostami's movie. Any Persian speaker hearing "where is the Friend's House", the name is the reminiscent of Sohrab's poem and Kiarostami's movie.

Interpreting poster from *inside* (the artwork), the poster is surprisingly simple, just like Kiarostami's movies, and shows the director, a track way, a tree, a boy who is wearing red, and the name of the movie. In case we choose our visual elements as Kiarostami and mountain, we see that Kiarostami is hugely portrayed in black and white at the background just like a mountain, in fact instead of the mountain. Mountain is not present in the picture but from its clues or conditions, zigzag track ways, we can say that there is a mountain. In other words, Kiarostami and mountains share the some features like simplicity, greatness and bearing in themselves tracks for others to follow.

Interpreting the poster from outside the artwork, we see a boy trying to reach the tree on the top of a track way. Boy and way, or boy and tree can be selected as different visual elements to form different metaphors. Then, he can step into the difficult way of life, or boy tries hard to reach hope in his life.

In all the visual elements chosen above, we have detected implicit metaphor; A is likened to B, while B is not present and we can only see its clues or conditions.

Figure 2 is Mehdi Saeedi's poster for an Iranian music festival. This minimal picture portrays a bird, most probably singing, on an empty turquoise color (pale blue and green that is a color traditionally used in Persian paintings or miniatures). We can

detect two layers of visual elements in this picture, both being explicit metaphors. Music and bird is the first set (from inside), bird and type is the second one (from outside). In the first case, a bird is portrayed and from its gesture we can infer singing that is a clue or conditions of music. In the second case, the bird is not portrayed, but from the typography we can infer that a bird was intended. In fact in both layers B is portrayed with clues or conditions of A; Explicit metaphor.

Using the terminology of Persian Rhetoric we should say in figure 1 “resembler” is portrayed and “resembled” is implied; in figure 2 “resembled” is portrayed and “resembler” is implied.

Conclusion

In Persian Rhetoric relationship between literal and figurative meanings are classified into two categories; metaphor and Majaze Morsal. The former includes only artistic comparison, and the latter involves all other possible relationships like homospatiality, juxtaposition, context, etc. Based on this classification, metaphors are divided into two limited genre; implicit and explicit. This classification is more artistic and less reductionist in comparison to approaches that take metaphor to be all kinds of relationship between literal and figurative meanings or visual elements (in case of visual metaphors). As a result, Persian Rhetoric’s classification for metaphor seems to be more aesthetic and easy to understand approach to analyze visual metaphors.

Majid Heidari (1980) is assistant professor at Ferdows Institute of Higher Education, Mashhad, Iran. He is the Head of Visual Communication Department. He has PhD in Philosophy of Art and writes on Aesthetics with focus on Islamic art. As a researcher he has several papers on Iran's Aesthetics, the Tension between Islamic Mysticism and Scholastic Theology in Aesthetics, the Role of Rhetoric in Islamic Aesthetics, Persian Painting and Narrative, and Visual Metaphors. He normally finds the theoretical framework of his papers in Pragmatism and Philosophical Hermeneutics, and puts especial emphasis on narrative truth and narrative identity in research projects. As a writer he published one collection of short stories "*The Infrastructure of the City*" and believes stories are one of the main ways to reach the truth.

Mahsa Taghavi (1996) is a graphic designer and student in Masters of Visual Communication at Ferdows Institute of Higher Education, Mashhad, Iran. She has Associate and Bachelors of Graphic Design and is a student in Masters of Visual Communication. As an art student she participated in several exhibitions. During her studies she was interested in combining the minimal art with Iranian's traditional symbols, which has led her to present her bachelor's project in the case of: "modern sculpture design mixed with Iranian features". Along with studying art, she has been an English teacher for two years. She is translating The Routledge Companion to Research in the Arts, in collaboration with Dr. Majid Heidari the head of Visual Communication Department at Ferdows institute of higher education, to be published in Iranian journals. Regarding to her interest in studying art, she has planned to study PHD in recognized foreign universities.

INTERSPACES OF ART AND SOCIAL LIFE – CHALLENGES FOR CONTEMPORARY AESTHETICS

Abstract | The paper deals with the consequences of an exceptional rise of hybrid forms of in-between spaces in contemporariness, which are populated with objects and phenomena from a wide and very heterogeneous field of (visual) arts. Theoretical reflection on this field requires cross-disciplinary networking and transdisciplinary treatment, intersectional co-operation of disciplines, and the deployment of new methodological approaches that often result from the recombination of already existing methods and procedures. We are dealing with the consequences of the productive fading of the boundaries of different areas (especially aesthetics, political philosophy, new urban studies, contemporary art history, cultural studies and new media theory), i.e. by introducing new hybrid research subjects, which expound the potentials of ever new, yet unexplored areas, which can also be marked on the level of terminology. The discussion aims to contribute to the analysis of the phenomenon of participatory art from the perspective of intermediate spaces between art and everyday social reality. The focus is on the critical reflection of contemporary participatory art practices in the light of the need to find new ways of analysing art, which would no longer be related only to visibility. The author comes from the view that participatory art cannot be adequately evaluated within the traditional framework of art criticism, which uses purely formal-aesthetic conceptual tools, in the light of its hybrid and transdisciplinary nature, and thus strives for more general concepts in the field of philosophy and political theory. Deployment of contemporary aesthetic approaches, which contribute significantly to the reflection on such art (besides Rancière's politics of aesthetics, the affirmation of aesthetics based on critical discourses of post-Marxist, feminist-queer, postsocialist and post-transitional perspectives), is particularly helpful for the author. The concluding thoughts sum up the intents of this paper with a glimpse into the potentiality of further aesthetic researches into the vast intermediate areas and interspaces of art and social life that lead us to the fundamental political issues of contemporary global society, with examples drawn from participatory art practices and new public art.

Index terms | *Art in social space; contemporary aesthetics; hibridity; in-between spaces; participation; new public art; transdisciplinarity; visual arts .*

What is crucial for the processes of the (neo-)avant-garde, postmodernism and especially contemporary artistic practices is precisely their crossing the artistic boundaries into the areas of exploring the ideal and broader social phenomena. Claire Bishop, an art historian and critic, points out in particular the “social turn” of art in the 1990s, with which artists changed from the creators of objects into the producers of situations co-created together with the other participants in the project.¹

Faced with contemporary artistic practice, art history found itself in a crisis. Since the 1960s, it did draw on the findings and methods of linguistics, psychology, psychoanalysis, semantics, various branches of structuralism, semiotics, Marxism etc. available in the international environment, which also had a significant effect on the happening in Slovenia, but this did not bring about a greater increase in interdisciplinary and transdisciplinary expansions of the field of art history.

In this contribution, we also endeavour to strengthen the significance of various theoretical approaches in shaping the interpretative tools in order to deal with contemporary (participatory) art in a more effective way. The social turn of art (Bishop) takes us through the insufficient sociological discourse on art to a renewed and strengthened philosophical and aesthetic reflection on contemporary participatory art, the kind stimulated by Jacques Rancière’s aesthetic oeuvre.

Methodological Remarks on Participatory Art: Towards the Politics of Aesthetics

The analysis of Claire Bishop’s case studies in her *Artificial Hells* (2012) effectively shows the challenge posed by the methodological implications of participatory process art, which demand that we seek alternative criteria for the study and evaluation of such art.² When research is faced with an artistic practice that has to do with people and social processes, visual analyses prove to be insufficient as they miss the affective dynamics between the participants of the event itself. It was already conceptualism and the performative practices of the 1960s and 1970s that tried to shake the commodity-object in favour of an elusive experience, but visibility remained their important part. In contemporary participatory art, performativity (in addition to teaching as an artistic medium) is crucial since the live contact between the participants enables a more effective participatory engagement. The emphasis therefore lies on direct experiences based on the process of intersubjective exchange (group dynamic, raised consciousness etc.). Bishop devotes special attention not only to the processual nature of participatory art, but also to its product or result, which she attempts to evaluate in relation to the formation of an “analysis of the politics of spectatorship.”³

As Bishop’s case studies of participatory art illustrate,⁴ we face the insufficiency of the positivistic sociological approach to participatory art (evidence, measurability of results), on the one hand, and the need to preserve the fundamentally undefined reflections on quality characteristic of the humanities, on the other hand.

We also have to mention the pragmatic aspect of the method of researching such arts, which due to their experiential nature demand a specific discursivity: concretely, the case study presented below took several years of continued research of the local art scene, ranging from the study of archive material and a series of conversations, interviews and discussions with the artists, curators and individual participants in the projects to the communication with the audience to which the research findings were presented in the form of texts, lectures, exhibitions and public debates.⁵

In the methodological sense, dealing with people and social processes, however, at least partially requires a sociological reading since the analysis necessarily has to include concepts such as “community”, “society”, “agency” etc., which traditionally had a greater significance within the social sciences than the humanities.⁶ But because, in addition to being a social activity, participatory art is also a symbolic activity, which enables it not only to be embedded in the world, but also to be separated from it and have a certain aesthetic distance to it, the positivist social sciences are, in this regard, less useful than the more general, more abstract concepts from the field of philosophy (especially aesthetics and political philosophy).

For the needs of discussing participatory art practices, we use the theories and concepts from aesthetics or the philosophy of art and political philosophy (Rancière, Mouffe), aesthetics under post-socialist and post-transitional conditions (Erjavec, Kreft, Šuvaković), contemporary art history and criticism (Bishop) and also architecture and urbanism (Jurman and Šušteršič, Krasny).⁷ This specific interdisciplinarity and trans- or post-disciplinarity differ from the interdisciplinary approaches of art history from the 1970s since the need for theoretical inter- or transdisciplinarity originates in the participatory art practices themselves.

Contrary to the sociologically and ethically coloured approach to evaluation is the decision to deal with participatory projects “*as art*.”⁸ In view of the described circumstances, we need to reconsider the role of aesthetics, which some time ago (in the context of historical avant-gardes and neo-avant-gardes) became discredited for allegedly concealing the inequalities and exclusions in society, which is why it was equated with formalism, decontextualisation and depoliticisation; furthermore, aesthetics became synonymous with the market and social hierarchy. A certain re-evaluation of aesthetics only came about in the new millennium with the important contribution of Rancière’s aesthetic thought. In addition to overcoming traditional art classifications and hierarchies, Rancière insists on preserving the tension or paradox between the autonomy and the heteronomy of art: “in this regime, art is art insofar as it is also non-art, or something other than art.”⁹

Participatory Art Practices under Post-socialism and Post-Transition: A Few Examples from Slovenia

The demise of socialism coincided with the emergence of Western postmodernism, which supports Erjavec’s thesis about the emergence of a specific form of postmodernism within the transition period of the so-called “postsocialism” of former Eastern Europe, which saw the rise of interest by the Western art system only in the 1990s.¹⁰ After the fall of communism, former Eastern Europe, that is, former socialist countries, also witnessed a rise in socially engaged and participatory art. When Slovenia became independent in 1991, it went through a period of transition to neoliberal capitalism, which was crucial for the formation of new production conditions for making art. This led to a change in the way artists worked and established a relation with the audience, but also to changes in the reception and the evaluation of art, which moved more and more to the margins of social happening. While the critical performative, research and participatory practices moved from the traditional institutional venues of fine and visual arts through alternative places and locations into the broader social space, they remained quite neglected in the eyes of criticism and critical theoretic reflection. We can assume that what caused a certain unease among the critics was especially their participatory procedures, which demanded a fundamental rethinking of value criteria.

In continuing this paper we shall focus particularly on those contemporary artistic articulations by Slovenian artists that are actualized in different hybrid forms of experimental spatial, aesthetic and habitation practices playing a connective role in a community. Central to those projects concerned with the production of spaces is the question of the role of the public in their involvement in decision-making processes regarding spatial practices, since these projects are connected to the local community's ways of habitation. The common attributes of discussed projects are a certain affinity towards conceptual art, expansion from "just art" to social space, urban contexts, forms to which we can attribute a relational form, participation and striving towards community despite the heterogeneity of their formal approaches and content accents.¹¹

The first wave of art in the public, urban, social space that appeared in Slovenia in the mid-1990s was followed by the second wave at the beginning of the new millennium (the majority of these artists have been from the narrower sphere of fine arts and architecture). Among the more prominent socially engaged artists of the first wave is Marjetica Potrč; from the second wave are especially engaged members of KUD Obrat (Polonca Lovšin and others) and also of the Association of Fine Artists of Celje (DLUC); the work of the latter has not been appropriately evaluated or entered in national art surveys, which is why I devote special attention to this below.

The internationally renowned architect, sculptress and urban anthropologist Marjetica Potrč artistically explores often overlooked and conflictual aspects of contemporary cities, possibilities of self-supply and habitation alternatives. Her typical artwork is based on a structure or situation that she finds in a remote location where she tries to contribute to its revitalization. Artistic actualizations of the ideas about self-sufficiency, self-organization, participation and alternative sources of energy in Potrč's art are based on high social and environmental awareness and are very engaged since they originate in the habitation needs of individuals, disadvantaged groups and local communities.¹²

An artist and architect, Polona Lovšin focuses on self-organized initiatives and alternative forms of action within architecture and urban planning. In her public art projects she explores spatial participation practices where the local community's collaboration plays a crucial part. The project *Movement for Public Speaking* is an interactive and temporary public sculpture¹³ that offers an opportunity to connect individuals and groups with the aim of public speaking. The sculpture is comprised of a podium and a platform for generating electricity, both interconnected and interdependent. Namely, the speech can only be heard if a group of people generates energy for the sound system by moving on the platform. **(Fig. 1)** Lovšin is also a member of the Ljubljana-based Obrat association. Obrat members strive for an interdisciplinary integration of art, architecture and urban planning in the so-called "critical spatial practices".¹⁴ In their project *Beyond the Construction Site* (August 2010–ongoing), which is situated in the long-closed building site on Resljeva Street in Ljubljana, they explore the potentials of degraded municipal areas and their revaluation with temporary community interventions: "[T]he site is being transformed into a hybrid community space, dedicated to urban gardens, socializing, ecology, culture, play and education".¹⁵ The practices of individual artists from the DLUC circle are also marked by social engagement and participatory tendencies – most prominently those of Andreja Džakušič, Simon Macuh, Estela Žutić and Gilles Duvivier.¹⁶ Art enters the public space, where it addresses the residents of the city of Celje. In this, the Celje art scene has important references in the so-called Celje alternative of the 1970s, which brought conceptualization and performativity to the local art practice that extended beyond the gallery walls.¹⁷ At the end of the 1990s, artists took art onto the streets of Celje

(the Admission Free festival has been run under the auspices of DLUC since 1999),¹⁸ sparking off a renewed interest in social issues and art activism. In Celje, a complex network of local artists has been forged in collaboration with the art institution, whose aspiration always strove towards change in the local environment. In the new social conditions, individual DLUC members practice community art as a part of an informal urbanism, actively involving themselves in initiatives for the revitalization of the city centre. In pursuing real, sustainable impact within the local community, these artists are acting following the principles of urban regeneration, social integration and participatory urbanism. In doing so, they stem from the belief that urban areas tied to the community can significantly improve the prospects for sustainable development. The artists appear in the role of co-initiators in establishing community-based urban gardening as well as in the conservation and expansion of green areas as an opportunity for sustainable development for the city. They are approaching the debate by means of artistic research covering experimental and educational workshops and actions for all ages, by which they are encouraging the exchange of experience and knowledge of all participants. In such a way Andreja Džakušič deals with plans for community-based gardens: together with workshop participants and experts, she questions the pressing environmental concerns and the possibility of hanging gardens as a form of sustainable, environmentally friendly urban gardening.¹⁹ An echo of Situationist urbanism²⁰ can also be recognized here, which likewise resonates in the proposals for contemporary informal participatory urbanism. The latter emphasizes user-friendly and adapted spatial planning.

These artists are interested not merely in the overlooked aspects of the local urban space in their research, but also in the relationships with the local residents of the space of exploration itself, as well as in the aesthetic and conceptual relationships with the gallery audience and the general public. The participatory process at a specific location itself does not actually have a secondary audience, which makes the public critical discourse in the form of an exhibition all the more important. The exhibition discloses the results of the preceding artistic research related, for example, to specific city locations that stand out by their topical nature since they are subject to broader civil initiatives. The artists communicate the messages from the separate initiatives through heterogeneous and multi-dimensional works, which are aesthetic and at the same time expand into the social space (the set of works can include live events, installations, documentary material, drafts, sketches, drawings, photographs, video, as well as materials, relocated from the urban environment into the gallery space). Creating works/projects following the principles of participation is necessarily integrated into a network of connections with specific historical and socio-political contexts as well as everyday life situations. The artistic means of the urban life research are always contextually specific, and thus bound to the singularities of determining the meaning.²¹

Towards an Elaboration of the Politics of a Critical View in Contemporary Aesthetics

Rancière's conception of aesthetics in its close relation to politics can importantly contribute to us understanding the effects of contemporary art dealing with the social field. With the help of Rancière's aesthetic regime and the politics of aesthetics, we can also see contemporary participatory art in Slovenia as a certain continuation of the participatory impulses of international neo-avant-garde movements and their heteronomous nature.

Questioning the emphasis on affective responses, compassionate identification and consensual dialogue brings to light a typical discourse around participatory art, in

which “an ethics of interpersonal interaction comes to prevail over a politics of social justice.”²² This is a frequent objection to participatory, community art. Opposed to this trend, which can be denoted as an “ethical turn”, is Jacques Rancière’s politics of aesthetics. In his influential critique of the recent ethical turn, Rancière points out the weakening or even the elimination of political dissensus and social antagonisms.²³ But it is not necessary that every such project ends in a consensus, exclusion and the concealment of otherness rather than in an aesthetic break with the habits of perception, a break that, by way of a dissensus, irony or critique, arouses a unique negative pleasure, embarrassment, unease, ambivalence etc. in relation to the questions about the “excluded” as a condition of the existence of every community (for example, about foreign migrant workers). For art is also characterised by elements of critically opposing society and operating in the field of antagonism or *agonism* (Mouffe),²⁴ where it can realise the power of maintaining a contradictory position in relation to the economico-political imperatives. The participatory process is not immune to the characteristic traps of the contemporary capitalist modes of production when it comes, for example, to unpaid collaborators that co-create the work of art etc. This is why it is not unusual that, with its distancing from the conventional forms of art production under capitalism, participatory art prompts discussions within the tradition of Marxist and post-Marxist writing about art (Mouffe, Rancière, Bishop etc.). In Slovenia, Lev Kreft has called for a reconsideration of the relevance of Marxist aesthetics in relation to the critique of political economy in the context of both art and aesthetics, referring to Marx’s research into “*esthesis* of the capital” and his “critical analysis of fetishism of commodities and universal mystification,” which Marx does not discuss “as ideological illusions, but as objective conditions of sensuality and perception.”²⁵ In contemporary times, after art and aesthetics turned to everyday life and all areas of life were taken over by the capitalist machine, the need for such a critique has become evident in view of the increasing objectification of interpersonal relations in line with the criterion of usefulness “because the commodity form translates relations between people into relations between objects.”²⁶ As a subversive social power against capitalism, art must reach towards the social (a sensual experience of community), but at the same time remain in the domain of art and be successful in both fields, which means that – in line with Rancière’s aesthetic regime – it persists in a constant tension, even a paradox. Artistic re-presentation has the power of intervening in public discourse, which appears as a contextually specific artistic or aesthetic strategy (of division, intervention, over-identification etc.), repeatedly put to the test in every new project (Rancière, Bishop). This realisation has important consequences for the reflection on contemporary participatory art, which, with the democratisation of the aesthetic means of expression, endeavours to transform the material conditions of its own practice and establishes new, different relations with the audience and the reality outside art. This is also in concurrence with Rancière’s finding on the radical contingency of the work of an “emancipated spectator,” who is in principle active and equal with everybody.²⁷ Furthermore, such a politics of spectatorship essentially concerns and determines the formation of the critical view and the elaboration of its politics also in the field of aesthetics dealing with interspaces of art and social life in contemporary global society.

She has been published in numerous publications in Slovenia and abroad. She is the author of the books *Contemporary Art and Aesthetics* (2010) and *Interspaces of Art* (2018).

POST-HUMAN AESTHETICS OF APOCALYPSE

Abstract | In times of crisis, eschatological narratives tend to proliferate and flare like symptoms on allergy seasons. In the form of horror films, dystopias, catastrophic films, post-apocalyptic films, or disaster movies, these narratives on ultimate destiny of humanity, or the end of the world, reflect our contemporary anxieties, fears, and concerns. When the nature of crisis is an acute, inevitable and legitimate struggle of life and death with a tangible foe, and a prospect for better days ahead, moral narratives accommodating rightful heroes help us to confront our anxieties. However, uncertain, pervasive and chronic crises, lacking a certain nemesis, and accompanying pessimistic future projections lead to despair and cynicism. While we are experiencing a simultaneous economic and political crisis, and a deeper crisis of existence, our apocalyptic narratives and dystopias are distancing from anthropocentric point of view. On one hand, feeding from sores of global capitalism, migration waves, and rising populism, a crisis of democracy is sprawling, and it is leading to illiberal or totalitarian regimes, and to one-man rules trivializing democratic institutions and civic rights. On the other hand, a moral and existential crisis is unfolding in the face of ecological crisis, natural catastrophes, and sustainability problems and it is prevailing upon us the idea that humans are just any other biological species. In this historical setting, the apocalyptic/dystopian genre films grow indifferent to the catastrophe of humanity and even celebrating its extinction, as a new beginning for hybrid forms or other species. This paper aims to exhibit the transformation of point of view in genre films, abandoning the lamenting tone in favor of other species. It also intends to exhibit the aesthetic strategies conforming to the shifting tone of these genre films towards a post-human stance. With the new historicist approach borrowed from literary historian Stephen Greenblatt, the paper will try to link the shifting tone of genre films with contemporary collective anxieties. Through analyzing the voice of narrative and its visual language, this paper will be an attempt to lay out significant characteristics of post-human aesthetics in apocalyptic/dystopian genre films.

Index terms | *Post-human; genre cinema; dystopian films; apocalyptic films; eschatological narratives.*

POST-HUMAN AESTHETICS OF APOCALYPSE

At times of crisis, eschatological narratives tend to proliferate and flare like symptoms during allergy season. In the form of dystopias, horrors, catastrophic or apocalyptic films, these narratives on ultimate destiny of humanity or the end of the world, reflect our contemporary anxieties, fears, and concerns. In the face of an acute, and inevitable struggle of life and death with a tangible foe, and a prospect for better days ahead, moral narratives accommodating rightful heroes help us to confront our anxieties. However, uncertain, pervasive and chronic crises, lacking a certain nemesis, and accompanying pessimistic future projections, lead to despair and cynicism.

While we are experiencing a simultaneous political economic crisis, ecological crisis and a deeper crisis of existence, our apocalyptic narratives and dystopias are deviating from anthropocentric point of view. On one hand, feeding from sores of global capitalism, social inequalities, migration waves, and rising reactionary populism, a crisis of democracy is sprawling, and it is leading to illiberal or authoritarian regimes, and to one-man rules trivializing democratic institutions and civic rights. On the other hand, a moral and existential crisis is unfolding in the face of ecological crisis, natural catastrophes, and sustainability problems. The unpredictable outcomes of biogenetic revolution, the advancements on artificial intelligence, and a raising awareness of animal rights are increasingly habituating us to the idea that humans are just another biological species living on Earth. In this conjunctural setting, apocalyptic/dystopian genre films are growing indifferent to the catastrophe of humanity, and even celebrating its extinction, as an opportunity for a new beginning.

This shift is very symptomatic in terms of marking a Posthumanist turn in popular culture. Posthumanism is an epistemological critique of the modernist definition of humanity and humanist ideologies, and an ontological reconsideration of the very definition of human. It has inherited the critique of Enlightenment and modernity which goes all the way back to post war era when the critical thinkers, Adorno and Horkheimer coined the term “dialectic of enlightenment.” According to critical thinkers, Enlightenment and its call for a universal idea of Humanity was bound to be totalitarian and its rationality was unavoidably self-destructive.¹ Thus, Fascism was not a deviation but a possible trajectory of Western rationality. Through the same logic, Walter Benjamin concluded that “there is not a document of civilization which is not at the same time a document of barbarism.”²

It was Michel Foucault, who distilled the critique of Enlightenment and modernity to achieve an epistemological critique of the concept of humanity. According to him, the idea of universal humanity –although subject to change during the course of history– was suppressing plurality and ignoring heterogeneity in favor of a totalitarian definition of humanity.³ Foucault, in *The Order of Things* reminded us that “man is an invention of recent date” and he warned, or rather heralded that perhaps humanity as a concept or a category is nearing its end: “Man would be erased, like a face drawn in sand at the edge of the sea”.⁴ Doubtlessly, after Foucault, the idea of universal humanity has come under fire for being normative, totalitarian, colonialist, sexist, speciesist and bearing other forms of exclusivism.

While critique of modernity in critical theory and later in postmodernist thought laid the theoretical ground for Posthumanist turn, thanks to apprehensions concerning technological advancements in bio genetics and artificial intelligence, ontological reconsiderations of human grew up gradually. Being prone to diseases, having limited

intellectual, physical, emotional skills or a limited life-span, human kind has biological inadequacies, therefore it is bound to be displaced by its own creations of supermen; biologically enhanced humans, machine-human hybrids, or cyborgs.

Furthermore, signs of ecological crisis, and problems of “sustainability” -a term defining our relation with nature in business management terminology- backed up a contemporary crisis narrative where human beings are a doomed species. Tightly linked with a new morality raised on animal rights awareness and veganism, this narrative had created a reactionary stance with a certain misanthropic tone. Questioning the central role of humanity in the universe in favor of other species –this narrative is in a way surpassing the Foucauldian questioning of universal humanity. But it also lays the blames of global capitalism and its late neoliberal mode on the entire human kind. Accordingly, we are a greedy species, exhausting and contaminating the Earth. No wonder if the apocalypse is near, and a possible extinction of humanity would be an auspicious beginning for the rest of the universe.

Slavoj Žižek attempts to link this apocalyptic narrative to the global capitalist system instead of a formerly denied universal conception of humanity. As the repercussions of global capitalism, he mentions “the ecological crisis, the consequences of the biogenetic revolution, the imbalances within the system itself and the explosions of social divisions and exclusions”.⁵ Then he uses the Kübler-Ross model which is popularly known as the five stages of grief.⁶ Accordingly, society’s first reaction to these repercussions is “ideological denial, then explosions of anger at the injustices of the new world order, attempts at bargaining, and when this fails, depression and withdrawal set in. Finally, after passing through this zero-point we no longer perceive it as a threat, but as the chance for a new beginning.”⁷

Some recent apocalyptic films putting away the pessimistic tones of dystopian narratives and embracing the apocalypse as a new beginning call to mind that we already passed beyond the zero-point. *The Girl with All the Gifts* (Dir. Colm McCarthy, 2016) cherishes an apocalyptic story with a utopian discourse and aesthetics. With a hazy atmosphere and warm filter colors, it portrays a blazing apocalypse where a mysterious fungal disease eradicates humanity as we know it. Airborne fungal spores transform human beings into flesh-eating “hungries” whom are stripped from reason, emotions and the notion of language. A small group of hybrid children however, born to diseased mothers, crave human flesh but they still retain the ability to think, feel and communicate. In this dystopic environment where airborne fungal spores forbid humans to exist, only those hybrids immune to disease have the ability to survive. The heroine of the story, the little girl named Melanie, performed by Sennia Nanua is not only a hybrid of humans and “hungries”, but also the Europeans and the migrants, civilization and “the barbarians”. With all the gifts and abilities she possesses, she embodies the hope of a posthuman life on earth.

On one hand, we are disturbed and worried by the idea that liberal democracy, national and international institutions, and civilization, which we owe to the legacy of Enlightenment, and modernity may come to an end. On the other hand, we are convinced that because of the flaws of the way humanity organized itself, and the way humans interact with their environment, it ought to happen already. That’s why we spurn the overzealous attempts of the scientist, and her means (cruel experiments on hybrid children) to save humanity. Throughout the story, Melanie comes to terms with herself and moves from being a lesser being, a mongrel which fails to meet what

requires to be fully human (in this case, being able to curb one's appetite and not to eat other humans), to self-realization as a different species, a non-human, which has more capacity, which is more fit to survive. Instead of consenting the humans, self-consciousness led Melanie to act for herself, and her kind (*für sich*, in Hegelian/Marxist terminology), as a conscious actor in history. Why then would she loyally sacrifice herself for the continuation of another –weaker- species?

The assumed audience is also convinced that Melanie should not be handed over to the selfishly humanist doctor. We resent the scientist's indifference to the right of hybrid girl to live. She should be saved from being dissected by the scientist, even though the only cure to save the human race from absolute extinction is dependent on the vaccine to be produced through her sacrifice. The readiness of the assumed audience here, to accept non-humans' rights to live at the expense of the entire human race is stunning. This is an eschatological narrative with an assumed audience entirely disregarding the extinct of human beings.

Here the vaccine works as a key plot device utilized as a means of humanity's salvation and Melanie's self-realization. Taking into account the alarmingly growing skepticism about vaccination and modern medicine, this device works perfectly to persuade the audience that the scientist is the villain in the story. After all, we do not obediently listen scientists any more. Anti-vaccine movement is gaining momentum, along with a wider, anti-intellectualist populist trend, and a new fundamentalism which deploys a vulgarized Foucauldian critique of modernism, particularly through the notions of "power/knowledge" and "disciplining of the body" as an entrenching tool to defend a reactionary skepticism about science and modern medicine.

Once the menacing scientist has been eliminated, Melanie's teacher remains as the sole specimen of the battered humanity. We see her stuck in an airproof cabin, an old mobile lab which looks like an animal cage in a zoo, or a prison cell. She cannot leave the cabin since the air is not respirable for her any more. Behind the cabin's window, she tutors the children of the new kind. Her life will end when her limited resources run out. But the wild children will form a new society. In the final scene, we see the hybrid girl as her eyes are sparkling with hope. The camera captures her smiling, from a lower angle like in utopian and optimistic early Soviets films. In response to her tutor, she confidently delivers her double meaning line: "There'll be lots of time," enough to listen stories from the last remnant of the antiquity and to build a new future. The sun illuminates the ruins of the city above a clear sky for the first time through the film. The haze seems to be gone, promising the upcoming hopeful days for a new society and we witness that hope exists in the absence of us.

War for the Planet of the Apes (Dir. Matt Reeves, 2017) concludes in a similar manner. A viral disease increases the intelligence of the apes while it kills most of the humans. Even in the face of total extinction, humans do not cease wars. They fight against apes and also against each other. At the end of the skirmish between two warring parties, an avalanche triggered by the victory cheering of soldiers consumes the last remnants of the humanity while apes manage to climb up to tree tops and save themselves from the snow slide. What brings the total annihilation of human beings, the wrath of nature, as a response to the imprudent cheers after a Pyrrhus victory, deters the assumed audience from lamenting the extinction of humanity. The film does not linger around the carnage. It promptly abandons the suffocated fellow human beings and chooses to focus on the ape survivors. Next scene depicts an ape exodus, which brings them away

from freezing winter scenery to a temperate lush valley. We watch the sun illuminates the land with warm tones, for the first time in the film, timely – as it happened in *The Girl with All the Gifts*- right after the disappearance of humans. Planet of the Apes series is considered by critics as a liberal allegory of racial conflict which also has been built on anxieties concerning Cold War and nuclear apocalypse. Nevertheless, what has started in 1968 as a dystopian and apocalyptic film series, eventually abandons the dark and pessimistic approach on apocalypse and human downfall. It rather embraces a utopian tone, celebrating the effort of the apes, to form a new society and to claim the earth deprived from human beings as their home.

Conclusion

What could be assembled under Posthumanist discourse exists in several strains. It has been established by the epistemological questioning of the universality of humanity in Western thought. Questioning the boundaries between humans and the animals,⁸ the “entire field of the living, or rather to the life/death relation,”⁹ added an ontological aspect to this reconsideration. The ontological questioning is frequently accompanied by the need to stress the biological inadequacies of the human, to conclude “the decentering of the human in relation to either evolutionary, ecological, or technological coordinates.”¹⁰ Y. N. Harari’s recent best-seller *Sapiens* which accounts a biological-determinist history of human successfully lodges in this strain and bridges it with futuristic narratives. *Sapiens* concludes with the demise of human due to genetic engineering, cyborg engineering and engineering non-organic life practices, a typical motif in posthuman literature, which goes all the way back to Frankenstein.

Futuristic narratives depicting a post-human world in literature and popular culture constitute a third strain with an emphasize on hybridity through all kinds of accented humanities and particularly the cyborg figure; a hybrid of machine and organism which blurs the boundaries of what it means to be human, and threatens the idea of “the original unity”¹¹ or “the ontological hygiene”¹² of humanity in western tradition.

These three strains exist for a while now. Perhaps what’s new in the landscape is a substantial and persistent crisis of global capitalism, the growing indignation it creates and an invasive populist wave absorbing the resentments like a black hole. Without a prospect of an imagined alternative to the dominant mode of production however, be it in the form of a utopia or a political program, the critical stance itself is doomed to end up in despair and grow politically sterile, cynical, nihilist and much worse, misanthropic. In other words, it channels the anger emanated from global capitalism towards society, and eventually the entire human kind. In the face of systemic crisis, we are urged to discard human centered ideologies, abandon the narrative of great humanity, and taint the humanist ideals either as naïve and outmoded, or straightforwardly barbaric. Let alone lamentation, the odd celebrating tone of apocalyptic films should be related with this languish. The effectual critique of humanist ideologies took down their intrinsic hope and utopian thought, too. Jameson quotes someone saying “it is easier to imagine the end of the world than to imagine the end of capitalism.”¹³ Maybe to reverse this suggestion, we need new utopias before facing the end of the world.

Özgür Yaren is an associate professor at Ankara University. Yaren lectures on film and photography, and his research interests include migrant cinema, Turkish cinema, film, and aesthetics. Recently he has been exploring Turkish exploitation cinema, and he plans to focus more on taste, and cultural legitimacy. His articles have been published in prominent journals on Film and Cultural Studies fields such as *Camera Obscura*, *Kosmorama*, *Journal of Popular Culture*, and *European Journal of Cultural Studies*. He is a board member of the SANART Association of Aesthetics and Visual Culture and a member of the European Sociological Association.

HOW TO PRODUCE NOVELTY? -- CREATING, BORROWING, MODIFYING, REPEATING AND FORGETTING, THE PROCESS OF CONTEMPORARY FASHION AESTHETICS

Abstract | Fashion is an important modern culture system. Its instant change makes novelty the core of fashion. However, the way that fashion produces novelty is not just creating something new. It is a complex transition process from creating to borrowing, from modifying to repeating, and finally forgetting. This two-part paper studies how the method that fashion produces novelty changed since the 20th century, and how the standard that we use to judge the novelty changed. The first part analyses some important fashion theories, and discusses the meaning of novelty based on Campbell's theory about 'the new', 'the innovation' and 'the novelty'. The novelty is a judgement about our subjective experience, it indicates something that we never experienced before. Thus, fashion is not about innovation, but the feeling of strangeness. The second part focuses on different methods of producing novelty in fashion history. In the early 20th century, designers, such as Chanel, Schiaparelli and Madame Vionnet, created some items brand new to lead the fashion. Then, as the pace of fashion change accelerated, the speed of creating cannot keep pace with fashion change easily. Designers started to produce novelty by borrowing foreign elements and modifying details. And as the pace of fashion continued to accelerate, when the borrowing and modifying cannot follow the pace, designers had to produce novelty by repeating what was in fashion a long time before. Hence, fashion became cyclical. And the fashion circulation would become shorter and shorter as the repetition accelerates. At this stage, the novelty is not based on whether the item is brand new, but whether we still remember it. And in the future, maybe the repeating of the old cannot make the feeling of strangeness any more since the pace of fashion change is too quick to give enough time for the new to become old and being forgotten. At that time, the novelty will not be based on whether we still remember it, but whether we want to forget it. Therefore, with the acceleration of fashion change, the way fashion produces novelty went through a process as follow: creating something brand new, borrowing foreign elements, modifying details, repeating the forgotten old, and forgetting what is still new. And the novelty went through a process from external determined to internal determined, and moving to the direction of self-deception determined.
