FASHION AND NOVELTY

Fashion is an important modern culture system. Without being limited in western world, fashion exists almost everywhere. Without being limited in the field of clothes and accessories, fashion dominates different areas from personalized art creation to serious scientific studies¹. It is well accepted that fashion is a system of constant change. What is in fashion today might be out of fashion tomorrow. In other words, fashion is always "becoming", it changes because of its need for change. Due to its transience, instability, levity and superficiality, some scholars describe fashion as an

unfashionable research topic, especially in philosophy which has aimed to find the absolute, the essence of our world since a long period². However, there are indeed some eloquent discussions about fashion in various disciplines, such as sociology, psychology, art history, philosophy and aesthetics³.

Given those studies, it is evident that one of key features of fashion is newness, since the newness is not only the result of constant change, but also the motive for constant change. It is the central element of fashion, and has built the aesthetics of newness. Kant believed what makes fashion popular is novelty⁴. Tarde defined the age of fashion as the age when the new is supreme⁵. Benjamin argued that fashion would bring the newest creations in each season⁶. In Lefebvre's reading of Baudelaire, fashion is "the most ephemeral expression of innovation for innovation's sake"⁷. This definition echoed Robinson's writing that fashion "is the pursuit of novelty for its own sake"⁸. And for George Darwin, the son of Charles Robert Darwin, fashion is "the love for novelty"⁹. Thus, just like Svendsen summarized, "practically all fashion theorists stress 'the new'"¹⁰.

However, it is important to note that the "newness" can be used in different dimensions. And not all of those meanings are the equivalent to the "newness" in fashion's change. According to Campbell, there are three different kinds of "new". The "newly created" or "fresh", the "innovative" or "improved", and the "novel" or "unfamiliar". The "newly created" or "fresh" is opposite to the "old". It is only used in the dimension of time. For example, in the sentence "I bought a 'new' dress yesterday", the "new" has no relationship to the style, the colour, the fabric, or the function of the dress. It only indicates a dress just bought or newly produced. In modern society, almost everyone would buy "new" things or "fresh" things, such as food, clothes, and other daily necessities. Nonetheless, this type of consumption is not following fashion, it is just the act of covering our basic needs. The second meaning of "new", the "innovation" or "improved", is used in the dimension of efficiency and capacity. It is relevant to the product's quality. For instance, iPhone X is newer than iPhone 7 because of more pixels. The "new" in this sense is closer to fashion than the "new" as "newly created", because it has been beyond our basic needs. However, it is still not the "new" which motivates fashion's change. The intention of "innovation" is to improve the function pragmatically, far from being innovation "for its own sake". The third meaning of "new", the "novel" or "unfamiliar", is used in the dimension of personal experience. Regardless of whether a product is newly created or worn out, whether it has been improved functionally or not, if someone has never seen this product before, it is a novel product for him/her. The "novelty" is the "newness" that embodies in fashion. It is relevant to the individual's feeling of unfamiliar, rather than to any objective standards. Therefore, it is "for its own sake". And to be more precise, the aesthetics of fashion is not just the aesthetics of newness but the aesthetics of novelty, the aesthetics of the sense of unfamiliarity.

Whereas, the novelty would be exhausted easily during consumption as we could become familiar with the commodity in a very short time. It can be argued that the novelty would disappear at the moment of a purchase being made¹¹. Thus, fashion has to endlessly produce "new" novelties to maintain its own existence. Undoubtedly, the most direct method of producing novelty is designing entirely new styles. But actually, there are multiple approaches to achieve the aim. With the development of fashion culture, the dominant method for producing the sense of novelty has also been changed from creating the newness to forgetting the newness.

METHODS OF PRODUCING NOVELTY

Creating and Borrowing

From late 19th century to early 20th century, in the early stage of modern fashion system¹², the most common method to produce novelty was to create some items entirely new to embrace the new millennium, or to borrow foreign elements which were unfamiliar for most fashion customers at that time. And it's worth noting that, the borrowing of foreign elements is not just in terms of geography, but also of technology, discipline, gender, etc.

Paul Poiret's Orientalism design is a typical example of both creating and borrowing geographically. On the one hand, freeing women from corsets was a creation in some degree. On the other hand, the eastern style harem trousers, sack dresses and hobble skirts had brought exotic atmosphere into western daily life. Both of them could bring the feeling of unfamiliar. Chanel's design is another example of both creating and borrowing. Although short hair styles, jersey knit suits, straight-line skirts were all new creations, they also can be regarded as borrowing from masculine styles. Vionnet's famous bias cut gowns were the creation in technology, as well as the borrowing from Greek culture. Schiaparelli borrowed inspiration from artist Dali, and created remarkable Lobster Dress and Shoe Hat. The collaboration with artists, or in other words, the borrowing from artworks, can also be found in many other designs, such as Robe Mondrian, the UT collections of Uniqlo.

Undoubtedly, creating and borrowing are the most thorough methods to produce novelty, since the novelty they produced is virtually external determined, which means we can find some objective criteria for evaluating the degree of novelty relatively. However, as the pace of fashion change is increasingly accelerating, the creation in a strict sense would be nearly impossible. Even those pioneering designers mentioned above had borrowed foreign elements to varying degrees. Hence, comparing to creation and borrowing in a large-scale, modifying and repeating the old form would be more efficient to produce the sense of unfamiliarity.

Modifying and Repeating

After the Second World War, with the rise of ready-to-wear industry, fashion system circulated much faster. However, the fashion change at this stage was not about creating brand new items. On the contrary, since some classical designs were confirmed, fashion companies would maintain their styles or signatures to protect the brand identity. Many designers would insist on their basic elements, such as the hourglass silhouette of Dior's new look, the straight cut lines of Chanel's suits, the loose shape of Issey Miyake's designs, etc. Thus, in each new season, what is new is more about unfamiliar details such as different colours, fabrics, pockets, buttons, rather than a whole novel look. Even those subculture fashions which seem like entirely new creations would not change dramatically every year. By modifying details of previous designs, we could readily promote the change of fashion.

Repeating is another efficient way to produce novelty. Since the sense of novelty is determined by our personal experiences, we would feel unfamiliar with those old-fashioned things again as time passed by. As Simmel said, like all phenomena, fashion "tends to conserve energy", and the most economical means to endeavour for change is "repeatedly returns to the old forms" which have been forgotten, hence, fashion became cyclical¹³. There are always some once old-fashioned items re-staged as a new fashions. Although fashion culture can be regarded as a game of reincarnation, it does not mean that fashion would repeat the old form accurately. Repeating and modifying always stand shoulder to shoulder. Fashion "wilfully cites any style from

the past in a novel incarnation”, and the appearance of fashion “is renewed by using past elements”¹⁴. New fashion is like a familiar stranger, it is always existing in the in-between space between familiar and unfamiliar.

Taken Svendsen’s words, the creating and borrowing is “a logic of replacement”, while the modifying and repeating is “a logic of supplementation”. And from late 20th century, the “logic of supplementation” has become the dominant logic of fashion change ¹⁵.

Forgetting

From another perspective, it can be argued that, in the “logic of supplementation”, the speed of fashion change is not only relevant to the efficiency of citing from the past, but also to how quick we can become familiar with those unfamiliar, and then forget those familiar objects. Thus, the logic of modifying and repeating might evolve into the logic of *forgetting*. From creating to forgetting, the novelty in fashion has transformed from external determined into internal determined, and moving to the direction of self-deception determined. There are no objective criteria we can use for differentiating the old and the new anymore. In the future, we might have to deceive ourselves into believing “I have never seen this before”, or “it is different” in order to preserve the feeling of novelty, and to maintain the existence of fashion.

It is widely accepted that in the context of consumerism, the circulation of fashion is constantly speeding up. This implies that we can easily forget the fashion of yesterday. It is not because we suffer from amnesia, but we have unconsciously made the choice to forget. On the one hand, dazzling commodities would accelerate the rate of forgetting as novel items emerging every day. Unfamiliar novel things are always nearby to induce us to abandon what we already own. On the other hand, the media also has the power to alter our personal judgements of novelty. In tradition society, our judgements of novelty are more about the object itself. For example, a dress is novel indicates that a dress is *physically* different. However, in modern society, or consumer society, the reference of our judgements is not only physical features, but also symbolic significances. The novelty is not only the characteristic of things, but of meanings. As Baudrillard said, fashion is the “production of meaning”, it is driven by meaning ¹⁶. For instance, baggy jeans could become a novel design simply by changing its name to boyfriend jeans, or dad jeans in recent two years, but actually, the shapes, the cut lines, the fabrics, the details all remain unchanged virtually. Wearing baggy jeans just indicates casual, leisure and comfortable, while the boyfriend jeans might imply gender equality, and dad jeans signify vintage styles, dedicated to work, or even family-centred.

However, those meanings or names are not connected with specific items eternally, combinations of things and meanings would fade with time. Almost all of those meanings are temporary interpretations made by mass media such as fashion magazines, advertisements, movies, social media, etc. They persuade us to believe all we have have been old, and there are always something different waiting for us ahead. They urge us to forget those we bought yesterday, and to buy something new today. They have stimulated our desires for novelty, and constantly produce new novelty by elucidating to satisfy our desires.

CONCLUSION

The aesthetics of fashion can be named the aesthetics of novelty in some degree since the novelty is concurrent with change. As discussed above, with the acceleration of fashion change, the method of how fashion produces novelty has gone through a process as follows: creating something brand new, borrowing foreign elements, modifying details, repeating the forgotten old, and forgetting what is still new. And the

novelty has gone through a process from external determined to internal determined, and moving to the direction of self-deception determined. At the early stage of fashion, the reason why we have the feeling of novelty is that we see something unfamiliar, but now the reason would be we have forgotten what we saw before and see some meanings unfamiliar.

However, it is vital to note that this process is a *logical sequence* rather than a *temporal sequence*. On the one hand, even today fashion designers are still able to produce novelty by creating, especially with the help of some new technologies and materials such as 3D print and high-tech fabrics. On the other hand, modifying and repeating are also methods used in the early stage of fashion system. Although it is uncertain that how far fashion system could go, it is certain that the logic of fashion has changed in a sense with the development of fashion's change.

LACAN AND MINIMALISM

Abstract | This paper questions about the relationship between Jacques Lacan's theory of image and the contemporary art in 1960s. Lacan's argument on image is represented by four chapters in Seminar XI titled 'Of the Gaze as *Objet Petit a*.' In these chapters, Lacan analyzes the effect of the painting as the dialectic of the eye and the gaze. Lacan only deals with the figurative painting such as Hans Holbein's *Ambassadors*. However, the flow of the contemporary art in America, at the time Lacan progressed Seminar in Paris, can be named as the decline of Greenberg's Modernism and the appearance of Minimalism. How can Lacan's theory have a power of explanation for his contemporary art? According to Lacan, human being's seeing is the split between the eye and the gaze because human being is always a subject. The eye's seeing is signifying and The gaze always escapes that signifying chain. Image, as an object of seeing, has the same structure. There can be the gaze in the typical image. Also, there can be the minimal part which can be signified in the image provoking anxiety. Lacan mainly explains his opinion using the painting. The representative painting with a fine command of perspective shows the position of the eye. On the other hand, Expressionism, Surrealism, (and most excellently) Goya's painting capture the gaze. The painting which is judged to be one success by Lacan is the painting functioning as the dialectic of the eye and the gaze. This painting reveals the fact that the subject's seeing constructed around the gaze. Lacan's example always has a 'human' figure. Leaving the ambiguous expression 'human' aside, Lacan only analyzes figurative paintings. However, the tendency of his contemporary art can be named as the decline of Greenberg's Modernism and the appearance of Minimalism. Abstract Expressionism and Post Painterly Abstraction left the major position and the practice escaping from that tendency attained eminence in contemporary art. In this context, this paper analyzes Lacan's contemporary art through Lacan's theory of image. This paper especially focuses on the functioning of Minimalism works as the blank provoking the subject's anxiety. This is because the equivalence of all possible meaning in Minimalism can be stated reversely as the impossibility of the meaning itself.

Index terms | *Jacques Lacan; Modernism Abstract Painting; Minimalism; Gaze; Anxiety.*

INTRODUCTION

Minimalism has been considered a precursor to the postmodern art movement.¹ It is because Minimalism rejects the existing semantics of art in three ways. First, Minimalism rejects the representational relationship between the artwork and the external object. Also, Minimalism refuses the artist as the absolute source of the meaning of art. Therefore, Minimalism is regarded to ensure all possible meanings based on the appreciation of art.

However, Minimalism failed to escape from the objecthood. It became a trend of sculpture art. Besides, Minimalist did not relinquish the transcendental subjectivity of *author*.² Last but not least, there is more to the appreciation of Minimalism than the equivalent coexistence of all possible meanings. The anxiety derived from the repetition of meaninglessness is the other side of the peaceful coexistence. To clarify this argument, this paper examines the theory of *image-screen* insisted by Jacques Lacan in *Seminar XI* and rediscovers the significance of Minimalism from the appreciation of the artwork.

LACAN AND MINIMALISM

Image-Screen Theory of Lacan

In *Seminar XI*, there is a chapter named “What is Painting?” In this chapter, Lacan changes the question to “What is seeing?” in other words, “How is the subject of seeing is constructed?” because the seeing of human as a subject is not the same as the physiological mechanism of the bodily eye or the geometrical optical trace of light.

Lacan describes the procedure of subjectivation by the concept of the Imaginary, the Symbolic, and the Real. The Real is the original state of existence for which image or language cannot substitute. The life of human being is not able to stay in this step because human being lives in the reality woven by the existing order, the Symbolic. Therefore, the pre-symbolic real can only be presumed for the subject and the reality of the subject is constituted with destroying the Real. The status of the subject is the acquired meaning at the expense of the original existence. The subject is the split itself between the meaning and the existence.

Equally, the seeing of the subject in the scopic field is the split between *the eye* and *the gaze*.³ The eye can be represented by the Cartesian thesis, “I see myself seeing myself.” In other words, the eye corresponds to the consciousness of modern subject coordinating itself and the world transparently. The straight eyeline of the Renaissance perspective is a concrete example of the eye.

Though the eye is not all of seeing and it is even far from the truth of seeing. The eye seeing everything clearly without any barrier is nothing but a phantasm. This deceptiveness of the eye is already predicted at the mirror stage.⁴ The identification of the fragmentary body with the coherent image of the body is fundamentally misconception. The self, *I*, made this way is only an effect of image.

For the subject, the reveal of the eye’s truth is a very embarrassing experience. Lacan explains this experience by introducing an anecdote.⁵ When he was on a fishing boat, the fisherman and he noticed a small can out on the waves. The man said to him, “You see it? Do you see that can? Well it does not see you!” Lacan emphasizes the unpleasant of this experience. He was anxious because the can him with reflecting light

while his eye was not able to see that can properly.

The gaze is something escaping the eye and reflected by the thing like the light from that can. The gaze is the other side of the eye which is always omitted.⁶ The eye supports the reality of the subject while the gaze indicates the hollowness of that reality. Therefore, the gaze can motivate the movement for the outside of the symbolic reality, the Real. In this respect, Lacan defines the gaze as *object petit a* in the scopic field.⁷

In conclusion, the argument that the seeing of the subject is the split between the eye and the gaze means that the seeing of the subject is between the symbolizing and the remainder outside of the symbolic order. As mentioned above, the core of this seeing is not the eye but the gaze.⁸ The gaze threatens the status of the eye and provokes the anxiety. To avoid this anxiety, the gaze should be tamed. However, the gaze cannot be tamed entirely because it is reflected from the Real, not another person. Therefore, the seeing of the subject is the dialectic of the eye and the gaze. Also, the effect of image, object of seeing, is formed between taming the gaze (relief) and capturing the gaze (anxiety).

As a strategy of taming the gaze, image has “Apollonian relief effect.”⁹ The image which can show this effect most clearly is the representative painting based on the symbolic form such as perspective. For example, Memento mori paintings replaces the death as an event with the doctrinal question, “How should we die?” Although Memento mori literally means “remember to die” or “remember you must die,” death is refined and becomes a means to live in Memento mori painting. The real state of death is forgotten and the anxiety from the meaninglessness of death is filtered.

On the contrary, some images appeal to the gaze plainly.¹⁰ Lacan mentions the exemplary Expressionists such as Edvard Munch, James Ensor, Alfred Kubin and the Surrealist like André Masson. Above all, Lacan emphasizes that it was Francisco Goya who excels at capturing the gaze.¹¹ The effect of images created by these painters is the anxiety itself. The approaching of the Real does not represent the sense of freedom but present itself as anxiety because the Real, the blank of the Symbolic, threatens the secure status of the subject.¹² For example, Goya’s *Saturn Devouring His Son* (1819-1823), one of his *Black Paintings*, shows the anxiety from the impending of death itself. (Figure 1) In this painting, the attempts to signify death is frustrated and the anxiety of meaninglessness is amplified by the gaze from death.

In sum, image is a veil to cover the gaze and simultaneously a layer where the gaze can be projected. Lacan thus defines image as *image-screen*. These two effects of image-screen coexist in most images. Because the veil conceals something beyond it and therefore indicates the fact most strongly that there is something beyond it. Furthermore, Lacan suggests the ethics of new subjectivation through the analysis of the dialectic of the eye and the gaze in artworks. Image can reveal how deceptive the shield of the eye to relieve the anxiety and can lead the subject to aware the lack of existence which was abandoned for subjectivation/symbolization.¹³

Minimalism of Image-Screen

Art in 1960s can be represented by the decline of Greenbergian Modernism and the appearance of Minimalism. Abstract Expressionism and Post-Painterly Abstraction decayed and the practices escaping from those movements started to stand out. How can the theory of Lacan be related to this flow of his contemporary art?

Greenbergian Modernism insisting anti-representation before Minimalism criticized the art which is easy to appreciate (ex. Academic Realism) as Kitsch and advocated the art which is difficult to appreciate (ex. Abstract painting).¹⁴ Therefore, Greenbergian Modernism can be regarded to represent the gaze's triumph over the eye. However, Greenberg emphasizes on the *pure* meaning of painting which only can be derived from the inner form of painting. Greenberg supports the transcendental subjectivity like genius as the source of meaning because it is who can decide the composition of artwork. Greenberg imports the Kantian history of mind into the art history. The purity of the modernist's eye is made by filtrating pollutant which cannot be captured by that eye, the gaze. If the pollutant, the gaze, encroaches upon image, it will be treated as delusion or pointless things and thus will be excluded.

The aim of Greenbergian Modernism, the ultimate reduction to medium itself, is utopian. The blank canvas is a kind of utopia at the end of Greenbergian logic but the meaning of existence of Greenbergian Modernism painting only can be assured when that utopia does not come.¹⁵ Consequently, Minimalism becomes to represent the collapse of Greenbergian Modernism and even the end of art itself because Minimalism seems to take its medium itself as the artwork.

As a fatal blow on Greenbergian Modernism, Minimalism refuses not only representation but also the spirit of artist as the source of the pure meaning. There is no basis for the univocal meaning when the object itself becomes the artwork and the artist as an author disappears. With Minimalism, the meaning of art disperses endlessly. Then Minimalism provokes the anxiety such as Goya's paintings?

The viewers accustomed to the appreciation process of Greenbergian Modernism paintings may feel like they are standing in the middle of a vast desert without any idea which way to go. On the one hand, it is because the form to see into is greatly constricted. There is nothing for the pure eye to contemplate. On the other hand, the cause of that sense of loss is the extremely expanded form of Minimalism. Most works of Minimalism repeat a unitary figure and their repetition seem endless. Even if the works do not have any repetitive figure, Minimalism makes its presence as it is and therefore involves the time and the space surrounding it.¹⁶ It means the works can change continuously. In this sense, the meaning of Minimalism is regarded to depend on the experience of the viewers. Then Minimalism can be another strategy to ensure the status of the subject with the authority to decide meaning more expansively and more actively.

However, the other side of the equivalence of every possible meaning is the hollow repetition of meaninglessness which nullifies every possible meaning. In some appreciation of Minimalism, meanings cannot coexist peacefully. The possible meanings fight against each other and they are dismissed by each other repetitively.¹⁷ See the cube made by Tony Smith in 1962 (Figure 2). This is a black steel box with oiled finish, 182.9cm in each dimension. The dimensions were determined by the size of the human body with arms and legs outstretched. Smith wanted it to be neither "a monument" (which can dominate the viewer) nor "an object" (which can be dominated by the viewer).¹⁸ Even though there can be room for argument whether Smith's intention is achieved by the dimension itself, the title of this box make the distinct tension between the profound meaning and the endless meaninglessness. The title is *Die* and this title can have at least three meanings. First, it means die casting, one method of the metal casting process. Secondly, it may allude to one of a pair of dice. The last and the most

general meaning of the title is the verb *die* which means to cease to live. The size of the cube infers that of a coffin. Black surface of the cube also leads the viewers to the last meaning. However, the form of cube is too simple to relate any symbolic meaning. Therefore, the abyss of death becomes the flat surface of the cube and *Die* seems hollow despite its weighty material. In the Symbolic, the verb *die* occupies the same place. *To die* is the existential event ahead of any meaning of *death* that spans from the medical examination to the religious dogma. The symbolization of death is the avoidance from a verbal form of death. While Memento mori paintings tries to tame death and Goya's *Black Paintings* captures the approach of death, Smith's cube takes the viewers to the cliff where the symbolization of death is pressed.¹⁹

CONCLUSION

Image-screen theory of Lacan is used in diverse field of contemporary art, especially in post-modernism art practices Minimalism signalled. Minimalism has been considered to destroy the logic of Greenbergian Modernism and to open up the possibilities for the coexistence of all meanings. However, there is always the other side of the equivalence of every possible meaning ensured by Minimalism, the repetition of meaninglessness itself. Minimalism leads the subject to the truth that the symbolization is ultimately impossible rather than restores the subject's authority of affirming every meaning. Lacan's theory explains this double-sidedness of image-screen and leads us to rediscover the significance of Minimalism based on the appreciation of it, particularly the appreciation provoking anxiety.

1 Minimalism is the term with various meanings. In this paper, Minimalism means the specific art practices that made an appearance at the edge of Greenbergian Modernism around New York and Los Angeles. The representative artists of Minimalism are Frank Stella, Carl Andre, Donald Judd, Robert Morris, Dan Flavin, Sol Lewitt, etc. Minimalism tried to rupture the logic of abstraction by attaining the highest reach of abstraction. In this respect, Hal Foster named Minimalism *the crux*. (Hal Foster, "The Crux of Minimalism," in *The Return of the Real: the avant-garde at the end of the century* (Cambridge, Mass.: MIT Press, 1996).

2 It is true that Minimalist declared to reject the status of *author*. It is especially worthy of notice that Brian O'Doherty, artist and art critic in 1960s, requested Roland Barthes to write "The Death of the Author." However, the notion of authority and of originality was reinforced as the artwork became housed in art institution. Miwon Kwon analyzes this current of art focusing on the concept of site-specificity. (Miwon Kwon, "One Place after Another: Notes on Site Specificity," *October* 80 (Spring, 1997), 85-110)

3 Jacques Lacan, *Le Séminaire XI: les quatre concepts fondamentaux de la psychanalyse: 1964*, ed. Jacques-Alain Miller (Paris: Seuil, 1973), 69-70.

4 Jacques Lacan, *Écrits* (Paris: Seuil, 1966), 93.

5 Jacques Lacan (1973), 89.

6 Jacques Lacan (1973), 79.

7 Jacques Lacan (1973), 97.

8 Therefore, Lacan modifies the field of seeing with the expression "scopic (scopique)" rather than visual. According to him, seeing is not the transparent reflection of the world even at the level of the bodily eye. Lacan refers to the theory of Merlau-Ponty and emphasizes that there is some ambiguity in the relationship between the light and the subject of seeing. (Jacques Lacan (1973), 88) This argument also corresponds to the recent discovery of neuro-aesthetics that the visual information processing of brain is close to the active filtering rather than the passive carving. (Semir Zeki, *Inner Vision: an exploration of art and the brain* (Oxford; New York: Oxford University Press, 1999)

9 Jacques Lacan (1973), 93.

10 Jacques Lacan (1973), 100.

11 Jacques Lacan (1973), 79.

12 Lacan defines anxiety as “the signal of the Real” in *Seminar X* of which subtitle is anxiety. (Jacques Lacan, *Le Séminaire X: l’angoisse: 1962-1963*, ed. Jacques-Alain Miller (Paris: Seuil, 2004), 188) In other words, the subject feels anxiety when the symbolization fails and he/she feels to be designated as the outer existence of the symbolic order.

13 Lacan analyses *The Ambassadors* (1533) by Hans Holbein in the lecture on 26 February 1964. This Vanitas painting seems the coordinates of the symbolism and the objects are described realistically. However, the most important thing in this painting is the anamorphous floating ahead of those objects. Viewers cannot aware the fact that the anamorphous is the skull until they leave the room. This skull contrasts to the symbolic objects and its meaning rejects to be fixed. The hollow gaze from the skull disturbs the typical symbolization and therefore causes tension. In this respect, Lacan argues this painting makes the subject as nothing (le sujet comme néantisé) visible. (Jacques Lacan (1973), 83)

14 Clement Greenberg, “Avant-Garde and Kitsch,” in *The Collected Essays and Criticism*, ed. James O’Brian (Chicago: University of Chicago press, 1986-1993), 16-17.

15 For painting, the reduction to medium itself means the blank canvas. It is because even if the painting excludes all figurative elements and pursues abstraction, the minimal element of abstract painting (dot, line and face) still recalls a sense of space. However, Greenberg argues that there be optical illusion which can only been seen into. (Clement Greenberg, “Modernist Painting,” in *The Collected Essays and Criticism*, ed. James O’Brian (Chicago: University of Chicago Press, 1986-1993), 90)

16 In this sense, Rosalind Krauss goes further and interprets that “the ambition of minimalism was, then, to relocate the origins of a sculpture’s meaning to the outside, no longer modelling its structure on the privacy of psychological space but on the public, conventional nature of what might be called cultural space.” (Rosalind Krauss, *Passages in Modern Sculpture* (New York: The Viking Press, 1977), 270)

17 Criticizing Greenberg’s Modernism theory, T. J. Clark defines both Modernism Abstraction and Minimalism as the practice of negation after the loss of the representational object. Clark argues that the object of art is always a composition made by social needs and therefore the art to capture the decisiveness of that composition has no choice but to lose its object and its depth. (T. J. Clark, “Clement Greenberg’s Theory of Art,” *Critical Inquiry* 9 (September 1982), 154)

18 Tony Smith, *Not an Object. Not a Monument*. (Steidl, 2008). It is also the principle Donald Judd and Robert Morris argued in their writings. Morris refers to Smith’s answer to a question. (Robert Morris, “Notes on Sculpture I,” *Artforum* 5 (October 1966) in *Minimal Art: A Critical Anthology*, ed. Gregory Battcock (New York: E.P. Dutton, 1968), 228-230)

19 Similarly, George Didi-Huberman also interprets Tony Smith’s works starting from the fact that Smith’s cubes look like tombs. Didi-Huberman develops his interpretation with the reference to the literature of James Joyce, Freudian concept of symptom and the thought of image by Walter Benjamin. However, his interpretation of Freud’s theory and his thought on the status of image are different from Lacan. (Georges Didi-Huberman, *Ce que nous voyons, ce qui nous regarde* (Paris: Éditions de Minuit, 1992))

Soojin Ahn is currently a Ph.D. student in Aesthetics at Seoul National University (SNU). She received B.A. degrees in Aesthetics and Business Administration and M.A. degree in Aesthetics from SNU. Her M.A. thesis, titled “Art and Masochism: through masochism theory of Freud, Deleuze, and Lacan,” reconsidered Feminist Art theories in 1990s which defined the abusive Body Art as ‘Masochistic Art’ based on Masochism theories of Sigmund Freud, Gilles Deleuze, and Jacques Lacan. She is also interested in diverse ways of archiving artworks and participated in the related projects such as “Digital Archiving of Senior Korean Artist (Lee Kun-Yong).” She plans to focus her study on the contemporary art particularly the practice of minor subjectivity.

MICHELANGELO ANTONIONI'S BLOW-UP AS ABSTRACT ART THEORY

Abstract | Near the end of *Blow-Up* (1966), there is a scene where the painter's lover says to the photographer hero "it's like Bill's painting", on viewing an exaggeratedly blown up blot from a photograph, that he thinks shows a dead body. In general, we can understand this scene signifies the existential loneliness or the inability of communication, as in other scenes from Antonioni's existentialist films. But I think here is another theme, namely that of "vision". As is well known, *Blow-Up* is based on Julio Cortázar's 'Las babas del diablo' (1959). In literary terms, it is very difficult to find similarities between both works, except in their outlines. A lot of critics therefore thought *Blow-Up* was Antonioni's own film with no special connection with 'Las babas del diablo'. But we should focus on the common outlines of the two. Both deal with "vision". The change of seeing through a viewfinder to seeing through a photographic print gives the protagonists a daydream-like experience. Cortázar was an amateur photographer, and Antonioni a film director. If both auteurs reveal their interest in "vision" in the works, we can say that Antonioni follows Cortázar regarding this theme and further develops it through his use of abstract paintings. Antonioni was concerned with differences between the vision of the naked eye and photographic vision and with similarities between the photographic vision and abstract painting. This could be perplexing, because we usually think photographs are more similar to the vision of the naked eye than perspective paintings and that photographs are completely different from abstract paintings. But Antonioni suggests the reverse through the words of the painter's lover. What does this say about Antonioni's understanding of visual arts? I think there is a key to resolve this question in *Blow-Up* itself. One can focus on not only the change of the protagonist's behavior in following the story's development, but also on photographs, abstract paintings, and a landscape painting that appear in *Blow-Up*. Then we would find the possibility that Antonioni thinks photography and abstract painting are tactile or haptic. I will especially focus on the scene where the protagonist touches the dead body. So, this paper examines *Blow-Up* as expressing Antonioni's visual theory, his art theory, and tries to clarify his understanding of "vision", especially his understanding of abstract painting.

Index terms | *Michelangelo Antonioni; Blow-Up; abstract painting; photograph; perspective painting; theory of vision; sense of touch.*

Introduction

Near the end of *Blow-Up* (1966), there is a scene where the painter's lover says to the hero "It looks like one of Bill's paintings" while viewing an exaggeratedly blown-up blot from a photograph that the photographer thinks shows a dead body (fig. 1). In general, we can understand this scene signifies "existential loneliness", as in other scenes from Antonioni's existentialist films. But we can also think that her words literally show similarities between the texture of Bill's Pollock-like abstract painting and that of the blown up photographs. If so, what did Antonioni want to express by the words she used? There is a key to resolve this question in *Blow-Up* itself. When we focus on the photographs, abstract paintings, and landscape paintings that appear in *Blow-Up*, we can find the possibility that Antonioni has a unique thought that photography and abstract painting are similar in visual forms.

1. "The rays of light" and "the line of sight"

As is well known, *Blow-Up* is based on Julio Cortázar's 'Las babas del diablo' (1959). In literary terms, it is very difficult to find similarities between both works, except in their basic outlines. A lot of critics therefore thought *Blow-Up* was Antonioni's own concept with no special connection with its source(1) and that both have different themes; "las babas del diablo" is a fantastic story, but *Blow-Up* is an existentialistic one(2). But we should focus more on the similarities of the two outlines. Peeping at a couple, taking a picture of them, the women looking back at the hero, quarrels between the heroes and the women, photographs that reveal a crime, and inexplicable endings. As you can see, both story-lines are almost the same, even though both stories give us completely different impressions.

Let us try to examine these similarities more in detail. When both heroes originally see the couples, they see them either with their naked eyes or through their camera viewfinders. On the other hand, at home, they see the couples again in photographs. Thus, both heroes' ways of observing things change, and these changes help the development of these stories. Then, how different are both visions? In 'Short history of photography' (1931), Walter Benjamin explains the difference between naked-eye vision and photographic vision as below.

"For it is another nature which speaks to the camera rather than to the eye: "other" above all in the sense that a space informed by human consciousness gives way to a space informed by the unconscious".(3)

According to Benjamin's words, the reason why the heroes have a nightmarish and daydream-like experience is that the photographs show a lot of details repressed in the unconscious. So, when the heroes see the photographs, the details in them stimulate both heroes' unconscious, and they have nightmarish experiences. Thus Benjamin's speculation is very adequate to analysis both works. But unfortunately, it is not enough to explain the connection between photographs and abstract paintings, which *Blow-Up* shows. So, to think about it, we start off by reconsidering the visual perception from today's understanding of the function of the eye. What we should be careful of here are a pair of phrases, "the rays of light" and "the line of sight". It is most simply explained as follows.

“The rays of light” emit from the surface of an object and pass through the pupil to the retina. Then the image is formed on the retina. We ordinarily think that this “retinal image” is our vision. But this idea is partially wrong, because the photoreceptor cells are not evenly distributed on the retina. As these are gathered in the center of the retina, the eye can capture clearly only the center of our field of vision. So, our eye has to be always moving, even while focusing on various points within our eyesight. By doing so, we put together psychologically and physiologically a number of tiny images that the eye captures moment by moment to construct the whole of the visual field.(4)

When we think this way, we can imagine that a straight line goes from the eye to the object we are looking at. This imaginary line is a so called “line of sight”. When we are looking at an object, this imaginary line traces the individual rays of light back to their origins. Thus, the eye movement is replacing the rays of light with the line of sight, while picking up only important rays for the viewer. So, the eye is the organ that “captures” the actual rays of light and “emits” the imaginary line of sight. Even though we think that we are seeing the retinal image moment by moment, in fact, our vision is the geometrically imperfect analogue of the retinal image constructed over a period of time. But we don’t notice this.

By the way, this also holds good for drawing techniques. Consider the famous images drawn by Leonardo da Vinci and Albrecht Dürer, which show a similar device for drawing in perspective (fig. 2, fig. 3). We think that their images explain the following two things. First, that the impression that real objects leave on the retina is the same as the cross cutting of the visual pyramid.(5) Second, in perspective, the scene we see is seen with a single and immobile eye.(6) But these things are only a hypothesis of Renaissance people. Think of how to draw with Leonardo’s and Dürer’s devices. Indeed the eye stays in the same position. But the eye itself is always moving. When drawing by using these devices, the line of sight is always moving to catch every point of the surface. At the same time, we put together these points on the canvas to make up the intersection of a visual pyramid. But when viewers see a painting in perspective, we regard it as a scene captured in a moment. We can see here the differences between “rays of light” and “line of sight.” In fact, this opposition of directions in vision has been questioned for centuries.(7) Alberti says in his *On painting* (1435) as below.

“Indeed among the ancients there was considerable dispute as to whether these rays emerge from the surface or from the eye. This truly difficult question, which is quite without value for our purposes, may here be set aside.”(8)

As Alberti didn’t distinguish “the rays of light” and “the line of sight”, he thought that the retinal image was our naked-eye vision and that the perspective truly represented our naked-eye vision. But by distinguishing “the rays of light” and “the line of sight”, we can clearly think “how a vision is formed” and “how we interpret it” as I said above. Now, let’s compare anew various visions in *Blow-Up* by using the concepts “rays of light” and “line of sight”.

2. The changing of our idea of vision in *Blow-Up*

In an earlier part of *Blow-Up*, the hero always sees people with his naked eye and through his camera’s viewfinder. For example, he takes sneak shots of a dosshouse, erotic photographs with a model, fashion photographs with a few models, and shots of a couple in a park. In these scenes, his line of sight is like a bullet, constructing the scenes in front of him as he thinks it should be, and his camera’s finder helps him to

do so. In addition, the scene where the hero tries to buy a landscape in an antique shop near the park might show that he sees objects in perspective. But after the hero was looked at by the woman and he saw the scene again through the photographs, he starts losing the power of his line of sight and he becomes the object of someone's gaze. In his photographs, he finds a third man with a gun and a dead body of the man who was with the woman. To confirm the fact, he returns to the park again and actually finds the dead body. Now he can't rely on his line of sight. He feels someone's gaze and becomes uneasy. He is influenced by his photographs. So, what causes this change? It is the "mesh-like structure" common between photographs and Pollock-like paintings.

The surface of film is covered with a network of silver halide grain, and the surface of the retina is covered with a network of photoreceptor cells. The chemical reaction of silver halide grain against light fixes the rays of light on the film, like the photoreceptor cells change light into electric signals. But different from the retina, on the surface of this artificial retina; film, a network of silver halide grain is distributed equally. This mesh-like structure of silver halide grain makes it possible for films to capture and print directly the rays of light emitted from lighted objects. So, when we enlarge any part of a photograph, its mesh-like structure of silver grain stands out more than the image. Interestingly, about that time Richard Hamilton dealt with this photographic feature for a series of his works (fig. 4). He was a teacher of Ian Stephenson who is the painter of Bill's paintings.

Needless to say, the reference to this mesh-like structure of the retina is one of many concepts that brought about abstract painting. Let's remember pointillist paintings like Seurat's. What pointillists wanted was to make the colours of paintings as similar to light as possible and to create as much luminosity as possible in their paintings. So, pointillists juxtaposed dots of complementary colours next to each other on their canvases rather than mixing their pigments on their palettes. Consequently, the surface of the canvas is covered by dots, and the paintings come to resemble veils or curtains with abstract mesh-like patterns. As is well known, Pointillists in the nineteenth century were influenced by their contemporary theories of color. So, we might say that as the painters paid more attention to the function of the retina, paintings also became similar to the retina. Thus paintings stopped being windows; instead, they started getting closer to being abstract flat planes.

In perspective, the surface of a canvas is regarded as a window. The line of sight here goes through it and its movement isn't noticeable. But, in the paintings with abstract mesh-like patterns, the line of sight can no longer go through the surface of the canvas but wanders over it as if we are touching it, without being able to construct any meaning. Then, the movement of the line of sight is noticeable. This is one of the tactile features of abstract painting, and we can see this in several scenes in *Blow-Up*. At the beginning of the film, the hero sees up close a pointillist abstract painting by Stephenson, which is lying on the floor (fig. 5). In the middle of the film, he draws a circle with his finger in mid-air as if to trace the pattern of an abstract painting by Peter Sedgley (fig.6). At the end of film, the camera moves over the surface of another pointillist abstract painting as the hero's gaze wanders, to show his bewilderment when he is looked at by a woman who is having sex with her lover (fig. 7).

This tactile feature also holds good for photographs. Because of the mesh-like structure, the film can homogeneously capture scenes with more details than the naked eye captures. So, standing in front of a photograph, we are often overwhelmed

by too many details, and our line of sight loses its power and wanders over the surface without being able to construct any meaning of that scene, as if to caress every object represented by it. As a result, while looking at photographs, the bewildered movement of the line of sight is noticeable. In *Blow-Up*, the hero also scrutinizes the details of the photographs to construct meanings of the scenes. Why did the woman want the film? But in the end, he fails to answer this question.

3. Conclusion

In addition, we can find another tactile aspect common between abstract paintings and photographs. It is that we are physically connected to the image by the rays of light in both abstract paintings and photographs. In figurative paintings, every brush stroke and every blot represents something different from it. So between the eye and every brush stroke, there are imaginary distances that have the same length as the line of sight. But, in abstract paintings, every brush stroke represents itself. The rays of light emitted from the surface reach us directly without making any imaginary distance and without constructing any meaning. The same is in the case of photographs. With the mesh-like structure of film, the rays of light are captured, and then light is emitted from the surface of photographs towards us. In *Camera Lucida* (1980), Barthes says,

“The photograph is literally an emanation of the referent. From a real body, which was there, proceed radiations which ultimately touch me, who am here.”(9)

This happens to the hero. Through the photograph, the rays emitted from the dead body touch him and he also touches the dead body in the park. Through the photographs, he touches on the origin of light without replacing the rays of light with the line of sight. In photographs and abstract paintings, we are connected with images through the rays of light. Now, we can say that both are so-called twins born from same idea. This is the second tactile feature common to both. Incidentally, different from three-dimensional illusions drawn in perspective, some kinds of patterns affect us physically and bring us “optical illusions” like a hallucination. We can recall here Optical Art by Bridget Riley, whose partner was Sedgley between 1960 and 1973. The patterns of both the exaggeratedly blown up photographs and the abstract paintings with mesh-like structure also might bring the hero a day-dream-like experience. We can see here the third tactile feature.

Takayuki Ijuin. He is Associate professor at Shimane University in Japan. He received a master degree (master of engineering) in Kyoto Institute of Technology, Japan, in 1995. His research interests include Modern art, Design, Film theory and Psychoanalysis. In his recent article, 'Visual Theory in Antonioni's *Blow-Up* and its Source, Cortázar's "Las babas del diablo": A Psychoanalytic Point of View,' (*Aesthetics* No. 22, The Japanese Society for Aesthetics, 2018), He regarded the blot that Antonioni's hero found in his photograph as Lacan's 'objet a' and Barthes's 'Punctum,' and tried to compare *Blow-Up* with its source written by Argentic writer Julio Cortázar from the point of 'Oedipus Complex.' Now, he reevaluated *Blow-Up* by focusing on a landscape painting and some abstract paintings that appear in it. In this congress, he will talk about an aspect of the abstract art theory in *Blow-Up*.

LANDSCAPE AS AN ELEMENT OF CINEMATIC EXPERIENCE ON THE EXAMPLE OF WESTERS

Abstract | Modernity requires new approaches and options for analyzing cinematic experience. The paper argues that, using the example of westerns, we can say that the theory of genres in its present form is in crisis: the so-called post-westerns in different variations («No Country for Old Men» (2007), «Aferim!» (2015) «Western» (2017),) erode the usual genre representations. But there is always an element grasped by the viewer allowing to identify and in a certain way categorize the movie as something in one way or another connected with “western”. In our paper, we decided to approach the analysis from the spatial category of the landscape. Through an analysis of theoretical works on space in cinema (G. Delleuse, A. Corbin, D. Cosgrove) on the one hand and an analysis of film material on the other, we came to the conclusions:

- landscape is one of the most important categories of cinematic experience. This is not just an element of the film, but one of the fundamental reasons around which the cinematic is formed and categorized for the viewer.

- it is necessary to distinguish between the categories of landscape and the categories of interior and place - that is why in this case we prefer the term «landscape» - in our opinion, it is the landscape that is largely responsible for what is constructed in front of the viewer as cinematic (in this case generally designated by the word “western”).

- landscapes are paramount in relation to westerns: in our opinion, one way or another connected with this genre definition, elements are formed around empty semi-abandoned landscapes with few signs of civilization. To all of this, narrative clichés (for example, a duel) are attached, however, optional. This is confirmed by the output of western-related works beyond the original spatial-temporal boundaries (USA, late 19th century): starting with various variations of contemporary westerns and ending with national adaptations (Eastern European, Soviet, Australian, Chinese, etc.). The plot in them can be very different, the traditional narrative and the cliché is missing or transformed beyond recognition, but specific landscapes, no matter in which part of the world, will invariably point to something that is not divided into what was once called «western».

Our study is significant because it offers a new approach to the perception of the cinematographic and an attempt at a new way of talking about it.

Index terms | *cinema; cinematic; interior; landscape; place; space; western;*

Modernity requires new approaches and options for analyzing cinematic experience.

And most clearly, in our opinion, this is manifested in the case of Westerns. Movies of the genre «Western», we could say earlier. But do we really have the opportunity to talk like that? We can say that the theory of genres in its present form is in crisis: the so-called post-westerns in different variations («No Country for Old Men» (2007), «Aferim!» (2015), «Western» (2017)) erode the classic genre representations, associated, for example, with the movies of John Ford or Howard Hawks (although, naturally, their canons were significantly revised before (remember the spaghetti-westerns), the examples above are quite radical cases. What, then, still allows us to use the word Western and mean something under it? This is the question that inspired our research. There is always an element grasped by the viewer allowing to identify and in a certain way categorize the movie as something in one way or another connected with “western”.

It seems to us that the key to finding such an element in this case is the concept of landscape. Landscape definition is a rather difficult thing, complicated by the interdisciplinary nature of the concept itself. For example, the researcher Martin Lefebvre writes: «[landscape] relevant in aesthetics as well as in economic and political debates over land development and exploitation, tourism, and national identity and sovereignty. Yet <...> landscape remains notoriously difficult to define» [1]. The variety of approaches entails a variety of attempts to determine. For example, historian Simon Schama believes that «landscapes are culture before they are nature; constructs of the imagination projected onto wood and water and rock» [2]. Denis Cosgrove prefers a more ideological approach, stating that the landscape is rather «ideological concept» that represents how «certain classes of people have signified themselves and their world through their imagined relationships with nature, and through which they have underlined and communicated their own social role and that of others with respect to external nature» [3]. Jay Appleton believes that the types of landscape «in art are really views of space that offer strategic or tactical advantage as prospect (“unimpeded opportunity to see”) or refuge (“an opportunity to hide”), thus relating aesthetic forms to spatial forms expressing group survival» [1].

In our opinion, the situation with the landscape in cinema is unique and not amenable to generalization within the framework of a broader view, in combination with other types of art. Some researchers, who studied the role of landscape in cinema, claimed that in cinema «actual landscapes become symbolic landscapes» [4], or the idea «of moving cinematic landscapes —as opposed to the motionless landscapes of still media»[1]. In our opinion, the landscape in cinema is much more isolated from the person than it might seem at first glance. The problem of the landscape as a construct of imagination is that with this approach, the human view psychologizes and subordinates the landscape, imposing the paradigm of imagination (whose?), denying the cinematic spontaneity and prejudging the reaction of the viewer who must understand this inherent fantasy. While a specific recipe for this fantasy is still difficult to formulate. The ideological version in the case of cinema is disputed by the history of the global spread of westerns: what was supposed to like a certain category of Americans at the very beginning surpassed the boundaries, got a new life in the USSR, GDR, Italy, China - and the class specificity was not so important and at the same time all these such different films still continue, albeit with an internal categorization, in a broad sense, attributed to westerns.

The prospect / refugee approach seems somewhat specific. Still, considering landscapes of westerns as conditional escapist space is only one of many approaches. No less suitable would be the option of looking at typical western landscapes as a terrible place, in contrast to which the viewer will feel calm. Or a detached look at the western landscape as a pseudo-historical place - there may be many options.

Finally, speaking of the approaches mentioned above, combining cinema and landscape directly, it is unclear what kind of actual landscape, turning into a symbolic one, can be discussed. Since the landscapes of westerns are a collective set of such a multitude of elements that the conventional Monument Valley will not be enough to describe

them all. Moving landscapes are a complex and controversial term requiring a separate discussion, but, in any case, chamber westerns come to mind, such as *Rio Bravo*, when a small town with, in general, several nominally functioning rooms exists as if it were one on a whole planet surrounded by a desert in which, even despite the presence of heroes and villains, everything froze. Temporality is very doubtful, and there is not very much faith that the visitor arrived from the city, which generally exists. In our opinion, the concept of moving landscapes is hardly applicable in such situations. Westerns, in our opinion, are much more similar in their functioning to something singular, formed by the collision of many small elements: vast desert spaces, low wooden structures, the possible predominance of windy elements in these spaces, whether sand, snowy or whatever, optional narrative clichés such as duels or conflict in the saloon, a harmonica soundtrack, whiskey and sweat. These structures have something in common and important for a person, evoke a response in him, and he tries to grope and somehow name it, to call it a genre to complace himself - but time shows that the term needs to be corrected. When in the context of talking about westerns at the same time they talk about the adventures of the German builder in Bulgaria («Western» (2017)), the 19th century Wlach vassals («Aferim!») and the robber brothers trying to return the family ranch («Hell or High Water» (2017)), it becomes clear that narrative categories and clichés here play far from the first role.

Probably, at the root of this lies a combination, on the one hand, of wild and not subject to unprepared person spaces, striking in their beauty, on the other hand, a reflection on these spaces and the events that occurred on them, re-taken too many times, but not annoying in its variations. Western = landscapes, many-sided, overgrown with clichés. This is the situation of the formation of the cinematic, one of the largest points to which the viewer time after time desires back, to which he inexplicably beckons: after all, no matter how many attempts were made to bury what is called a western, it never completely died, even in the 80s (Clint Eastwood and the Lonesome Dove can confirm that).

To sum up, in our opinion, landscape is one of the most important categories of cinematic experience. This is not just an element of the film, but one of the fundamental reasons around which the cinematic is formed and categorized for the viewer.

Also it is necessary to distinguish between the categories of landscape and the categories of setting and place - that is why in this case we prefer the term «landscape» - in our opinion, it is the landscape that is largely responsible for what is constructed in front of the viewer as cinematic (in this case generally designated by the word “western”). Finally, landscapes are paramount in relation to westerns: in our opinion, one way or another connected with this genre definition, elements are formed around empty semi-abandoned landscapes with few signs of civilization.

CAN ARTWORKS BY ARTIFICIAL INTELLIGENCE BE ARTWORKS?

Abstract | The thinking power of Homo sapiens made human being the lord of all creation. The ability to reason is also the premise of human existence. We, however, now know that this does not confine only to human but to Artificial Intelligence. When I look over the history of mankind, human beings have attempted to create an immortal being that surpasses them and complements their inferiorities. We are making something immortal and transcendent which are opposite properties from our own. Artificial Intelligence may be able to evolve on its own like humans have been doing. As a kind of numerical being, humans are able to be omnipresent as long as the technology is provided. This new kind of existence makes us think about and see things differently. Humans are attempting to create 'beings' that can generate art, take care of weak human beings, talk and discuss human issues, and fall in love with human. As our minds can run beyond the boundaries created by the limitations of our bodies, we would like to infuse our creativity into AI. such that it might evolve from its beginning state. Similar to what Prometheus did, humans are attempting to share their legacy with another existence. Recently a research team from Rutgers University in New Jersey proposed a system, which is named CAN: Creative Adversarial Networks for generating art with creative characteristics. The team demonstrated a realization of this system based on a novel creative adversarial network. Their proposed system possesses the ability to produce novel artworks which make people believe they are produced by human artists. The data the team proposes prove that now AI is attempting to create something. With this research, the definition of art should be reconsidered. Since the 'Fountain(1917)' by Duchamp, open concepts toward artworks are embraced by many artists and their colleagues. However, it is time to contemplate of the new phase. When we regard something as an artwork, should it be created, selected, and combined by human beings? Is it possible that the thing that is accepted as an artwork by people can be an art? This paper pursue to propose the several opinion regarding these questions.

1. Introduction

Now AI pervades in human life, forms new relationships with us, and processes the information much better than the humans do. Living with AI, culture and the way we think toward our society and human are changed. Today, we live in an information-oriented, media-resistant society and face a sort of de-realization of reality and material in every area of life. It is because communication technologies replace direct contact with the physical environment and because the mass media form their own world, the hyper-reality.

In this hyper-real world, the gap between image and reality disappears because all of the information we obtain from the mass media is a simulation of the original event. We are hardly exposed to the physical actuality of unedited actual events and information. The actual events transform into images, messages, and symbols in the information network of the whole society, and the actuality eventually disappears.

If there is no significance for the substance in our highly developed civilization, what will be the fate of our kind, Homo sapiens? With the premise that artworks can be considered as accumulated information, is it adequate to limit the validity of artworks only by humans? It seems that we accept the artworks generated by AI as another flow of art in the new era. The creation of AI appeals viewers and provokes sensation as they appreciate it. Thus this paper discusses the latest issue regarding producing artworks by AI and its traits. By doing so, I would like to propose questions that are when we regard something as artwork, should it be created, selected, and combined by human beings? Is it possible that the thing that is accepted as artwork by people can be art?

2. Message from AI

In the 1990s, more user-friendly computer hardware, the evolution of personal computers, and the introduction of the World Wide Web add speed to globalization. It is the time known as the "Digital Revolution". The Digital Revolution means reading and receiving with two numbers, 0 and 1, which means that we can reduce all information to numbers. Therefore, by lowering all external data to a numerical system of 0 and 1, the human has built the communication system between human and machine. During the period of the Digital Revolution, aesthetics as well as the arts and their creation, have been affected worldwide, and by the end of the 20th Century, digital computer technology began to exist in almost all parts of our lives.¹

To clarify the relationship between these media and human societies, Marshall McLuhan (1911-1980) argues that through interaction with the human senses, media initiate the interaction, and, by transcending the mere means of information transmission, media act as the power that determines the communication structure and patterns of human perceptions, or more broadly, the nature of the entire social structure.² McLuhan thought that media acts not as a mediator but as an active participant. With the dynamic influence of the media, the message receives "the physic and social effects of the media."³ It suggests that the medium plays a vital role as a means rather than merely transmitting the content of a message. The new medium is not just the conscious and mental extension, but the extension of human beings, that is, the expansion of real human capabilities.

Besides, this development of physical function also affects the domain of human consciousness. In this time, the medium becomes a substance that, beyond its

functional meaning, can change human culture and society in general. If we accept the hypothesis that technology is the expansion of humans, so does an extension of the whole experience. In the entire experience, all media are influencing the way we perceive the world, regardless of the message they contain.

Unlike what we experience in the real world, we go through these data experiences in a digitized state of information. Through various editing processes such as abbreviation, editing, or overlapping, this information is a transformed version of the original data. The development of digital media and its application in our daily lives make us no longer consider the gap of physical distance or time as obstacles or limits to the development of human society.

The changed perception by this new medium is shaking the roots of our thoughts about fixed and immutable beings, allowing us to experience things and humans that go between presence and absence as well as reality and imagination. The application of new media plays a dominant role in almost every aspect of human culture and social-economic. Digital media allow us to experiment with humanized media by dreaming up a human-like machine and constructing technical infrastructure so that human beings can exist as the information itself.

3. Human as Information

In most cases, 'self' refers to consciousness or idea about oneself. For a generation accustomed to talking through the social networking system (SNS), people have accepted the virtual self as another personality. The self in cyberspace may be a social or concealed self. A virtual self broadly refers to a being that works in cyberspace and refers to a surrogate self- working in cyberspace on behalf of a user of the physical world.

In this paper, I discuss the virtual self in this general sense and AI that is a number of selves blended with positive and desirable standard human selves. AI is not a substitute for any one of our virtual selves or those derived from someone else. AI is a synthesized entity generated by accumulating data and experiences of the researchers who produce it and of various people rather than one person. Thus, it is an implementation of a universal and ordinary human model. To the contrary, the self, in reality, is dominated and developed in the physical environment to which we belong.

The difference between the physical world where our self is revealed and the cyberspace is that the identity of our experience unfolds differently. In other words, time and space are relatively experienced in the physical area, and this relative experience cannot be separated from the subjects of the experience. The space and time of cyberspace, however, deviate from such attachment and, in many cases, depend on our own intentions. It is because, from the beginning, the time and space of cyberspace operate only by human manipulation. Thus, as long as cyberspace also includes the being-the virtual self- it has its own time and space unfolding, but the concrete way of this unfolding can be "selected" and "changed". In this space, all beings are based on the first being and are distinguished from the real world, in which material is the basis of the being.⁴

The virtual self can legally resume a new life that is not related to our own lives in the real world, and it is possible to move or delete the place of existence at the desired moment and to return without any restrictions when necessary. However, the

virtual self cannot be entirely established from the virtuality or fiction. That is, one's understanding of itself is similar to the situation that a person uses maps to navigate to places. It is because when a person is looking for a direction, one cannot find the right destination unless one knows one's current location and situation. Therefore, if I understand my position in the real world - my present positions, I can properly set the direction for my identity in the virtual world.⁵ Therefore, cyberspace and the real world are inter-penetrating and overlapping, even though both are heterogeneous.

Now, human beings- physical beings- can exist as an information body in cyberspace, and the point at which people maximize this information is the artificial intelligence system. As the digital medium visualizes the human imagination, the connection between the machine and the human becomes a natural imaginary context, and artificial life is composed of so-called artificial intelligence-cybernetics-⁶ which is thought, invented and operated by oneself.

Now no one doubt cyberspace has almost the same influence and effect that can change not only the physical environment also human's thoughts and cultures. Rather than an identity embodied by the human body, people regard this new human identity as a flow or patterns of the information. It lets people visit everywhere they want to go because, without bodies, and with being the states of encoded being, people can go beyond their boundaries. Besides, as people can accumulate far more information together in one place that we call net society, they have learned how to use the information and attempted to apply it to AI. Absorbing the whole data in the net, AI tries to generate things humans consider as art. In human's case, we may call it as displaying human's creativity.

5. What can be the artwork?

As discussed, the goal of producing AI is to make a "being" similar but different from humankind. Humans have attempted to build AI that transcends the limitations and faults of human beings and that displays mechanical consistency, accurate and fast calculation, and optimizing a vast amount of information. Moreover, A.I. can evolve by learning itself because it was made to combine the best techniques from machine learning and systems neuroscience to build powerful general-purpose learning algorithms.

Humanized AI shows characteristics of all types of competencies is able to be self-conscious and is self-aware in interactions with others. Coline Mrtindale proposed a psychology based theory that explains new art creation. He hypothesized that at any point in time, creative artists try to increase the arousal potential of their art to push against habituation. Creative artists would eventually break the forms established styles and explore new ways of expression to increase the arousal potential of their art.⁷ The creative power of humans has been granted to AI, an artist that generates seemingly 'creative' artworks.

A research team from Rutgers University in New Jersey proposed a system, which is named CAN: Creative Adversarial Networks for generating art with creative characteristics. The team demonstrated a realization of this system based on a novel, original adversarial network. Their proposed system possesses the ability to produce innovative artifacts because the interaction between the two signals that derive the generation process is designed to force the system to explore creative space to find a solution that deviates from established styles but stays close enough to the boundary

of art to be recognized as art. This interaction also provides a way for the system to self- assess its products.⁸ AI autonomously evaluates its products. Does it mean it can discern aesthetic attributes of things and people or it 'express' something?

An essential component in art-generating algorithms is relating their creative process to art that has been produced by human artists throughout time. The team thinks this is important because a human creative process utilizes the prior experience of and exposure to art. Thus, the system is trained using an extensive collection of art images from the 15th century to the 21st century with their style labels. For the training, they used 81,449 paintings by 1,119 artists in the publicly available WikiArt data set. (Figure 1) With the exposure, the system accumulated information of artworks and learned about their features. The system can generate art by optimizing a criterion that maximizes stylistic ambiguity while staying within the art distribution. The system was evaluated by human subject experiments which showed that human subjects regularly confused the generated art with human art, and sometimes rated the generated art higher on various high-level scales.⁹(Figure 2)

Moreover, to generate artworks that seem to be created by human artists, the researchers have applied to "Arousal Concept" by Daniel Berlyne(1924-1976). This psychophysical concept has great relevance for studying aesthetic phenomena.¹⁰ The term "arousal potential" refers to the properties of stimulus patterns that lead to raising arousal. Besides other psychophysical and ecological features of stimulus patterns, Berlyne emphasized that the most significant arousal raising properties for aesthetics are the novelty, astonishment, complexity, ambiguity, and puzzlingness. He coined the term collative variables to refer to these properties collectively.¹¹ When respondents were asked to rate how intentional, visually structured, communicative, and inspiring the images were. They rated the images generated by CAN, artificial intelligence higher than those created by real artists.

However, what the system generates is the accumulated and processed information of human artists. Of course, what human artist produces can be seen as information that has been experienced by human artists, but human artists feel, sense, and filter with their sensory organs that are eyes, ears, nose, and hands, etc. Artworks are not numerical information. Even the art, such as "Brillo Pad Box (1968)" by Andy Warhol or "Fountain (1917)" by Marcel Duchamp, is what resulted from their sensory reactions toward life experiences, art history, Aesthetics, and artworks from their predecessors.

Those daily objects make viewers ponder why those artists introduce them as art. However, the paintings generated by CAN are the calculated and combined information that was not from sensory reactions nor based on aesthetical perception. Works that cause profound aesthetic questions and make people seek the proper answers can be defined as art. One of the main characteristics of the proposed system is that it learns about the history of art in its process to create art. However, it does not have a semantic understanding of art behind the concept of style. It does not know anything about the subject matter, or explicit models of elements or principle of art. The learning here is based on exposure to art and concepts of styles.

In that sense, the system can continuously learn from new art and would then able to adapt its generation based on what it learns.¹² Learning the art and experiencing art is beyond enumeration of what an artist has learned. Empathy is a critical aspect. It occurs when we are aware of the context of the producing artwork. The background is more significant than the resulting artworks. Even though the subjects of the

experiment rated the artworks by CAN higher than those by human artists, still the historical context of producing artwork is crucial and meaningful.

6. Conclusion: Further Question

Accepting the digital media and its sub-products, humans can exist as an encoded being in the cyberspace and net society. Living and interacting in the net world, people can build up enormous information which becomes the seed of AI. Humans have attempted to raise something immortal and transcendent which are different properties from our own. As becoming a kind of numerical being, humans can be omnipresent as long as they can employ the appropriate technology as if they did not have flesh and blood. This new way to exist makes us think about the definition of presence and see things differently. Humans are attempting to create 'beings' that can generate art, take care of weak human beings, talk and discuss human issues, and even fall in love with the human.

As our minds can run beyond the boundaries created by the limitations of our bodies, we would like to infuse our creativity into AI. AI CAN that can do self-reflect and modify what it does generates various images from the learning system just like an art majored student does. Should we consider the images from CAN that provoke sensation or make the viewers remind nostalgia as art? I would like to extract the last passage from "The Future of Aesthetics" by Arthur Danto as my opinion about the questions I proposed in advance.

"I think the rediscovery of aesthetics is best understood as the rediscovery of the role that aesthetic qualities play in the use of art to present meanings by visual means. Ontologically aesthetics is not essential to art- but rhetorically it is central. The artists use aesthetics to transform or confirm attitudes. That is not the same as putting us in the mood of calm aesthetic contemplations- which has tended to hijack the concept of aesthetics. I don't say it is unimportant, but it is not the only important role aesthetics plays in art....The rediscovery of aesthetics means an enrichment rather than a transformation of current art historical practice. It shows how, in the domain of objective spirit, art has played an important role in society. So far as philosophy is concerned, it is probably a good thing for philosophers to be liberated from the ontological preoccupations that obsessed me and my contemporaries, it is to address art now pragmatically from the perspective of life."¹³

TOTAL ENVIRONMENT (SCULPTURE) AS A SYMBOLOGY: THE MESOLOGICAL STUDY OF AXE MAJEUR IN CERGY-PONTOISE

Abstract | More and more sculptures appear in New Cities in France since the 1970's in order to bring significant symbols and certain cultural qualities and to avoid constructing the problematic urban landscape dominated by the functionalism. In the case of Cergy-Pontoise, the artist Dani Karavan is commissioned to conceive the three-kilometers linear path named as Axe Majeur connecting the city center and the vast riverside. The path is composed of 12 stations in succession with natural materials, geometric volumes, and astronomical observatories. Instead of a work of art to contemplate, Karavan builds a sculpture in the form of instrument with which people are equipped to measure the existent elements, to process environmental data and to find their own interpretation of the site. By making factual information measurable and translatable into cultural connotations, Karavan's work implies a mesological point of view from which osmosis between sculpture and site invalidates the opposite physical/phenomenal. The paper studies this method not only with the aid of the notion "mediance" – a dynamic coupling of being and its milieu – proposed by the geographer Augustin Berque but also through a field survey in Cergy-Pontoise. Three principles constitute the method. First, Karavan invents a sculptural metrology functioning in the way of the perceptive calibration system. Human's body here is a unit of measurement to qualify the site. Secondly, *Axe Majeur* shows a "total Environment" which means not only 12 parts as a single unit but also the inseparable relationship of Karavan's Environment (art) with the whole geographical environment. Each part annotates the signs left behind after Earth's motion (e.g. topography, geothermal energy) and after cultural activities (e.g. orchard, view of Paris) and turns these signs into the basis on which imagination could be formed and new meaning could spring up. Finally, the architecture is introduced to the work as a parameter which allows a systematized measuring on a human scale. As a trigger of place meaning, *Axe Majeur* represents a specific urban planning method which articulates historical and spatial dimension with an environmental symbology and which moves away from international-vernacular (modernism) or historical-ahistorical (postmodernism) debate. It necessitates people's corporeal and mental engagement in the site in order to create the significant environment. In conclusion, total Environment is far more than a mere accessible three-dimensional work of art for a particular exhibition, but a complex operation mingled with reality, society, dwelling issues and collective image.

INTRODUCTION

Developing the cultural dimension of urban space is not a new issue in urbanism. During the interwar period, the term *urban art* is used largely as opposed to the *tabula rasa* tendency of urbanism and to its resulting lifelessness city. Especially employed in the field of urbanism, the term does not refer to a mural painting or a sculpture installed in a public place but a whole urban space conceived as a work of art. In search of a synthesis between the past embellishment practices and the new ambition of urban extension, urban art implies at a time aesthetic composition and functional optimization.¹ Its principal idea is that some of the urban forms in the past constitute a better way of living and serve as an essential reference for the present urban planning. To mention just a few key points: Pierre Lavedan's studies which argued the superiority of radiating concentric city plans over regular "checkerboard" plans²; Camillo Sitte's *Der Städte-Bau* which valued the ancient public squares³; Charles Buls's analysis which examined how winding streets allow a visual richness and an unexpected view⁴.

When the term reappears in the French New Towns projects of the 1970s and the 1980s, it shows a great interest in finding a proper culture for the cities however presents very different results. Several contemporary artists are commissioned to collaborate with architects and city planners. The first secretary of New Towns institution (SGVN) Jean-Eudes Rouiller has observed that they help improve public space qualities and solve the problems of urban aesthetic with their quasi-instinctive method, in contrast to the functionalism oriented by rational thinking and by pure technical requirements.⁵ Numerous publications associated with this initiative discussed the relationship between art and cities. Some of them focused on the art of public procurement since 1983⁶; some of them on the new functions of public sculpture and its new roles in urban planning⁷. However, very few studies dealt with the close relationship between the method and the artistic practice called *Environment*.

In the late 1950s, the term *Environment* firstly comes to light with Allan Kaprow's room-size work.⁸ It is used later in France, as François Loyer explained, with a different meaning to describe an art on the boundary between sculpture and architecture.⁹ The term then extends to the research of urban space and implies a specific way of providing synthetic spatial experiences. Merged with the field of urban art, this *Environment* liberates not only public art from its traditional role but also the culturalist perspective from an obsession with certain past urban forms or civic life. Integrating *Environment* into the New Town projects displays a new approach which could turn living space into the sculpture, and which could enable people to explore values and meanings *of* and *for* the place they live in. In the case of Cergy-Pontoise, the sculptor Dani Karavan is invited in 1980 to take part in the conception of the *Axe Majeur* which transforms the whole site into an *Environment*, the most complete and the largest scale's *Environment* to this day. Through a study of the *Axe Majeur*, this paper aims at clarifying the method at the crossroad between art and territorial planning, between *Environment* and urban art.

MATERIALS AND METHODS

Urban Art in Cergy-Pontoise

The French urban planning in the 1960s is dominated by a functionalist perspective from which large-scale housing estates – the grand ensembles – is considered as an only practical solution to the housing crisis. Viewed as a remedy of social segregation, a large number of massive constructions are built in the suburban area. They do not result in a utopia where people live together in harmony and in a way of the middle class¹⁰ however cause gravely landscape problems. Against this background, the New Town project provided in the following decade, as Gilbert Smadja indicates, is permeated

with the urban culturalist perspective heightening the value of site and symbols and leading “back to the *real city* with its cordial, polyfunctional complexity, and take every necessary distance with the icy functionalism of former days”¹¹.

In the Saint-Christophe district of Cergy-Pontoise, the project is divided into two parts. The first part is to build a city center around the railway station and mainly for housing, by means of a system of zoning. Marcel Bajard, Michel Gaillard, and Michel Jaouën believe that the typo-morphological method encourages the urban planners and the architects to discover the notion of urban art, along with a functional asset and a formal laxness.¹² Nevertheless, it comes in the end with a boom of postmodern architectures such as the medieval bastide-like blocks built by the agency G.G.K. and the Georgian style crescent created by Ricardo Bofill. An accumulation of such diverse style buildings gives rise to a blurred and composite patchwork-like form without producing a clear and coherent cultural image.

After viewing Karavan’s Environment made in Florence, one of the project directors Michel Jaouën invites Karavan to design the second part of the district connecting the central city to the aquatic area. According to Pierre Restany, this idea of the artistic intervention on a town scale dates back to 1970 when Rouiller discovers that “the solution to urban art did not lie in setting up sculptures for such places, but on the contrary in transforming those places through the artist’s vision”¹³. In doing so, the cultural dimension is developed by the actual sculptural research rather than by the traditional urban forms.

Environment as Public Sculpture

When designing an urban production, town planners tend to relate contemporary art to an excellent way to enrich people’s leisure activities and to ennoble the site. It was believed that a new function of the public sculptures is to endow the New Towns with a high-ranking identity opposed to the grand ensembles. As Georges Duby says in the preface of *Art and the City, Town-Planning and Contemporary Art* published by SGVN, the function “is to make manifest [...] that this is truly a city, [...] a place in which it is good to live, to stroll, to reflect and rejoice; and that it has been the city-dweller’s privilege, through the prestige of public art, to the higher level of what we call culture”¹⁴. In the eyes of Gaillard and Jaouën, the *Axe Majeur* performs perfectly the function and is considered as an advantage that could attract potential clients namely future inhabitants.¹⁵

When we look at the sculptures created in this context, we find that many of them are closely related to the practice Environment, for example, Ervin Patkai’s *Mur-Fontaine* (1967) in Grenoble, Gérard Singer’s *Déambuloire* (1975) in Evry and *Cheminement* (1977-1981) in L’Isle-d’Abeau, Luc Peire’s Place Salvador Allende (1976-1982) in Marne-la-Vallée and evidently the *Axe Majeur*. However, there is a discrepancy between the planners’ expectation and the artists’ vision. None of these Environments is in line with the attempt to magnify the place, to upgrade it from suburban housing conglomerate to superior city, or to cultivate people and to instruct them an elitist lifestyle.

Patkai uses an architectural casting technique to shape a layered sculptural volume. The stratum-like structure left after demolding become a coordinate system which helps read the structure. Midway between rational and irrational, the form makes an encoding and a decoding mechanism possible. Singer creates in a residential area a walk-in space covered with blue epoxy resin and composed of stalagmite-like steles and bubble-like prominence. Through confronting dwelling experience with alpinism experience, the artist tries to provoke the sensations during the arduous ascent and the following euphoria of being unattached so that man’s intuitive feeling would replace his rational thought. Peire designs a pavement consisting of white, black and blue tiles,

like a giant painting of strict lines drawn on the ground. And the work visually joins the vertical lines on the facades of the surrounding building. By mingling the pictorial universe with the three-dimensional living space, Peire's Environment extends from the realm of imagination to reality. In the above examples, we find that the culture the Environments reveal does not simply result from a reproduction of the heritage elements or a revival of the past noble life. Beyond that, the artists are concerned more about people's perceptive faculties than about transplanting the ancient spatial system to the actual site. To "reset" the cognitive system dominated by a materialist vision, the Environments are conceived as a high degree of combination between the spiritual and the real space.

The same goes for the *Axe Majeur*. Within the 12 stations Karavan creates, we find a belvedere tower, an orchard, an esplanade, an amphitheater, a pyramid, a footbridge, also, an axial perspective practice, and a landscape interest. All recall the cultural heritage such as the medieval fortified tower in the Tuscany region, the impressionism, the Louvre, the ancient Egyptian astronomy, and Le Nôtre's garden. However, these elements do not serve as reproducible motifs from a retrospective nor from a postmodern point of view. They could not be easily recognized by their cultural references because of their minimal appearances and geometrical forms. As Karavan's answer in an interview to the question about his non-respect of the traditional French garden composition: "What matters from my starting point is the unity of the axis and not the historical quality: it does not matter whether with a palace or not" (my translation).¹⁶ Instead of following the correct historical formula, Karavan places great emphasis on allowing the axis to run through the whole site in order that the landscape plays a key role in ensuring the place meaning.

Point of View of Mediance

To better understand the meaning-emergence operation triggered by the *Axe Majeur*, it is useful to start with the landscape theory proposed by the geographer Augustin Berque. Inspired by Tetsuro Watsuji, Berque has developed the notion *fûdo* (風土) – the ensemble of physical and social characters of a given region.¹⁷ The term is composed of two sonograms 風 (*fû*) and 土 (*do*) which mean the wind and the soil/earth respectively. According to the syntax of Japanese, the wind is in a position of determiner while the earth is determined, and that denotes the earth subject to the wind. In Japanese, *fû* means "mores" or "in the manner of". To sum up, "*fûdo* signifies that certain land is seized – perceived, exploited and arranged – in a certain manner by a certain society" (my translation)¹⁸. Derived from *fûdo*, the notion *fûdosei* with the suffix *sei* equivalent to the English *-ness* is defined by Watsuji as "the structural moment of human existence" (*ningen sonzai no kôzô keiki* 人間存在の構造契機) and is proposed against Martin Heidegger's theory of temporality without valuing the spatiality. Berque points out that in Japanese, the human being – *ningen* (人間) – is composed of two parts: *nin* (人, read as *hito*) which means human's individual part; *gen* (間, read as *aida*, *ma* or *ken*) which means its relational part and designates betweenness or spatial or temporal interval. From this perspective, Heidegger's concept of *Dasein* is reconsidered with the interconnection not only between humans but also between human and its environment. And "this correlation is a dynamic coupling – a moment – which evolves in a certain sense, and which for the Being in question is charged with meaning"¹⁹. Highlighting the importance of space means that the human existence should imply both: in Heideggerian way that the *Dasein* is aware of its finitude through the understanding of death and then concerns its existential possibilities, and involves in the world – "there" (*Da*) of *Dasein* – without drifting away from itself; and in Watsuji way that this temporality should be also founded on the spatial structure, both social and environmental, where – "there" as *aida* 間 – the links are established, and constantly changed and moved between the human being and its

milieu. By relating *fûdo* to *milieu*, Berque translates the Watsuji's notion *fûdosei* (風土性) with a neologism *mediance* which indicates "the dynamic coupling of Being and its milieu".

After reviewing the concept *mediance*, we believe that it is crucial to analyze how Karavan takes the ecological and the social aspects of the site into account of the *Axe Majeur*. As a first step, we conducted a field survey in the Saint-Christophe district to evaluate the collected data. And then we brought out the essential idea of Environment realized in the *Axe Majeur*. Finally, we developed the relationship between Karavan's method and the concept of the landscape which, from a point of view of *mediance*, implies at the same time nature and its representation, in other words, objective facts and subjective value.

RESULTS

Sculptural Metrology

When walking through the site of the *Axe Majeur*, we are not obsessed anymore with a confused feeling of *déjà vu* we experience between the railway station and the Place Ronde surrounded by Bofill's monumental semicircular buildings. We begin with the first station *Tour Belvédère* standing at the center of the Place Ronde. There is a long straight path extending from the Tower and paved with white concrete slabs which suggest us the following itinerary. When we leave the Place Ronde, we quickly noticed that all elements such as an apple orchard, a parterre, buildings, and hedges are arranged in a symmetrical way. Our eyes are oriented towards the vanishing point where lies a layer of green and the view of Paris. Then we continue our promenade along a steep slope down to the riverside. We are led to perceive in detail the site including the movement of nature and the variety of the landscape.

We find that 12 stations, instead of being historical elements loaded with cultural qualities, serve as perceptive instruments, as a guiding system for people to explore their relationship to the site. This guiding system is made with various measurement devices following the symbol of time: the number of 12, its multiple, or the multiple of its tenth. There are 12 stations. One of them consists of 12 columns, each 12 meters high. In addition, the *Tour Belvédère* is 3.6 meters wide, 36 meters high, and is visually divided into 24 cubes. On the ground of the Place Ronde, there is a paved circle which contains 360 slabs, each 36 centimeters wide, and which corresponds to a 360-degree graduated compass (see figure 1). This ground circle transforms the central Tower into a giant gnomon from which the moving shadow figures the passage of time. Inside the Tower, there is a narrow opening on every floor to let people see the axis of the site (see figure 2) and observe it step by step while going upstairs or downstairs. Moreover, a wider hole in the middle of the opening plays the role of viewfinders that helps viewers focus on the view of the Parisian region saturated with memory. This process of scrutiny continues until reaching the rooftop of the Tower. Situated right at the junction of the two parts of the district, the Belvedere offers a panorama. On the northern side, vendors occupy the main street with their vivid and colorful tents, fitting architectural diversity. On the south-eastern side, the richness of the *Axe Majeur* comes into sight (see figure 3).

The narrow views show the axis passing through the plateau Puiseux, the hillside, the Oise River, mentally continuing to Paris, and crossing the *Axe Historique*. This evokes the links between the old and the new city. Besides, the experience of climbing to the top allows people to observe the composition of the site and the relationship between each component from the different height they stand. During their movement, the landscape is configured progressively while they realize the correlation between scales, distances, and viewing positions. Instead of simply providing a spot with a good

view, the Tower acts more as an observatory which engages people in a progressive discovery of *Axe Majeur*, its shape, its colors, its size, its topographic features, its spatial relationship with surrounding areas, and further its possible meaning. Simply put, this is an instrument not for observing pure terrestrial events but for capturing cultural dimensions of the site.

As an approach to research of mediance, the *Tour Belvédère* put the dynamic coupling into operation with metrology. On one hand, the Tower and the Place Ronde presents a huge sundial from which the movement of the sun and clouds become measurable. On the other hand, the Tower constitutes a system of perceptual calibration through which the site in people's mind and eyes is firstly reduced to the main road of the *Axe Majeur*, secondly complemented by the images observed from different angles, and finally, strongly characterized by a physical and mental axis. The sculptural metrology quantifies what is unmeasurable before no matter in the natural or the cultural field, thus articulates phenomenon to facts. Unlike the postmodern tendency flourished in the neighboring urban area and fascinated by endless historical connotations, Karavan's method attaches great importance to the spatial condition of the site: light, water, breeze, plants, etc. The measurement makes all elements we observe reducible to calculable data, not for creating an abstract world but for triggering possible interpretations.

Total Environment

The metrological approach is also used in the other stations. For example, the *Douze Colonnes* (Twelve Columns) which highlight the end of the plateau and the starting point of the slopes become a reference point for viewers to verify their spatial relation to the site. The same logic applies to the *Passerelle* (Footbridge) equipped with rangefinder-like structures which allow viewers to survey the environmental cadence. Through continual measurement and calibration, the relationship between Being and its milieu could be established in order to create an Environment interlaced with history, space, and people's participation in the site.

This Environment composed of 12 stations is in accordance with the notion "total Environment" that Pierre Restany mentions regarding Karavan's works in Florence and defines as "artscapes integrated into the landscape"²⁰. We are able to verify the notion from an etymological point of view. According to John Brinckerhoff Jackson's study, the suffix *-scape* which functions like *shape*, *ship* or *sheaf* indicates collective aspects of the environment and signify an organization or a system (e.g. *housecape* equivalent to household, *township* describing administrative unit).²¹ Kenneth R. Olwig points out that the suffix *-ship* designates an abstraction of something concrete: *friendship* and *fellowship* describing a quality or state of being friend or fellow.²² He explains that the *landscape* is related to the powerful meaning of *shape*. On the one hand, *shape* as an expression of *-ship* implies the abstract state of a portion of land, configured with the aid of a shaping process. On the other hand, *shape* suggests the material form as a result of that process "by which the land is shaped as a social and material phenomenon"²³.

From this point of view, we understand that the 12 stations – in other words, 12 Environments – present a shaping operation which brings to light the shapes of art. In the sense of urban art, the *artscapes* could be considered as the small-scale urban forms charged with culture and meaning. The fruit trees, the geothermal steam, the abandoned tracks, the river, and the silhouette of the townscape awake people's memory. All of these take the shape of art which manifests at a time the cultural qualities (i.e. "art-ship") and the cultural forms (i.e. "art-shape"). Therefore, a walk in

the *Axe Majeur* leads to a nest of *artscapes* superposing each other so that both the abstract collective state of the site and its concrete material form emerge. Through organizing its landscape, the site is transformed into a work of art: a total Environment.

DISCUSSION

Environmental Symbolology

If Karavan has developed in Cergy-Pontoise a place of symbols as Kosme de Barañano points out²⁴, it means that time, axes, trees, columns, water, vapor, a bridge, a pyramid and a laser beam here appear as signs and will become cultural symbols through the participation of the public. The symbolology that Karavan carries out is defined by Restany as a “synthetic strategy of adaptation” in parallel with an “analytic tactic of intervention” employed by the other artists such as Daniel Buren who conceives *Les Deux Plateaux*, Gérard Singer *Canyoneaustrate*, and Jean Amado *Hommage à Arthur Rimbaud*. The former approach which adapts the art to the site aims at shaping the work while “the visitor becomes a reader: he grasps the symbolic significance of the work as he gradually moves through it”²⁵. The latter one confronts the artists’ individual vocabulary to the problematic urban expression. The artistic intervention in public space is based on their recognized style.

We find that Restany’s semantic analysis recalls Kant’s “subject-predicate judgment”. If we take Buren’s work as an example, the analytic proposition could be: “the colonnade Galerie d’Orléans is columns”. That is to say, the predicate “columns” is *included* in the subject “colonnade”. Introducing a new linguistic reference – Buren’s columns of variable height and with alternate black and white stripes – dislocates the predicate and then modifies the original subject. In Karavan’s example, the synthetic propositions would be: “the center of an Oise River loop is an axis”. Here, the predicate “axis” is *related* to the subject “center of an Oise River loop”. With the measuring devices on a human scale, the relationship between the predicate and the subject depends on man’s perception, on how he achieves a synthetic understanding of the site. Buren alters what is supposed to be the predicate whereas Karavan generates a predicate which could be continually translatable into other predicates. Here comes the following proposition: “the axis is a link to Paris”.

From the point of view of mediance, this process of predication is summarized by Berque with a ternary relation S-I-P which denotes subject-interpret-er-predicate following the same principle as Peirce’s semiotic triad sign-interpretant-object. This means that S is P for I.²⁶ Based on the relation, the reality of all milieu is a result of a *trajective chain* by which S could be indefinitely re-interpreted as P, P’, P’’, P’’’, and so on, thus formulated as: r (reality in the making) = $((S/P)/P’)/P’’/P’’’...$

In contrast to the modernist and postmodernist approach, territorial planning through the *Axe Majeur* reveals a long-term process. As Karavan says: “Sowing the seed, then ensuring all stages of growth. This is a complex and curious process of creation, the artist being both the one who directs and the one who is directed, the one who directs the work while being directed by it” (my translation).²⁷ Due to various factors of milieu, neither the artist’s vision nor the environmental condition could occupy the dominant position in the planning. He adds that “it is this nature-architecture relationship that controls the succession of stations and determines the different behavior of users, the effective participation of the public” (my translation)²⁸. But far from the determinism, Karavan also “strives to create for men so that they can put into action all their senses” (my translation)²⁹. The creation of the site will be achieved only when visitors discover what resides in their milieu, in other words, only when their sensibility and interpretation

make the synthetic proposition possible, make the environment significant.

CONCLUSION

Reviewing the *Axe Majeur* has provided a new perspective for the culturalist urban study. We have found that the work associates urban art with the practice of Environment and presents an innovative way which revalues at the same time the cultural issue and the environment. According to Karavan, this “is a work with the visible and invisible, with the sensitive matter, with the memory and with the personal and historical conscience” (my translation)³⁰. By adapting the site to man’s vision, the total Environment implies a shaping process of the landscape which deploys the mediance. Here comes an Environmental symbology by which environmental signs become symbols at the same time as the reality emerges in the process *trajective chain*. From this, the site meaning is no longer given directly from what architects or artists construct however lies in the landscape, in the connotation that the spatial characteristics could carry according to people’s historical-cultural interpretation. This has led us to conclude that the *Axe Majeur* as a mediance-oriented method develops a perceptive system by which the place meaning resides in the interrelationship between an individual, society, history, and space.

Yi-Ting Wang is a Ph.D. Student of University of Paris VIII Vincennes-Saint-Denis in France. She studies history and aesthetics of contemporary sculpture and focuses especially on the environmental art and the urban sculpture in France from the 1960's to the 1980's, on the basis of the sculpture *Axe Majeur* made by Dani Karavan in Cergy-Pontoise. Considering the relationship between sculpture and environment allows to clarify the meaning-appearance operation from a historical perspective and hence to think about the potential of space at the crossroads of real, imagination and symbolism. Through a multidisciplinary research, Yi-Ting Wang tends to provide some reflections on today's urban aesthetics issues.

BETWEEN LIFE AND NON-LIFE: SACHIKO KODAMA'S BLACK AND BRIDGET RILEY'S PINK

Abstract | The contemporary world is so technological that we humans are located on the verge of life and non-life. Computers, cyborgs, artificial intelligence (AI), and androids permeate human society, and people have become fascinated by such menaces of the non-life. This paper clarifies why contemporary society loves the idea of the rise of artificial beings by analyzing the use of artificial colors—namely, black and pink—by the most cutting-edge female artists Sachiko Kodama and Bridget Riley, both of whom realize complex visual arts fusing life and non-life. The media artist Kodama uses black liquid while the abstract artist Riley uses pink pigments as key materials. According to the color theorist Asao Komachiya, black is the color of the blind; it appears on the verge of being and non-being. Meanwhile, Barbara Nemitz identifies pink as an artificial color that does not exist in the spectrum of sunlight; it is associated with precarious existence, such as cherry blossoms and the skies during dawn and sunset. Both colors are highly evaluated in technological and consumer society and widely used on the surface of many goods, including electronic appliances and fashionable dresses. Kodama's and Riley's strong reliance on black and pink and their high reputation as top class artists signify that, in terms of both technological and commercial lives, contemporary society likes the precarious artificial beings that exist between life and non-life. In light of the recent emergence of globalism, we have lost absolute rights and beliefs, and no longer can we be naïve to believe one criterion. We surveil each other on the Internet and SNS all over the world. In such suffocating circumstances, Kodama and Riley have realized the field of liberty, as their works are original, unique, and—as their extensive use of artificial colors black and pink indicates—ultra-human. Both artists confess their love of contemplation, and they explore the solitude and sufferings of contemporary society to free themselves. Kodama's and Riley's gender is also key. As Dora Haraway suggests in "Cyborg Manifesto" (1991), contemporary women, who have historically been dealt with as peripheral existences, survive as ultra-human beings (i.e., cyborgs) rather than the goddesses of the olden days. By considering significant female artists such as Kodama and Riley, we can understand not only the contemporary aesthetics of visual arts, but also the concurrent yearning of contemporary society for liberty, ultra-humanity, and non-life.

Index terms | *black; Bridget Riley; color theory; cyborg; feminism; liberty; pink; Sachiko Kodama;*

INTRODUCTION

Today, the Internet, SNS, robots, androids, AI, IoT, and their programming have become the core of our lives. Our age marks a time when mechanical and non-living things are a deep part of our daily lives. For us, these mechanical and non-living things have dominated the center of the world. We are depending on non-living existences, yet at the same time, we are afraid of the age of “singularity,” when the mechanical ability will surpass our own. We feel both fear and power because of the existence of machines.

This paper focuses on two living artists in this difficult age: British abstract artist Bridget Riley (1931–) and Japanese media artist Sachiko Kodama (1970–). Influenced by the French Neo-Impressionist painter Georges Seurat, Riley went into the world of abstract art. Although she herself dislikes to be called an “optical artist,” by the 1970s Riley had painted very minute abstract paintings that incorporated certain optical effects. At that time, her geometrical works skillfully used artificial colors like pink. These works are never stiff, but are rather quite vivid and lively. In fact, Riley is a very humane person who dislikes mechanical interventions and prefers direct communications.

Kodama, on the other hand, is known for her meditative art, which uses the magnetic liquid called “ferrofluid.” The leitmotiv of her art is minimalistic black. Although Kodama calls herself a “media artist,” her personality is humane as well, and according to her, the source of her inspiration is located in the nature of her homeland of Shizuoka, Japan.

These two female artists are ingeniously exploring the border between life and non-life in such an age when life is threatened by non-life. Here, I focus on their creativity and charms while simultaneously reading for clues for those of us who have to survive this difficult age.

BLACK AND PINK: THE COLORS ON THE BORDER OF OUR EXISTENCE

Japanese media artist Kodama uses black in her art. Kodama began to use ferrofluids, the leitmotiv of her art, in 2000. Her leitmotiv has not changed from “Protrude, Flow” (2001) to “Éblouissant” (2017). Technically speaking, the black liquid—the feature of Kodama’s works—consists of nanoparticles of iron oxide, which is colloiddally melted in oils. It is smooth and non-stagnated black (that actually includes a little brown as rusted iron) that gleams in the light. According to Kodama, these works produce meditative effects, and comments on her work have included “I feel like I am looking at the ocean waves,” “Your works have certain meditative effects,” and “I can look at these works for nothing.”¹ “Morpho Tower” (2006) has become a representative work of her ferrofluid art since the year 2000. The black flowing liquid and cylindrical tower are the cores of her art. For most of her ferrofluid art, electromagnets are used to generate a magnetic force when wrapped by copper wires or iron. The strength of the electrical currents in copper wires is computationally programmed in advance by Kodama, who tries to get viewers to go deeper into the works psychologically. The works give us a certain rhythm of nature, like ocean waves or trees trembling in the wind. This is the color “black” that is the core of Kodama’s hybrid art: the combination of meditative art and technological media art. Color theorist Asao Komachiya defines black as the color of non-existence. Komachiya says, “Logically speaking, the color black does not appear even when it exists under the condition of darkness. Our perception does not work when no stimulus exists. Our eyes see things when a certain light is offered. According to this logic, the eyes never work when the light is not given.”² In other words, the color black appears in the border between working eyes and non-working

eyes, or between existence and non-existence. Komachiya points out that black does not appear even though it exists and that black is a paradoxical color of dialectics.³ Komachiya also mentions the “Purkinje phenomenon,” in which our eyes perceive black shifting from red in the sunset darkness.⁴ Kodama’s work “Éblouissant” in dim light is reminiscent of the darkness of sunset, when red things shift to appear black. In short, black is the color on the border of existence and non-existence. Its ethereal nature is favored by Japanese traditional architectural space which Junichiro Tanizaki expresses in his essays. Kodama’s black reminds us of Tanizaki’s “In Praise of Shadows” (1933-34). Tanizaki says, “The wonderful feeling that comes from using lacquerware takes place in the moment between removing the lid and soundlessly bringing the bowl to your lips. It is a time to gaze at the contents that have settled silently in the deep, dark recesses of the bottom of the bowl and appreciate how the color of the lacquer matches that of the broth. It is impossible to distinguish what is there in the darkness, but one feels the slow liquid movement of the broth in the bowl, sees the slight beads of moisture at the bowl’s edge, then notices the steam rising as it carries the aroma—offering a faint hint of the taste before the coup even enters the mouth. [...] I think when Westerners speak of the ‘mysteries of the Orient’ they are very likely referring to the uncanny silence of these spaces.”⁵ Such esoteric meditative time on the border of existence and non-existence is brought by technological black of Kodama’s works. Her technologies are connected with the traditional “mysteries” of Japan and other Asian countries. Meanwhile, Riley began using pink more frequently around 1960, when she shifted from figurative paintings to abstract. For example, we see pink in her “Pink Landscape” (1960) and the murals on the 10th floor in St. Mary’s Hospital in London (1987, 2014). The former work, which draws the scorching heat of Siena, is painted in pointillist style in pink. The work gives us a feeling of warmth as well as a void. The latter is composed of beautifully colored stripes and, true to Riley’s impersonal style, contains no sign of compassions or soppy emotions regarding the patients. The murals emit a strong introspective light in the hospital atmosphere, where life and death intersect and the individual must carry the full weight of their burden. Considering these factors, for Riley, pink is the color that can express subtle feelings of figurative and abstract art on the border between life and non-life in scorching heat as well as in the hospital. In her book *Pink: The Exposed Color in Contemporary Art and Culture* (2006), Barbara Nemitz points out that the color pink does not exist in the solar spectrum.⁶ In fact, the Munsell color system puts a non-existential color magenta between red (long wave length) and violet (short wave length). Goethe’s color theory (1810) regards purple (Purpur) as the supreme color. Pink, just like black, is a color on the border; it is fragile and unstable. Pink appears in dawn, sunset, and cherry blossoms, all of which are transient. To borrow Nemitz’s words, “Pink is simply too beautiful to be true.”⁷ Pink is not only an artificial and unstable, fictional, and dreamy color, but also a color of flesh—that of the actual borders of our body, such as lips and vaginas. In this sense, pink has a profound existential meaning.⁸ While Kodama is trying to surpass the fleeting human existence with black, Riley expresses the subtle ambiguity of the border between life and non-life with pink. The two artists create their works with these two colors on the border of life. Both black and pink have been favored in Japan traditionally as well as contemporarily, as evident in the Japanese dim architectures, lacquerwares, cherry blossoms, and pop-cultural pink and black. Not surprisingly, both Riley and Kodama have many fans in Japan.

ON THE BORDER BETWEEN LIFE AND NON-LIFE: WHY ARE WE FASCINATED WITH NON-LIFE EXISTENCE?

Why are we humans fascinated with non-life existence? To answer this question, I first offer examples from Japan. In modern and contemporary culture in Japan, we have taken a very positive attitude toward “machines,” which are representatives of non-life existence.

The Japanese have a passion for the border between life and non-life, such as the manga characters Atom Boy, Draemon, and Gundam; the virtual character Hatsune Miku; and the recent android development efforts of people such as the scientist Hiroshi Ishiguro. To borrow the words of one Japanese scholar of aesthetics, Ken-ichi Sasaki, this is something similar to the Japanese affinity with *meguri* (natural cycles). At the beginning of the chapter titles “Ten to Hito no Meguri” (Cycles of the Heavens and People) in his book *Nihon-teki Kansei* (Japanese Sensibilities, 2010), Sasaki quotes a tenth-century poem by Tachibana Tadamoto. The poem tells its recipient not to forget that, no matter how great a distance may separate us, just as the moon returns its cycles (*meguri*), we too will meet again.⁹ As Sasaki points out, the feelings of reassurance and hope aroused by the cycles of the heavenly bodies and the seasons often underpin our thought processes. He writes that, “It is worldview based on the hope that even knowing how unreliable the other person may be, the repetition of good cycles will intervene for the better.”¹⁰ The feeling of reassurance aroused by *meguri*, which started from the veneration of nature, reminds us of the extreme love of regularity and formalism in Japanese culture. Japanese culture in part does not fit with Western homocentrism represented by the Renaissance culture. It might be due to our vulnerability and sensitiveness. Japanese culture, since the modern opening of the country, has expressed veneration for machinery. Such love of machinery runs counter to homocentrism, and we Japanese, without noticing it, avoid human vulnerability. The machine, which semi-permanently cycles, is a target of veneration, as is the moon. Yet Western culture also cannot go without machines, just like Japanese culture, as we can see in the recent developments of artificial intelligence. The difference is that, in Western culture, “loneliness” is a key, which *cogito* since Descartes and pragmatic thought derived from American culture bring about. It is when people are at the extreme of introspection and isolation that they lose the ability to distinguish between machine and human being. In his treatise “Discourse on the Method” (1637), which lay the foundation for modern Western philosophy, René Descartes compared himself when thinking to a traveler wandering alone in the forest.¹¹ When he dismissed all uncertainties and concentrated solely on his thinking self (*cogito*), he felt that animals were like machines.¹² This idea of “animals are machines” led in 1748 to Julien Offray de La Mettrie’s theory of man as a machine, which links to artificial intelligence and the concept of human substitution in the present day.¹³ Then what happened when machines intervened in the actual world? Charles Babbage (1791–1871), who invented the world’s first calculator, let it calculate the vast amount of data in voyage records. In other words, it was the “extension” of human ability. In 1936, Alan Turing (1912–1954), made the prototype of the modern computer, the Turing Machine, by cryptanalyzing the “enigma” during World War II. How Turing thought about machines can be read in his famous paper entitled “On Computing Machinery and Intelligence” (1950),¹⁴ in which he invented the Imitation Game that judges whether the counterpart in the conversation is a human being or a machine. In this thesis, Turing claims that the question “Can machines think?” (essentialism) can be replaced by the question “What will happen when a machine takes the part of A in this game?” (pragmatism).¹⁵ This is a breakthrough of paradigmatic shifts because one does not ask what machines are, but instead how machines act, which is a radical shift from essentialism to pragmatism. The 21st century, the age of Singularity, when the machine’s ability surpasses the human’s, is also the age of the extreme pragmatism. If machines are regarded as an equivalent to human beings, the meaning of act (how one acts) surpasses the meaning of perception (how one feels). In other words, one does not care how we feel; only how we act matters. This is the world of the extreme pragmatism, where one can only know how people act and not what people feel. The psychologist Jessie Bering says, “We all have our doubts from time to time—I’ve stared, square in the eyes, my share of somnambulist students who I would swear were cleverly rigged automations.”¹⁶ Turing also suffered from loneliness as a secret agent in World War II as well as a homosexual; he invented the Imitation Game, which pragmatically judges whether the counterpart is a machine or a human

being, even though he claimed that machines are essentially different from humans. Such extreme loneliness can be found in Japan, where people are very delicate and have a strong sense of doubt. As previously mentioned, Japanese culture has been attracted to machines, robots, and androids. In his novel *For Humans to Become Androids* (Hito wa Android ni narutameni, 2017), Hiroshi Ishiguro wrote a story about a human girl who opens her mind only to an android counselor. The counselor's favorite phrase is "Human beings are born to become androids." The human girl acquires an eternal android body and chooses to live in space.¹⁷ Like this girl, many Japanese dream of a life in which they change to an eternal existence from vulnerable human beings. This might be an admiration for the eternal being because the Japanese live in unstable human and natural conditions. In developed countries like Japan in the 21st century, a mutual monitoring society has developed in extreme pragmatism. That means one only sees how other people act. In such a society, we cannot tell life from non-life. The arts of Kodama and Riley are appealing in such a hybrid world, where life and non-life are mingled.

PERIPHERAL WOMEN: CONSIDERING KODAMA AND RILEY THROUGH GENDER

Since an early age, women have dreamt of the ultra-human existence. Mary Shelley (1777–1851), who wrote *Frankenstein* (1818), dreamt of the border between the human and the ultra-human. In her novel, the scientist Frankenstein invented an ultra-human being, and that being committed a number of murders. In addition, Ada Lovelace (1815–1852) imagined that Babbage's calculator could deal with any information other than numerals.¹⁸ To be a woman has historically been connected to being an ultra-human. Donna Haraway, in her famous book *Cimians, Cyborgs, and Women: The Reinvention of Nature* (1991), points out that peripheral women, if they have power, have been deified since ancient times. However, what Haraway dreams for women is an existence as cyborgs, which is the ultra-human position in another sense.¹⁹ It is "Cyborg Feminism," which counts how women act in society rather than how they show mercy to it. This is the new way of self-assertion in this pragmatic society. For women, overcoming life is a dream and one of few choices in which they can overcome gender issues. By using black and pink, the colors on the border of our existence, Kodama and Riley have gained a certain freedom that overcomes life. They never swarm, but rather realize freedom in the history of art.

MANIPULABILITY IN DIGITAL FILMMAKING IN THE INTERSECTION BETWEEN DATA-IMAGE AND 偶然

Abstract | While Gilles Deleuze's cinema theory examines images based on viewing photochemical cinema, this paper contemplates the images of digital cinema to respond to changes filmmakers have experienced from the shift in their tools and the nature of the resulting images. The interstice between images that Deleuze associated with the time-image seems to face a crisis following the appearance of digitized and data driven images, due to their excessive accessibility, connectivity and manipulability. The resulting new type of image, which we call the *data-image*, allows us to reveal and analyze the logic and power of creators to make an unlimited amount of modifications and manipulations to images. This analysis of the digital image creation process demonstrates how easily the data-image is dissected into flexible and composite-ready modular pieces, to be manipulated spatially (in the composite) and temporally (in the edit). This data-image can, however, also drown creators in an unlimited amount of choices. The amount of data and its manipulability has gone so much beyond the capacity of human processing power, that filmmakers need a new paradigm to configure their decision making process to create images without producing endless clichés. In search of new approaches to this situation, this paper attempts to establish a new mode of being as a filmmaker, through the practice of two concepts, *middle voice* and *guzen* (偶然), a Japanese concept that floats between contingency and fate. These concepts provide a framework that enables filmmakers to grapple with the data-image to create digital films which contain something new, despite the challenge of making choices from limitless footage and infinite combinations: a mode of playing with impossibility, like gamblers capable of embracing an uncontrollable reality.

INTRODUCTION

In the production process of a science fiction short film, *Perfect World*,¹ which I directed, we decided to employ any tools available to extract the potential of digital filmmaking. In addition to a RED camera, with which we recorded 4-6K images, we ‘captured’ (≠ ‘filmed’) the scenes with three Microsoft Kinect cameras, these are infra-red depth sensor cameras, to entirely digitize the performance and the set. This method allowed us to re-create the scenes using 3D data in post-production much more accurately than motion capture technology, which extracts only the ‘bones’ of actors to attach them to virtual characters. With our method, we could manipulate technically anything, in unlimited ways. “We will fix it in post,” a common phrase in film production referring to the ability to fix mistakes in the post production process, and a typical producer’s method to keep the day moving, was taken to the extreme. We could not only fix it, but also “(re-)create it” – in post. Our workflow is representative of the most extreme forms of digital filmmaking. What could be seen from our process is that every step was in different ways heavier than conventional film production, especially due to the massive amount of possibilities available and the consequent decisions required. This paper is built on the back of that film, as it became clear to me that I needed conceptual and theoretical frameworks to face these new challenges.

Since the appearance of digital cinema, ‘real life’ has become the material data of digitized footage – a thing to be combined, manipulated, composited and edited. All the shooting and editing tools readily available have enabled filmmakers to be in an endless loop of connecting images. The digital image, referred to as the *data-image* in this paper, seems to have changed the meaning of creating films. As an influential film theory, Gilles Deleuze’s *Cinéma 1: The Movement-Image*² and *Cinéma 2: The Time-Image*³ can provide some insight on this matter, but I will consider updates to the theory, as it was originally published in 1983 and 1985 before digital cinema hit the mass market. And this examination will be done through the perspective of a filmmaker, for two reasons: firstly, filmmaking is being democratized through digital tools, making everyone creators; and secondly, the manipulability of digital data typically effects the filmmaker more than the viewer.

This paper will discuss the following topics:

1. **Interstice:** We will examine this key concept from Deleuze’s writing from a filmmaker’s perspective. The interstice is the gap between images, which Deleuze’s argues in *Cinéma* is a key concept in separating the movement-image from the time-image.
2. **Data-Image:** The nature of the data-image, as a category of image type in digital cinema, distinct from the movement-image and the time-image, and how it effects filmmaking.
3. **Chance and Control:** The relationship between chance and “interstice,” especially in how they are influenced by the data-image, which provides filmmakers with infinite control.
4. **Creativity in Digital Cinema:** An exploration of the possibility of making creative films with digital tools, under the premise that creativity is defined by unique connections that are not cliché. Approaches to this will include avoiding conventional action-reactions in editing, the utilization of middle voice, and contemplations of *guzen*—a Japanese concept between chance, indeterminacy, and improvisation. For good measure, we will also consider gambling as a way of making decisions out of unlimited choices.

Interstice

Gille Deleuze's *Cinéma* is a theory on the categorization of images, and one of the most important differences between his primary concepts of the movement-image and the time-image is in the way images are, or are not, chained together. While the movement-image puts images together following what Deleuze calls sensory-motor schema, by connecting actions and reactions, these sensory-motor connections are broken in the time-image. The time-image "makes man a seer,"⁴ turning him into an onlooker. This leaves "interstices" between images, as in Godard's films, in which characters do not follow clear action reaction paths - instead remaining lost about their direction.⁵ This theory on the interstice between images is inspiring, not only for audiences but also for filmmakers, as it validates the unrationalizable connection of images, or the jump cut (in French, *faux raccord*, meaning wrong connection). Creating these interstices or gaps in editing is in fact paradoxical for filmmakers. It is impossible to create gaps with intention, since there is a connection as soon as intention arises. (Is an intentional mistake a mistake?) On the other hand, connecting images unintentionally can lead to random editing, or no connections (arguably no film), in the extreme scenario. This means that the creation of gaps is an impossibility for filmmakers, but this can also be the exact reason why filmmakers can be creators.⁶

So how can a filmmaker be creative, or more precisely, create interstices between images, in the digital cinema era? To tackle this question, we will examine the image in digital cinema that I call here *data-image*, to differentiate it from Deleuze's categorization, which is largely dependent on physical photochemical film (pellicule).

Data-Image

The simplest way to define the data-image is by the tools used to create it. Let's call any image captured, scanned and/or rendered as digital data, a data-image. These images have at least three characteristics of note:

1. **Quantity:** They are qualitatively unlimited, due to their lack of "privileged indexical relationship to prefilmic reality,"⁷ hence any media coming from any digital platform, database or internet can be included in the database.
2. **Speed:** Quick and easy access (no 'development' is required and they can be searched using metadata).
3. **Manipulability:** Complete manipulability, ready not only for immediate and endless editing (temporal editing) but also for compositing (spatial editing, including compositing in virtual 3D space, called deep compositing,).

In discussing new media, Lev Manovich defines cinema as "right at the intersection between database and narrative,"⁸ examining the complexities that follow. While database has no direction or order, by contrast, cinema, as an art form, contains sequential images projected on one framed screen, typically requiring linearity.⁹ To achieve narrative from database, digital-filmmakers are challenged to go through an endless selection of images. And as soon as 'reality' is digitized, what the data-image brings to the filmmaker's mind is the sense of ultimate control, to achieve their oeuvres by diminishing mistakes, errors and chance.¹⁰

Chance and control

Although chance can play a role in the filmmaking process, as theorists and filmmakers like Noël Burch argue,¹¹ the creation of the interstice in the process of editing requires a different framework. This is because it must be the filmmaker's decision to connect one image to another, unlike in the filming process, where the filmmaker's role is to keep chance in the images by deciding not to make a choice during the improvisation of actors and camera movements. This means that there is always some intentionality in editing, which would make the gap disappear. And the ability for a filmmaker to intentionally control the film can be, at least theoretically, successfully enforced in digital filmmaking because of the quantity of footage allowed in a shoot, the speed of access to all footage via metadata, and the manipulability of every pixel. The data-image makes filmmakers feel, even though it is not always true, that 'we can fix everything in post.' Therefore, if those three elements: quantity, speed and manipulability, represent the data-image accurately, it seems there is very limited space for the interstice, or, the (un)intentional gap, in digital cinema.

We could see, however, an example of digital film editing style in favor of chance in *Soft Cinema: Navigating the Database* by Manovich and Andreas Kratky,¹² in which a software edits the movie; and any movie 'generated' (≠ created) by automatic editing software.¹³ It is not a far leap from 'automatic editing' to the possibilities of artificial intelligence. Of particular relevance here is the story of the AI Benjamin, who participated in the filmmaking process by writing a script. Although it was only the writing phase that the AI (Benjamin) participated in, and that its source was biased in genre and limited in quantity, its project *Sunspring*¹⁴ gives us some insight in terms of the integration of AI in filmmaking, and the possibility of intentionality. What Benjamin did to filmmakers, including actors, seems to be making them interpret the "hilariously nonsensical" script, delivered to them without further explanation. The 'reality' in Burch's theory is now replaced by Benjamin, the AI., or more accurately, the database behind it. But obviously, as Benjamin is artificially created with limited resources (sci-fi scripts from the past), it is not the same reality, but a *composited reality* made out of database and AI. Even if Benjamin were to handle the film production, shooting with 100+ cameras and depth sensors, compositing the images with the complete 3D data and editing the images together, I am not certain if the resulting film would be regarded as a creative piece in a Deleuzian way. But at least the relationship between the image-database-algorithm, in Benjamin's case, and the composited reality it provides, is insightful for considering what a filmmaker is in digital filmmaking. And more importantly, if "interstice" or "chance" is a key word, could a filmmaker really beat Benjamin in its 'creativity'...?¹⁵ In the case of *Sunspring*, Benjamin's script required filmmakers' participation to be interpreted or modified. And it is not the absence of control, but the inbetweenness of Benjamin, "somewhere in between author and tool, writer and regurgitator," that can make it/him/her a creative filmmaker of digital cinema.¹⁶

Creativity in Digital Cinema

One thing that a Benjamin like AI cannot answer at this point is how the connecting process can be initiated. In other words, how can one become a digital filmmaker? To think about this question, I would like to borrow Aki Morita's approach, which is to examine the creative process through the middle voice.¹⁷ Middle voice is a category of voice, different from active and passive, in which the verb indicates a process where the subject is inside it (i.e. βούλομαι: will/wish/want).¹⁸ Pointing at the fact that artworks have been produced even after the "death of the author"¹⁹ as god-like creator, she

describes the creator as the ones who “are swallowed in the middle voice of the process,”²⁰ pointing out the a posteriori nature of becoming an auteur.²¹ Artists create in middle voice, pushed by nature affecting their body, soul, and brain without awareness or intention. If we follow this, artists do not actually create, they do not will to create, but they only choose to do something that other people regard as creation. In relation to middle voice, Kokubun differentiates choice, which is “*constantly done* in daily life” as the “consequence of the past²²,” from will, which “governs the ability to start.”²³ If we deny the artist’s will to start because their creation is done in middle voice, what they do is simply to choose to do something. What is lacking in this argument is the difference between choices for simple daily actions and those that lead to the creation of artworks. The key to differentiate a simple choice and a choice to create is whether the choice is close to impossibility or not, as Deleuze associates creators with their impossibilities, in other words— their ability to discover possibility when faced with the impossibilities they themselves have created.²⁴ The key here is that the filmmaker is not an actor in the creation, they are almost carried along through it – perhaps nearly acted upon by the filmmaking process itself.

To provide a framework, I would like to bring in the Japanese philosopher Shuzo Kuki’s theory on *guzen*. Guzen is a Japanese word, usually translated as contingency,²⁵ but it can also be translated as accident, chance, coincidence, fortuitous, hazard, incident, or even fate, depending on the context.²⁶ He defines guzen as an “encounter of two independent dimensions”²⁷ that happens irrationally, meaning it exists outside of the chain of necessity, and more importantly, its mutability cannot be captured by the theory of probability or statistics. What is relevant to our discussion here is Kuki’s theory between guzen and possibility. He argues that as possibility increases guzen decreases, and its extreme is that possibility becomes necessity. On the contrary, as guzen increases, possibility decreases, and its extreme is impossibility. Because of the unexpected that happen by guzen (chance or accident in this case), he argues that guzen, or the surprise it evokes, is the source of artwork, which expresses the “play between life’s decadence and arbitrariness.”²⁸ If we apply Kuki’s theory into the argument of choice, we can say that what separates daily choices and ‘creative’ or ‘artistic’ choice, is this impossibility to which guzen is linked. Whereas daily choices are linked to necessity, following our sensory-motor schemas and classic action/reactions, ‘creative’ choices are accomplished regardless of their possible impossibility. This conflicted way of making decisions is very similar to gambling. As Higaki argues in *Pari/hasard (Tobaku guzen no tetsugak)*, gambling is done when “we, the finite, stands at the present in front of the infinite time.”²⁹

In *Perfect World*, while the unlimited possibilities from the data-image overwhelmed the filmmakers, myself included, the data-image’s unlimited manipulability kept us in the realm of (the desire for) control, necessity and hence cliché, by preventing us from feeling resignation.³⁰ Without this resignation, filmmakers remain in the mode of searching for the missing link between images, instead of deciding to leave gaps. It may be, in fact, the data-image’s manipulability that may have been manipulating filmmakers, by making them believe in the existence of reasonable connections between everything. In this sense, the search for control in filmmaking is no longer the issue, but the control over the controllability is what filmmakers need to remain creative.

Conclusion

Compared to cinema with material film, in which chance was to some extent guaranteed as long as filmmakers decided to let chance take place through the improvisation of actors; the data-image's manipulability and controllability is much more against the "interstice" and creativity. But through an effort to integrate chance, the gap can be creatively crafted if the filmmaker can be open to guzen. Guzen is, perhaps, an ultimate tool of digital filmmaking. It is a mode of living, not in the future (possibility) or past (necessity), but at the present time, in taking the risk of living as a gambler.

- 9 Even when the story is told with twisted plots and 'out of order,' images need to be connected sequentially regardless of the medium, from printed film to Digital Cinema Package (DCP).
- 10 An interesting transitional example is *Dancer in the Dark* by Lars von Trier, where they used one hundred cameras to capture the dance scene. In an attempt to capture the scene as a one time event, Trier decided to create a set exactly like a prison with countless surveillance cameras, to be able to include even mistakes as a gift. But here we see an interesting conflict that filmmakers face in the digital era. The question for von Trier is, why he did not use one single camera, as in traditional film production, if the mistake is a gift. In other words, his desire for controlling chance seems to have overwhelmed the importance accidents as gifts. *Dancer in the Dark*, directed by Lars von Trier (Denmark, Germany, Netherlands, Italy, USA, UK, France, Sweden, Finland, Iceland, Argentina, Norway, Taiwan, Belgium: Angel Films, 2000), 35mm film. EMPTY PAGES AND FULL STOPS. ON THE AESTHETIC RELATION BETWEEN BOOKS AND ART

Abstract | Books and artworks have a long common history. Written texts as well as the joy of reading and the act of writing them appeared on pieces of art from early Antiquity onwards, well before the current form of the book itself was invented. Apart from indicating readers and writers, the book had also become a basic symbol of culture, education, or the attribute of saints. On the other hand, there are many artists who create special artist's books, i.e. special one-copy and one-edition volumes, not only containing the artist's drawings or paintings but the whole assemblage of the book (and often even the paper itself) is the creator's own work. From the Early Modern Age and especially from Romanticism onwards, also the sketchbook of the artist grew rapidly in its importance. In this paper however I would like to focus on a third aspect: when the book, or a special part or aspect of the book, serves as the basis of the (creation) of the artwork, hence the book and some of its features becomes the intellectual and/or material basis for a new piece of art. Therefore, my present investigation is not about the book as simply a depicted element in a painting or a motive appearing in a sculptural work as an attribute (as in the case of representation of books), and not even a newly created book-like art object (like in case of the artist's books). Instead of these aspects, my current examination aims to analyse the phenomenon of the book, as how its materiality and referential ability may inspire the artist to further develop considerations on social, cultural and political issues. Works by the art collective Slavs and Tatars, Sophia Pompéry, and Ákos Czigány are among those to be analysed.

Index terms | *Artworks; Books; Artist's Books, Sketchbooks, Ákos Czigány; Slavs and Tatars; Sophia Pompéry;*

Can we be optimistic and see a revival of books? Or can we at least be less pessimistic and hope in their a survival? On the one hand we regularly hear and read complaints about the less and less reading of books, on the other hand certain signs should still make us somehow hopeful. For example the sheer number of new books published each year – even if sometimes in significantly lower number of copies than some decades ago – and the renaissance of cover design shows that for many the several millennia-old object remains significant despite all the threats coming from among others disinterest in reading and digitalisation in publishing. And the increasing popularity of various slow-movements can also find allies among readers of long books, instead of accepting to be satisfied with the high-paced text with ephemeral significance we are regularly bombarded with.

For our current discussion about the aesthetic relationship between books and art, there are plenty of connection points between these two cultural phenomena. For example art can be analysed and artworks can be reproduced in books. Books can appear in pieces of art, what's more, they can become artworks, not only as a special artist book, i.e. special one-copy and one-edition volumes created by the artist, but also as raw materials for installations. And just like books can become artworks, also pieces of art can inspire authors or serve as a central motive in novels.

Books and artworks thus have a long common history, and in two recent publications we can see a nicely illustrated survey of this: in “Books Do Furnish a Painting” by Jamie Camplin and Maria Ranauro (2018) the authors focus on the cultural history of the book, based on its representation in art pieces over the centuries.¹ David Trigg’s “Reading Art. Art for Book Lovers” (2018) is also a lavishly illustrated visual anthology of great works, mainly focusing on the appearance of books in pieces of art and the representation of people reading. However, he adds examples of the aforementioned process too, when the book becomes material for installations.² From these volumes the reader can survey how written texts as well as the joy of reading and the act of writing them appeared on pieces of art from early Antiquity onwards, well before the current form of the book itself was invented. However, apart from indicating readers and writers, the book had also become a basic symbol of culture, education, or the attribute of saints.

There are some further areas however in the examination of the relationship between art and the book as a form that we can add to our analyses, and that were not mentioned in the above volumes: for example the sketchbook of the artist, that grew rapidly in its importance from the Early Modern Age and especially from Romanticism onwards. Although it may at first seem to be of secondary importance, some outstanding examples can illustrate what a broad range of aesthetic and artistic considerations a sketchbook can trigger, i.e. that a sketchbook may contain invaluable information about both the artist’s own ideas and about novel approaches and tendencies of art. Just think of for example Villard de Honnecourt, the 13th century French sculptor’s survived parchment that contains many visual notes, including also textual references to forms drawn “from life” – the expression that despite its ambiguity and doubtfulness in the context still indicates the start of a crucial turn in Western art, i.e. the idea that instead of the pure copying of the already existing material in model books, the invention of a new mode, creation of new forms based on the direct observation of the actual object can also be an adequate way of artistic and creative process. Or, another example of high importance is the 18th century Venetian painter Canaletto’s survived sketchbook, published in a modern facsimile edition by Giovanna Nepi Scirè.³ In and through this

sketchbook we can observe the artist's way of taking notes, working method, ideas, ideals and artistic solutions, that will then help us to better understand the features of his capriccios and vedutas, as well as the convoluted connection of these two genres to each other and to reality.

So far I quoted rather classical connection points between books and artworks. In the following section however I would like to focus on another aspect: when the book, and especially its material property or physicality serves as the basis of the creation of a novel artwork. In other words, I focus on pieces of art where the book is not simply a depicted motive or an attribute and it is not even a newly created book-art object. Hence my current examination aims to analyse the phenomenon of the book, as how its materiality and referential ability may inspire the artist to further develop considerations on cultural, social and political issues. In this way my five examples below do depart from books, or from some parts and aspects of them, but in none of them will the book itself appear in its regular form and function. What's more, in some cases even the content of the book becomes less important, compared to other characteristics and to the symbolic features it might bear and refer to.

A functional and at the same time symbolic aspect of the book and of the text in it serves as the basis for the poetic and conceptual works of Sophia Pompéry. What we see at first of the Berlin-based artist's series titled "Und Punkt" (And full stop) are undefinable amorph greyish spots (Figure 1.). Later however we learn that the pieces are photographs taken with a special microscope, reproducing the last full stop of several love novels of over two centuries, ranging from Goethe's *Werther* (1774) to Ingo Schulze's *Adam und Evelyne* (2008). For the series Sophia Pompéry was working with the Staatsbibliothek in Berlin and with the Rathgen Research Laboratory, and always used the first edition of each book. For the viewer of the pieces the most surprising aspect is that in such an enlargement the points are not necessarily round at all, e.g. the full stop of the "Traumnovelle" by Arthur Schnitzler (1926) or the aforementioned *Werther* are for example rather square-like, and even the "rounder" ones are irregular and messy, thus challenging our primary concept of the roundness of a full stop. At the same time, as Tobias Roth wrote, the artist creates a special "typographic intimacy", that also explains why all the full stops come from love novels.⁴ In this way also our idea of the efficiency of the finishing of the story is challenged or at least questioned, seeing how the final act of the author, the last point, may float away. While Sophia Pompéry took only a point from a book, my next example, Ákos Czigány, in certain aspects, even less: in his series "Darwin Online" the photographer created artworks by composing together the blank pages of Charles Darwin's works (Figure 2.). Just like Sophia Pompéry above, when creating his conceptual works Ákos Czigány used the first edition of the books, but instead of photographing them, took the material from the extensive online archive of Darwin's texts. When Darwin's books were scanned, all the pages were digitalised, even those which, for normal editorial reasons, like chapter divisions, did not contain any text. The artist selected these and put them together, without modifying the colours, appearance, resolution and especially not changing their order. The final pieces are nevertheless not entirely and simply blank pages, for several reasons: the printed text from the other side of the digitalised empty sheet may partially be visible due to the strong light of the scan, and in many cases signs and elements of the natural decay of the book – brownish spots, effects of moist, folds of the pages etc. – can be observed. The assembling of the blank pages will thus result in an abstract image having lost its resemblance to the original book, where each of the individual page makes the contexts of science, art and media meet in the

textual gaps. Naturally the blank pages can also stand for a wide array of potential considerations on the gaps of meaning, missing links in the chain of evolution and not lastly on the thrilling ambiguity of preserving and using knowledge – for this last aspect see the dichotomy between printed and digital, and the digitalization of the material decay of the original.

Especially this latter aspect – i.e. the investigation of the ways of gaining and consuming knowledge – can connect Ákos Czigány's work with my next example, a series by Slavs and Tatars, where, despite the different appearance, the experience and experiencing of the materiality of the book will become essential in the interpretation of the pieces. The analyses of the social, historical and political realities – as well as of the multiple possible issues connected to their transformations – and a country's, a nation's or a group's struggle for finding and maintaining its cultural coherence throughout the vicissitudes of history are examined in the works of the art collective, Slavs and Tatars, who examine the cultural and geopolitical changes of the Eurasian region. They are particularly focusing on the mixture of cultures, religions, traditions, languages and forms of expressions from the former Berlin Wall to the Chinese Wall – hence their artist name "Slavs and Tatars", referring to the dominant groups of these vast lands. Their interest is nicely illustrated in an on-going series titled "Kitab Kebab" (Book kebab), where, quoting from their website: "A traditional kebab skewer pierces through a selection of Slavs and Tatars' books, suggesting not only an analytical but also an affective and digestive relationship to text. The mashed-up reading list proposes a lateral or transversal approach to knowledge, an attempt to combine the depth of the more traditionally-inclined vertical forms of knowledge with the range of the horizontal."⁵ Obviously, among the titles we can see works of authors from the wider region, and hence the direction and dimension of gaining knowledge gets very much in parallel with the discovering of the interwoven histories of the populations and nations of their research area – "area" in both geographical and metaphorical sense.

In the following two examples the power of books and the power of culture symbolised by the book is more directly connected to social and political issues. Both were shown at the 2013 edition of Istanbul Biennial. The first one is Jorge Méndez Blake's work, as part of a series of installations, built inside the exhibition space, that the artist had created in several occasions and versions. It consists of a solid brick wall, which however, after the first superficial glance, shows a significant irregularity: the artist added a book in the lowest row of the bricks that naturally broke the regular pattern of the construction, resulting in a growing crack in the wall, a potential opening of an architectural and urbanistic form of which primary aim is closing, division, separation and exclusion. Throughout the series Blake uses different books, the one shown in the 2013 Istanbul Biennial was Kafka's *Castle*. Naturally the work is open to many readings, some of which I mentioned in an earlier essay, starting from the inaccessibility of complete knowledge: just like K. in Kafka's novel cannot understand the situation and series of events he finds himself in, we are also unable to take out the book to read its content.⁶ Besides this – or better to say, despite this – it can also remind us of the power of critical thought that may open up walls. This latter aspect got highlighted in a more recent version of the piece, installed in December 2018 in New York, where the artist built Kafka's *Amerika* in the wall, and we may easily understand why the actuality and references of this text is important for the Mexican artist.

In my last example the book's actual content has less direct connection with the final work itself, it becomes and is used to symbolise culture in general and to analyse its

current threats and challenges. In Carla Filipe's work titled "Rorschach-installation", old books, taken from the artist's favourite bookshop Moreira da Costa in Porto are shown. The beautiful aged volumes are however partly eaten by bookworms, and the delicate, fine lines and holes of this dereliction appear symmetrically on – or in – the open books. This naturally makes them resemble the random forms of the Rorschach-tests, originally used to examine the mental state and personality disorders of a patient. In Carla Filipe's work however, the test is not applied on an individual but for the survey of the state of culture on the level of the entire society, by testing the mental preparedness and ability of its individuals to care for the human culture. Therefore, on the one hand we can agree with Fulya Erdemci, curator of the 2013 Istanbul Biennial when writing in the catalogue that the books "focus on the cultural impact of the global financial crisis at the local level, reminding us that if culture is abandoned, it will gradually disintegrate and be overpowered by nature."⁷ Adding to this interpretation however, we can also understand that the Rorschach-test-like lines involuntarily caused by the bookworms are thus testing us not only whether we can simply understand the signs of the current dereliction of human culture, but also challenge us whether we can find solutions for its proper maintenance and care – for our own cure.⁸

Despite all the differences in the above examples, we can see as connecting point that the artists are not merely experimenting with new forms and appearances but by alluding to the symbolic strength of the book as an object, and by departing from the material properties and from the physicality of the book, they examine curious questions of art and literature, pressing issues of contemporary society, politics and most importantly the actual state of human culture, as well as the threats we need to face when caring for this culture and cultural objects. These works show us that books can contain and maintain culture, but they themselves can often and easily decay. Worse however, their decay directly leads to our own.

ETHICS OF CONTEMPORARY ART

Abstract | *Ethics of Contemporary Art.* – The text attempts to point at a change in contemporary art and the fact that this art is theoretically attractive not only for traditional scientific disciplines but also for ethics. It shows why and for what reasons contemporary art raises eternal precaution and which specifically raises this alert. The use of the description of contemporary “turnovers” in the art world shows that artworks that have come to the centre of both theoretical and practical interest can be understood as an event, story and situation and that this situation may be an “ethical situation” requiring not only aesthetics and art theory, but also ethics.

Index terms | *ethics, contemporary art, turnovers, applied ethics*

From the point of view of ethics, one cannot miss that in contemporary art there are so many changes which brought to the centre of interest a participatory work or an artistic experiment that at first glance has common features with ethical situations or directly with human experiments which ethics deals with so deeply. At second glance it is obvious that the way of perceiving the subject and the framework, which this perception is taking place in, is as important in aesthetics as the subject itself. In a more observing view, it is clear that artistic events, participatory works and artistic experiments take place in another context of perception, action and evaluation. In the aesthetic and artistic mode of action, the “just like” mode. What is essential in the aesthetic mode of perception or the artistic mode of action is very different from what is essential to the ethical modus. Participatory works acquire ethical optics of another dimension and acquire other qualities than those revealed by optical aesthetics. With the first one we find out what rules apply to the situation, what rules should apply and whether and for whom this situation is good. With aesthetic optics we are primarily able to reveal the aesthetic qualities of the artwork (which often is “the situation” nowadays, as I try to prove below), its aesthetic quality and value. The form of contemporary art, influenced by many “turnovers” (especially the “turnover to the viewer”), some of which are presented below, are encouraging to change this optics, and calls for the exploration of artistic experiments with the perspective of ethics. The ethics of contemporary art is thus a reaction to the form of contemporary art, an effort to pay attention on those specific features of contemporary art that raise the ethical attention and ask why it is like that. Why contemporary art (and what, in particular) attracts ethical attention?

The ethical perspective of exploring art is nothing new in theory. There is something that could be called traditional ethical perspective of understanding the work of art. It takes into account the normative role of art and could be characterized by the fact that the work is perceived as what confirms and preserves certain values (of commonality, municipality, community, nation), as evidenced, for example, by the existence of national galleries which have to raise the spirit of the nation through works of art. At the same time, however, the critique of these values and standards also belongs here. To the traditional ethical perspective does not only belong the apologetic role of art but also its critical role. Also the critique of the norms of this community or nation [Skabraha 2010: 97-107]. The current “ethical turnover” may mean something completely different, but not even he can offer the proposed change of perspective. This turnover is characterized by the origin of a dichotomy between “unethical”, purely author’s artistic expression and “ethical” artwork which other “ordinary” people participated in. Eventually a dichotomy of “active” and “passive” access to the artwork. The ethical scale is then determined by the definition and amount of engagement of those “others”. In the first place there are works of art that have been created by “real people” and then in the last place there are artworks created by the artist himself. Ethical is the work which viewers participated in and the artist somehow suppressed his artistic creativity, unethical it then something that is the result of the individual creative activity of only one artist. Purely mathematically: ethical = participative, unethical = individual. Eventually, and ultimately, the theory of art can be considered as an ethical perspective that can be seen in the discussions of aesthetic cognitivists. Aesthetic cognitivism as the direction of the art theory, which puts the relationship of art and knowledge at the centre of its exploration, offers the following ethical perspective. It considers the ethical and unethical content of the work or the author’s moral credit versus the aesthetic quality of the artwork. The debate between so-called autonomists and moralists is crucial on this count. Moralists insist that in evaluation of the artwork, the moral nature of its content plays an important role. The autonomists defend the artistic autonomy of the artwork, i.e. its independence from the morality or immorality of its content, and insist that the moral dimension of the artwork is not important in its valuation. These two attitudes, in their radical forms, have brought the debate to an end, from which a possible starting point

was probably offered by the theory of ethical autonomism by Rob van Gerwen. [Cf. Gerwen 2004] Gerwen tries to defend the importance of the moral aspect of an artwork, which does not condemn his view on art. However, the new ethical perspective, the ethics of contemporary art, does not come from one of these “traditional” approaches. The Ethics of Contemporary Art that we want to propose will focus on contemporary art and try to see it as an ethical situation. Here is the question of what does contemporary art look like and what does contemporary artwork look like.

The transformations of contemporary art, described by the interdependent or intertwined “turnovers”, have moved into the centre of interest and artistic happenings of artworks that are not “parts” in the traditional sense (sculpture, painting, plastic art) but rather social events, performances or workshops. “Although these practices are usually not very visible in a market-oriented art world - dealing with collective projects is much more complicated than with individual artists, and often it’s not about an ‘artwork’ but more about a social event, publication, workshop or performance - nevertheless they have more distinct place in the public sector “[Bishop 2006: 179]. Among the turnovers that have led to a shift towards these “dematerialized” artworks belong the social, ethical, community and educational turnovers. All of them can then be put together under one common denominator “turnover to the viewer”, characterized by an increased interest in the role of the viewer, focusing on activities which are aiming to mediation the art and promoting the visual literacy of the audience or their participation in the creation of the artwork and direct participation in the cycle of the art world. This novel focus on the audience and the obvious emphasis on their role in practice and art theory has a more general and broader character and can be distinguished from the strategies of participative art only - wiping out of the difference between the creation and the acceptance of the artwork, the involvement of “real” people in the artistic project etc., from the “educational turnover” aimed at combining art and education, empowering spectators’ competences and increasing visual literacy. “Turning to the viewer” is not only about effort to involve the viewer in an art project, in artistic and educational events, in his involvement in a particular artistic intent and creation, but rather about a wider and more general interest in the role of the viewer in the contemporary art world. In the narrower sense, “turning to the viewer” can only mean the development of the cognitive potential of the viewers, the development of “visual literacy” or the attempt to participate in an art project, and more broadly any focus on his participation in the art world, their role and transformation of this role in contemporary art.

I believe that the role of the viewer has never had so much attention on so many levels of the art world as it is today. The possibilities of actively engaging the audience in the events of exhibition institutions in the form of gallery animations, commented tours, workshops, or other inexpensive activities to make the audience available and attract them to the institution are given more and more attention. The current “turnover to the viewer” can be considered as the total and general emphasis placed on the viewer in contemporary art, which is manifested in many partial forms. Whether it is a range of activities to attract the audience into the institution and make specific artworks accessible to them or to develop their overall visual literacy and cognitive skills which are necessary to perceive contemporary art or to carefully analyse the possibilities of audience participation in artistic projects, where the viewer is always the centre of interest. From the traditional and today obsolete triangle of the artist - artwork - the viewer, for example, due to the absence of the figure of the curator, it is in my opinion the viewer who is in the centre of the theoretical and practical interest in the circle of the art world.

“Turnover to the viewer” is the result of far-reaching changes in art and artistic operations, and directly responds, for example, to the institutionalization of art, new methods of artistic creation, especially post-production and contemporary cultural anchoring of art in

visual culture. Each of these factors influenced the form of contemporary artwork in a different way, but all of them are united with the influence of “turnover to the viewer”. However, this turnover is also very closely related to the above-mentioned turnovers. Whether it is a community turnover, where artists first become part of a community, within which they later work artistically and solve for example its social themes or an educational turnover, where the focus is most visible to the audience, because in this turnover it is only the viewers who are at the centre of all efforts and actions.

The educational turnover is characterized mainly by focusing on the educational potential of exhibitions and the educational possibilities of art projects. It is manifested in the form of thematization of possibility of “education” and is realized for example as “accompanying educational activities”, “possibilities of mediation of art”, “commented tours” etc. “Educational turnover” is manifested by increased interest of artists and curators in examining the relationship between art and education, in projects that relate to possibilities of education with methods and forms in the widest sense of the word. This interest can be traced back to the beginning of the new millennium, in general we can say that this happens to us later in response to the world’s artistic happenings. The forerunner of artists today associated with “educational turnover” is considered Joseph Beuys and his pedagogical experiments. “The question of education in a broad sense is perhaps addressed by every institution which is currently engaged in the presentation of art. On the theoretical and practical level, this subject has been a long time ‘in the air’ and it is difficult to ignore it simply because the requirements for expanding the educational component of the institution or the so-called development of the audience and the integration of various disadvantaged groups into the operation of artistic institutions are at least in the European environment increasingly becoming a part of officially formulated cultural policies and the follow-up priorities of grant subsidies “[Kottova 2015: 75]. This theme “hanging in the air for a long time” is also very actively “brought back to the Earth” and is of course also theoretically elaborated. As significant and up until now main theorists of this “turnover” are Claire Bishop and Irit Rogoff.

Claire Bishop is also a leading theorist of the other “turnovers” and the author of the term “social turnaround”. The term “social turnaround” was used by Bishop for the first time in 2006 in *The Social Turn: Collaboration and Its Discontents* for Artforum magazine. By the social turnover the author means primarily a wave of artists’ interest in collective cooperation, the involvement of others in artwork or the transition from visible to invisible, from a clearly visible artistic object to a less visible art project, from monumental sculptures placed in the public space to coteremporary, later “invisible” artistic and social events involving viewers. The considered transition is perceived by the author as a critique of one type of artistic “use” of the public space and a turnover to another use - the social use.

As a product of “social turnaround” Bishop considers a participatory artwork, and this work, thanks to “social turnaround”, gets into the centre of events and in the art world and in the public sector is becoming more and more important and distinct. Bishop describes present participatory work as, for example, “temporary projects that directly involve viewers - especially representatives of groups considered to be overlooked - as active participants in the production of a process, politically aware community event or program. In these projects, the intersubjective exchange becomes the focus - and the medium - of artistic exploration “[Bishop 2006: 179]. These practices, which Bishop examines as a result of “social turnaround”, are hidden in the theory of art under the terms “community-based art, experimental communities, dialogic art, littoral art, participatory, interventionist, research-based art, or collaborative art” [180]. Under these numerous designations we can according to the author see attempts to the theoretical grasp of the social use of public space by art and the result of the “social turnaround”,

which is “participatory work”, and find out how much attention is paid to this type of art today and what place does it have in the art world.

In the contemporary world of art, it is therefore the viewer and the participatory work that get an unprecedented practical and theoretical interest and attract attention on themselves. They also attract the ethical one, because it puts a man in the centre of the event. The viewer becomes not only the creator, co-creator and author of the work, but also the tool of the artist, the author of the idea, the artistic experiment, and the theme of participation. The viewer is drawn into the process of creation in various forms, and at different levels with varying intensity, “artistically” manipulated. And it is these manipulations that raise ethical vigilance. The transformation of the viewer’s role in recent decades, the current form of artistic manipulation with viewers, the creation of unique situations and artistic experiments involving so-called “ordinary” people (i.e. those who are not known or related to the artist and who are no longer “somehow pre-prepared “and instructed), and whose participation is most valued, resemble the situations, which ethics deals with and tries to draw attention to the possible danger of unethical behaviour, slippery slope, threat to human dignity, etc. The framework of these actions forms sort of a modus “just like,” it takes place in the “art creation” platform and does not apply any or “other”, “artistic” rules in them. However, taking into account the results of the most famous psychological experiments aimed at “seeking good and evil in man,” it can be quite convincingly claimed that the “just like” mode is almost impossible to leave. Ethics of contemporary art should therefore take into account the work of art (in the spirit of its current transformation) as an action, human action, and should perceive it as an ethical situation in the spirit of its exploration and deal with it as an ethical problem, examine whether there is any ethical danger in the contemporary types of artistic action, or whether we have been slipping down a slippery slope already and whether we can avoid it. Ethics of Contemporary Art should examine whether it is conceivable and imaginable to set rules of dealing with people in the artistic environment? Who would design them, watch their observance, punish the violations, and ask what it all does with the artistic creation, freedom and creativity? The question of the following research of the ethics of contemporary art, which cannot be solved in the limited space of this text, should be interpreted, if we can look at contemporary art as and ethical problem, as how to solve this problem.

CURATING THE ARCHITECT'S ROLE AND RESPONSIBILITY FOR THE BUILT ENVIRONMENT AS PART OF A POLITICAL PROJECT

Abstract | This presentation interrogates the radicalization of creative practices in relation to the built environment and discusses the strategy of appropriation by analysing two art interventions by Rotor as case studies. First *Usus/Usures*, an exhibition presented at the Belgium Pavilion at the 2010 Venice Biennale of Architecture and second *The Bomel Cultural Centre* in Namur, Belgium, 2015 will be analysed and discussed with reference to statements by the authors in order to explore the nature of critical practices when associated with reusability as a process of resistance.

Index terms | *Curating; Built Environment; Exhibiting; Reusability; Sustainability;*

EXHIBITING ARCHITECTURE

Architecture exhibitions have played, and continue to play, a major role in architecture culture. It is difficult bringing architecture into the space of galleries, museums or multinational biennales because architecture once it is built is always already on display. That is one reason why Architecture exhibitions are almost always exhibitions of representations of architecture. The architectural exhibition then is, to quote Bergdoll with a few exceptions a radical deracination of architecture – simulacra and deracination, a substitute representation or a displaced original.¹

The architecture exhibition throughout the twentieth century and beyond have allowed architects to take extremely speculative positions and use exhibitions as laboratories for architectural ideas.

Exhibitions particularly those from the 1960s and 70s, like group shows such as The Trigon Biennale 1967 (Ambience/Environment) and the 1969 Trigon Biennale 1969 (Architecture/Freedom) in Graz captured, for example, the political ethos of the late 1960s. This kind of experimental installation-based environments demonstrates that architectural exhibitions have not only played a role in canonizing architects and buildings but also can affect architecture's social role.

In Italy architect's collaboratives such as Superstudio, (one of the participants of the Architecture/Freedom exhibition), Archizoom, Global Tools, Gruppo 9999, and U.F.O. expanded their role in society 1968 to shape the contemporary political and cultural agenda through "Radical Architecture" without the intervention of a building. Because architecture, they claimed, had become complicit with late capitalist land development and status production and had disclaimed its responsibility to provide affordable housing to Italy's middle and lower classes. In an attempt to divorce themselves from what they perceived as a corrupt discipline; radical architects replaced construction with a variety of alternative mediums. They reject the various mediums of architecture in favour of other, non-tectonic modes such as montages, models, films and foremost exhibitions, installations and magazines using all the techniques of mass communication to broadcast their message to a global audience. In 1972 those radical groups were selected through an open competition to participate in the ground-breaking exhibition Italy: The New Domestic Landscape at MoMA, curated by Emilio Ambasz.²

The contribution by 9999, Casa Orto—Vegetable Garden House, would become one of the defining projects in the early ecology movement. Lettuces and cabbages were presented against the backdrop of the museum and used as the raw material for a collage of the Home Garden. This ecological and communal oriented design approach like Casa Orto promoted a globalism founded-on beliefs in a common culture of human survival and evolution serving a "global commons" imagined as an 'open work' rather than owned resources.

The urgent issues we face today about ecology, globalization, technology, and social justice seem to closely echo the issues addressed by the Radical Movement. Now the world of radical architects is reflected, quoted and exhibited by younger contemporaries such as Rotor's ('Usus/Usures', at the Venice Biennale, 2010 and "Behind the green

door” at the Oslo Architecture Triennale, 2014), and numerous others.

CURATING THE ARCHITECTS ROLE AND RESPONSIBILITY FOR THE BUILT ENVIRONMENT

The work of the Belgian architects’ collective Rotor displays a valuable understanding of the designer’s role in society, the material world, and the environment. And by directly addressing or challenging the architectural dimension on the notion of environment, their exhibitions suggested new terms on which architecture and design could be practiced, prepared and presented. Architecture is no longer just the object of the exhibition. Instead, the exhibition itself has emerged as an important site for reframing and representing the discipline of architecture.

Through their work as curators and makers of several exhibitions, Rotor raises the question: How can the design profession reinvent its discourse around responsibility?

Hence, the work of Rotor explores the notion of wear, that is, materials, objects and building structures in relation to use. Use is not to be conflated with program or function, but rather the social aspect of occupation and inhabitation of architecture during the life-span of a building, which allows Rotor to approach critical questions of reusability and sustainability.³

Rotor focuses on modernist and contemporary buildings slated for demolition in order to reuse their material components for radical redesign. This obsession with the worn-out and wearing out of architecture is intended to question the standard approach of demolition to create a tabula rasa situation for new projects, not only to save materials (and energy) from the landfill, but also to introduce a social point of view, to keep the qualities that are already there, to improve on the existing, and to remember the people and events that took place. Material re-use encourages one to consider buildings as repositories, not just of the materials, but also of knowledge and past practices of crafting buildings. These past practices are also given as raw material— in this case, of knowledge—that might find new applications and contribute to new value systems.

REUSABILITY, SUSTAINABILITY OF THE BUILT ENVIRONMENT AS A PART OF A POLITICAL PROJECT

Rotor’s design approach addresses reusability and sustainability as part of a political project. It formulates a critique of throwaway consumer culture and highlights how outsourcing products to global supply chains conceals labour conditions, resulting in depoliticization of both working conditions and environmental costs. To counter this, Rotor developed guidelines, protocols and regulatory work for the reclamation of reusable materials and the integration of “waste” into the current building process. Transgressing the disciplinary limits of architecture, they research, design and exhibit work in response to industrial production, consumption and waste fabrication.

Rotor’s national survey of existing second-hand building material dealers⁴ in 2013 showed the lack of firms working with large scale industrial materials of the twentieth

century, out of which Rotor DC (Deconstruction/Consulting)⁵ in Brussel developed as an independent wing of Rotor’s design activity.⁶

In 2015, Rotor developed a vade mecum for off-site reuse: a model of legal and practical guidelines for the reclamation of reusable materials from public buildings in Belgium. In cooperation with a lawyer, they are also working on policies to re-introduce salvaged building material into the construction process of buildings within the European market. Here, the client is the European Union in Brussels because waste legislation, rules on public tendering, and product norms are subject to EU policy. Rotor hopes to dissect and redesign the material economy and its underlying (legal and processual) conditions which could be understood as a political project.

CASE STUDY I: USUS/USURES – THE ARCHITECTURE EXHIBITION AN ENVIRONMENT FOR RE-USE STRATEGIES

As a relatively young office, the work of Rotor represents a new kind of emerging practice in architecture, in which various disciplines are combined: from research and exhibition making to material studies and re-use strategies. Rotor is interested in material flows in industry and construction, particularly in relation to resources, waste, use and re-use which challenge historical conceptualizations of building culture, heritage and social value. They deconstruct buildings into elements (construction, materials) and re-assemble them in new ways. This is an approach about material and knowledge of past practices of crafting buildings and interiors. They aim for both new applications and new value systems around materials and assemblies. Rotor undermines the typical professional divisions of responsibilities between clients, contractors, workers, designers, users and other stakeholders.

This distinct interdisciplinary approach of Rotor—which can be described as deconstruction, relocation and assemblage—has been at the centre of their exhibition ‘Usus/Usures’ for the Belgian Pavilion at the Venice Biennale in 2010.

At the international architecture exhibition, they displayed mundane materials and products salvaged from Belgian social housing projects as abstract art. The selection and framing of used materials and architectural elements of a social housing complex is neither a purely aesthetic nor neutral act, but points to the social problematic of disappearing low income housing in Belgium and other Western countries.

‘Usus/Usures’ (Fig.1, Fig.2, Fig.3) was entirely made from salvaged building components that are usually overlooked and treated as “waste” (*deconstruction*), such as carpet, stairs, railings, etc., exhibiting them in a denaturalized way (*assemblage*) in the Belgian Pavilion at the Venice Biennale (*relocation*).⁷

Unlike common architectural practice, where thinking about material and making means the design of new objects, description through specifications, and ordering through product catalogues, with ‘Usus/Usures’ there is an entirely different process in place: thinking of materials as something physical and tangible to be identified, transported from one place to another, and then reframed. A red carpet, for example, was taken from one apartment of a social housing block (relocation) and mounted to

the wall of the exhibition as floor plan of this apartment (assemblage).

The caption for this piece merely stated: “Acrylic fibre carpet in a living room adjacent to an entryway, a hallway, a bedroom and a kitchen.” The red industrial carpet, already depreciated as “waste”, becomes a kind of manual of use, a diagram of wear created by the occupant representing the processes of habit and inhabitation. Instead of being a deficiency, the traces of wear lead to reflections on use, users, and construction practices through the new context of the art exhibition.

In a similar fashion, an extracted banal industrial staircase shown in the Belgian Pavilion could be read as a map of human movements walking up and down this stair. These works create an understanding of the human body as a performative tool that leaves distinct material traces of everyday human activity.

The building components were exhibited in an isolated manner as to draw closer attention to their own intrinsic qualities, despite – or perhaps exactly because of – their anonymous and ordinary appearance. Through minimalist in its appearance, the exhibition ‘Usus/Usures’ resulted from Rotor’s extended research into and analysis of the use and wear of buildings and building materials.

Rotor underscores the fact that sustainability cannot fully be defined in a scientific way; it is also a political matter, because it emerges from a multifaceted process with many contributors.

The stakes for architecture are aesthetic, economic, environmental, and social.

Rotor’s intention for ‘Usus/Usures’ was to bring the subject of materiality into the arena of the Venice Biennale opposing the glorification of ‘the New’ that is implicit in this kind of exhibition format.⁸ They intended the subject of wear to draw attention to the reaction of buildings to long-time use, and more, to challenge architects to anticipate this process.

Looking at buildings through the lens of wear leads to reflections on use, users, and construction practices. Rotor encourages the public to change their attitude towards building materials, but also in a more general sense, towards all objects around us.

Wear is largely a taboo topic in architectural circles because it contrasts fundamentally with the value of purgation, but also with the construction cycles which become shorter and shorter: *“in the 20th century, under the combined influence of increased real-estate pressure, an obsession for speed in demolition, the availability of power-machines and explosives and fiscal constructions had encouraged accelerated building obsolescence.”*⁹

CONCLUDING REMARKS

Exhibitions by Rotor use technique, material, process and the spaces of the art world (museum, galleries, Biennale) as realms for political commentary that are critical of the current global economic regime. Not only do their distinct yet comparable approaches entail urgent questions of sustainability, re-use, and appropriation, they also imply a

need for a different view on history and the historical production: they recharge the critical aspect of curating architecture (as already present in the 60's and 70's and expand it to the problem of re-use: the re-use of materials and of building elements, but also the re-use of ideas, the re-use of knowledge, of archives and memory. They deconstruct existing value systems in art and architecture and open room for exhibitions as environments to initiate a radical redesign of the built environment. Rotor continues its critical investigations in sustainability issues in architecture by curating and designing various exhibitions, including the Oslo Triennale 2013 'Behind the green door' (A critical look at sustainable architecture through 600 objects by Rotor) and the 2016 exhibition 'Constellations' ('new ways of inhabiting the world [...] in the context of today's political, ecological and cultural crisis' in Bordeaux.

LARGE SCALE LINEAR DRAWINGS: ARCHAEOLOGY AS AESTHETICS

Abstract | When used as an archaeological instrument designed to visualize the Past, the linear drawing as land-art has the advantage of underlying, and consequently of revealing, the borders between different entities, of materializing invisible rites of passage, of determining perimeters, in other words of creating forms. On a large scale, this characteristic allows the tracing of the contours of settlements, or tracks, or any other traits, invisible to the contemporary observer.

Large scale linear drawings require the viewer to perform a double exercise of imagination: first to visualise the whole pattern, and second to imagine the ancient form revealed by the lines. The revelation of the Past by means of large scale linear drawings is a continuation of the current aesthetic paradigm of mapping and territorial organization, being a synthesis of ancient designs and contemporary minimalism.

The reception of the images of the Past via large scale linear drawings can lead to a new perception of the revealed place, since the contemporary diagram also possesses aesthetic traits inherited from the ancient design.

Index terms | *Aesthetics; archaeology; borders; imagination; land art; linear drawing*

INTRODUCTION

My goal as an experimentalist is to reveal “things hidden since the foundation of the world” (Girard 1987) by augmenting some fragments of reality and highlighting both the unseen and the partially seen, but not understood. I do this with large drawings with straight lines. If we look into the past, we can see that, with some exceptions from the Palaeolithic iconography, the straight line starts to appear frequently during the early Neolithic, marking the beginning of a geometric way of perceiving and using space. Such a structure, using straight lines that could intersect generating non-existent forms in Nature, could have had a mystical character, analogic to an aesthetic character in contemporary perception. On a large scale, the straight line is at the heart of the largest prehistoric megalithic monuments and long ancient roads (Robb 2013). It can be said that the straight line belongs to a timeless aesthetic, as a metaphor of stretched textile threads. Textile yarns are still certified in the Palaeolithic (Adovasio et al., 1996) and it is possible to deduce, if the patterns from the anthropomorphic figures are analyzed, the existence of an advanced practice of weaving, which implies the use of straight threads. But only with the advent of the Neolithic can one see an obvious propensity to the straight line, both in the structure of the living space and in decoration. I believe that straight line geometry was one of the important elements of prehistoric space domestication (Gheorghiu 2014), as illustrated by the analogies between the geometry of the spatial structures and the patterns generated by the loom. The linear frame of the loom threads shows an obvious analogy with the frame of a tell settlement in Southeastern Europe, for example. If we observe the (almost) regular frame of such a settlement, we can certainly imagine that it was drawn using stretched textile yarns like those forming the loom’s warp. Domestication of space also means orientation, and it is done by straight lines. There is definite historical data on the relationship between the stretched textile thread and the measurement of the earth or the positioning of a building. In Egypt, the foundation ritual for the construction of a sacred building called “stretching the cord” (Miranda et al., 2008) has a social but also a magical value.

MAGIC AND EXPERIMENT

The very Euclidian geometry used in prehistory and Antiquity seems to have had an aura of magic and religiosity (Zellini 2016), hence its apotropaic use in the form of “decoration” on objects. Looking at the magic of Euclidian geometry, we can ask if a parallel to the aesthetics of the sublime can be drawn. For the modern mind, the magical significance of this type of geometry has disappeared with the “disenchantment of the world” (see Gauchet 1985). Although in time the archaic significance of geometry has changed, I consider that the archeological experiment and the experientiality of the performer can provide a series of data otherwise impossible to access only by simple theoretical deduction.

Take, for example, the “stretching the cord” with the magic and beauty (we say today) of the straight line drawn with a stretched textile thread. In my experiments on prehistoric cognition I wanted to get close to the design and realization of past monuments and architecture using a technique similar to stretching the cord using textile fabrics. The stretching of a textile thread involves the use of symmetry; it takes two fixing points to stretch a string, two human characters or two landmarks fixed to the ground. These two fixed points marking the extremes of the straight segment generate the straight line. I identified such a configuration designed to create an alignment of standing stones with a mark on each of the stones to control the linearity in Sardinia at the Birru

e Concas monument. The textile thread can reach enormous dimensions on a macro-scale, as is the case, for example, with the lines of the Nazca geoglyphs (see Klokočnik et al., 2016).

ART AS A TOOL OF IMAGINATION IN ARCHEOLOGY

By the end of the last century, archaeology, as well as anthropology, was undergoing a crisis of representation. Anthropology, however, had been able to propose the concept of evocation instead of representation (see Tyler 1986), but archaeology had not yet discovered a method of using evocation, although post-processualism had attempted to release the archaeological imagination. Finally, evocation was found in art (see Renfrew 2006), which should have become a kind of source of awareness for the archaeologist. This dramatic change in optics was inspired by the art of the 1970s when artists focused on ethnography (see Foster 1996) and even archaeology, to quote Richard Long, who was inspired by the straight lines of ancient roads or archaeological excavations. If we consider the metaphorical character of artistic productions, it is possible to use art as an evocative tool for both archaeologists and the public. For example, a land-art that would delimit the outline of a settlement hidden underground could simultaneously have an artistic and a scientific character. In this case, the art-science synthesis will be an organic one and the result obtained will be an activation of the imagination of the person receiving the visual message.

LANDART AS AN ARCHAEOLOGICAL TOOL TO AUGMENT REALITY

Although I was separated from the Western experiments by an iron curtain, I discovered, independently of them, the evocative power of art as an archaeological tool. My first works in this area in the early 1980s tried to evoke weathering processes on artistic productions. Then followed the use of the straight line to visualize today's invisible perimeters of past architectures. At the beginning of the new century I resumed this process of revealing the beauty of the past (Gheorghiu and Stefan 2013), with experimental archaeology and art-chaology (Gheorghiu 2009), respectively, with large scale linear drawings, sketching over the archaeological records the contours of settlements or ritual paths. In my experimental research I used art to augment real-world data: the lines I draw with land-art on the ground surface not only reveal hidden aspects of the past, but also evoke complex forms exciting the imagination of the viewer, thereby enhancing the perceived reality. My art is profoundly contextual, being organically related to archaeology and well-defined cultural contexts. The diagrams I propose, the result of a number of related straight lines, act both as scientific and aesthetic instruments. The lines drawn help to understand hidden cultural features of a material and immaterial nature (such as the lines of ritual actions completely invisible in the archaeological record) and at the same time produce an "aesthetic state", like any artwork. For the contemporary viewer the straight line has an aesthetic visual load not only because of the beauty of the Euclidian geometry of ancient design, but also because of the technological tradition of Modernity, where it has been extensively used.

LAND-ART AS AN INSTRUMENT OF ARCHAEOLOGY

Viewed from the perspective of an archaeology of experientiality, the augmentation of reality made with the mentioned textile landmarks would involve the following stages of a phenomenological-artistic process: - An understanding of the archaeological record to be revealed; - A design of the diagram that will reveal the invisible elements; - An

experience of positioning the lines. From the point of view of the aesthetic perspective, the augmentation of the archaeological record with the land-art diagram represents an exercise of evoking the past (i.e., an archaeological act) viewed through the art of the present. In this case, two semiotic visions overlap: over the iconic data of the Past, the diagram (see Dirmoser 2011: 154 ff) of the modern linear drawing is projected. Here, simple lines could be decoded as metonymies, similar to those ‘figures of thinking’ (Dirmoser 2011: 156 ff) in rhetoric.

CASE STUDIES

1. Monte Velho, Portugal

An example of evoking the past by straight line geometry are the two works I undertook in November 2010, executed on the slopes of Monte Velho. The archaeological theme was to visualize the perimeter of a Chalcolithic stronghold positioned on the top and slopes of Monte Velho. For this purpose, I drew two parallel lines of white plastic strips fixed with plastic strings, overlapping over the defence walls buried in the ground, thus making them visible from a great distance. (Figure 1) The first reaction that I experienced on the mountain was to their cosmic scale, the monumentality of the drawing that sprang into the scenery like the Tagus River or the national highway that was seen on the horizon. (Figure 2) This experience of the monument, not only as a visual but also as a physical exercise, took place at the same time with the viewing of the operation from above, just as you look at a drawing on paper. On this occasion, I realized the phenomenological and cognitive complexity of the simple ritual of stretching the cord, and also the anthropological dimension (including the contemporary aesthetic experience) of drawing a monumental line in the landscape.

2. Barclodiad y Gawres, Anglesey, UK

In 2014, I conducted an experiment designed to reveal the unseen part of the Neolithic Tomb with Corridor at Barclodiad y Gawres, Anglesey Island, Wales. Inside the monument there is a massive stone block with a pattern of incised lozenges, a pattern I have experimentally reproduced by the simple plating movements of two textile strips on the surface of the stone, and which proved to be a ritual action being both repetitive and standardized. (Figure 3) Considering that this ritual action was representative for the monument in question, I tried to reveal it to the public with the help of a linear land-art, exposing it as a diagram on the surface of the tumulus containing the tomb. I stretched the textile strips to draw the lines of the lozenge on the curved surface of the monument, conducting on a macro-scale an action that mirrors the one inside the monument. (Figure 4) The gigantic linear drawing displayed above the Neolithic monument evokes the ritual gestures of the prehistoric engraver, as well as my gestures of stone embossing, extracted from the subterranean chamber and now exposed in the landscape, visible both on the ground and in space. The human drawing became part of the landscape due to its monumentality. (Figure 5)

CONCLUSIONS OR ARCHAEOLOGY AS AESTHETICS

Straight lines on a monumental scale belong to an aesthetics of the past and, at the same time, to an aesthetics of the present. Their use in land-art in the form of diagrams is an exercise of archeology as well as of art, and the method of approaching the past using such a contemporary technique gives the archaeological approach an aesthetic character. Thus, augmenting information with the help of monumental linear design

becomes a process of cognitive-aesthetic evocation, which transforms the science of archeology into an aesthetic activity.

ACKNOWLEDGEMENTS

I wish to extend my thanks to Professors Luiz Oosterbeek and George Nash for inviting me to work on Monte Velho and Barclodiyad y Gawres. Many thanks also to M. Pedro Cura for his help on the Monte Velho project. Last, but not least, many thanks to M. Bogdan Capruciu for his help in clarifying the present text.

URBAN ART PRACTICES IN THE VISION OF PROJECTIVE AESTHETICS

Abstract | Modern urban art practices (public art, street art, flash mob, performance, etc.), are engaged in a radical aesthetic transformation of everyday life, and are considered in contemporary aesthetics. Projective aesthetics suggests that one should mark out art projects which are created in the real aesthetic experience and which represent topical cultural issues in the human daily life. Being the subject of projective aesthetics, main examples of that kind are the projects of actual art in the urban environment. It is a group of artifacts at the border of art and everyday life that is called urban art practices.

The environment, shape, language and functioning of this form of art are so unusual that the question whether these artifacts are art is being constantly discussed in contemporary aesthetics. An article is devoted to the study of the features and possibilities of projective aesthetics in relation to contemporary urban art. Interacting with the developing practical aesthetics - environmental and urbanistic - the projective aesthetics allows to include in the philosophical discourse the urban culture where actual art practices work.

In the relations between urban art and projective aesthetics a special place is given to the idea and practice of "potentiations" (Epstein's concept). According to this concept, the contemporary city's potential is revealed by means of art for creating a polylogue, for intertwining various aspects and form of city life and for developing a rhizome of urban culture.

City art practices, being a phenomenon of everyday life, represent in a single image all aspects of everyday life - from political, ethnic, national, regional to aesthetic and artistic meanings. City buildings become a unique aesthetic project itself: it simultaneously combines architecture, graphic art, sculpture, video art and so on. And, of course, the most important feature of this project is the expression of developing interaction of various cultural spheres of the city.

Index terms | *art practices; culturionics; projective aesthetics; urban art; urban culture*

First of all, it should be considered that contemporary aesthetics, as well as the whole sphere of knowledge in the humanities, including philosophy, is in the state of an evident paradigm shift. It is connected with sociocultural, mental, artistic and aesthetic transformations that are headed towards the future away from Classics and Post Classics.

St. Petersburg University professor Moisey Kagan, one of the prominent representatives of Russian aesthetics, analyzed the development prospects for aesthetics as a philosophical science in condition of bifurcation, in which culture found itself at the turn of the millennium. In his study he considered the “aesthetosphere of culture” as a new subject of aesthetics (Kagan M., 2001). We will agree on that with him: concerning the prospects of the development of our science, the “cultural aesthetosphere” notion precisely expresses mental and practical expansion of the subject of contemporary aesthetics, overcoming the borders of traditional aesthetics and setting new challenges for it.

It was the very first artistic avant-garde in the beginning of the 20th century that performed a radical aesthetic transformation of the cultural world, its total aestheticization that correlated with equally radical sociocultural transformations. By the turn of the millennium, this cultural reformation resumed, bearing the nature of total transformation.

Correspondingly to this situation, aesthetics is expanding its methodology through dynamic interaction with theoretical, historical and practical culturology. The philosophical methodology of classical aesthetics is transforming and being complemented with contemporary sociocultural methodology. It helps to understand the peculiarity of radical change that is happening to contemporary art, its forms, language, methods of identification and operation. A considerable expansion of the subject of science towards practical aesthetics is equally reasonable and explainable, considering the appearance of “another”, alternative, actual art that goes beyond the traditional artistic reality into everyday life (Prozerskij V., 2008). It is especially important to understand the significance of marginal artistic phenomena called art practices.

It is not a coincidence that they have become a subject of study for environmental aesthetics in the context of urbanism. Urban studies include an analysis of art in the city environment as in the special area of artistic artifacts (Shuo Yang , 2016).

In today’s Russia the focus on culturological methodology and contemporary philosophy of artistic culture is connected with such names as Mikhail Bakhtin, Yuri Lotman, Moisey Kagan, Arcady Eremeev, Victor Bychkov, Mikhail Epstein, Lev Zaks and their colleagues at Russian aesthetics. However, moving forward is also important.

In this regard, we would like to emphasize such an important peculiarity of studying contemporary culture as culturionics. In his research Mikhail Epstein relies on culturionics while suggesting a methodology that expresses the orientation of culture towards the future. Culturionics is an urgent necessity of innovative dominant for sciences that use the sociocultural methodology.

Considering the radical turn of contemporary culture away from Post – Post – Post..., Epstein talks about the importance of projectivism of contemporary discourse in the humanities. In his *Proyektivnyi filosofskii slovar’* (“A Projective Philosophical Dictionary”) M.Epstein distinguishes contemporary culturology from culturionics. Culturionics is

“...a construction of new forms of activity in culture, new methods of communication and cognition, new patterns of perception and creativity. While culturology thinks in projections, which are symbol systems of various cultures, culturronics thinks in projects, which are symbol systems that haven’t yet become practices or institutions of any culture, and form a plan of possible transformations of the whole cultural field” (Epstein M., 2003)

In the culture of postmodern, which is connected with the end of the 20th century, a fundamental change-deconstruction of all traditional cultural values takes place, and the shift itself sets the projective direction for changing culture. Postmodern culture gave rise to the domination of contemporary, topical project activity and projective methodology in its theory, though it did not develop much.

However, nowadays the main vector of the future is projectivism and, correspondingly, projective aesthetics, and actual art practices are the creative material of today. What is a methodological basis here?

Main philosophical and aesthetic methodologies, which allow specifying contemporary or, to be more precise, actual art, are closely connected with the main paradigms of mentality in the humanities, from Classics to Postclassics, but to a greater extent with a new paradigm that can be called Protoclassics. However, while classical and post-classical methodologemes are still trying to rely on interpretations within the limits of analytics, systematics, hermeneutics and deconstruction, fundamentally new protoclassical methodologies, such as schizoanalysis, conceptivism and projectivism, allow going beyond the boundaries of previous interpretations of art and understanding contemporaneity as such (Orlov B., 2015).

Considering further intellectual development of sociocultural methodologies in the study of contemporary art, new orientations of culturronics and its projective thinking turn out to be consonant with projective aesthetics, which regards the post-non-classical, constantly changing subject of aesthetosphere as a base for new aesthetic projects of human existence.

Projective aesthetics suggests that one should mark out art projects which are created in the real aesthetic experience and which represent topical cultural issues in the human daily life. Being the subject of projective aesthetics, main examples of that kind are the projects of actual art in the urban environment. It is a group of artifacts at the border of art and everyday life that is called urban art practices.

In this regard, an artistic transformation of urban environment stands out from the artistic culture of the 21st century. Such art practices as public art, street art, flashmob and performance carry out this transformation, and exactly these art practices constitute the main body of urban art.

Art practices originate and live in the urban environment, locating themselves in the space of buildings, streets, squares and parks. The environment, shape, language and functioning of this form of art are so unusual that the question whether these artifacts are art is being constantly discussed both among the public and in art-related sciences. The very term “practices” is applied to label another – concerning the previous division of art into forms and genres – positioning of these artistic artifacts that does not revoke their quality of artistic merit.

Urban art functions as a visual and notional benchmark in the chaos of everyday life, helps to revalue the present and set the prospects for the future. Together with urban design, urban art contributes to the development of creative city environment. In this regard, a developing philosophy of art gives an opportunity to understand the peculiarity of contemporary artistry and embrace actual art as the most representative material of new projective aesthetics (Lisovets I., Orlov B., 2017).

In the relations between urban art and projective aesthetics a special place is given to the idea and practice of “potentiations” (Epstein’s concept, Epstein M. 2004). According to this concept, the contemporary city’s potential is revealed by means of art for creating a polylogue, for intertwining various aspects and form of city life and for developing a rhizome of urban culture.

Considering the practice of urban art in Yekaterinburg (the Ural region, Russia), one cannot but admit a rapid development of street art with its annual festivals, street sculpture and public art that have changed the city space. And in 2015 a multifunctional cultural Yeltsin Center appeared in Yekaterinburg. This center became the place where politics, historical past and present of the Ural capital, cultural initiatives and life of the contemporary city merged with each other. Located on the Iset river waterfront, the Yeltsin Center organically fuses cultural artifacts, art practices and related events. The building of the center is a unique aesthetic project itself: it simultaneously combines architecture, graphic art, sculpture, video art and so on.

The architecture of the Yeltsin Center has found a successful continuation in the concept and space-time composition of the Museum of the first Russian president Boris Yeltsin, which is the core and sense-making space of the Center.

The exhibition space of the Museum at the Yeltsin Center supports the image of motion expressed in the architectural structure: it is organized as Russia’s journey through the 1990s. The dramatic concept of immersion into that time, namely, the image of road, was created by famous Russian film director Pavel Lungin who emphasized the drama of these years by means of an unusual exposition. Lungin made a large-scale metaphor of the biblical 7 days of creation, where events of the decade are related to one of seven crucial days of the 1990s. Each day has its own set of media and artifacts – from a nuclear briefcase to a shop counter ravaged by the shortage and a real trolley bus which Yeltsin took to get to work at Mossovet, the city administration of Moscow.

Like all contemporary art, the Yeltsin Center visually connects and presents in its inner and outer space possibilities of all forms of actual art, actively addressing its public and expecting a constant contact with it. Significant features of projects in the sphere of contemporary art practices are expressed in the phenomenon of the Yeltsin Center: the interaction of diverse artistic forms, multifunctionality of space that brings together all art and design.

And, of course, the most important feature of this project is the expression of developing interaction of various cultural spheres that is significant for the actual being of contemporary people and reveals meanings and prospects of their future.

The reported study was funded by Russian Foundation for Basic Research (RFBR) according to the research project № 18-011-00977.

ECOCRITICISM AS SUBVERSIVE AESTHETICS

Abstract | Art is subversive in a given period, when it crosses the boundary of the generally acceptable, although over time it can enter the main stream. A much more complicated question is what is subversive in aesthetics? Ecocriticism has already become, along with ecofeminism and animal studies, an academic discipline. It can be defined as subversive if it is understood in terms of an attitude, which is not anthropocentric. And here is the catch: how can I, as a human being, take such an attitude or position that is not only human, but also comprises of the attitude of “beings from alien worlds”? The question that emerges here is all but rhetorical: how can we decentre and amplify our human consciousness and perspective to include zoocentric, biocentric or geocentric positions? At this point the contemporary theory creates contrasting opinions, which cross the boundaries of aesthetics, poetics and ecocriticism since they reach out to the fields of metaphysics and antimetaphysics. Within the phenomenon of perception the other always appears, as Deleuze said in his Logic of sense, as “a priori Other”. We have to deal, henceforth, with a kind of pre-reflexive level of consciousness and amplified sensory perception, which, as we know, is the basic condition of artistic creation. Thus, this paper – because it wants to penetrate into the node of these questions – takes literary art as its starting point. In the spirit of the above mentioned observations, I have attempted to investigate in “minority literature” (the female authors of contemporary Polish and Slovene literature) how this decentred attitude, which Jure Detela poetically defined, corresponds to our thesis on a particular ecocritical stream, which can be defined as an ecofeminist aesthetics. The “minoritarian literature” here is meant exclusively in the sense that was defined by Deleuze and Guattari’s books *Kafka* and *Thousand Plateaus*.

Index terms | *Anthropocentrism; Ecocriticism; Ecofeminism; Minoritarian literature; Perception; Subversiveness*

INTRODUCTION

We are saving the world.

What do you mean, you are saving it? he asks.

Because it is poorly made.

A work of art can be classified as subversive if in one or more terms cross the boundaries of what is generally acceptable in a given cultural context. What is acceptable is, of course, time-limited, variable, and historically determined. But to establish such subversiveness we do not need subversive aesthetics. Furthermore, the syntagm itself appears pleonastic, since every new philosophy of art is supposedly subversive in some way regarding the established norm. I am not talking about subversiveness in terms of a revolutionary reversal or a carnivalesque transformation of hierarchies; I have in mind much else. With 'subversiveness', I denote a precise attitude towards life, both organic and inorganic, as it is thematised in some literary works that can be read as texts, primarily written for the readership which is yet to come or for a minority readers, and only then for contemporaries. In light of this concept, launched by Deleuze and Guattari (D&G), I intend to present ecocriticism as subversive aesthetics, based on the opuses of two contemporary women writers. It is very likely that none of the authors I have in mind, that is, Polish Olga Tokarczuk and Slovenian Breda Smolnikar, did not set their pens to paper for this purpose. This means that the effect of their creations far exceeds the intentions of the authors. However, both authors are very well aware of the ecological problems of the world.

MINORITARIAN LITERATURE

Writing for the future audience means to enter the minority literature, conceived as D&G defined it in the books *Kafka: Pour une littérature mineure* (1975) [*Kafka: For Minor Literature* (1985)] and *Milles Plateaus* (1980) [*Thousand Plateaus* (1987)]. Therefore, it should be noted immediately that none of the above-mentioned writers are members of a national minority or minority language. The reason why I have declared their literature as minoritarian is entirely elsewhere and is quite complex in the context of this philosophy. As claimed by D&G, it is not only about literary, linguistic and philosophical references, but also musical, legal and political, because the difference between a minority and a majority is by no means the decisive issue of quantity, but much else:

Let us suppose that the constant or standard is the average adult-white-heterosexual-European-male-speaking a standard language (Joyce's or Ezra Pound's *Ulysses*). It is obvious that "man" holds the majority, even if he is less numerous than mosquitoes, children, women, blacks, peasants, homosexuals, etc. That is because he appears

twice, once in the constant and again in the variable from which the constant is extracted. The majority assumes a state of power and domination, not the other way around. /.../ A determination different from that of the constant will therefore be considered minoritarian, by nature and regardless of number /.../. This is evident in all the operations, electoral or otherwise, where you are given a choice, but on the condition that your choice conforms to the limits of the constant (“you mustn’t choose to change society...”)

This last statement, which is not without reason in quotation marks and brackets, is very important for the consideration of ecocritics as subversive aesthetics. Democracy, as D&G observe, gives us a choice, but does not offer the possibility of a radical change in the social order. If I develop this thought further, I can say that those who oppose the radical changes in society (they are the majority of democratic systems), often refer not only to the advantages or disadvantages of one or the other social order, but also to two complete constructs: the so-called “natural order of things” and “collective savvy”. Hence, the concept of minority literature and some other related concepts, for example, becoming and untimelessness, are not only the most appropriate concepts to begin with in a critique of representative democracy based on political representation, but also appropriate to form a critique of literature and art and the critique of its criticism.

I intend to show in the case of texts of the two writers how and when the subversive ecocritical approach turns out as productive for dealing with literature, and what subversiveness has to do with timelessness, becoming, direct speech, and some other concepts. Ecocriticism can also be understood as a derivative of post-constructive tradition. This is further affirmed by the decisiveness of the ethical and performative dimension of literary work in ecocritical research. This implies the context and the evocation of reality outside the text, or “the intervention of the real far into the depth of the text” and outright permeability of the boundary between the text and the context. In this regard, ecocritics has a special position since nature, otherwise than, for example, the former colonized people cannot express its truth, but it is true that it can “strike back” so much more violently. The subversiveness of ecocritics does not depend solely on its relation to environmental problems, but above all on how it values all other non-human beings. It is, therefore, meant to advocate a model of life, which is not only about a different social order, but it interrogates the so-called common sense manipulation and the “natural order of the world”. Representatives of the majority in their texts, literary, scientific or other, like to refer to these two constructs. Consequently, the subversive ecocriticism, resulting from ecological awareness is the discipline, which can in the literary works reveal exactly this feature: not only how much they are socially involved, but how much they deviate from the models advocated by official ecology, from the so-called “balanced” view of the world, which seeks to “democratically” take

into account the opinions and positions of the majority. The prototype of literature that discusses the deviation from such a model has long been known in Slovene literature in the poetry and essayist opus of Jure Detela (1951-1992). Long before him, Rosa Luxemburg (1871-1992) wrote explicitly about this in her personal letters. These texts speak precisely about how “the world is poorly made”, and they express a uniquely unconventional attitude towards everything that exists. /.../ with every little fly that one carelessly swats and crushes, the entire world comes to an end, in the refracting eye of the little fly it is the same as if the end of the world had destroyed all life.” This quote calls for a comparison to the excerpt from the novel *Drive Your Plough over the Bones of the Dead* by Olga Tokarczuk, where the protagonist is shown by the entomologist the home of countless larvae under the spruce bark: “At that time, I thought that every wrong-handed death still deserves a kind of publicity. Even the death of an insect. The death that nobody noticed changes into a double scandal.” And a little further: “There are no useful or useless creatures from the point of view of nature. This is just an unwise distinction used by people.” Very similar characteristic features for minority literature, such as controversy and subversion of accepted ideas and established concepts, are also noticeable in the poems of Polish poet Wisława Szymborska (1923-2012), and in Slovenia in the poetry and essays of some contemporary authors such as Iztok Geister, Barbara Korun and Iztok Osojnik.

The question is: How is this attitude manifested in concrete literary works? Primarily in the relationship between literary representation (structured world of actuality) and becoming (immanent chaos of virtuality) prevails. This is reflected in the settlement of the foreign language within the native language. What is contrary to the law of imitation is the law of the molecular world, an indefinite, non-individualized world that allows the entering into the zone of indeterminacy and it comes before representation and before the principle of reason. In the philosophy of D&G, becoming denotes an endless process that implies metamorphosis (not metaphors) and the current encounter of series of virtual points that characterize every object or being. In this process, the space of interaction opens, where new figures and intensities are emerging, a new force (puissance) of literature. This process, contrary to common sense, does not follow chronological facts, it does not rely on the subject as a condition of thought or the notion of historical determination. Therefore, such a narrative opens up the world in the first place, and only then represents and consequently enables a variety of becoming; in the case of the opuses of our two writers, in particular, becoming-minoritarian, becoming-woman and becoming-animal; D&G specifically emphasize that becoming-man and becoming-majority is not possible.

UNTIMELESSNESS

Untimelessness in the everyday sense of this term is usually a positive valued indication for the work of art, and the timelessness of D&G is another name for the virtuality that

participates in each event. Deleuze defines this concept in *The Logic of Sense* as “the extraction from modernity of something that relates to modernity, but which must also be turned against it in favour of the hope of a future time.”

An untimely literary text is supposed to be an event as a product of a multifaceted, and in some cases also a multi-voiced narrative that brings all involved into a new assembly (fr. *agencement*). The critique of such work should focus primarily on the aspect of artistic creation, which invents the new conditions of its creation, that is, literary work does not reproduce the rules, but constitutes them, thus opening up to becoming. The implementation of such a process of subversion of the genre can be observed both in the work of Olga Tokarczuk, especially in the text *Drive Your Plough...*, which is the case of the subversion of the criminal novel, and in the text of the *Jacob's Scriptures*, where the historical novel is subverted, as well as in the most of the texts by Breda Smolnikar's subversion of the folk story. Thus she introduced into Slovene literature a new genre of artificial narratives – only for adults.

TWO NOVELISTS

In an interview, Olga Tokarczuk stated that she wrote her novel *Drive Your Plough...* during a break between *The Flights* (Bieguni 2007) (her most famous novel) and her most extensive novel so far, *Jacob's Scriptures* (Księgi Jakubowe 2014). At the same time, she said that for her it would have been a waste of paper and time to write a book just to finally reveal who the killer is. Therefore, as she said, the ecological dimension in the form of the issue of animal rights has also been included in the novel. The book consists of seventeen chapters, each introducing a motto from Blake's *Proverbs*, most of which relate to animals. In addition, the book, although a thriller (i.e. the literary genre, where illustrations are the exception rather than the rule), is illustrated – a fact on the basis of which one can infer the influence of Blake's “composite” art.

The fact that a murderess escapes without penalty can be on the one hand understood as a subversion of the genre's laws, and on the other hand, in this aspect, it is impossible to overlook the similarity with the fate of Mr. Ripley, the famous killer in the novels by Patricia Highsmith. But the difference is that the novel *Drive Your Plough...* is written in such a way that a reader, even if in principle rejects murder as a means of achieving the goal, is always on the side of the killer. While Mr. Ripley acts as a morally controversial hero, Ms Dušejko is portrayed as an all-embracing person who, with a series of murders, crosses the civilization edge, but the implicit and, at the same time, the explicit presence of Blake's views in the novel, draws attention to the dubiousness of such rational explanation of phenomena. The text, by the way, impugns the entire humanistic tradition and its laws, while it opens up the question of the relation between good and evil, as well as the question of implausibility of the rights that man has in the past used to usurp at the expense of all other beings: “Winter mornings are made of

steel, have a metallic taste and sharp edges. On Wednesday, at seven in the morning, in January, you can see that the world was not created for man, and especially not for his comfort and pleasure.”

In the later author’s novel *Jacob’s Scriptures*, we find a unique constellation of all kinds of fragments, letters, documents, reports, biographies, and above all, recordings of events; it is not just about the history of the followers of Jacob Frank, but also the history of events in the then Poland and wider in Central and Eastern Europe. But the novel is not only of a hybrid genre, but it has also a kind of polyphonic creation, where the voices are constantly intertwined, interrupted and sometimes overlapping, but above all they operate untimely and, therefore, in a minoritarian manner.

We also discover something similar in the literature of Breda Smolnikar, especially in the aforementioned novel *When the Birches Up There are Greening*, but also in other texts that have not yet been translated into English. The role of the heterogeneous element as a fundamental condition of minoritarian literature, which in the texts of Olga Tokarczuk is mainly shown through more or less implicitly or explicitly thematized inter-textual elements, takes the theme of a specific feminist perspective and ecological orientation in the texts of Breda Smolnikar. The space of events around the Kamnik-Domžale field (Slovenia) expands to the sea -coast and the USA, and then it narrows again in the Kamnik-Domžale field. Here, numerous descriptions and evocations call for an ecocritical approach. The narrative is an original critique of the former socialist and current neoliberal progressive orientation and it focuses primarily on its narrower environment, to Domžale and its surroundings. In recent times this area has become an inhospitable suburban settlement and as such embodies the tragedy of the former as well as the present time, which transforms the villages and small towns with a long tradition into the ugly suburbs of the metropolis. Praiseworthy old houses crumble without any need, gardens are destroyed, century old trees fall, and the water is dried; in their place plastic department stores, housing blocks and warehouses grow.

All female protagonists by Breda Smolnikar are something special, so that even on the background of European literature they emanate a subversive effect. Even though they are moving in completely different coordinates and do not pursue the same goals, their exceptionality or magnitude is comparable to the protagonist of the novel *Drive Your Plough...* Wherever they find themselves, with their own pervasiveness, positive or negative, they make a considerable difference in the world, leaving their trace. They are supported by a narrator at the language level. Smolnikar use of a free indirect style and the corresponding syntax, alienates her own native language and brings it to a sort of delirious state on the fringe. The consequence of this is a remarkable poetic effect. A typical example are the closing sentences in the book *When the Birches...*, although

they are in fact without a conclusion:

“and Rozina screams, the tops of the trees rustle, moan, roar, and golden, golden liquid bursts from the groove, I want it I want it, Rozna is crying, lying close to the groove, it’s pouring from all trees, from all grooves, from all trunks, from all branches, from all trees, from all roots, from birches and mountain maples and white maples, Rozina’s body is turning golden, oh, Rozina, Rozina, and Brinovic is there right next to her, holding a bottle of cherry brandy in hand, look there is soil still on the bottle, girl , they’re all gone, Rozina is surprised in his arms, there is one more , and it is golden says Mary, looking at them, o judi, moji judi, ča si lipa.”

Delirium is a disease, but also a measure of health, D&G claim, it is the other of language taken by the “witch line” that is escaping the majoritarian dominant system. It is about the invention of a new language within a language, using its own syntax, which is evident in *When the Birches...* and other narratives of Breda Smolnikar. The novel is written in a single long, composed sentence, which begins in the middle of the phrase “those were Greek ships that were coming to the harbour, she was waiting ...” and also ends in mid-sentence, with three dots and a comma. These long sentences, never interrupted by a dot, evoke a pure joy of life and narration, what E.T.A. Hoffmann called *die Lust zu Fabulieren*, a joy that passes into a passion that is purely physical in character and is characteristic of the entire writer’s opus. The writer “writes on the edge constantly, goes beyond the boundaries of the generally accepted, thus putting the personal and writer integrity at risk.”

Rozina, the protagonist of the novel *When the Birches up there are Greening*, is an example of such a markedly positive surplus. With her, the writer puts the figure of an emancipated and self-confident woman who does not need a man for protection, but much more so for love, sensuality and eroticism. These are the areas for which she is no less sovereign than in business. She stands in the arena of life, she is completely attached to it, but she does not seek to change the world in a direct way. She operates always around the bend, and she is always successful.

But let us return to timelessness, which also marks the work of Breda Smolnikar. It is characterized by the fact that more than through a variety of thematisations, it manifests itself through the bi-vocal free indirect speech, where, through one statement, the trail of different voices is preserved. For example, in a short novel or story, as it is defined by the author of *When the Birches...*, “she did not care how and where she rode, she’d wash herself at home, she was never upset on the way back as long as those on the shore saw her neat and tidy, upright, with American jewellery, it really did not matter on the way back.” The fundamental act of the narrative style, according to D&G, is not a metaphor, but a free indirect speech. It indicates the movement on the edge, which is the doubling of subjectivation. Such speech is characterized by inherent duality and heterogeneity of the subject, which cannot be merged into one nor split into two. It settles into an untimely space in-between. It is addressed more to fantasy

than to a reason. The subject is no longer the perfect master of language, although she expresses her thoughts or desires through her language. The consequence of this is unique poetics, especially seen in films, for example, in Pasolini, where “the camera does not simply give us the vision of the character and of his world; it imposes another vision in which the first is transformed and reflected. This subdivision is what Pasolini calls a ‘free indirect subjective’.” Deleuze detects in Pasolini’s films some poetic consciousness, which is neither aesthetic nor technician, but somewhere in between, it is prevalently mystical or “sacralising”.

This “sacralising” seems to be the most concise and best designation of the narrative style of Breda Smolnikar so far. It turns out that this is actually a very “cinematic” narrative. It is therefore surprising that nobody tried to shoot a film after the novel *When the Birches...*, or after some other text of this writer. Agnieszka Holland shot a film entitled *Spoor (Pokot – 2017)*, based on the novel *Drive Your Plough...* by Olga Tokarczuk.

CONCLUSION

Facing such literary texts, ecocriticism in its subversive version is supposed to perceive them not only as an act of representation, but as an experiment which is trying to achieve untimely thought, which allows us to step out of dialectical thinking. Thus we are no longer trapped between formalism and historicism. Rather than on the chronology of narration, attention should be paid to virtual thinking that is to untimely elements, contained in the act of writing.

VIEWING THE DEVELOPMENT OF TIANQIYUAN NATIONAL FOREST PARK FROM AESTHETIC FEATURES AND GEOGRAPHICAL POSITION

Abstract | Tianqiyuan National Forest Park is located in the eastern part of Zibo City, Shandong Province, China. It is under construction and mainly includes 7 functional divisions such as destination image display, forest movement, rural life, healthy resort, cultural and pastoral sightseeing, agricultural science and Tianqi culture. The first phase of the project is currently completed. Although Tianqiyuan Park is a contemporary construction, its history can be traced back to the Warring States' Qi state in ancient China. Due to its special geographical location, the waterfall formed by the Zi River water source was so impressive that both Qin Shi Huang and Han Wu Di, which were brilliant and influential emperors, came here to hold a sacrificial ceremony. In brief, Tianqiyuan became the sacrificial place of the ancient emperors with its unique geographical conditions and the beauty of scenery. On the other hand, the sacred rituals made Tianqiyuan a process the beauty of culture and be famous in the long history. Due to the over-exploitation of agriculture in the last century, the original landscape of Tianqiyuan was destroyed, and the current scenic spots are restoring and wish to recover the amazing scene. This article mainly introduces three aspects of Tianqiyuan Park, covers historical origin, natural landscape, and activist practices—tourism development towards Tianqiyuan, aims to dig and present the overall style and aesthetic features of Tianqiyuan Park.

Index terms | *Tianqiyuan; Landscape Aesthetics; Cultural Aesthetics; History and Culture; Tourism development*

Tianqiyuan is located in Linzi district, Shandong Province, on the south bank of Li river, and it's the central part of Qi State. It once had a spring of clear water whose temperature is always 19 degrees Celsius. It is called Tianqiyuan, also known as Hot Spring. Tianqiyuan once witnessed the thick and heavy history of ancient China, and now it has been rebuilt and protected as a symbol of the beauty of nature and culture.

HISTORICAL ORIGIN

Tian Qiyuan once named Ruiquan and Fengshui, and contained the beautiful wishes and reverence of the ancients. Linzi, the place that Tianqiyuan located in, is the capital of Qi State in the Zhou Dynasty. The place was deeply influenced by the "Tian Qi Culture". The Chinese character "Qi" is the phonetic loan character with "navel" in ancient times. The word "Tian Qi" means "the navel of the sky", referring to the central position of the world [1]. "God of the sky" is the god of ancient China and one of the eight gods in Qi state. The ancient Chinese book "Historical Records and Fengchan Book" once described the historical facts that Emperor Qin Shihuang and Emperor Wu of the Han Dynasty came Tianqiyuan to hold sacrificial ceremonies for the Eight Gods. The ancients built the Gods' temple in Tianqiyuan, expecting to nourish the Gods with the water of the hot spring, in order to promote the national economy, which contained the people's good wishes. At the same time, bureaucrats and the people in ancient China would hold the Xiuxi activity in the Shangsi Festival in Tianqiyuan [2]. Xiuxi is an ancient traditional folk custom. It refers to the ritual of swimming and washing along the water. On the third day of March in the lunar calendar, people come here to bathe with bluegrass, pray for cleaning up diseases and seek for the benefit of the child.

In addition to the ritual activities, Linzi is the birthplace of Cuju which is an ancient Chinese sport similar to football, and Tianqiyuan is one of the important geographical indications of Qi culture. In recent years, some social and cultural activities have been carried out here. On October 22, 2018, the International Cup of Origins was opened in Linzi, Shandong Province. Tianqiyuan held a sacred ball collection ceremony. Choosing it as the ceremony place was to trace the source and express regards for this far-reaching traditional sport. On that day, people wore dresses, playing ritual music, dancing traditional dances, and performing ancient and solemn cultural scenes. The modern and cultural activities are connected in ancient and modern times, which makes the history and culture of Tianqiyuan inherit and carry forward.

Tianqiyuan carries the thick history of Qi and the country. The grass and trees have witnessed the changes of culture. The beauty of the culture is reflected in every monument. Today's descendants of Qi State come here to visit and ponder on the past, to tell the children the source and meaning of Tianqiyuan's name, as well as the sacrificial ceremony and Xiuxi customs here. Qi culture is activated and extended in the cultural environment of Tianqiyuan.

NATURAL LANDSCAPE

The scenery of Tianqiyuan used to be beautiful, especially the scenery of one of the cliffs and the springs sighed. According to the historical records of the "Qingzhou Fuzhi" in the Jiajing Period of the Ming Dynasty, the place once "had five springs spraying together, the big springs were sprayed with jade, and the small springs spit out the pearls. It was a spectacular scene. The springs were sparkling and looked like jade; the springs were misty, which made the place like a dream." The Ming Dynasty's Zhibian Lao has been known as "hot spring poetry", which is an impressive scene depicting

Tianqiyuan at that time. Later, because of the immoderate underground mining, the water level sank and the water was exhausted. Then the mountain was dry and Tianqiyuan lost its vitality. In the last century, people began to develop and construct stone materials in Tianqiyuan, which further damaged the landscape. Although it has been destroyed, Tianqiyuan still occupies an important position in people's hearts. After repairing and rebuilding, we can also get a glimpse of the grand scene.

The restored Tianqiyuan National Forest Park has many unique landscapes with different postures, such as cliffs, waterfalls and the tranquil lake. Strolling on the plank road of Tianqiyuan, you can enjoy the scenery, such as the waterfall, the green waves, the stone carvings, the shades of the trees. It's the exquisite scenery that makes people linger and fully appreciate the beauty of the landscape here. Today's Tianqiyuan, there are three clear springs flowing out from the cracks of the stone, and flow through the huge stones into the shallow pool, reflecting the blue sky and clouds, surrounded by green trees and red flowers, and it's full of the beauty of colours [3]. Tianqiyuan National Forest Park will create farmland ornamental landscapes, wetland recreation landscapes and slow traffic landscapes. Different landscapes are matched and integrated with each other, thus reflecting the chic landscape interlaced and vertical and horizontal beauty.

TOURISM DEVELOPMENT

In 2016, Linzi District of Zibo City, Shandong Province, launched the Tianqiyuan National Forest Park Construction Project to carry out ecological renovation and tourism development activities. The first phase of the project covers an area of 280 hectares and plans to invest 500 million yuan, focusing on building an ecological system of "two mountains, one field and one village" [2]. One of the key tasks of the project is to select spring entrances manually on the cliff wall and then draw the underwater to form a waterfall effect in order to restore the original appearance of historical records. After the exploration by experts, three points of "one high, two low" were finally selected, which learned from the writing of ancient Qi characters. After repairing, the cliff wall is more than ten meters high, three springs are flying straight down, turbulent and tumbling, and the water splashes on the rocks, causing the water to splash, hazy vapor lingering, making people amazed and full of praise. In addition, the park has built a 3,000-meter wooden plank road that runs through the mountains and hills, making it easy for tourists to stroll. There are some landscapes platforms designed which are convenient for people to take a rest. In order to avoid destroying the landscape as much as possible, this plank road is made up of pure wood and the structure of it is built according to the terrain. It is a natural scene with the surrounding trees and stones which make roaming on the plank road is interesting and enjoyable. When visitors are walking on it, they can breathe fresh air and feel the breeze from the forest which is effective to relax their bodies and minds. According to the park manager, some trees and shrubs will be planted on both sides of the plank road to create a tree-lined corridor with streams, where we can see flowers in three seasons and see greens in the whole year. What's more, Tianqiyuan added the beauty of culture and the beauty of nature by building agricultural science and Qi cultural functional areas, which is icing on the cake.

From the perspective of tourism aesthetics, Tianqiyuan has cliffs, springs, lakes, pavilions, lush forests, historical monuments, and sacrificial culture etc. It has rich aesthetic information which can bring visitors with profound aesthetic experience. The

first phase of the construction of Tianqiyuan National Forest Park adheres to the theme of “idyllic tourism, ecological leisure and restoration of historic sites”. The second phase is based on the theme of “the protection and development of remains and mountain sports”. Both of them carries out tourism development and construction to create a landscape scape for tourists which has rich images, containing sound and colour, dynamic and static, natural and human infiltration. The project aims to realize three important purposes of ecological restoration, leisure tourism and cultural heritage, and will drive the development of local tourism service industry.

Tianqiyuan has a high degree of landscape aesthetics and historical and cultural values. At Tianqiyuan, people can enjoy the pleasant scenery, understand the Qi culture, and cultivate the sentiment, so that they can achieve the satisfaction of spiritual needs and the improvement of spiritual realms [5].

A CASE OF CONFLICTUAL PERSPECTIVES: ARTISTIC FREEDOM VS RIGHT TO REPRESENTATION. TWO EMBLEMATIC CASES: ROBERT LEPAGE'S SLAV AND KANATA (2018).

Abstract | The harsh controversies over two musical/theater productions, SLAV and Kanata, from internationally acclaimed Quebec theater director Robert Lepage during the summer 2018 in Montreal, and more generally the Canadian cultural community, demonstrated the need for a better understanding of artistic freedom, censorship, cultural appropriation, and systemic racism in a post-colonial context.

SLAV is a musical play inspired by Afro-american slaves songs conceived by theater director Robert Lepage and Montreal based singer Betty Bonifassi. On the premiere's evening on June 26th during the Montreal International Jazz Festival, around 100 protesters were standing outside expressing their discontent about the fact that on a total of six singers playing slaves in cotton fields, only two were black. After a few representations the show was canceled for a few days due to Bonifassi's broken ankle. On July 4th, the Jazz Festival producers cancelled the whole production following a letter from Moses Sumney, an Afro-American musician who decided to cancel his own show appearance and boycott the Festival because of the controversy surrounding the SLAV. The Festival mentioned „security“ reasons for the cancellation of the show, a cancellation which fuelled hundreds of protests in the following months, accusing the protesters and the Festival of censorship.

A few weeks after those events, another Robert Lepage's production, Kanata, conceived to be presented at the Festival d'automne de Paris in December 2018 became the centre of attention fuelling another harsh controversy: the show was supposed to illustrate the history of the relations between the indigenous peoples of North America and the European settlers. This time again, the main people implied and concerned were absent from the scene.

Among the arguments of Lepage and his defenders about his highly problematic castings in both productions was „artistic freedom“ and the refusal of any kind of censorship (for example: to claim that white actors or singers could not play the roles of Afro-American slaves was criticised by many as being a kind of censorship).

We aim to address the common problematics of those two controversial cases and we intend to do so in order to demonstrate the need to redefine the concept of „artistic freedom“ in a post-colonial context, especially regarding the rights of minorised and discriminated groups to be taken into account and justly represented when artists refer to their stories and bodies as artistic material.

« A CASE OF CONFLICTUAL PERSPECTIVES: THE RIGHT TO ARTISTIC FREEDOM VS THE RIGHT TO REPRESENTATION. TWO EMBLEMATIC CASES : ROBERT LEPAGE’S *SLAV* AND *KANATA* »

Introduction: The *SLAV/Kanata* stories

Quebecers will probably remember the summer of 2018 for quite a while. Not only because it has been the hottest summer in almost a century but also because of the unusually “hot” and virulent debates that surrounded two theatrical/musical productions of internationally acclaimed Quebec based theatre director Robert Lepage, *SLAV* and *Kanata*.

SLAV is a musical play based on Afro-American’s slave songs collected during the 1930s by ethnomusicologists Alan and John Lomax. The lead singer and co-creator of the show, Betty Bonifassi, had already done two solo albums with this repertoire. *SLAV* was a Montreal International Jazz Festival special event and presented in one of the most important theatres in Montreal (Théâtre du Nouveau Monde). It premiered on June 26th but was soon to be cancelled due to Bonifassi’s broken ankle but also, following the Jazz Festival’s official declaration (July 3rd), due to “security risks”. The fact that about 100 protesters were standing in front of the theatre on the evening of the premiere is supposed to have counted among those “risks” – but the main risk was clearly the consequences of the cancellation by Afro-American musician Moses Sumney, who explained in a letter sent to the Festival (July 2th) that he chose to cancel his performance in support of *SLAV*’s protesters (the risk here being that other musicians scheduled at the Festival could follow his example, putting the Festival’s program and reputation at stake).

One of the main protests was that *almost all* of the production dedicated to Afro-american’s slave songs and tragic history was made by white persons. Which led to accusations of racism and cultural appropriation among other things but also, and much more importantly I think, to the denunciation of the invisibility of the “visible minorities” on the cultural scene in the Province of Quebec. It was certainly not a lack of talents in the Quebec black community if only two black singers were chosen among six. This problem has indeed been observed, documented and publicly criticized many times over the past 10 years at least¹. In the following months, a fierce public debate went on in all of the Quebec/Canadian medias and social networks about artistic

1 Since its foundation in 2004, Diversité Artistique Montréal has been quite active in promoting the artists from the “visible minorities” in all fields and producing studies and recommendations to improve the situation. Cf. <http://www.diversiteartistique.org/en/publications/studies>. They also intervene among other groups to denounce racism and discrimination in the cultural scene as they did for example when a well-known Montreal theater (Théâtre du Rideau Vert) used a “blackface” in 2015 instead of hiring a black person for a production. We should also take notice that those claims from “visible minorities” are more and more widely shared all over the world nowadays in the cultural scene, especially in the theater and film industry : “OscarsSoWhite”, Cannes 2018 (16 black actresses made an official statement about the limitations of their roles in France), etc.

freedom, censorship, cultural appropriation, racism and the lack of representation of the “visible minorities” in the arts and the cultural industry in general.

The second production, *Kanata*, was supposed to tell the story of the difficult and tragic relations between the indigenous peoples of Canada and the European settlers since the beginning of the colonisation². Robert Lepage had been invited by famous French theatre director Ariane Mnouchkine to create a play with her theatre company in Paris (Théâtre du soleil), a production meant to be presented at the Festival d’automne in December 2018. Shortly after the *SLAV* debate had been ignited, the news spread that *not a single indigenous person* was part of the *Kanata* production, adding a much unneeded fuel to the ongoing harsh public debate³. A collective declaration signed by numerous indigenous artists published on the July 14th explained their criticisms towards the show (quite similar to the ones addressed to *SLAV*). Five days later, Lepage and Mnouchkine came to Montreal to meet 35 indigenous artists and cultural entrepreneurs, a meeting that lasted many hours but was not conclusive⁴. The controversy finally provoked the cancellation of some of the funding Lepage was supposed to receive from North-American co-producers which led him to completely cancel the production of *Kanata* on July 26th (the production finally took place December as initially planned and went on until March 2019).

Common problematics

Although the themes and historical material of *SLAV* and *Kanata* were completely different –and were also created in two completely different contexts– they raised similar problematics within the Afro-descendant and indigenous communities, as well as for those familiar with the postcolonial debates and concepts. Both stagings were inspired by their tragic histories, deeply marked by the hundred years of colonial oppression, discrimination and exploitation of their ancestors’ bodies and territories, a “dramatic material” that still bears psychological and physical extensions in their daily lives today since both communities still suffer from discrimination, systemic racism, physical violence and “invisibilisation” in contemporary Canada, a society some experts describe as being still colonial (e.g. the “Indian Law”⁵). Both communities have also

2 The project changed in the meanwhile and finally mainly concentrated on the problem of the missing and/or assassinated indigenous women in Canada, a national tragedy which made thousands of victims, and is still going on today.

3 Some objected to this absence by saying that Mnouchkine’s company is itself plurinational and many of her actors and actresses come from immigration and have a difficult if not tragic background. A video has been produced to explain this and put online on the 1st of March 2019, cf. <https://vimeo.com/320809875>.

4 Ariane Mnouchkine’s public declarations since the meeting have been incredibly condescendant and demononstrated her incapacity to take into account the deepness of the problems the indigenous protesters tried to point at – thus adding to the legitimacy of the criticisms that were addressed in the first place. Cf. <https://ici.radio-canada.ca/premiere/emissions/medium-large/segments/entrevue/81799/ariane-mnouchkine-kanata-annulation-denonce-injonction> and <https://www.telerama.fr/scenes/ariane-mnouchkine-les-cultures-nesont-les-proprietes-de-personne,n5809605.php>.

5 The indigenous communities have not only been deprived of many rights through

been struggling for decades for more recognition and additional rights in general and more recently in the cultural industry as well.

Not only have those productions raised similar problematics, but the heated and symbolically violent debates they have sparked present many common arguments. We can split them broadly in two groups: on the one side, the defenders of Lepage's creations in the name of artistic freedom, who swiftly accused the protesters of "censorship"⁶, "intimidation", "white racism", "cultural fascism", etc.; on the other, the protesters, who tried to explain the reasons why an artist couldn't use the story of "others" while excluding them from his creations anymore, as if it could be a simple and neutral "artistic material", especially when their story concerns such a difficult and tragic past with so many echoes and consequences in their actual lives—their social and political invisibility as "visible minorities" and the silencing of their specific challenges and their suffering being only two examples here of those consequences.

To Lepage's credit, we have to mention that he did consult a few experts and artists from the two communities concerned in *SLAV* and *Kanata*, but it didn't seem to be very productive as some of them explained in public declarations later on⁷. It must of course

this colonial law but also suffer from many injustices and social problems that have been put to light in the past 20 years: rape and murder of hundreds of indigenous women, many of which disappeared, the system of „residential schools“ where thousands of indigenous children were forced to go after having been literally kidnapped from their families (the last one closed in 1992), abnormally high incarceration rates and suicidal rates, extremely bad living conditions (poisonous water, overly high prices for food, no health care). Cf. <https://www.upress.umn.edu/book-division/books/red-skin-white-masks>.

6 A position still defended by Betty Bonifassi months later in a TV interview as the play was to take place in Sherbrooke City (January 2019). Cf. <https://ici.radio-canada.ca/tele/tout-le-monde-en-parle/site/segments/entrevue/102564/slav-spectacle-critique-reconciliation-betty-bonifassi-elena-stoodley>. Whereas Robert Lepage, on the contrary, explained at the end of December 2018 in a kind of "mea culpa" letter that he had made mistakes and regretted the harshness of the controversy surrounding SLAV fueled by the medias not mentioning a single time the word "censorship". Cf. http://mi.lapresse.ca/screens/6b6b6daf-c590-45d0-a986-a2d6379b220d__7C__0.html.

7 Among them, the Quebec City based rapper Webster (real name Aly Ndiaye) who's also an historian of black history and slavery in Quebec, was consulted for the SLAV production during the summer of 2017. He was very disappointed to observe at the first preview that his advices hadn't been taken into account, especially those concerning the fact that white women were playing the roles of black slaves in cotton fields. Cf. https://quebec.huffingtonpost.ca/webster/le-probleme-avec-slav_a_23470580/. See also Marilou Craft's text months before the premier of SLAV (dec. 2017): <https://urbania.ca/article/quest-ce-qui-cloche-avec-le-prochain-spectacle-de-betty-bonifassi/> and her critique of the show on July 3rd: <https://urbania.ca/article/slav-bilan-de-marilou-craft/>, both texts for which she received numerous insults and threats. Finally, one must also mention that, despite advices from experts before the production and even after SLAV was "revised" in a new version following Lepage's meeting with a group of artists and cultural actors in the Fall of 2018, the show still alludes in the new version to the so-called "Irish slaves" although it has been proven that this story is a pure product of the American alt-right. Cf. expert historian Le Glaunec: <https://ici.radio-canada.ca/nouvelle/1147404/nouvelle-controverse-slav-erreurs-faits-historique-robert-lepage-betty-bonifassi> and <https://www.lapresse.ca/arts/spectacles-et-theatre/201901/18/01-5211502-une-theorie-conspirationniste-dans-slv.php>. This choice of keeping the figure of the "Irish slave" is highly emblematic of the lack of rigor in the production of those two shows and has not been either explained nor

also be emphasised that Lepage intended with those to shows to denounce the racism affecting these communities. Unfortunately, as we all know, hell is plagued with good intentions.

Two conflictual perspectives: the main arguments

There has been literally thousands of publications, radio and TV interviews around these two controversies which makes them difficult to summarise⁸. We'll concentrate here on the most important ones.

1) The “let-them-do-it-too argument”

Defending Lepage’s right to artistic freedom and the choice of any materials and contents he might be interested in, some objected that nobody had prevented the communities involved to do their own shows, present their own versions, their own stories, and so on –some even insinuated that if they didn’t, it was probably because of a lack of talent... While this objection was frequently used, it is also the least interesting and relevant one since the artistic and cultural community know too well how difficult it is to get fundings and even more when you are not already an established artist like Lepage (who is undoubtedly one of the most famous theatre artists in Canada), a difficulty which is even greater for the members of ethnic minorities. The other problem is also related both to the way the medias always give more visibility (and thus more importance) to better known artists leaving little public space (if any) to emergent artists, and to the mechanisms of the culture industry.

2) The “slip-into-the-other’s-skin argument” (literal translation of French « se mettre dans la peau de l’autre »)

A more serious argument concerning the problematic casting of both *SLAV* and *Kanata*, on which many insisted, was the fact that theatre was the art “par excellence” where actors slip into the skin of others and that one doesn’t have to be Jewish or an homosexual to play a Jewish person or an homosexual, meaning here, by extension, that a white person could also play the role of a black person.

Notwithstanding the fact that, as any professional working in theatee or cinema knows too well, the casting for a role is a prior and extremely important part of the success of a play, this argument tries to evacuate the question of *corporeity* and the specific burden of the black body, heavily stigmatised (in many different ways –one has simply to think of the attention given recently to the sole question of the black people’s hair in a few shocking events⁹). Contrary to the white body, the black body commented by Lepage.

8 In February 2019 Google had a total of 740,00 references for the key words “SLAV + Lepage”.

9 For example: <https://www.theguardian.com/sport/2018/dec/22/high-school-wrestler-dreadlocks-hair-cut-video-racism>.

cannot make itself forgotten nor transformed into its contrary –a black person cannot chose to become white the way some white persons nowadays try to become black. It simply doesn't work that way¹⁰. It is also impossible to prevent the colonial and racial glaze on black bodies contrary to the "colour-blindness" argument Bonifassi used as a justification of having white singers playing black slaves, showing thus the sheer blindness to the actual living conditions of racialised people, especially the black people and the history of more than 400 years of slavery their bodies have endured.

Another very important aspect about the "slip-into-the-other's-skin's argument" overshadows the fact that both *SLAV* and *Kanata* had a *documentary* dimension (both related to *historical and factual contents*) and had a "didactic" ambition. This "semi-documentary" aspect has also decisive consequences on the so-called artistic freedom as we'll see later.

In *not even one* of his declarations about *SLAV* has Lepage explained *why* he chose white persons to embody black slaves, be it for artistic reasons or the quality of the voices of the white singers. He might have done so if he had opted for a Brechtian stance, or for any other artistic justification, *but he didn't*.

In the case of *Kanata*, there was a convenient justification: Lepage could not choose the actors because they belong to Mnouchkine's company. Despite this justification, it remains hard to believe that Lepage couldn't invite at least one or even a few indigenous actors to play along the company in Paris – being the artist that he is, and having the means that he has.

Mind you, we are not here suggesting that an artist cannot conceive a show denouncing the plight of a people belonging to another culture or that a comedian cannot play the role of a person with a different nationality. In general, this can of course be done. But here we are dealing with a complete or an almost complete exclusion of an entire community. Even worse, these are communities who have been silenced or whose voices have not been heard and they are communities that still suffer from the oppression or colonisation of a dominant white community.

3) Artistic freedom

This is certainly one of the most important arguments. Since the beginning of modernity at the turn of the 19th century, artistic freedom has been gained over harsh battles against censorship, moral hypocrisy, religious interdictions and political dictatorships. Trying to intervene into Lepage's creative freedom by criticising his choices (especially the casting) thus amounted for his defenders to censor him as in the "bad old days".

The fact that both shows were cancelled (but finally presented) has been directly

10 Contrary to Rachel Dolezal claims to "trans-racialism", cf. <http://theconversation.com/the-contradiction-at-the-heart-of-rachel-dolezals-transracialism-75820>.

attributed to the protesters (some were even accused of “cultural terrorism”), despite the fact they were both cancelled by the producers for reasons not pertaining their *contents*. If a few protesters asked for a boycott, it was certainly not them who put an end to the productions. Many protesters have also explicitly declared that they did not wish for a cancellation at all, but simply hoped their criticisms would be heard and taken into account¹¹.

As some rightly observed, the defenders conveniently confused criticism, censorship and intimidation, some of Lepage’s defenders becoming themselves the perfect examples of what they were condemning in the first place¹². They were indeed the ones who have spoken the most in the medias, contributing to silencing those who were protesting or simply criticising the shows from the very beginning.

Another important confusion about the so-called censorship against Lepage’s *SLAV/Kanata* concerns the *convenient* lack of distinctions between their “content” and the political demands of the communities involved, who were simply asking to be justly represented and given a place in stories that were theirs in the first place. Both communities insisted on the fact that part of their history in the past centuries –both rooted in colonialism and racism– *was precisely that they had been silenced, not considered, or invisibilised*, and thus too often stereotypically portrayed without letting them express their own voices in the context of insidiously perpetuated domination that they were trying to fight against. And here again, *by not wanting to consider those legitimate revendications and focusing on the question of artistic freedom*, the defenders became censors themselves *thus participating to the exact situation denounced by the protesters*.

Moreover the defenders refused to acknowledged the fact that any artist who works with the story of real persons, real facts and historical content has to accept *the responsibilities which come along that choice*. Any documentarist knows indeed how this choice commands greater caution in the treatment of the material they use, as there are stakes for the persons concerned and their representation, and thus their public perception to start with, as well as issues about truthness or falsehood. In the case of the communities involved in *SLAV/Kanata*, those stakes were crucial because the way they are publicly represented directly affects their image and the way they will be socially perceived in a situation where they are still regularly victims of discrimination and racism. A wrongfull representation has way more impact on them as on any member of the dominantly white and euro-ascendant community and can therefore be not only offensive but also cause prejudice, as their overall invisibility precisely insidiously does¹³.

11 In the case of Kanata the criticisms were formulated months before the show was supposed to take place in Paris, where it finally took place without any substantial changes.

12 Cf. Pascale Cormier, <https://onjase.org/post/2018/07/31/182-SLAV-et-Kanata-%3A- rendez-vous-manques>, Michel Seymour, <https://onjase.org/post/2018/08/06/183-Museler-la-controverse>.

13 We can usefully recall here French philosopher Ruwen Ogien’s distinction between

Finally, for those who complained that artists “can’t say anything anymore” because of what would be simple and stupid “political correctness” –another form of censorship for them– there is a huge difference between not being able to express oneself about one’s experience and reality on the one side, and, on the other side, the way to express it and *include or exclude others* in what we say, especially if those “others” are directly concerned and in a *vulnerable position*. In that sense, the well-known Quebec comedian Guy Nantel who was complaining about the criticisms of his show¹⁴, and who was condemning what he qualified as a new and unacceptable censorship, did not understand this crucial difference. What one could say without problems “before” should not necessarily be legitimately said today (among which racist and sexist jokes).

4) Cultural appropriation and privileges

There was a lot of discussions (and confusions) about “cultural appropriation” in relation to the artistic freedom’s argument. *SLAV/Kanata’s* defenders argued mainly that culture belongs to everyone and this has always been the universal ground on which artists base and nourish their creativity. There has been, here again, many fierce debates and it would necessitate a whole separate discussion. The problem that I want to emphasise on here concerns the way things were presented without the participation or consideration of those whose histories and cultures were sources of inspiration and creation. As mentioned above, the problem was the absence of their involvement more that the fact of using them as a source of inspiration.

Another problem which became clear in that context is that thoses stories/songs seemed to need the gaze and voices of those who are already in a dominant position to get to be seen and heard, or they would otherwise remain silent. Some pointed at the risk of using these materials in a manner where they could be emptied of their profoundness and authenticity (as some criticisms of *Kanata* underlined) especially by the way they were made “spectacular”, a criticism that I find problematic for many reasons.

Some underlying problems

As they expressed it publicly in many occasions, Lepage, Bonifassi and Mnouchkine were extremely surprised by the reception of their work and the criticisms it prompted. They clearly underestimated the extraordinary weight of the long history of oppression and exploitation that the communities they wanted to talked about (with good intentions) still have to go through on a daily basis in their lives and in their bodies.

being simply offended, a case which cannot command “censorship”, or being the subject of prejudice, a case that commands either correction or condemnation. Cf. *La liberté d’offenser. Le sexe, l’art et la morale*, Paris, éd. La Musardine, 2007.

14 He made very indelicate jokes about “rape culture” and about a woman who had publicly accused a politician of raping her (summer 2018).

They also seemed to be unaware of the huge and urgent need for recognition and respect those communities have been trying to express for years. They underestimated the way they no longer want to be reduced to representations with which they do not identify. Those representations have been too often cliché, stereotyped, and diminishing, when not bluntly demeaning and deshumanising – *a situation worsened by their cultural and mediatic invisibility*.

As good and as noble as they could have been, the artistic intentions at stake encountered the symbolic and political burden of centuries of colonialism and racism from that Canadians inequality inherited and which affects one differently depending on which side one stands. Something as ordinary as wearing a sleeveless white cotton shirt doesn't have the same resonance on a white person as on a black person, as the organizers of a parade in Montreal learned at their expenses recently¹⁵.

Some theoretical avenues

Among many factors of explanation for the surprising unawareness of such “avant-gardist” artists as Lepage/Bonifassi/Mnouchkine, and the incredible crisis it unleashed in the public sphere, let's just mention a few analytical avenues I will try to explore in a further paper: 1) the blind concept of “universalism” which was often brandished in these debates without any grasp of the concrete situations and conditions of those who are supposed to be included in that universalism, 2) the emergence of “counter-publics” in the public sphere and the demands for a visibility and a voice for those who are usually not taken into account¹⁶, and 3) the typical symptoms of “epistemic injustice”, as theorised by Miranda Fricker¹⁷, exemplified by how the protesters were silenced, by the fact their testimonies were not taken into account, and by the usual prejudices against their communities being activated.

Conclusion:

With freedom comes responsibilities and thus with artistic freedom comes artistic responsibilities. The artists who gained artistic freedom should be aware more than ever of their responsibilities toward those who have not yet gained the recognition of their rights to an equal freedom and visibility in the artistic sphere or in society. These responsibilities shouldn't be perceived as a restraint to creativity but, on the contrary, as an inspiring and productive challenge.

RECONSIDERING SPECTATORSHIP IN SOCIALLY ENGAGED ART

Abstract | Since the 1990s, socially engaged art practices that incorporate the performance of ordinary non-professional people have become an indispensable trend in contemporary art. Such practices have increased in Japan especially after the Great East Japan Earthquake and the Fukushima Daiichi nuclear disaster in 2011.

With this social turn in contemporary art, the distinction between art practices and social work or political speech becomes unclear. It could result in art being institutionalized as a mere tool for social improvement. Claire Bishop criticizes the framework assessing socially engaged art based on its direct social efficacy, while also insisting that it is crucial to discuss, analyze, and compare such works critically as art. However, it does not mean that we espouse conventional formalism or autonomy of art. Rather, we have to find a new approach to criticize and evaluate these new types of art practices aesthetically.

Discussions on socially engaged art practices primarily focus on the fact that an audience, which used to view the artwork from the outside is now transformed into “participants,” as a part of the artwork. However, the question to ask is whether participants performing within the art work can simultaneously be an active audience. This paper emphasizes the point that aesthetic experience requires a certain distance. To perceive an art practice’s subtle social and political meaning, it is also indispensable to view “participation” from the outside.

Accordingly, this paper aims to focus on the importance of a secondary audience that experiences socially engaged art indirectly, using the practices of Jeremy Deller, Phil Collins, and Koki Tanaka, wherein amateurs perform specific political themes such as a labor struggle, war, or refugee crisis, not as certain characters but as themselves in situations that are carefully devised by artists. Filmed performances are included in installations to be viewed by a large secondary audience. Though practices are fictive, ambiguous, and do not seem to solve any social problem, they produce a new narrative on social and political problems by offering the audience a powerful affective experience evoked by the performance of ordinary people. There, we can find an alternative approach to socially engaged art different from art activism, which aims to have a direct impact on society. This paper describes the significance of this new type of viewing experience and explores the potentiality of an audience that does not participate but goes beyond being mere passive onlookers.

Index terms | *Participation; Performance; Secondary audience; Socially Engaged Art; Spectatorship*

INTRODUCTION

Since the 1990s, socially engaged art practices involving people, communities, and social interaction have become an indispensable trend in contemporary art. With this social turn in art, the distinction between art practices and social work or political speech becomes unclear. It could result in art being institutionalized as a mere tool for social improvement. Claire Bishop criticizes the framework assessing those practices based on its direct social efficacy, while also insisting that it is crucial to discuss, analyse, and compare such works critically as art.¹ However, it does not mean that we espouse conventional formalism or autonomy of art. Rather, we have to find a new approach to criticize and evaluate these new types of art practices aesthetically.

Discussions on socially engaged art practices primarily focus on the fact that an audience, which used to view the artwork from the outside is now transformed into “participants,” as a part of the artwork. However, the question to ask is whether participants performing within the art work can simultaneously be an active audience. This paper emphasizes the point that aesthetic experience requires a certain distance. To perceive an art practice’s subtle social and political meaning, it is also indispensable to view “participation” from the outside.

Accordingly, this paper focuses on the importance of a secondary audience that experiences socially engaged art indirectly, using the practices of Phil Collins, Jeremy Deller, and the Japanese artists Hikaru Fujii and Akira Takayama, wherein non-professional people perform specific political themes such as a labor struggle, war, or refugee crisis, not as certain characters but as themselves in situations that are carefully devised by artists. This paper describes the significance of the new type of viewing experience offered by those works and explores the potentiality of an audience that does not participate but goes beyond being mere passive onlookers.

ALTERNATIVE APPROACH IN SOCIALLY ENGAGED ART

Using social and political themes, Collins and Deller intentionally create unique images by incorporating fiction and ambiguity. This chapter analyses their works and explores how those works compel the audience to face social realities.

Connecting audience and performers

They Shoot Horses (2004) by the British artist Phil Collins (1970–) is a video work of an eight-hour dance marathon by Palestinian teenagers hired after an audition in Ramallah.

The video features nine participants dancing to Western pop music without an intermission, like a marathon dance contest from the Great Depression of the 1930s, forerunners of the modern reality TV show. Though the political situation of Palestine is not mentioned, the dancers’ long hours of endurance, the dancing bodies being frequently cut off by the fixed camera frame, and the title referencing the long-ago novel and film encourage the audience to grasp the meaning of the work for themselves.

The two adjacent screens that show the performers life-size, and the shallow depth of background space inside the screen emphasizes the physicality of their dancing bodies. There the audience feel as if sharing the space with the performers. The sentimental and familiar melodies of Western pop music work as mediators that draw viewers and subjects together through emotion. When their cheerful and energetic dance gradually turns into a battle against extreme fatigue, viewers sometimes shed tears and even dance alongside the screen. By utilising globalised pop culture and construction of the image and the installation space, the work connects a specific political problem to the situation of all oppressed ordinary people from the Great Depression to the present.

Creating layers of audience

The Battle of Orgreave (2001) by the British artist Jeremy Deller (1966–) is a re-enactment of the brutal confrontation during the 1984 miners’ strike in the United Kingdom. This re-enactment involved more than 800 participants, including former miners and policemen who were part of the original conflict and historical re-enactors. Switching the roles of some miners to that of policemen has made this re-enactment fictional and politically ambiguous rather than just a faithful reproduction.

Significantly, the work produced several layers of the audience, each of which had a different experience. The first is the local residents who were on the site of the re-enactment. It was a unique and surreal experience because brass bands and stalls appeared, and children ran around the riot re-enactment. The second is those who watched the televised film by director Mike Figgis. Containing interviews with miners, the film evokes sympathy with miners and criticisms of Thatcher’s policy of mine closures. The third is the museum visitor who viewed The Battle of Orgreave Archive (An Injury to One is an Injury to All) (2001), which consists of a chronology, news videos, and books on people involved in the 1984 conflict and records and documents of the re-enactment. The re-enactment film is a part of a large archive in which materials of fact and fiction are juxtaposed in the same room. It makes the audience, who are distant from the site of the re-enactment, experience the subtle and nuanced antagonisms among people in various positions that cannot be converged into a single resolution or a political message of the era. It is this third audience who can perceive the situation of the society most intensively and vividly, where divisions and contradictions accumulate and become intertwined.

In They Shoot Horses and The Battle of Orgreave, audiences are removed from the participants’ performance in both temporal and spatial terms. However, as those practices indicate, the indirectness of these artworks can help the audience to perceive social and political issues in all their complexities and contradictions.

INDIRECTNESS IN SOCIALLY ENGAGED ART

In Japan, representative contemporary artists have been producing works containing sharp social criticism, especially after the Great East Japan Earthquake and the Fukushima Daiichi nuclear disaster of 2011. This chapter, examining their works, explores the possibility of art practices which are indirect but can be socially engaged.

The possibility of socially engaged art in the museum

Southern Barbarian Screens (2018) by Hikaru Fujii (1976–), presented at the exhibition Travellers to commemorate the 40th anniversary of the National Museum of Art, Osaka (NMAO) is a video installation featuring a man carrying the photographs of Namban screens taken by the photographer Ikko Narahara (1931–) out of storage and displaying them in the exhibition rooms.

Namban screens are a form of Japanese art depicting the 16th- and 17th-century trade between Japan and Portugal. The screens depict Portuguese merchants and Christian missionaries visiting Japanese harbours, with many small figures drawn precisely in vivid colours. Inheriting the spirit of the Osaka Expo in 1970, one of the tasks of NMAO was to locate Japanese art in the history of international relations.¹ Supported by the special budget for reproduction of the masterpieces of Oriental art, the Narahara visited the National Museum of Ancient Art in Lisbon in 1982 to photograph the screens.

This work incorporates the gaze of four people. The first is of a painter of the screens. Customers who purchased those screens were mainly merchants, especially wholesalers

in ports.² In the screens, the master/slave relationship of the figures is expressed clearly in the details and colouring of the skin, clothes, and behaviour. The images of wealthy white merchants who owned servants and slaves were painted to express curious exotic customs of foreign countries, but furthermore the images reflected the aspiration of Japanese merchants to expand their power. However, despite the frequent appearance of non-Western figures on the screens, they are rarely mentioned in the discourses on the Namban screens.³

The second gaze is of the photographer. Narahara produced not only faithful photographic reproductions of screens but also many shots of small parts from his own point of view. Figures of non-white people were carefully chosen there. What these images indicate is that Narahara was interested in these people and also, as Fujii noted, that countless variations can be produced from a single painting by changing perspectives in the distance, height, position, and angle.⁴

The third gaze is of a man being shown exhibiting photographs of Narahara. He is Peter Golightly, a member of the artist group Dumb Type. Although Golightly is a professional in performance, in this video his role is just to carry the photographs and display them on gallery walls as an anonymous person. While working, he takes time to look at the pictures and murmurs personal impressions. In another art museum space that appears in the video, he performs not only as an exhibitor but also as a spectator.

The fourth gaze is that of artist Hikaru Fujii. He rediscovers Namban screens through the perspective of Narahara and makes another attempt to view them anew through the performance of an African American living in modern Japan. While viewing the Namban screens through the intermediary of Golightly, the audience is forced to pay attention to the non-Western figures appearing on the screens. Furthermore, the audience's attention is drawn to how Golightly feels while seeing those figures. At the end of the video, Golightly runs in the gallery room towards the camera. It is the only scene in which he looks into the camera lens, and it makes audiences feel like being watched by him and being asked what they do and do not see.

Creating another exhibition space in the video screen, where photographs taken at a foreign museum many years ago are exhibited, the work relativises the institution of the museum. It indicates that the museum is not a neutral, independent institution in any country or any period. In particular, the national museum has the power to authorise works of art, determine what is worth seeing and what is not, and affect audiences' own perspective and memories. On the other hand, in the white cubes isolated from the noise-filled world, audiences are led to deliberation in looking at subtle differences in the colour and form of artwork, and they have the ability to imagine and even mentally fill in any perceived gaps. The fact that Narahara's photographs reflect his own attention to non-Western figures and the way the man exhibiting photographs murmurs his own thoughts suggest the potential power of the audience, who can develop their imagination and thoughts beyond the framework established by the museum. Accordingly, in the intersection of the four gazes, this work seems to reveal the ambiguous possibilities of the museum.

Blurring the boundary between art and activism

Collaborating with people who do not specialise in theatre, the theatre director and artist Akira Takayama (1969–) has taken broad approaches, such as touring performances and social experimentation projects, to extend the concept of theatre to real society and urban spaces. Since 2017, as an associate artist at Mozorn Tulum Theatre in Frankfurt, he has developed a project called European Thinkbelt/McDonald's Radio University. Inspired by the unrealised city plan by the architect Cedric Price in the 1960s, Takayama launched a project to transform the Balkan route along which many

refugees travel into a belt of thinking and learning. Then Takayama selected branches of McDonald's restaurants as places where refugees could deliver lectures.

At that time, many theatricalists tried to express refugee issues in straightforward ways in the traditional theatre framework, such as bringing refugees to the stage and incorporating refugee issues as a topic. As a foreigner himself, Takayama conceived a more indirect approach. When this project started, he met with strong resistance from German intellectuals, because McDonald's is seen as a symbol of global capitalism that serves unhealthy meals and exploits immigrant workers.⁵ Takayama, however, was paying attention to another aspect of McDonald's overlooked by intellectuals—they were shelters in the city where free Wi-Fi and cheap meals were available and long stays were possible. Like some refugees, he has had the experience of staying through the night in McDonald's in Tokyo. He tried to create a theatre from the perspective of people who are compelled to use McDonald's as a tool of survival, not one of people who criticise McDonald's from a position of comfort. In Tokyo he also met many young people who work by day and spend all night in McDonald's and recognised that they are like invisible refugees.

In McDonald's, visitors can pay for lectures and listen to them on MP3 players or listen to live lectures on the radio. Fifteen subjects are offered, including literature, philosophy, biology, accounting, sports, and architecture; the lecturers are from Syria, Afghanistan, Pakistan, Burkina Faso, Iran, and elsewhere. Lectures are based on their experiences and knowledge, but not the harsh experience they have had as refugees. For example, a refugee from Ghana who had won an international marathon gave a lecture on what it was like to run a marathon. In people's lives, there are invariably stories to talk about other than their experiences as refugees, and the lectures allow the audience to access those buried stories.

Thus this invisible theatre paradoxically makes refugees visible and changes the appearance of the city. By sitting in McDonald's and listening to another person's story through earphones, one finds that the initial image of the person, limited to the attribute of "refugee," transforms into the image of a real person living in the same society.

Takayama's practice includes real actions that create circuits to listen to the voices of people excluded from the theatres, as well as to extend theatre to the city. However, unlike conventional protest actions or political activities, it encourages audiences to discover and change values that open passages to other worlds in familiar places in everyday life.

CONCLUSION

The works of Collins, Deller, and Fujii demonstrate that profound and incisive questions can be posed to society even in the museum. And the work of Takayama blurs the boundary between art and activism by creating an imaginary theatre in the city. In the four practices, indirectness is required to stimulate audiences' imagination and deliberation and to spur the audience to go beyond being merely passive onlookers and face new social realities. Though practices are fictive, ambiguous, and do not seem to solve any social problem, they produce a new narrative on social and political problems by offering the audience a powerful affective experience evoked by the performance of ordinary people. There, we can find an alternative approach to socially engaged art different from art activism, which aims to have a direct impact on society.

AESTHETICS OF THE CITY IN THE BORDER AND MIGRATION ENVIRONMENT

Abstract | In this paper I will deal with how migration affects the aesthetics of the city and whether the camp is a new city in the way Agamben wrote. The border surrounding, the migration paths and the city as the source and goal of most migrants influences and changes the aesthetics of the city. Although cities are the first places of refuge for migrant populations, it appears that they have less visibility than borderlands. Borders are the hubs that make visible the national policies rejecting international migration. Walls, camps and surveillance systems are concentrated in these strategic places while camps, “jungles” and squats are regularly built by migrants in cities, and regularly displaced, destroyed and evicted by public authorities. Migration is all too often seen as a threat, not as an opportunity. Fears over migration are fueling populism and mistrust, and undermining governments capacity to manage flows. Public perception needs to change – from viewing migration as problematic to highlighting its benefits for the city and its population. Migrants have made enormous contributions to society and helped boost the economic growth of cities and countries. Cities themselves are at different stages of development and commitment regarding the management of migration. Migration usually appears as an afterthought rather than as an integral part of the process. Understanding the magnitude of its effects on city infrastructure is a prerequisite for city planners to mainstream migration. While most migration-related initiatives continue to focus on inclusion and integration, migration’s effect on urban infrastructure and services is often underrepresented, as it also affects a city’s social and economic development. Cities are where migrants interact with communities, society and, at least indirectly, with the host country. Hybrid cultures could be seen as an enabling force for cosmopolitan conviviality although cultural differences and the complicity in justify negative attitudes towards migrants and refugees. Migrants are often depicted as an opposition to the urban sphere, forming a contrast in ethical terms but street art brings together diverse creations, whether they take the form of verbal or visual signs, graffiti, maps, installations or performances.

Index terms | *aesthetics; border; city; migration; opportunity; street art; threat; visibility;*

INTRODUCTION

The city has always attracted newcomers as a magnet. It used to be barbarians, traders, teachers. Those who aspire to new knowledge, new experiences, but above all a better life. A newcomer is what is essentially the city itself - a constant process and change. The one who is a foreigner today is a measure of urbanity for someone who is coming. The city is a refuge and fortress, but also a one-way street and a ghetto. The city is fluid as well as the man on the move, as migrant or refugee, hides his face or changes his color. His canvas is a facade and the language is graffiti. And the city will be conquered by those who will be captured by him like in the song of Constantine Cavafy:

“You won’t find a new country, won’t find another shore.
 This city will always pursue you.
 You’ll walk the same streets, grow old
 in the same neighborhoods, turn gray in these same houses.”

What is common to the city and the newcomers is the boundary. As it is difficult to define who is a newcomer, stranger, migrant, refugee, it is difficult to define the boundaries and especially the borders within the city. The city is constantly expanding like a pulsating organism. The boundary is the term but also the content before the line, rather than the wall or fence, between the stranger and the one who appoints him. The boundary can be visible, can be perceived or just be a mental construction.

CITY AND MIGRATIONS

Cities have always attracted migrants. Cities reap the largest benefits of mobile talent but also face the important challenges of integrating migrants and offering them services. Cities can either capitalize on migrants’ skills and enhance their competitiveness, or increase the overall cost on their welfare system from unemployment. Migration has shown an unbroken upward trend, be it of people who have left their homelands voluntarily for economic or other reasons, or of those who have been forced to leave their homes (refugees, displaced persons, etc.). Migration trends, both internal and international, are presented, along with global migration projections. The number is expected only to increase, from an estimated 244 million international migrants in 2015. Internal migration is three times that of international migration, affecting the lives of far more people, although it is given much less attention in political debates and planning processes. In other words, migrants make up more than 1 billion people, or one-seventh of the world’s population. Migration to “global cities” – those that are advanced producers of services, have large economies, are international gateways, and are political and cultural hubs of international significance – is increasing. Since 2012, more than 3.5 million people have applied for asylum in the EU, or 2.5 million in the last two years alone. According to conservative UN estimates, Europe will have to cater to more than 500,000 new migrants annually in the coming years, particularly those from Sub-Saharan Africa. Cities have been destinations for most of the world’s migrants, given their degree of economic activity, their cultural and intellectual expression, and their development.

Migration is all too often seen as a threat, not as an opportunity. Migrants are not a burden, even less so a threat. Fears over migration are fuelling populism and mistrust, and undermining governments’ capacity to manage flows.

Half of Europeans think that refugees are going to take their jobs and social benefits. And regardless of actual migrant numbers, half the public in the USA and among the OECD's European Members think 'it's too many'. The evidence shows that in almost all OECD countries, migrants contribute more than they take in social benefits. Once they arrive in their destination country, migrants overwhelmingly remain in cities. The refugee crisis in Europe has also established cities as first points of arrival, transit hubs and ultimate destinations. The tendency to live among one's own group is pronounced and responsible for establishing enclaves within cities. Enclaves offer advantages of community and social support, greater availability of ethnic goods and food, centers of worship and other community institutions. The number of ethnic enclaves is rising in the urban areas of developed countries. Migrants are also a source of ideas and innovation who can contribute to businesses, governments and other entities in the city. Their way of life, music and other creative endeavors all play a role in enriching the destination city. Nevertheless, migration involves complexities associated with diversity of race, religion, ethnicity, language and culture. It can lead to social tension associated with xenophobia and discrimination and to violence in neighborhoods, workplaces or schools.

WHAT CAN ARTIVIST DO

Although cities are the first places of refuge for migrant populations, it appears that they have less visibility in activist works linked to migration than borderlands. Borders are the hubs that make visible the national policies rejecting international migration. Walls, camps and surveillance systems are concentrated in these strategic places. A whole activist field linked with borderlands seeks a subversion of biopolitics and the criminalization of migration. The centers of European cities as well as urban spaces more broadly are becoming major sites of bordering and debordering. Borderities are not to be found only at the edge of state territories but also within cities where the figure of the "stranger" is re-enacted through multiple urban sites of exclusion and segregation. Refugee camps in the city centers of Paris, Berlin or Belgrade were widely opened and closed since 2015. The classic linear and fixed topography of borders is more and more shifting to reticular, virtual and disseminated functions. Urban space is mainly considered as a reflection of social processes rather than as a direct object of subversion. Cities are present in activist and artistic works about migrations, but they remain often secondary to the sites of states' external borders or reduced to the status of décor.

The politics of art is always contingent rather than predetermined or foreclosed. In response to the question of how art propounds a politics, Ranciere argued:

"It is necessary to reverse the way in which the problem is generally formulated. It is up to the various forms of politics to appropriate for their proper use, the modes of presentation or the means of establishing explanatory sequences produced by artistic practices rather than the other way around".

Street art works, graffiti, activist mapping, architectural interventions and urban performances are examples of urban activism. They are based on concrete practices through direct interventions on the urban space (graffitists, ephemeral constructions) or through the performativity of representations and performances in the urban space (carnivals, counter-mapping, subversion of urban roles). The street is used to express what migrants has to say but also to send messages of solidarity with them or to present political slogans denouncing migratory policies. It is what Deleuze calls a

‘new cartography,’ a practice that creates new possibilities and realities. Talking about desirable city, mapping it and contribute to making it happen. They aim not to install a new system but to constantly destabilize the established and the legitimate one and to call into question the status of “migrants” as people who are “victims” or “deviants” and have to be “saved” or “normalized”. In this context, it also reminds us that we may need to face up to the challenge of talking about social relations without the representable trappings of identity.

AESTHETICS UNDER THE IMPACT OF MIGRATION

The institutional model of multiculturalism that simply promotes the representation of diverse identities as add-ons to mainstream culture is in fact a fairly static one, which does not address the issue of interaction. If aesthetics is to be more than a conservative art theory, it has to function within “cramped space” of contemporary culture and that is, not the space made available within the institution for major art but the lived space, in which we encounter exclusion, confinement, marginalization, difference and change. Contemporary aesthetic practice embodies the shift from identity to relationality, and toward an exploration of communality as a process, is a key development in terms of political aesthetics. What could be called migratory aesthetics is less a style than a strategy - it is a transitional politics. To this end, it is essentially hybrid. This is what migratory aesthetics can do - what aesthetics can become under the impact of migration. It embodies ‘exodus’, in Virno’s sense of a creative flight from the state toward alternative community formations, but combines the image of exit or departure with an elaboration of movement across new territory—of an arrival, however provisional.

CLOTHING CORRESPONDENCES

Abstract | In philosophy, the aesthetic is classically treated as an object, attitude, experience, or a judgement. But objects cannot be depicted apart from the human attitude towards, experience of, and judgement about them. The attitude implies a human autonomy from her surroundings, that establishes the demand to experience every confronted object constantly in an aesthetic manner. The experience is considered detached from the actions and objects experienced. And aesthetic judgements are only possibly made when experiencing objects with a certain attitude. As these four common phenomena are interdependent, they only partially capture the aesthetic, and eventually they fog the issue. The search for the aesthetic x remains open.

A new x shall be thrown into the shark tank of philosophical debate, namely the aesthetic intra-action. To illustrate what aesthetic intra-actions could be, they are applied to the clothing. Here, the clothing is understood not as the material objects of clothes (dress/wear); but rather as the continuous, most intimate, and thus broadly relevant and accessible relation between humans and clothes. The clothing concept is meant to push two traditional views of fashion/dress aside. Firstly, it depicts humans-clothes relations as non-anthropocentric. Clothes are not a blank page on which the human can draw herself; and the human is not the one who applies clothes onto her body. Instead, humans and clothes equally and mutually affect each other via dressing and wearing intra-actions. Secondly, dressing and wearing are not inter- but intra-actions. Humans/clothes do not encounter each other and thus shape the clothing; but they rather become temporally enacted by the clothing.

Loosening the grip on aesthetic (attitudes towards, experiences of, judgements about) clothes, aesthetic clothing means that humans and clothes form part of a correspondence, a mutual fitting-to intra-action. Humans as such are neither tall/small, nor are clothes in and for themselves wide/tight. They rather are “too tight/wide for”, viz. they only become aesthetic in relation to another. Hence, humans/clothes are non/aesthetic, and only become enacted as aesthetic by the clothing relation via their degree of fitting. Thus, the aesthetic cannot reside in one of the (clothing’s) entities; but must be searched for within the relation itself, namely in non/correspondent (dressing/wearing) intra-actions. Via the clothing, the correspondence as aesthetic intra-action is reached, and shall be offered as new aesthetic x.

Index terms | *clothing correspondence, aesthetic intra-action, fashion/dress, humans/clothes, new materialism, Karen Barad*

INTRODUCTION

Philosophical aesthetics has hitherto treated its subject of research as one of the following four issues: an object, attitude, experience, or a judgement. However, as these issues cannot be clearly demarcated from one another, they do not capture the aesthetic abundantly. Therefore, the question what the aesthetic is, the search for *the aesthetic x* remains open. A new *x* shall be thrown into the shark tank of philosophical debate, namely the aesthetic *intra-action*, which is a *correspondence* (both terms from Karen Barad). The clothing, the daily and thus broadly accessible humans-clothes (clothes here are understood as both dress and wear) relation, is an apt field of illustration for aesthetic intra-actions, and can help to draft a more detailed picture of what correspondences are.

First, the status-quo of research in aesthetics is drafted, based on Shelley's partition into four. Second, a new materialist intra-active reading of the clothing is undertaken. Third, it will be shown how focusing not on aesthetic clothes, or the human aesthetic attitude towards, experience of, or judgement about clothes; but instead looking at clothing aesthetically, *viz.* locating aesthetics in-between humans/clothes, can help further an understanding of what the aesthetic can be.

IN SEARCH FOR THE AESTHETIC X

Hitherto research was lead under the assumption that the aesthetic is either an attribute of an object, or a human attitude towards, experience of, or judgement about objects.

The Aesthetic Object

Many scholars (esp. in artistic formalism) have tried to find attributes that define objects as aesthetic, such as e.g. symmetry or harmony. Thereby, the aesthetic was located in the object. The object *is* aesthetic. Yet, what characterizes the object as aesthetic is as much what the human perceives as aesthetic. Hence, the aesthetics of the object is constituted within the human-object intra-action. Objects are not aesthetic, but they *become* aesthetic by our intra-action with it. And how does such an intra-action look like? Humans approach objects with an aesthetic attitude, experience them aesthetically, and then judge them as aesthetic. Thus, it is not only that the object in and for itself is non/aesthetic; but it is also that the object as potential aesthetic *x* cannot be delineated from the other three candidates.

The Aesthetic Attitude

An attitude is a human way of confronting non/human others. We encounter objects in a certain attitude, by which the objects become shaped. The world is bright and kind when our attitude is sympathetic; and it is grey and hostile when our attitude is irritated. Locating the aesthetic at the human attitude towards objects implies that *everything* can be experienced in an aesthetic attitude, everything can *be* aesthetic; by which the debate around the aesthetic object is nullified. Instead, here the aesthetic is a mere question of attention, as only a certain mindset is needed to experience and judge objects as aesthetic. On the one hand, this puts quite some pressure on us humans to please approach everything, or at least as much as possible, with an aesthetic attitude. On the other hand, it clearly shows that the attitude is directed towards experiences and judgements of objects, and as such cannot be demarcated

from the other three aesthetic xs.

The Aesthetic Experience

Dewey defines experience as a “heightened vitality” apart from the common flow of life, which makes an aesthetic experience a moment of joy. Internalists locate it inside the human, by which it comes close to the aesthetic attitude; whereas externalists locate experiences in the lifeworld, by which they become dependent upon objects. Some philosophers do see experiences as the only world access we have. Yet experiences, literally meaning “observations”, seem somewhat detached from the world. For instance, there seemingly is a difference between drinking a tea, experiencing the drinking intra-action as aesthetic, and experiencing the tea and the cup as aesthetic objects. But why is nobody talking directly about drinking *aesthetically*?

The Aesthetic Judgement

Following the team of empirical aestheticians around Helmut Leder, University of Vienna, the aesthetic judgement is a potential last part of aesthetic experiences. Hence, the judgement happens within the frame and under the circumstance of the experience. As such, the aesthetic judgement is momentary, as it cannot be re-entered and lived through again, which demarcates it from what Kant called teleological judgements; but approximates it to the aesthetic attitude as defined by Lind. Only the outcome of aesthetic judgements can be remembered, namely that the object was (judged as) aesthetic. Thus, the debate about aesthetic objects is about *what* is judged; whilst aesthetic judgements deal with *how* what is judged is judged — the object determines the judgement, and the judgement constitutes the object as aesthetic.

What has been tried to show so far is that all four classic aesthetic xs are unsatisfying, because they are interdependent, which is why they leave space for further attempts to define and locate the aesthetic. In other words, if these four terms cannot be disentangled from one another, what then is the aesthetic? What if the aesthetic is not located on either side? What if it is neither in the object, nor in the human; but in-between and thus prior to and enacting both humans and objects? In order to sketch the idea of the aesthetic as a special kind of intra-action, correspondences in the clothing will be discussed.

THE CLOTHING

Before coming to an idea about how clothing can help draft a new aesthetic x, the clothing as such needs to be explained. Clothing here shall not be understood as the material object of clothes, that are traditionally seen as costumes (as in historiography), adornment (anthropology), or dress (fashion studies); but as the relation existing between humans and clothes. Thus, the clothing is a new materialist attempt to re-read and finally cross the primary dualism of humans/clothes.

Therefore, two traditional views of the clothing must be pushed aside. Firstly, humans-clothes relations were hitherto read as hierarchical. The human applies clothes for her own wishes and needs, be that covering and adorning the body (a rather externalist view), finding the self (rather internalist), or expressing/conveying the own identity (an internalist turned externalist view). It was said that the human dresses and clothes herself, and that she is the one that wears her clothes. However, as it will be shown below, it is as much the clothes that clothe, that dress and wear the human. And this

is why the clothing here is understood as a non-anthropocentric and non-hierarchical humans-clothes relation.

Secondly, thinking the clothing non-hierarchically means that humans and clothes actively relate with each other. Hence, clothes are also granted with an agency, with a capacity to tease, steer, and determine the human. Yet humans-things relations are usually read, even if non-anthropocentrically, as an interaction. *Inter-* is the Latin prefix for between: First there are the entities, they encounter and affect each other, and thereby form their relation. Clothing hitherto was the result of the interactions that take place between humans and clothes.

In opposition, the clothing here shall be understood as an *intra-action* (extracted from Barad). *Intra-* means in-between or between-within. Only in a relation can entities affect each other. The relation is not the result of interacting entities; but the entities are momentarily *enacted* (another term taken from Barad) by, they are *temporary graspable halts* of the relation: The human can be another person dependent upon the clothes she intra-acts with; and clothes perform different identities relative to the clothings they are in. Hence, clothes as objects and we as humans (our attitudes, experiences, judgements) are enacted by the clothing.

Two intra-actions happen within the clothing, the dressing and the wearing. It is not the human that dresses herself by dressing clothes; but the dressing rather is a mutual pulling near, close and into each other of humans/clothes, and thus states an *attiring* (from Latin: *a-tirare*, pulling towards) intra-action. The human is drawn towards some and shoved away by other clothes. Some clothes allow/neglect to be combined with only certain other clothes. And a particular cloth affords to be dressed by specific dressing movements and directions (e.g. a pullover top-down versus trousers bottom-up).

Besides, it is not only the human who wears clothes, carries them around with her and through the life she leads; and who wears and tears clothes. Instead, the clothing is a carrying and abrading intra-action. Clothes carry us to specific experiences, and clothes abrade us. Socks leave striped marks around ankles, bras draw red lines around breasts; and throughout repeated wearing intra-actions, a mutual adaptation of flesh and fabric takes place. As both dressing and wearing cannot be assigned to humans/clothes; they are but features of, intra-actions within the relation. To subsume, in the clothing, two intra-actions happen, the dressing and the wearing, and in these intra-actions, humans and clothes equally and mutually affect each other.

AESTHETIC CLOTHING

For Barad, responding is as much about showing the self to the other by the own response; as it is about being responsible for the other, allowing for the other to respond, and being open for whatever responses one will receive. If the responding, in both its senses of response-ability (being able to respond) and responsiveness (being sensitive for and welcoming any response), is mutually enacted, it is a *correspondence*.

Although Barad surely is right when saying that each relation “entails an indebtedness to the other, who is irreducibly and materially bound to, threaded through the self”; it shall be stated that, as a matter of fact, humans and things do not always (permit the other to) live up to this indebtedness. For this reason, in differentiation to Barad’s usage of this term, the correspondence here shall not be seen as an inherent characteristic of

all relations; but as a characteristic of only some relations, by which these relations as well as the therein intra-acting entities become aesthetic.

With regard to the clothing, aesthetic relations might be best described as a mutual fitting of humans and clothes in both dressing and wearing. Neither humans nor clothes are correspondent; but it is the relation that is/not a correspondence. Put simply, a fitting always is a fitting *to*, and therefore located within the relation, not in either of the entities intra-acting therein. A human in and for herself is neither tall nor small, a cloth neither tight nor wide; but humans/clothes only become enacted as such in relation to each other. The relation enacts humans/clothes, because it determines whether the clothes fit *to*, are too wide, or too tight for the human; and it identifies the human as too small/tall *for*, or fitting into the clothes. Hence, the clothing relation enacts the aesthetics of its entities via their degree of fitting.

Clothes and humans are aesthetic if they find themselves in a fitting, correspondent intra-action. Not only the aesthetics of clothes is determined by the clothing; but also our human aesthetics (our beauty, fitness, attractiveness) is largely shaped by the clothings of which we (currently/habitually) form part. If humans and clothes are defined by their relation, then none can act as a fixed point for establishing the other's identity and thus aesthetics. Whatever characteristics she might be perceived as owning, the human as such cannot act as *aesthetifying* clothes; and the human can wear whatever clothes she might, the clothes as such do not have the power to define her as aesthetic. This is because only the clothing relation has the power to temporally enact humans/clothes as aesthetic. Hence, the aesthetic cannot be found on the humans/clothes' side; but between them, in their intra-action.

On the one hand, whether a fitting takes place within the clothing depends upon the dressing intra-action: Some clothes (e.g. a sheath dress) might not fit if dressed top-down, but they indeed fit, and the human indeed fits into them, if they become dressed bottom-up. And each particular cloth dictates a restricted range of other clothes to which it fits (e.g. pleated skirts to short tops; one shoe to the other of its pair). Hence, only certain dressings allow for the clothes to fit the human, the human to fit (in) to the clothes, and the clothes to fit to each other. Similarly, a tutu feels floatingly fine when worn for ballet, but exposes the human wearing it in rugby as vulnerable; large shoulder pads are protecting in rugby but inhibiting in ballet. But a tutu (as an exemplary cloth) owns the potential to be both aesthetic (in some surroundings) and non-aesthetic (in other situations). Thus, only if there is a correspondence between wearing situation and worn clothes, can clothes/humans become aesthetic.

In sum, a correspondence as such was defined as an aesthetic intra-action. A clothing correspondence states a fitting-to between all intra-acting clothes/humans. Dressing and wearing correspondences are determined by the clothing relation, not by humans/clothes; yet a correspondence in the dressing/wearing is needed for the humans/clothes to become aesthetic. That is, only when they are finding themselves in a correspondence, can the clothes respond to the human and allow her to respond; and vice versa. Thus, the correspondence between humans/clothes might finally result in their perception as being aesthetic individually; yet above all, it is the clothing that is aesthetic.

DEDUCING THE CORRESPONDENCE AS NEW AESTHETIC X

This paper started with showing why object, attitude, experience, and judgement are no satisfying locations for the aesthetic. Via the clothing, a new notion of the aesthetic was drafted. As humans and clothes are temporally enacted by their relation, the aesthetic cannot be a feature of a singular entity; but must reside in the “in-between”, namely within the clothing. Aesthetic clothing was defined as a fitting or correspondent humans-clothes intra-action. Therefrom can be deduced, that only those human-thing/human-human/thing-thing relations, that are coined by correspondent intra-actions, are aesthetic relations; and that entities are only aesthetic if they currently form part of correspondences. The correspondence as aesthetic intra-action shall thus be offered as a new aesthetic x, and it would be interesting to see whether it stands its ground when becoming applied to other realms apart from the clothing.

Swantje Martach is a PhD-candidate in Philosophy at the Autonomous University of Barcelona, where she is conducting her research under the supervision of Prof. Jessica Jaques (aesthetics) and Prof. David Casacuberta (philosophy of mind), and in collaboration with the London College of Fashion of the University of the Arts London, esp. with Prof. Ian King. In her research, she is dealing with the aesthetics of clothing. She sees the clothing as a humans-clothes entanglement and conceptualizes it alongside New Materialist theories; and aesthetics as a kind of intra-action happening therein, which might be best titled a correspondence. It is her aim to show why clothing is such an apt field of study to reconfigure the common notion of aesthetics.

THE ARTIST AND THE STREET: COMMUNICATION STRATEGIES

Abstract | The purpose of the article was to show the possibility of applying interdisciplinary analysis to some works of Russian street art. The author examined the development of street art in Russia from the 1990s to present time and claimed that Russian street art is a distinctive artistic phenomenon, which is probably in its heyday now. In contrast to its American, European and even Arab counterparts, Russian street art has not undergone proper examination and recording on a theoretical level yet. The focus on the critical pathos of street art does not allow theorists to see its unique aesthetics and poetics. The aim of the article was to show that the discussion about the poetics of street art is not only possible but also extremely necessary. The author referred to the methodology of the formal school in the Soviet literary criticism, showing its applicability in the analysis of works of some street artists. The author stated that in their practice, the artists such as Pasha 183 and Timofey Radya used the technique designated by Lomonosov as “conjugation of distant ideas” and later described in detail by Tynyanov and Lotman. The example of this was the work of Pasha 183 (Pavel Pukhov) “The Truth versus the Truth”, as well as the work of Timofey Radya “Lampshades”. Thus, the practice of modern street artists actualizes the techniques of classical Russian poetry, showing that not only words can reveal the poetry. Any other objects, which are active semantically, can do the same. That means that the poetry of trash bins, borders and lanterns is possible. Moreover, it already exists. The proposed analysis allowed us to conclude that Russian street artists inherited the art program created by French Situationists of the 1950s.

Index terms | *street art; public art; urban art; Pasha 183; Timofey Radya*

The term “street art”, which has recently been in a marginalized position on the periphery of research attention, is increasingly frequently found in headlines of major journals on aesthetics, philosophy of art, art history [1, 2]. As is known, a phenomenon of graffiti is considered a source of modern street art. The term “graffiti” was first used by an archeologist Rafael Garruchi in relation to the discovery in the 19th century of numerous inscriptions and drawings on the walls of those buried under the volcanic ash of Pompeii [3, p.7]. In a broad sense, graffiti appears in the form of inscriptions and drawings made on city walls, as well as on any other public surface. This phenomenon has a thousand-year history. From Antiquity to the present day, wherever there are cities, we find various artifacts (inscriptions, signs, drawings) left on the surface of a city by means of stones, incisors, markers, spray paints, etc. For many centuries the phenomenon of graffiti has not intersected with the world of art. However, in the last third of the 20th century, all inscriptions and drawings have *suddenly* become a recognized and extremely fashionable art form. State museums, collectors, the press, influential curators and prominent theorists are taking an interest in graffiti. For several decades, graffiti has made the way in the minds of ordinary people, artists and theorists from obscene inscriptions, declarations of love and other manifestations of the “collective unconscious” to the full-fledged direction of artistic culture of the second half of the 20th century. Such a dramatic change in the attitude to the phenomenon, which had been perceived until the 1970-80-ies as a marginal phenomenon and had not been culturally significant, is in itself a landmark event. “What made (or what *makes*) graffiti –art?” is an important question for the aesthetic thought that faced in the turbulent 20th century with the need to describe the procedures resulting in gaining a status of “art works” by various practices and artifacts.

Graffiti art is of interest not only in itself, but also in connection with the influence that this phenomenon had on the artistic situation of the last third of the 20th century. Inscriptions and drawings made on the walls of houses, mainly by urban fringe groups, actualizing a set of ideas dating back to the European avant-garde, provoked a true revolution in the artistic world: having experienced the influence of graffiti, artists from around the world make a mass exodus from the artistic spaces that are traditional for the Modern Times, preferring the illegal invasion of the urban environment to exhibiting own works in museums, private collections and galleries. The intensification of this process in the 1980-ies has led to the formation of not even a new direction (as is often heard), but a new artistic paradigm – street art. Maintaining links with the backbone tradition, street artists obviously break from a number of paradigm features, which until now were considered integral attributes of the “artistic”: anonymity comes to the place of the cult of the author that is known both to the classics and modernism; the fundamental openness of the artistic gesture entering into active and direct relations with the space of life and man in the space of life comes to the place of the framework fixing the formal and semantic completeness of an artwork; repeatability

and circulation come to the place of “singularity” (the quality of a true masterpiece).

The community of theorists has already done considerable work in the field of documentation, classification and understanding of street art. Nevertheless, in our opinion, the theory still remains at the stage of marking the path. In the academic environment, street art is often described as marginalized practice, which is mainly critical. This approach is obviously one-sided. A critical message of street art is indisputable. However, street art cannot be reduced to countercultural resistance, ignoring its pronounced aesthetics and poetics. The purpose of this article is to expand theorists’ ideas of modern street practices. We will try to prove the possibility and necessity to talk about *poetics* of street art. Moreover, about poetics in a literal, literary sense.

In this regard, we intend to draw attention to the unexpected relevance of the ideas of the formal school of literary criticism when analyzing the works of Russian street authors.

In our opinion, the innovation of the formal method developed by Soviet literary critics was primarily that they (formalists) shifted the emphasis from the eternal question “What is art?” to a less obvious, but no less significant question “How does art work?” This shift made it possible to detect and describe a number of poetic techniques (techniques of creating a poetic effect) predominantly through the semiotic analysis. A technique of “conjugation of distant ideas” noted by M.V. Lomonosov became one of these techniques described by the formalists. Tynyanov Yu.N. characterizes this technique developed by Lomonosov as follows: “The favorite technique of Lomonosov is the combination of words that are far from each other in lexical and subject rows using a conjunction...” [4, p.191] Developing Tynyanov’s ideas, Yu.M. Lotman, reflecting on the function of a rhyme in the structure of the poetic text, argued that a rhyme gains the greatest poetic power if it “clashes” words that are acoustically as close as possible and, at the same time, as far as possible by their stylistics and/or semantics: “The sound of a rhyme is directly related to its suddenness, i.e. it is not acoustic or phonetic, but semantic in nature. It can be proved by comparing tautological rhymes with homonymous ones. In both cases, the nature of rhythmic-phonetic coincidence is the same. However, a rhyme sounds rich in case of discrepancy and remoteness of meanings (their convergence is perceived as a surprise). When the sounding and meaning are repeated, a rhyme seems to be poor and hardly recognized as a rhyme” [4, p.191]. Lotman illustrates this statement with a number of examples, referring, in particular, to Mayakovsky’s poetry: “The coincidences of sound complexes in a rhyme match the words that would have nothing in common with each other outside this text. This counter-opposition produces unexpected semantic effects. The fewer intersections between the semantic, stylistic, emotional fields of meanings of these words, the more unexpected their contact and the intersecting structural level, which allows uniting

them together, becomes more significant in the textual construct”[4, p.192].

However, how are these philological findings of formalists (furthermore, they are out of fashion) related to modern street art, even if it has gone far ahead of primitive tagging?

According to our findings, the point is that modern street artists, reorganizing urban objects, resort (voluntarily or unwittingly) to the technique of “conjugation of distant ideas”, creating “living metaphors” in the urban environment. In Yekaterinburgan artist Timofey Radya turned street lamps of the central square of the city into cozy floor lamps, using lamp shades made in the workshop (<http://lamshades.t-radya.com/3/>) (2012). The work gained love and recognition of citizens. The special feature of the work is the convergence of the features of a “street lamp” (traditionally perceived as an element of external, street, public space) and a “floor lamp” (traditionally perceived as an element of internal, home, personal, even intimate space) in one object. Two poles, two opposites (personal and social, public and intimate, street and home), uniting into one thing, create a certain poetic tension. The work of Pasha 183(2011), timed to the anniversary of the 1991 coup, should also be noted. The artist pasted the images of riot policemen armed with shield on the doors of the Moscow Metro (<http://www.183art.ru/putch/putch.htm>). As in Timofey Radya’s work, the tension is created by combining the incompatible (“conjugation of distant ideas”): “doors”, through which tens of thousands of citizens walk every day, and “riot shields” designed not to let a single one through. The fact that the functionality of the doors is not lost, additionally strengthens the work. The next morning, after a nightly intervention, city people, having stood only for a moment indecisively, pushed away the riot shields, confidently moving through the “impassable” wall.

Thus, we see that the conceptual apparatus developed by Soviet formalists in the process of analyzing classical works of Russian literature is applicable for describing the practices of modern street authors. Reorganizing urban artifacts, a street artist obviously updates the techniques of classical poetry, thus proving that *not only words, but also any objects that are semantically active can be the material of poetry*. Therefore, the poetry of pipes, litter bins, kerbs and street lamps is actually possible, moreover, it already exists. One cannot but recall the Situationist Program announced by Guy Debord: “The games of poetic subjects among poetic objects need to be organized” [5, p. 81]. It seems that this program (as for situationists, it is speculative in many ways) is finally being materialized in the practices of free artists of Moscow, Yekaterinburg and other cities.

MEANING AND DANCE: BODILY CREATIVITY AND MOVEMENT

Abstract | Dance aesthetics has been severely neglected in the history of philosophy. A new approach was offered with the phenomenology of body in the second half of the 20th century. The main issue here is the idea that the body as such is the subject of dance. Being the subject of dance, body is to be understood as the origin of both production and reception of this art - that is, as both creative and intersubjective realm of the actualization of dance. In order to offer such an interpretation, one also has to abandon the primacy of the vision and visuality with regard to dance and accept the movement as its essence. The main issue I will address here is the problem of bodily creativity and the (bodily) response to such creativity, the interplay between the dancers and their audience. Bodily creativity will be analyzed in terms of movement, i.e. kinaesthetic phenomena. Further investigation of the meaning embodied in dance will confront it with the idea of dance as representation, which derives from the primacy of visuality. Bodily creativity will be shown here as a source of meaning which resists reduction to verbal, conceptual, and visual modes of comprehension. Finally, the analysis will rely upon works of M. Sheets-Johnstone, M. Merleau-Ponty and M. Henry.

Index terms | *bodily creativity; movement; dance; meaning; visuality;*

INTRODUCTION

The art of dance has rarely been a topic for aesthetical research in traditional philosophy. Traditional aesthetics is more concerned with the general notion of art than with specific arts, like dance. Moreover, traditional philosophy elevates poetry, music, and painting, draws conclusions and takes examples from these arts - but not from dance. The problem of dance is either completely neglected, or interpreted with regard to more prominent arts: in those cases, analysis of dance merely follows the interpretation of music or theatre, it is not developed as an aesthetics of dance *per se*.

The most important period of dance theory is 18th century, when the art of dance was elevated to the fine (and not merely folk) arts. The fact was noted by some of the prominent philosophers of the time: for example, Batteux included dance in his list of cardinal arts, along with music, poetry, sculpture, and painting.¹ At the same time, *Encyclopedia* of the Enlightenment substituted dance for the architecture,² and thus presented Europe with a different list of cardinal arts – the one that had much more impact on future European understanding of art.

The 18th century was also the period which saw the rise of non-philosophical dance theory: most important example is French dancer and ballet master Jean-Georges Noverre (1727-1810), creator of *ballet d'action*. Noverre's influence was decisive – both his practical and theoretical work presented dance as a true art, and developed the idea that ballet is physical and emotional expression of the dancer; before Noverre, ballet plays were conceived as visual pieces, where scenography and costumes played the key role.³ Noverre cleared ballet from the excess of its outer visual presentation and opted for the movement as the true medium of play's dramatic plot, and as the expression of the relationships between the characters in the play.

During the 20th century, both art of dance and its theory endured radical changes. The art of dance is not restricted to the classical ballet forms anymore, but is now wide open for various dance poetics. The theory of dance is now in most cases interdisciplinary, which gave rise to the development of the philosophy of dance and revealed its absence in traditional aesthetics. Inquiry of this absence went hand in hand with the analysis of the background ideas surrounding dance theory and practice. The results of such analysis showed that it was philosophy governing traditional conceptions of dance and its meaning. Philosophy was, once more, invited to contribute to the analysis of dance, at least as a tool for the critique of philosophical ideas influencing dance in the past.

THE PRIMACY OF THE BODY

The most prominent of philosophical ideas influencing dance is modern division of subject and object, exemplified in Descartes' dualistic metaphysics.⁴ Applied to dance, it endorses the primacy of the soul over the body, which is thus interpreted as a mere tool for the expression of the contents enclosed in soul: it is the soul that

is creative – the body is merely following its instructions. This idea influenced even the process of teaching and learning dance, which is usually realized as a process of gaining control over the body, disciplining the body.⁵ It also endorses the primacy of the choreographer: since the body is merely a tool for the creative workings of the soul, actual dancing is not necessary for the true creation of dance. For this purpose, it is essential to *conceive* dance, to create *an idea of dance* which could further be imposed on the body. As far as the body is merely a dancer's tool in the process of dancing, dancers themselves are merely tools for the choreographer's idea of dance to be presented.

Contemporary aesthetics of dance, however, questions such primacy of the mind and soul, and proposes the primacy of the body as the true subject of dance. Such inversion is complex: it is not about reversing the relationship between body and soul, so that now body would be the tyrant – it is about avoiding the body and soul division altogether. Dance should be interpreted starting with the body, because the body is – without a doubt – always present in dance. However, such theory of dance demands for a new and unorthodox conception of body. Since modern dualistic conceptions are also to be found in science, especially physics, the new conception of dance should disregard the scientific concept of the body. Another idea of the body is in focus here, arising from the phenomenological experience of (our own) body.⁶ The most relevant philosopher in this respect is, without doubt, Maurice Merleau-Ponty: in Merleau-Ponty's philosophy, Husserl's differentiation between *Leib* and *Körper* gave rise to the concept of a *lived body* (*le corps vivant*).

Lived body, as revealed to the consciousness, is the realm of meanings. According to Merleau-Ponty, lived body is always directed towards the world: it is the intentional directedness of the body that opens the primordial realm of meanings we experience, and those meanings are pre-reflexive.⁷ The relations of the body and world are, thus, the primary relations in which we are situated. Of course, we can reflect upon them and derive various theoretical ideas concerning the body-world connection, but such understanding is grounded in bodily knowledge: 'bodily knowledge is not a provisional knowledge, a primitive knowledge perhaps', but rather 'the foundation and the ground of all our knowledge', says Michael Henry.⁸ On the most basic level body is not *tabula rasa* – it can grasp the immanent meaning of its relationship to the world prior to any conscious interpretation of it, in a bodily manner. For Merleau-Ponty it is the body – and not the soul – that is the true origin of the meanings and the understanding of the world we are living in, since it is the body that makes the first contact with the world.⁹

The idea of the body as the subject of dance could be further developed following Merleau-Ponty's line of thinking. The dancing body is to be interpreted as a living body in Merleau-Ponty's sense – not as material or physical body of the sciences.

Lived body is the core concept of phenomenological aesthetics of dance of Maxine Sheets-Johnstone and Sondra Horton Fraleigh.¹⁰ The dancing body, as lived body, is the origin of the meaning of dance, and consequently the origin of the artistic elements of dance movements: 'the meaning of any dance comes alive for us only as we ourselves have a lived experience of the dance'.¹¹ If there is any meaning in dance, it cannot be reduced to the movements with no inherent meaning – with meanings inscribed into the body prior to the actual dance (mind/soul, choreographer). Therefore, such body is the proper creative body: all that we grasp as artistic and meaningful while experiencing dance belongs to the body and its creativity.

The body that dances is thus not merely a medium that allows for the dance to be seen; it is the creator of dance, as well as the defining condition of its reception. The fact that artistic creation of dance is of bodily character for Fraleigh and Sheets-Johnstone implies that space and movement are domains in which the meaning of dance is realized. Meaning produced and conveyed by dance is thus prereflective bodily-dance meaning, which we are aware of prior to any rational interpretation. Consequently, dance communicates the very basic level of us being aware of any meanings concerning ourselves and the world we live in; that is why Fraleigh says that dance is not only shaping the body, but the entire self.¹² '*We literally discover ourselves in movement*', says Sheets-Johnstone.¹³

According to this view, dance meaning is prereflective, which means that it cannot be understood rationally, reduced to verbal meanings, or fully expressed in language. Since it is produced by the body (dancing), it could only be comprehended by the body. The movement is at the core of such meaning, which is why Sheets-Johnstone says that the phenomenon of dance is an *open* and *kinaesthetical* phenomenon – a phenomenon in constant change and fluctuation, but with certain inherent structure.¹⁴ We should not expect that language could ever articulate such experiences, since that would imply the process of 'translation' from one system of meaning (the bodily one) to the other one, evident in language and logic.¹⁵

However, although contemporary aesthetics of dance avoids body/soul dualism, is nevertheless left with another problematic division, the one between production and reception of dance. Namely, the reception of dance is also in the body; however, this is the body that does not dance, the body of the spectator. Now, if bodily-dance meaning is kinaesthetical, is it possible to comprehend it without moving, merely sitting and watching the performance? Can visual perception of dance amount to the comprehension of it? According to phenomenology of dance, that is not the case: the basic level of all perception is actually kinaesthetical, and consequently visual perception is merely a reduced primary bodily experience.¹⁶ Therefore, if we react on

dance, we do so because we are kinaesthetical beings, because we ‘resonate’ it with our own bodies. Even if we are merely watching the dance and not moving, we are not merely contemplating it – we ‘live’ it with our own lived body. The final consequence of discarding the body/soul division is, thus, yet another inversion: it is not the eye that sees the body, but the body that moves the eye.

PRIMACY OF THE MOVEMENT AND THE PROBLEM OF VISUALITY

What does it mean for the body to be creative in dance? First of all, creative body has to be active in originating bodily meanings: although they are never originated in ‘pure body’, stripped from all relations with the world, nevertheless they belong to the body, since it is bodily activity with the world that produces them;¹⁷ dance is one of such activities. Bodily activity is, however, not restricted to visual perception, nor to any specific perception: ‘creaturely movement is the very condition of all forms of creaturely perception’.¹⁸ According to the phenomenology of the body, the body is a complex system of perception, and it produces a *sinaesthetic* experience.¹⁹ *Sinaesthetic* experience is, thus, the basis of any particular perception: visual percepts are, therefore, restricted in meaning and grounded in the more fundamental bodily experience of the world.²⁰

The same applies to dance: the creation of dance is realised at this basic *sinaesthetical* level, and therefore bodily-dance meanings are also originated there: ‘As one might wonder about the world in words, I am wondering the world directly, in movement’.²¹ Accordingly, if those meanings are conveyed, if we are receptive to them, such reception has to draw from the same fundamental *sinaesthetic* level – it cannot rely on pure vision.²² In most cases, the audience is merely sitting still, focused on what is seen; thus, we could easily make a mistake and identify the basis of dance reception with *visuality*.²³ The same idea is embodied in classical ballet, which insist on lines, figures and other more visual elements of the performance.²⁴ However, visual perception is a reduced one, and it cannot grasp the true dance-bodily meaning being conveyed; therefore, we must conclude that the true basis of dance reception is not *visuality*, but the *sinaesthetic* experience of the whole lived body. Such *sinaesthetic* experience is, as we’ve seen, actually the *kinaesthetical* one: in Michael Anry’s words, ‘the essence of sensing is constituted by movement’.²⁵

Now, what is actually conveyed in such manner? As we have seen, the body is

25 Henry, *Philosophy and Phenomenology of the Body*, 77.

never divorced from its relations with the world: the very directedness of the body (as one side of these relations) - towards the world (as their other side) opens a certain bodily space, which is defined by such intentionality.²⁶ For Merleau-Ponty, the space of the body as such is merely a point in the more basic spatiality, located *between* the body and its intencum.²⁷ Spatiality is, then, the true place of meanings originating from the bodily creativity; it is the baseline of any relation the body can be a part of. Such spatiality is, of course, *lived spatiality* – it cannot be described geometrically, although it can become a phenomenal ground for the development of a geometry. Additionally, bodily movement is also located there, and so the same goes for the dance movement: 'a pre-reflective awareness of space is (...) intrinsic to the dancer's lived experience of the dance';²⁸ the meaning of dance, thus, draws from the original relations between the body and world. Consequently, since the reception of dance is kinaesthetical, the dance is a sort of interplay between the dancer and the audience.

Such primordial movement is, however, not a movement situated *in space*, but a movement *opening some space*.²⁹ In other words, the concept of movement is here more fundamental than the concept of space, because the only way in which body can relate to the world is through the movement; even in cases of 'pure' vision, we still need to move our eyelids in order to see.³⁰ Therefore, it is the movement that defines the relation of body and world, and such relation was previously described as primodinary spatial one. Kinetic 'essence' of the body is thus inverting traditional and scientific matrix of ideas, best exemplified in Newton's concepts of absolute and relative space, time - and movement: in the case of lived body, there is no 'where' or 'when' prior to body enacting itself as a body, being bodily aware of itself as a body.³¹

Relying on Merleau-Ponty's philosophy, phenomenological aesthetics of dance stresses the movement as the basis of dance. Therefore, dance is the movement, developed in a certain way: the way of its development gives rise to a certain space of the body dancing and creates all kinds of relations within so created space. Particular positions and dance figures, like *arabesque* or *pirouette*, are therefore only parts of the bigger whole; they do not have meanings as such, for their meaning varies according to the features of bodily-opened space they belong to.³² Meanings of particular elements of dance are determined with the dance movements that came before it and that will follow.

Such interpretation of dance goes against the idea of dance as representation. Such an idea originates from the traditional definition of art as mimesis, which in case of dance present it in more visual than kinaesthetical manner. As we have seen, the phenomenon of dance cannot be reduced to a visual one, since it involves the whole body in both its production and reception. Accordingly, meanings dance produces and conveys escape any theoretical description; they have to be experienced. A philosophy

THE AESTHETICS OF GREEN ART AND GREEN SKILLS

Abstract | As a term, *green art*, or, in the plural, *green arts*, is not established and is used only randomly. It is even more uncommon to speak of green skills, though there is always a close connection between art and skills. The aesthetic skills required in green landscaping are connected to the sphere of everyday and applied aesthetics (e.g. *green thumb* in gardening).

Green art is characterized by using living plants, either as such, or as groups, fields, and walls in multi-material works. It can be seen as an umbrella concept, which covers plant art, flower arrangement (*ikebana*), the shaping and growing of miniature trees (*bonsai*), bio and eco-art, garden and park arts, as well as landscape architecture and design. More broadly it is a question of cultivated forests and rural land.

The farmer and the forester use vegetation and individual plants for profit mostly. Though utilitarian objectives and the requisite skills are primary in these, the practice has an aesthetic and artistic flavor. Constructed green environments and green art in general lack clear boundaries; they change in time and are dependent on care and attention. The material is living, or at least organic (such as dried plants in a herbarium). Second-degree green art is the photographing, drawing, and painting of art-like plants and vegetation.

In its basic form, green art is *ready made* art: taking plants for use as art, either growing or cut. Trees and bushes are shaped and planted to form patterns; flowers are refined and bred for aesthetic purposes; cut flowers are tied in bunches and composed in arrangements. Green art is temporal: plants have their life cycle *from seed to compost*. The peak and turning point is flowering: descent begins from the development of seeds, and ends in withering or desiccation and finally decomposition.

In a symbolic sense, greenness refers to youth, *joie de vivre*, freshness, liveliness, well-being, and innocence. Surprisingly, green is often also seen as strongly negative: poison green, deathly ill, green with envy.

Nature has given us the possibility to shape and refine matter into cultural environments. The creativity, inventiveness, and novelty relating to all art are also points of growth in green art. It is a laboratory, from which inventions move and can be transformed to the large-scale processing, care and protection of the green world.

I FROM THE GRASSROOTS LEVEL

Green Art Emerging and Rising

An art institution is forming around a new genre according to the model of already established genres. Here, too, works have their author; the artist has a production, *l'oeuvre*; there is the audience. Green art is emerging. Basically and simply, it is characterized by using living plant material either as such or as groups and fields in order to form aesthetically impressive totalities.

The term, *green art/s*, can be seen as an umbrella concept, which covers – entirely or partly – plant art, flower arrangement (*ikebana*) the shaping and growing of miniature trees (*bonsai*), bio- and eco-art, gardens and parks, as well as works of environmental art and landscape architecture. More broadly it is a question of different types of modified environments, such as urban forests, lawns, farmlands and commercial forests.

In its basic form, green art is *ready-made*: plants taken for use as art, either growing or cut. Trees and bushes are shaped and planted to form patterns, flowers are refined and bred for aesthetic purposes, cut flowers are tied in bunches and composed in arrangements.

Plants have their life cycle “from seed to compost”. The peak and turning point is flowering, descent begins then from the development of seeds, and ends in withering or desiccation and finally decomposition. Even a dead plant – a jutting stalk in winter or a dead tree – can be impressive.

Cultivated green environments in general are lacking in clear boundaries; they are changing and ephemeral, and dependent on care and attention. The material is living, or at least organic, such as dried plants in a herbarium. Second-degree green art, art from art, is the photographing, drawing, and painting of plants and their environments.

The environment is multi-sensual: sight, smell, taste, hearing, and touch are all partial factors. In rose breeding, attention is paid to appearance and also to scent; in lawns, the aim is not only an even visual greenness but also a soft feel of moss; trees are expected to provide cooling shadows and the sound of wind and rustling leaves; fruit trees and berry bushes produce a tasty harvest.

A paradox of green art is that literal greenness often remains a base and background color, from which the brilliant colors of flowering stand out. Barren non-green environments, like high mountains, and deserts are generally felt to be aesthetically challenging. “Real nature is not green, but manufactured nature sure is,” claim the authors of the book *Next Nature* (2015) provocatively. [1]

Skill for Profit and Pleasure

Skill runs parallel to art – so we can speak of green skills. Agriculture and forestry demand knowledge of vegetation and ground. Green building means landscaping, with the limits set by the quality and form of the ground.

Garden and park art have their traditions, classics, and top names, just like other forms of art, but more usually than high art, green works represent *outsider art*: making without knowing or caring about fashions and traditions, nowadays even in the form of boundary-breaking *guerrilla gardening*.

Small-scale balcony, wall, and roof gardens are modified miniature models or samples of larger environments. Agriculture and forestry create and maintain large green environments, with the means of clearing, tilling, fertilization, protection, irrigation, and fencing.

Landscape art, and landscape care in general, are green art on a grand scale; an intentional or unintentional aesthetic aspect relates to planning and cultivation. Parks and gardens have a strong aesthetic emphasis when articulating open space.

The interaction, the symbiosis of humanity and the living environment, affects health and welfare. Agriculture and forestry, as well as working for pleasure in a garden deepen our nature relationship; it means not just physical sowing, planting, and weeding. A biased emotional relationship is formed with the earth and plants: we rejoice at the flowering and well-being of plants, weep at their suffering and death, enjoy of destroying unwanted invaders – weeds and pests.

Nature can destroy areas taken for cultivation by reconquering or smothering them and replacing them with stronger vegetation. Uncared-for areas become wild, open fields become overgrown and turn into forests. Carefully pruned trees and bushes lose the shape they were forced to. Even a cared-for landscape deteriorates as the vegetation ages, although natural or artificial renewal takes place continually.

Greenness Depicted and Created

The second-degree green art appears in essays and various arts – in literature, painting, music, theatre, film. The mythical Garden of Eden is a paradise and a utopia, in which nature serves humanity and humanity serves nature. We now speak of ecosystem services.

In his book *The Gardener's Year* (1929), the Czech author Karel Capek follows and lives with a gardener's "work calendar" through the year. In the same spirit, the film director Virpi Suutari follows five Finnish gardening couples in her documentary *Garden Lovers* (2014). The Korean Kim Ki-duk draws a parallel between the human life cycle and the

continuity of generations in his film *Spring, Summer, Fall, Winter... and Spring* (2003). Fairy-tale fantasy is represented by Tim Burton in the film *Edward Scissorhands* (1990); in its most memorable scene the natural prodigy, the semi-finished human machine Edward (Johnny Depp), takes a moment to prune trees skilfully into artistic shapes.

The Green Identity

Where is the core of green art, its identity? A wide spectrum of art genres loosely related to each other gather under a common umbrella. The internal limits are movable, able to be questioned, and redrawn. It is important to see the large picture from plants to landscapes, a continuum from the micro to the macro level.

Even a small work can be presented and “framed” as a landscape feature and an articulator of a whole environment. Such is an individual plant or delimited ecosystem comparable to a sculpture, a painting, or a spatial work, which lives a double life: on the one hand as a building block in a landscape picture, on the other in its own autistic loneliness. The landscape effect may be great – just like the solitary boat in the novel *Ice* (2016/2012) by the Finnish author Ulla-Lena Lundberg, the opening sentence of which reads: “No one who’s seen the way a landscape changes when a boat appears can ever agree that any individual human life lacks meaning.” [2]

Nature has given us the possibility to shape and refine matter into cultural products and environments. Peaks have been classified as valuable landscape areas or as objects of cultural heritage. Green matter contains aesthetic capital; the roots of green art are in it.

Care includes favouring desired plants and controlling those considered to be weeds – a weed, after all is that which is not wanted. Green art is a laboratory, from which inventions move to the large-scale developments. All kinds of environment appear as an artcized and aestheticized field, from which a part changes, grows, differentiates and emerges to become literally art.

II GREEN GLOBE

The Astronaut’s View

I look at the globe that I bought in Calgary, Canada; it rotates by itself through the force of the Earth’s magnetic field. The globe is a three-dimensional model of the Earth. On the correct scale appear oceans and continents, landforms and even colors: blue and green, also brown and white. The natural boundaries are between water and dry land, drawn by rivers, lifted by mountain chains. Place-names and national borders bring an external, cultural addition.

When an astronaut views the Earth, he sees a blue-green sphere, unlike anything else

in space. It has been said that seeing the Earth from outside – at once and in its entirety – created a new kind of feeling of our togetherness, of the vulnerability of our habitat, and of its beauty. To an astronaut, this view is real before his own eyes, to the rest of us, in pictures and descriptions.

I look at the slowly rotating globe in front of me, like Shakespeare's Hamlet looking at the skull on his palm. The skull is a symbol of the mortality of the individual, but also an image of the wider cycle of life: it shows before your eyes one's own place in the continuity of life. The globe, better than a planar map that distorts three-dimensional reality, leads me to the fundamental questions of existence. The image of the Earth is repeatedly used in posters proclaiming an ecological message of interdependency: the Earth is our common home.

Maps are images of reality, their colors semi-conventional. Most widely used are green and blue, the basic colors of life. On a map they remain unchanged, in nature they change according to the seasons and time of day, according to the effects of weather and lighting – the world moves. The blue of water dominates by its extent, but it too is mixed with green of vegetation. The earth demands water – and the greener, the more watery: the jungle is soaked with moisture. Brown then signifies barren ground, white on the poles covered with permanent snow and ice means the strange and unknown. Space around us is black, dark, still largely hidden.

Surprisingly, green is often seen as strongly negative: poison green, deathly ill, green with envy. Green slime or mould growth may be visually beautiful, but treacherous, even deadly dangerous; bitter only is raw green. Green is also someone who is new in a job, someone who doesn't speak the language, or someone without work experience and evidence of necessary skills.

Fur and Skin

Only when seen from afar is the greenness a single shade; the closer we come, the more different shades it is seen to have. The bluish atmosphere, thinning and vanishing upwards, covers the Earth. The atmosphere is a shielding band, an overcoat, a condition for life.

Clouds are a part of the atmosphere that changes shape, vanishes, and reappears. Clouds are rarely shown when depicting the Earth from above, and never on globes. White summer clouds, sometimes black thunder and rain columns, cover part of the Earth's surface, on which their shadows wander. A unified, downy white cloud cover is often below when flying.

Next in the Earth's layer clothing is the surface cover: water, forest, grass – sometimes nothing but desert. The forest is seen as fur, which has often been moth-eaten by

falling. Looking down at an angle, settlement and the modest openings of fields are confusingly shadowed by forest. The forest fur is green, green is the patchwork quilt created by agriculture, as is the basic vegetation spreading as a mulch. The dark green dominating late summer becomes oppressive, as does the whiteness of the all-enveloping snow cover in winter.

Water lets Earth become green. The life cycle of vegetation or a single plant extends from seedling to flowering and death, natural or violent. The surface revealed by spring rains from beneath the snow gets a living cover; when winter comes it retreats again under the snow cover.

Barren is the ground stripped of surface vegetation, burned or felled bare, opened and broken by mining. The forest's fur is taken off and replaced with another: clearing a field changes the forest's dark green to the light green of cultivation. A destroyed forest returns naturally or through human action, by planting seeds or seedlings; the French author Jean Giono's short story *The Man Who Planted Trees* (1953) tells of a determined self-made forester. Plant generations wander – from their roots, from seeds spread by the wind and animals.

Plants and animals have protective and covering colors: the idea of camouflage has been adapted for military use. By seeking the protection of plants people can return to the animal or plant kingdoms by body painting and tattooing, hide in a group, in other situations differentiate, in the sense of scaring. The Finnish performance artist Riitta Ikonen dresses herself and her photography models in plants; the German photographer Hans Silvester depicts Ethiopians in ritual body paint and plant costumes.

The Human Footprint, Fingerprint, Handprint

It is claimed that the only human achievement visible from space is the Great Wall of China. Seen from outside, the Earth looks still untouched. Something of the idyll of the Garden of Eden remains. In his *Nature Museum* series, the photographer Ilkka Halso presents manipulated images of nature protected by massive technical structures. Are botanical gardens and greenhouses *Wunderkammer*-type cabinets of peculiarities, a prison, or last refuge for plants, as zoos are for animals?

The interests of nature and culture may be irreconcilable: one eats the other. Compromises are sought; unreconciled conflicts of interest are reconciled. The philosopher Frederick Ferré presents his ideal, *kalogenesis*, with flaws: "The meaning of life is to be both a maker of beauty and a destroyer of beauty in order to make more beauty. That really is the rhythm of the universe." [3]

The large landscape picture is created by town and country planning and landscape architecture. How to find a balance between nature and the built environment –

settlements, roads, power lines, and all of human work? The landscape architect and the gardener, but above all the farmer and the forester, are professionals, who use vegetation and individual plants for profit and pleasure. The result is more or less an aestheticized production and recreational environment, sometimes also literally art, or at least something approaching it. “We like to see plants as our paints and walls as our canvases!,” proclaims the Vancouver company *Green over Grey: Living Walls and Design*, which designs indoor and outdoor green walls. [4]

The everyday environment, its ordinary yards, gardens, and planting are designed, but without a named designer. In it, style does not mean the same individuality as in actual art. Sometimes plant and animal individuals are the objects of portrait-like presentation. A dry flower in a herbarium, a photographically precise drawing, or a photograph itself represents or presents a typical exemplar of its species. An artist, on the other hand, emphasizes rather individuality.

The general trace of humanity – culture and civility – can be seen in the Earth. Each individual presses their own footprint on it through their way of life, leaves their handprint in what they have made, and signs their work by pressing their fingerprint on it. In an ecological sense, the human effect should be light, imperceptible, but, in a cultural sense, deep and lasting. Our desire and duty is to leave a positive imprint, to take the world better, to hand over the globe to our descendants in good condition, livable – and beautiful, green.

Yrjö Sepänmaa (1945) is Professor Emeritus of Environmental Aesthetics at the University of Eastern Finland. His main research themes are in applying theoretical aesthetics to real-world situations, but he also has dealt with questions related to the concept of beauty, margins of art, and philosophy of literature. He has written and edited books and scholarly essays in these topics, e.g. a monograph titled *The Beauty of Environment – a general model for environmental aesthetics* (Helsinki 1986; second edition, Denton, Texas, USA 1993; transl. in Korean 2000, and in Chinese 2006). His present research deals with the future of environmental aesthetics and environmental aesthetic civility. Mr. Sepänmaa organized an international conference series on environmental aesthetics (1994–2009): landscape, forest, bog, water, agricultural land, stone, sky/heaven. He was the President of the XIII International Congress of Aesthetics, *Aesthetics in Practice* (Lahti, Finland, 1995).

THE FAMILY OF MAN IN JAPAN: A PHOTOGRAPHIC EXHIBITION FOR WORLD PEACE AND ATOMIC CULTURE IN THE 1950S

Abstract | The large-scale photographic exhibition *The Family of Man*, curated by Edward Steichen for the Museum of Modern Art in New York in 1955, toured around the world with the support of the United States Information Agency (USIA) between 1955 and 1962. Globally, the exhibition attracted nine million visitors, one million of whom saw it in Japan. The 1956 Japan tour of *The Family of Man* was organized by the Japanese executive committee, whose members were leading photographers, a graphic designer, and an architect: Ihei Kimura, Yoshio Watanabe, Shigene Kanemaru, Takashi Kono, Kenzo Tange and others. This exhibition, which celebrated world peace was welcomed at 25 venues across Japan, but it had started with the removal from the Tokyo venue shortly after its opening of photographs by Yusuke Yamahata, which depicted the aftermath of the A-bombing on Nagasaki and had been specially added by the committee. This paper investigates the criticisms of this removal that were voiced in the world of Japanese photography and characterizes the incident as the collision of two items in the cultural context of Japan in the 1950s. First, the A-bombing photographs of Hiroshima and Nagasaki, which had been censored by General Headquarters, were released to the public in 1952, and subsequently the fishing boat *Daigo Fukuryu Maru* was irradiated by a U.S. hydrogen bomb explosion had a big social impact in 1954. Second, there had been positive representations of atomic power in popular culture brought by physicist Dr. Yukawa's winning of Nobel Prize before the publication of Osamu Tezuka's manga *Mighty Atom* (known as *Astro Boy* in English) in 1952, along with another important exhibition supported by USIA, *Atoms For Peace*, which also started Japan tour in 1955 and attracted millions of visitors. This paper argues that the Japan tour of *The Family of Man* should to be reconsidered as an event in the atomic culture in Japan.

INTRODUCTION

The Family of Man was a monumental photo exhibition curated by Edward Steichen in commemoration of the 25th anniversary of the Museum of Modern Art in New York (MoMA) in 1955. It was a large-scale installation work, in which 503 pictures by 273 photographers were structured three-dimensionally in about 40 sections, depicting human life, such as marriage, childbirth, work, hard times, death, and so on. Juxtaposing countries, races, religions, and cultures, Steichen represented a grand theme, “the essential oneness of mankind throughout the world.”¹ Following a tour in the U.S., the exhibition then toured 48 countries and made a record of over nine million visitors. As it attracted a mass audience, however, it encountered severe criticism, including the naive humanism of its theme, its assertive curation that ignored the original context of the photographs and the photographers’ intentions, the inappropriate property of a few of the 500 photographs, and other criticisms that are often made of photo exhibitions that collect the work of many photographers’ works for the masses. Likewise, the political aspects of this issues exhibition, devoted to world peace, were discussed because of the world tour of *The Family of Man* were being conducted under the auspices of the United States Information Agency (USIA, known abroad as the United States Information Service [USIS]). Eric Sandeen discussed in his foundational study that the show held in Moscow played an important role as the cultural diplomacy of the U.S. during the Cold War.² At a recent international conference, “The Family of Man in the 21st century,” held at Clervaux castle in Luxembourg some presented papers investigated the reception of the show in Germany with revisionist approaches.³ Beyond the Soviet Union and Germany, diplomatic relations with Japan were high on the agenda of the post-war U.S., and, the Japan tour of *The Family of Man*, which was elaborately worked-out, attracted over 1 million visitors between 1956 and 1957. However, the removal of photographs related to the atomic bombing of Japan, which had been added to the show, has not been sufficiently discussed. This paper will first explain how the photographs were added to the show and removed soon after its opening and then consider the reasons for the removal relative to the curatorial concept of the original exhibition and f to the social and cultural situation of Japan in the 1950s.

THE FAMILY OF MAN IN TOKYO AND ITS CRITICISMS

To prepare for a tour of *The Family of Man* in Japan, Steichen himself visited there with all the negatives and enthusiastically told his idea to the executive committee for the exhibition in 1955. The Japan tour was promoted by *Nihon Keizai Shimbun*, a major economics newspaper, and the executive committee members consisted of prominent photographers Ihee Kimura, Yoshio Watanabe, Shigene Kanemaru, and Yasuhiro Ishimoto, graphic designer Tahashi Kono, and architect Kenzo Tange, who would design the installation. Steichen and the members decided to recreate four sets of photographic panels newly in Japan and to add 60 works by Japanese photographers, among which five of Yosuke Yamahat’s A-bombing photographs from Nagasaki were included. As soon as the Tokyo exhibition was opened on March 21, 1956, the venue, Takashimaya Department Store, was crowded with enthusiastic audiences. However, when two days after the opening, the Emperor Showa visited, one wall of one section was concealed with a white curtain. The fact that the images of the Nagasaki bombing had been hidden from the Emperor was reported immediately by the newspapers, and then, the wall was entirely removed on March 25 with the exception of a photograph of a boy holding a rice ball, from the original set of *The Family of man*.

Protests followed in newspapers and magazines that the Emperor should have been able to see the hidden photographs, and some publications published the image of the wall, which allows readers to what was removed.⁴ A photograph of a hydrogen bomb explosion that was originally placed at the climax of this section of the show was

replaced by a mural-seized landscape of the ground zero at Nagasaki the day after it was bombed, showing nothing but burnt-out ruins, including corpses whose tortured, bent limbs show their sufferings from their burns. Four pictures show a staggering mother and her boy, standing holding rice balls, a boy carrying his injured brother on his back, a father holding an injured infant, and a girl waiting for rescue, sitting between lying bodies that were placed over the landscape. A quote from Bertrand Russell appeared on the upper left of the wall: “there will be universal death—sudden only for a fortunate minority, but for the majority a slow torture of disease and disintegration.”

The newspaper reported Steichen’s statement that, although he had been impressed with the photographs, he regretted that there had been a minor misunderstanding him to approve them for the Japan exhibition. He explained that he had consistently avoided any specific matters in the exhibition, devoting it instead to general themes of mankind because a specific matters might be distorted in significance unless presented in detail.⁵ However, mass media and photographers were not satisfied with this explanation, and the incident continued to be a focus of questioning. Yosuke Yamagata asked if A-bombing could be called simply a specific event,⁶ and nine well-known photographers and critics, including Tsutomu Watanabe, Yonosuke Natori, and Koen Shigemori announced that the removal of the A-bombing images without a clear reason could be considered as a threat to freedom of expression and the right to view. The promptitude of their protest may stem from their concern over censorship. During the occupation period, under the General Headquarters (GHQ), images of the Hiroshima and Nagasaki bombing had been strictly censored, and images of victims and damage were only revealed to the public in 1952, with a large social impact.⁷

Steichen did not respond again, and the Japan tour of *The Family of Man* continued until 1957 without the disputed photographs. The concealment of the photographs from the Emperor appears to have been the result of a sudden decision by the organizers in response to an announcement by the Imperial Household Agency that they had recognized that the show contained photographs of the aftermath of the bombing and had informed the Emperor about it in advance. Masakazu Inubuse explained the concealment in his recent paper that the semiotic meaning of these photographs would have been different for general audiences and the Emperor. For the general public, the unprecedented disaster caused by the A-bombing was a symbol of a tragedy shared by all citizens of their defeated country Japan, and they were able to accept the image as a universal symbol of the misery of war. However, the Emperor, the former head of the state, who was exempted from war responsibility under the occupation policy of the U.S., could not be a victim of tragedy. Therefore, because the Emperor who could not on principle accept the photographs as symbols, the organizers naturally chose to conceal them.⁸

THE CONCEPT OF THE ORIGINAL EXHIBITION AT MOMA

Thus, how are we to understand the entire removal of the photographs from the exhibition? Steichen continued to be suspected that there could be other political reasons for this, although he himself stated the having photographs of a specific incident would damage the theme of the whole. Tsutomu Watanabe cited Steichen’s career of conducting the photographic propaganda for the Navy during the Pacific War and stressed the political tone of his work, questioning the genuine nature of Steichen’s universal humanism.⁹ However, this criticism misses the mark, only to hit another point. Among the executive committee members of the Japanese exhibition, Ihee Kimura, Yoshio Watanabe, and Shigene Kanemaru were involved in the propaganda under the support of the Army Staff Headquarters during the war.¹⁰ In other words, if Steichen’s background can be questioned, the backgrounds of the Japanese executive committee members must be questioned as well.

Contemporary criticism unexceptionally praised the composition of *The Family of Man*,

although its conception and narrative were rarely discussed in detail. In recent studies, according to Miles Orvell's analysis of the original exhibition at MoMA, the exhibition's central point was the image of H-bomb explosion. This unique image, which was not included in any catalogs and was replaced with a black-and-white image in the other travelling versions, was a mural-sized back-lit color transparency in the original MoMA exhibition. Orvell reads this as the lynchpin of Steichen's argument, namely, a horrible warning.

Of course one might read the giant luminous bomb image as a Cold War threat as well, a warning to the rest of the world, a warning to our 'enemies', that we've got the power to kill you. But that power to kill is also suicidal, for the bomb is a threat to all mankind, not just the enemy. [...] the perceived differences represented in *The Family of Man* – between rich and poor, first world and developing world, city and farm, scientist and hunter – will be erased, not by love but by death.¹¹

As Steichen was preparing for the exhibition, images of the victims of A-bombing in Hiroshima and Nagasaki were released in *Life* magazine in the U.S.; at the same time, the first experimental H-bomb was successfully detonated. As Orvell alleges, these must have inspired Steichen with his theme of imminent world peace. Thus, if the experimental H-bomb explosion is a warning of a miserable future, the image of the United Nations presented in the following section may indicate a means of choosing the future, allowing audiences to hope that they can avoid a horrible doom. In contrast, the apocalyptic images of Nagasaki bombings are records of a past event, leading to the images being read as an event to be regretted. Therefore, the A-bombing images conflicted with the optimistic tone of Steichen's original concept, and the Japanese executive committees did not understand this point. This was what Steichen called "a minor misunderstanding" in his statement.

JAPANESE ATOMIC CULTURE IN THE 1950S

However, if we observe the Japanese version of the exhibition from the outside, political factors are visible as well, including the fact that the peaceful use campaign of nuclear energy was being promoted both in the U.S. and Japan at that point. After the occupation of the GHQ was ended in 1952, restrictions on study of nuclear energy were lifted, and the Japanese government and media launched a campaign triggered by Eisenhower's "Atoms for Peace" speech of 1953. Meanwhile, the civil movement against the atomic and hydrogen bombs was growing in Japan, given impetus by the *Daigo Fukuryu Maru* incident, in which a fishing boat was affected by the nuclear fallout from a U.S. H-bomb test in 1954. The mass media vigorously reported on the opinions of politicians and intellectuals trying to recover the confidence of the state, which had been totally destroyed by the A-bomb, through peaceful use of nuclear power. Those aspirations were fueled by the event of the first Japanese receiving of the Nobel Prize, theoretical physicist Hideki Yukawa, in 1949.¹²

At the same time that *The Family of Man* was traveling around Japan, another exhibition organized by USIS was also being shown, the scientific exhibition *Genshiryoku Heiwariyo Hakurankai* (Atoms for Peace). It gave a pleasant image for the introduction of nuclear power and its scientists, nuclear reactors, the use of nuclear power in many fields, and finally the images of a fantastic future, supported by nuclear power for the masses. The Japan tour of *Atoms for Peace* started in November 1955, sponsored by USIS and the largest Japanese newspaper *Yomiuri Shimbun*, and it traveled to 10 venues around Japan, including the Hiroshima Peace Memorial Museum, which had just been inaugurated for the memory of the A-bombing there. Two and a half million visitors attended the exhibit over two years.¹³ The popularity of the exhibition was supported by significant media coverage by *Yomiuri Shimbun* and other newspapers, in addition to support at local venues, and the boom in the representation of atomic power in

popular culture, such as the manga *Mighty Atom* and the movie *Godzilla*.

The purpose of the two USIA exhibitions was to display U.S. power: its artistic strength with *The Family of Man*, which absorbs the cultural differences of the world, and its scientific strength, with *Atoms for Peace*, which gives affluence to the world through nuclear energy. Thus, the two exhibitions travelled in coordination throughout Japan. Remarkably, while *Atoms for Peace* did not mention nuclear fear, *The Family of Man* dealt with it in an implicit way, such that the literal images of A-bombing were required to be eliminated. However, not all audiences in Japan received these as USIA intended, due to the complexity of the in culture around atomic matters. While the government and major media were rushing to use nuclear power, there were heated civil movements against it and cool insights in popular culture. The first serial appearance of the *Mighty Atom* in 1952 is worth noting: it features a nuclear-powered robot who is human enough in his distress that he is not human; this character fights against the greed and cruelty that mankind still bears in the future. Further, *Godzilla*, released in 1954, a surviving dinosaurs made gigantic by the exposure to successive H-bomb experiments symbolizes the very nuclear disasters as it attacks a fishing boat and then Tokyo. A scientist who develops a new weapon to defeat Godzilla chooses to die with Godzilla to prevent the weapon from being used in another war, which emphasizes the responsibility of scientists. The message of these works of entertainment seems to bear similarities to *The Family of Man*, or they may do even deeper.

Therefore, *The Family of Man*, which drew controversy in Japan with its representation of photographs of the results of atomic bombings and the removal of the photographs, should be considered not only as an indicator of the reception of an American exhibition in the world of Japanese photography or as part of US–Japan cultural diplomacy but also relative to domestic political issues and popular culture at the time. Today we reflect with regret that time, a crucial point when nuclear power could have been rejected.

Her recent research focuses on documentary photography in the 1930s–1970s, and her latest publications in English include “FSA photography and the Steichen Collections: The Family of Man and The Bitter Years in Luxembourg,” in *Aesthetics*, Online journal of The Japanese Society for Aesthetics, no. 20, pp.62-74 (2016).

ARCHITECTURE AND MUSIC IN PENTHOUSE

Abstract | The building of PentAhouse, my home in Apeldoorn, The Netherlands, was inspired by two narratives. The first one originates from my involvement with the history of the golden section as an aesthetic criterion, which resulted in the insight that this was a Romantic invention retrojected into history in the middle of the nineteenth century. Nevertheless, in the twentieth century it was a fruitful inspiration for a number of architects, of whom Le Corbusier with his *Modulor* is the best known example. Personally, I was inspired by the work of Dutch architect Ton Alberts. Some principles which he used in his best known work, the ING building in Amsterdam (1986), also found their way in PentAhouse.

The 'restricted multiplicity' of angles in the structure of PentAhouse corresponds to the 'restricted multiplicity' of musical intervals in our tonal system. This leads to my second source of inspiration: Dutch composer Peter Schat, whose lessons I followed during a short period around 1970. About ten years later, he carried through a new and original analysis of the 'chromatic universe', the totality of the pitches used in the domain of western music. As opposed to Schoenberg, who isolated the twelve tones in an attempt to have them relate only to one another (and not to their harmonic function or to another musical context), Schat reverted to Rameau's classical concept of *triads*. He realized that only 12 different triads are possible in the chromatic domain, and considered these as the twelve hours of his *Tone Clock*. Apart from bringing them to life in his music, he also produced a visible representation of the twelve hours by transforming them into twelve leaded windows in the roof of his house in Amsterdam, thus creating a beautiful appearance of synesthesia. Since the original windows from his house are now exposed in an open space of the Royal Conservatory in The Hague, PentAhouse is the only place where the twelve hours, materialized in newly constructed leaded windows, can still be observed with their original function: allowing the sunlight to enter the top floor of the house.

The unification of the two narratives is to be found in the *omphalos* of the house, a dodecahedron whose twelve faces each reproduce one of the hours of the Tone Clock. In this way, PentAhouse fulfills the recommendation by Luca Pacioli in his *Divina Proportione* (1509): including a mathematical body based on the golden section in a building will be a remaining source of contemplation for scholars and philosophers.

Index terms | *angulation; chromatic universe; dodecahedron; dodecaphony; golden section; tone clock; triad*

ARCHITECTURE AND MUSIC IN PENTHOUSE

It is with some hesitation that I present this paper at an International Congress of Aesthetics. During the past conferences, I have generally contributed my views on Kant and Hegel, on Adorno and E.T.A. Hoffmann, and on Nietzsche and Wagner. I dealt with the traditional giants of aesthetics, who may look down on us from their elevated position in heaven. But *this* paper is very domestic. Literally: it is about my home, PentAhouse, which I conceived and designed in collaboration with an architect. I hope I may use the fact that this year's ICA venue is a Faculty of Architecture as an excuse to discuss here the architectural background of my house, in relation with its musical conception.

PentAhouse's *material cause*, as Aristotle would put it, consists of bricks, glass, and a lot of wood, since it has a timber frame, hidden under the exterior structure. But its *formal cause* is basically built up from two narratives. The first of these is the dissertation in which I investigated, some decades ago, the ideational history of the golden section.¹ In this sense, PentAhouse is a sequel to *Die Geschichte des goldenen Schnitts* (The History of the Golden Section). The credits for the second narrative go to one of my former teachers, Dutch composer Peter Schat, who developed an original analysis of what he called the 'chromatic universe', the totality of the twelve possible pitches used in the domain of western music.

The first narrative: principles of the golden section

The often-proclaimed idea of the golden section being a leading aesthetical concept during earlier ages, especially in the Renaissance, is literally out of date. Although text books in art history teach us otherwise, the *aesthetic* career of the golden section begins only in the 19th Century. The idea of *applying* the golden section as a formal mould to give shape to any work of art, be it in architecture, pictorial art, music, literature or any other art form, would never cross any Renaissance artist's mind. It runs counter to the basic intuition that was cultivated in Renaissance theories of proportion, as these were based on Vitruvian principles of symmetry – that is, *modular symmetry*, which originates from *proportion*². In the Vitruvian prescription, the architect does not meet *aesthetic* standards, but *ontological* ones. Vitruvius sincerely believes that the structure of a temple must follow the structure of the human body, and that this goal can only be realized by obeying to the proportional build-up of that body. The body's structure can be 'read' or 'understood' by seeing through its modular build-up. The well-known illustration by Francesco di Giorgio Martini shows that this conviction was indeed shared during the Renaissance. Leonardo's even better-known drawing of the 'Vitruvian man' is further evidence that the golden section is not at home in Renaissance thinking: the drawing confirms the equality of vertical and horizontal sizes, and certainly not the irrational proportions that would be implied by the golden section. The text around the drawing confirms that the human body has a modular structure, and Leonardo clearly indicates that this structure is constitutive for architecture: 'Vitruvio, architect, puts in his work on architecture that the measurements of man are in nature distributed in this manner, that is: a palm is four fingers, a foot is four palms, a cubit is six palms, four cubits make a man, a pace is four cubits, a man is 24 palms and these measurements

1 *De ontstelling van Pythagoras*, Kok Agora, Kampen 1998. The second edition of the German translation, *Die Geschichte des goldenen Schnitts*, came out in 2016 (Frommann Holzboog, Stuttgart).

2 Cf. Vitruvius' recommendation for the construction of temples: 'Aedium compositio constat ex symmetria, cuius rationem diligentissime architecti tenere debent. Ea autem paritur a proportione (...).' 'The composition of temples comes into being from symmetry, the ratio of which the architects must diligently hold on to. This ratio, however, originates from proportion (...). Vitruvius, *De architectura*, III.I.1.

are in his buildings'.³ Leonardo refers to the navel as the point which is 'naturally placed in the centre of the human body' (that is, the centre of the circle drawn around the outstretched body) – never as the point which divides the body according to the golden section! And Dürer joins in, presenting detailed proportional analyses of the human body, and also referring to the Vitruvian idea that studying the perfect proportions of the human body is a precondition for the designation of buildings. *Figure 1*

There is, however, one clear sign of interest in the mysterious irrationality of the golden section during the Renaissance. This is the book by Franciscan monk Luca Pacioli, illustrated by the same Leonardo da Vinci, his fellow employee at the Milan court of Ludovico Sforza during the last decades of the 15th Century. The book is called *Divina Proportione*, and both its title and its content betray why this proportion is not meant to be 'applied' by artists: it is divine, not human. Pacioli mentions this in so many words: divisions according to the golden section are *non naturali ma divini*⁴. This implies that humans, including architects and painters, have no cognitive access to them. They should stick to the proportions they can measure and understand. When Pacioli calls the golden section a *divine* proportion, he means this quite literally: the irrational proportion of the golden section is unknowable in the same sense in which God is. The *cognitive awareness* of the golden section is reserved to mathematicians and theologians, the only scholars to have access to proportions that are not rational.

There is one place in Pacioli's text in which he seems to stimulate humans to materialize the divine proportion in an architectonic context. This is not in the manuscript of the *Divina Proportione* (1498), but when that manuscript was edited in print (1509), Pacioli added a few other texts, the most important of these being a treatise on architecture. This treatise contains basically the lessons which modern architects have to learn from Vitruvius. The term 'divine proportion' occurs in this section only to refer to the manuscript of that name, with one exception: in Chapter 18, we find the recommendation to include one of the mathematical bodies, discussed in the text about the divine proportion, within the architectural edifice. Such bodies would serve a philosophical purpose: they do not only serve as ornaments, but also allow intellectuals to speculate about the properties of such intriguing, unknowable forms.⁵

Pacioli states explicitly that he is transgressing the Vitruvian boundaries here;⁶ in PentAhouse, as we will see, I have tried to do justice to this once-only transgression.

The second narrative: triadic relationships

Traditionally, the realm of western music, using twelve pitches within one octave, has a *diatonic* structure: its scales are made up of five major seconds plus two minor seconds, so that in any traditional major or minor scale seven pitches are at home, while the other five pitches (cf. the black keys on a keyboard) may play an ornamental role, they may add some 'colour' to a melody (which conforms to the literal meaning of the term 'chromatic'), or they may be used as stepping stones when modulating from one key to the other. This fundamental 'language' (the 'langue musicale', in semiotic terms) is the solid outcome of a long historical process which reached its culmination in

3 Translation of the text above the drawing in *Gallerie dell'Accademia*, Venice.

4 *Divina Proportione*, Ms. Milan, 1498; 1st printed edition Venice, 1509. Chapter 6.

5 '(...) non solo lo renderanno adorno ma ancora ali docti e sapienti daranno da speculare conciosia che siempre sieno fabricati con quella scientia e divina proportione havente medium duoque extrema'. 'Not only do (the mathematical bodies) provide an ornament but apart from that they are food for contemplation to scholars and philosophers, as they were made with the knowledge of the divine proportion, having a middle term and two extremes.' *Divina Proportione*, treatise on Architecture, Chapter 18.

6 '(...) avenga che di loro particolarmente non ne faccia mentione alcuna el nostro Vitruvio'. '(...) although our Vitruvius does not specifically mention them.' Ibidem.

the 18th Century. Although the process is ongoing, it seemed as if it was meant to reach a goal that was now achieved. It was characterized by a complex system of tensions and releases, for which a new terminology had to be found since this phenomenon had never before been part of music theory. Classical theory had been based on ratios and intervals; from now on, the proceeding of a piece of music was understood as the development of a series of harmonic progressions. The units carrying this progression were not the individual tones, nor the intervals, but the *triads*, the combination of a root note with its third and its fifth, which were internally heard even if they were not externally resounding. Please note the parallel between the historical development of composed music (which was not steered by theoretical convictions) and the theoretical understanding of the musical process: this occurred in a period in which physics had taken over from mathematics in being the principal science to understanding what was going on in the world, and especially, *around* the world. In other words: a period in which the Neo-platonic, mathematical approach of Kepler's cosmology had been replaced by the kinetic, physical approach of Newtonian mechanics. Of course, physics continued to use mathematics in order to formulate its laws, but mathematics became, so to say, *grounded*, and bound to physical reality. The concept of (natural) *force* took over from the concept of (ideal) *form*.

Harmonic progressions were not arbitrary, they followed a certain logic, apparently given by nature. Composers could *apply* this natural logic at their discretion, but not at random: they had to respect the laws of harmonic attraction, just like celestial bodies have to 'respect' the laws of gravitation. Major and minor triads determined the harmonic fields of force, and when this conception was codified, it was considered as yet another scientific discovery. In true Enlightenment fashion, Jean-Philippe Rameau, who established the classical theory of harmony, called his book *Traité de l'harmonie reduite à ses Principes naturels* – 'Treatise of harmony reduced to its natural principles' (1722). *Figure 2*

First source of inspiration: architect Ton Alberts (1927-1999)

Although the principle of the golden section is generally explained by dividing a line in such a way that the ratio of the major part to the minor part equals the ratio of the whole line to the major part, this is not the most attractive way to visualize it. The so-called *golden figures* reach a better result (golden triangle, golden rectangle, pentagon etc.). In architecture, the golden section left its traces in anthroposophical architecture; Rudolf Steiner, e.g., based the auditorium of the first Goetheanum on a pentagonal structure.⁷ After World war II, it was especially Le Corbusier who became known as the architect who included golden section proportions not only in the exterior structure of his buildings, but also in the interior, in the proportions of the rooms and even in the furniture.⁸

Inspired by Steiner, Ton Alberts developed his own style of architecture in the Netherlands. The creative force of form is his point of departure; everything is done to break through the exclusive right of the rectangular boxes that make up most of 20th Century architecture. His theoretical input is embarrassingly primitive, made up from confusing rags of theosophy, anthroposophy, taoism and New Age thinking.⁹ But his architectural choices are most inspiring.

His most famous creation is the ING building in the South Eastern part of Amsterdam. We find pentagons on top of each of the ten towers, with a specific function: to serve as solar panels. But more characteristic for the building as a whole is its angulation. Not

7 David Adams, 'Rudolf Steiner's First Goetheanum as an Illustration of Organic Functionalism', in *The Journal of the Society of Architectural Historians* 51 (2), 1992, p. 192.

9 Ton Alberts, *Een organisch bouwwerk* (Kosmos, Utrecht/Antwerpen 1990).

all the walls are perpendicular to the surface level; we recognize the pentagonal angle of 108°. Alberts emphasizes that this slant is not arbitrary. There is a strict criterion: all the angles are multiples of 9°, a unit derived from the pentagram.¹⁰ (The pentagram angle is 36°, four times 9°.) Alberts claims to be the first to have applied the golden section not as a ratio of the lengths of line segments, but as a norm for angulation. This is especially visible in the windows and the inside doors, and it defines the specific look of the building. Doors and windows also illustrate how much Alberts, like Le Corbusier, insisted on the continuity between exterior and interior proportions. The illumination of the building strengthens this experience. I was fortunate to have lived rather close to that building for a number of years, and to have had the opportunity to view it inside and experience the comforting atmosphere of its variegated forms. *Figure 3*

Second source of inspiration: composer Peter Schat (1935-2003)

Although Rameau's *Traité de l'harmonie* remained unchallenged as a textbook for a fundamental understanding of musical harmony, music history moved on. The triads expanded to seventh chords, and these to ninth chords. One might say that Wagner completed this part of music history, pushing it to the boundary where it became impossible to distinguish between the several harmonies because they had become overcrowded.

So, what could come next? Instead of pushing ever more notes in a single chord, the chords had to be cleared of this abundance. Debussy played a pivotal role here: instead of banishing the newcomers (such as the ninths) and return to the decent 18th Century harmonies, he did away with their traditional harmonic pillars (such as the fifth), which gave his harmonies the ambiguous character that we now recognize as typically impressionist. Harmonic progression was pushed to the background, and the clarity of the tonal functions gave way to the indeterminate impressions of soundscapes.

But the most radical solution came from Arnold Schoenberg. In 1921, Schoenberg did away with the very principle of harmonic progression, and decided that from now on, the twelve possible pitches used in the domain of western music should not relate to anything else but to each other: *zwölf nur auf einander bezogene Töne* Thus, he opened the way to dodecaphony, obliterating the distinction between consonant and dissonant harmonies.

That was a radical decision, and it came at a price. Now that the tones were not carried anymore by their supporting harmonies, they had to fix the job of making musical sense on their own. Not to every listener's pleasure: the audience waited in vain for the reliable logic of harmonic progression. Not only were the twelve tones in the chromatic universe more than the seven tones of the familiar diatonic universe, but as opposed to these, they were all equal. The musical game of confirmation of expectations, or negation, or delay, simply did not work anymore. For the audience, it did not matter which tone would be followed by which. Schoenberg's reply to the question of how to consider the relationship between the twelve tones had been a simple denial of any hierarchy. There was no mutual order among them, as there had been in Rameau's diatonic conception, based on triads.

In 1982, Peter Schat published an unexpected discovery.¹¹ If one allows not only the major and minor third as building blocks for a triad, but any combination of two intervals, then there are exactly twelve possible triads in the chromatic universe. Schat called these triads 'the twelve hours of the tone clock'.

10 *Een organisch bouwwerk*, p. 108.

11 Originally in articles in Dutch newspaper NRC Handelsblad (1982), then in *De Toonklok* (Meulenhoff, Amsterdam 1984). Published in English as *The Tone Clock* (Harwood Academic Publishers, Chur etc. 1993).

Figure 4

Then, he moved on to make these triads not only *audible*, but also *visible*, by imagining them not only as *resounding triads* but also as *perceptible triangles*. He realized this materially by constructing twelve leaded glass windows in the rooftop of his canal house in Amsterdam. After his death, the house was first planned to be a museum, but when that plan failed, the tone clock windows were transported to the Royal Conservatory in The Hague, the institution where Schat had both studied and taught.

Schat's intervention implied that he united Rameau with Schoenberg. He submitted Schoenberg's harmonically independent equality of tones to the order of Rameau's triadic relationships, and he expanded Rameau's diatonic restrictions to the chromatic universe that Schoenberg had opened up. This led to a new discovery. Rameau had allowed his diatonic triads to be *inverted*, meaning that the root note is not necessarily the lower note (Figure 2); Schoenberg and his followers had allowed their series of harmonically unrelated pitches to be *mirrored* – either from right to left (crab motion, or retrograde) or from up to down (inversion), or both at the same time (retrograde inversion). Schat allowed his chromatic triads to take part in both types of symmetry, inversion *and* mirroring. Moreover, he found out that, by allowing this, each of these triads can be pictured four times on the dodecagonal dial of a tone clock face. In this way, Schat succeeded in reintroducing Rameau's traditional concept of the triad, with its organisational capacities, in Schoenberg's chromatic universe, thus creating a synthesis between 18th Century and 20th Century theoretical conceptions. The only killjoy in this attractive scheme is the 10th hour, where four diminished triads do not fit in one dial (after c-e^b-f[#], c[#]-e-g, d-f-a^b you are left with a-b^b-b, which is an example of the 1st hour, not the 10th). Schat solved this problem in an elegant way, by allowing three diminished seventh-chords to take the place of four diminished triads (c-e^b-f[#]-a, c[#]-e-g-b^b, d-f-a^b-b). Visually, this meant replacing four triangles by three squares. Shortly before his death, he began an autobiographical website which shows the several aspects of his work in the shape of a tone clock.¹²

The narratives united

PentAhouse gratefully integrated the bold interventions of the two Dutch artists. Due to gravity, it is very difficult not to allow the right angle of 90° to play a dominant role in the construction. However, if only the 90° angle may be called *the right angle*, does that imply that all the other angles are *wrong*? The ING building shows the contrary. But such a solution demands a lot of space, which was not available on our modest lot. PentAhouse shows another way to integrate the right angle with the pentagonal angle of 108°, both vertically and horizontally. The left side wall is perpendicular to the surface level but shows a 108° angle with the ridge. And as the ground plan shows, its base can be seen as a combination of two rectangular grids, showing a shift of 18° with regard to each other. This leads automatically to the appearance of pentagonal angles of 108°. *Figure 5*

This allowed for a rich variety in angulation, fully in keeping with Alberts' principle to use only multiples of 9°. This principle was also applied in PentAhouse, both on the outside and on the inside. The outer windows have angles of 90°, 99°, 81° and 90°. For the windows in the inner doors, we have applied angles of 90°, 117°, 144°, 99° and 90°. Not only have we used *exclusively* multiples of 9° as angles for the building; we have

12 <http://peterschat.nl/toonklok.html>. The tone clock itself can be found at the eighth hour of the website.

used *all* multiples of 9° (between 90° and 180°), as is shown by this view of the rear elevation. *Figure 6*

When Peter Schat's leaded windows were transported to the Royal Conservatory in The Hague, they were hung there from a giant dodecagon in a vacant space above the staircase. It is a perfect way to admire the twelve windows themselves, but in this constellation, they have lost one important function: they do not allow the sunlight to reach out into the building, and they do not provide a glance at heaven. Therefore, they do not do justice anymore to Schat's fascination for *cloudscapes*. In PentAhouse, this function was restored. The northern windows allow a free view on the clouds, and when the sun is high, the southern windows create colour fields that slowly make their way on the floor. *Figure 7*

The ultimate unification of the two narratives is to be found in the *omphalos* on top of the mailbox. Remember that Pacioli recommended the ornamental use of a mathematical body, showing the characteristics of the divine proportion, as a source of contemplation. This recommendation reminded me of the omphalos near religious buildings (such as the Delphi temple), the place where spiritual power was concentrated. We also had to face a very mundane problem: according to Dutch rules and regulations, the mailman is not allowed to walk more than 10 meters from the public road to reach the mailbox. If the distance is greater, a separate mailbox must be installed next to the road. To prevent having to walk that far, we provided PentAhouse with a pentagonal extension bulging out of the house, with a built-in letterbox of the required measurements, just less than ten meters from the road. On top of this extension we have placed an open dodecahedron, each of whose twelve pentagonal faces provides a place for one of the twelve dials of the tone clock. In this way, the figures of Peter Schat's tone clock, perpetuated in PentAhouse's rooftop, also found their way on its pentagonal structure. This omphalos lights up when it gets dark, and our secret hope is that one day, the scholars and philosophers, uniting around it in admiring contemplation, may also be able to hear the sounds of the twelve triads of the chromatic universe. *Figure 8*

CHRONOLOGY OF THE IMAGINARY IN THE ESTETICS OF THE SERBIAN ARCHITECTURE OF THE SECOND HALF OF 20TH CENTURY AND ITS SOCIAL RELATIONISM

Abstract | *Imaginary* is not a lie - regardless of whether the imaginary is a category used by the society to confront the real or rather to spread beyond its limits, what remains is the question of its presence not only in the esthetical, psychological and anthropological, but also in the social and historical situation, especially in case of a feature which is a significant catalyst of creativity and esthetical formation. The discovery of the imaginary in the esthetic codes of the development stages of the overall Serbian and Belgrade architecture in the Yugoslav ideological milieu, opens the possibility of classificatory schemes, which yield the potential for the critical history of formation of the visual culture of the capital city and Yugoslav state heritological valorization. Discovery of the imaginary represents the theoretical mechanism which, in the hermeneutical circle, connects the esthetic theory, heritological matrix of architectural creativity and social relationisms. Comparative observation of the esthetic tendencies of Serbian and Belgrade architecture of the late 20th century in *large chronological chunks*, leads to the conclusion that there are three key chronological phases of the visual transformation of the architectural esthetic medium: [1] the phase of the modernity tradition, alongside the ideological pressures of the short-term neo-Marxist antibourgeois revolution till the early 1950s, during which it goes beyond the Eastern-European socialist-realistic esthetic paradigm; [2] the phase of the *highly modern architecture*, alongside the changing tendencies of ideological revisions of the socialistic autonomous idea of the liberal society and industrialization, during which the western architectural esthetics was surpassed through the establishment in the domain of critical regionalism and features of the advanced classical construction system, and finally [3] *the postmodern phase*, alongside the populist social revolution and the final phase of the populist vulgarization of the state during the final stage of the Yugoslav cryptofederal union, during which the renewal of the traditionalistic discursive formations takes place, as a dominant centrifugal forces in the framework of the official ideology. In a political platform of the populist vulgarization of the state which foreshadowed the social hypocrisy of the then already Serbian, so called, transitional period, the postmodern esthetics was, on a global wave of pop-culture and, by means of social populism, transformed into a vulgar architectural kitsch, permeating profoundly into the 1990s.

Index terms | *imaginary, architectural chronologies, esthetic paradigm, social relationalism, symbolic formation*

INTRODUCTION

The imaginary is a simultaneous outcry of the powerless, irresolute and ambitious society. Nowhere has that been so evident than in the representative creativity which makes *imagination* in the architectural esthetic especially relevant. Regardless of whether the imaginary is a category used by the society to confront the real or rather to spread beyond its limits, what remains is the question of its presence not only in the esthetical, psychological and anthropological but also in the social and historical situation, especially in case of a feature which is a significant catalyst of creativity and esthetical formation. The substrate of the imaginary could be a question of visual culture, thought, presentation, stereotype or iconological exchanges in architectural esthetics. Imagination in architecture is, most often, a result of a crossover between the esthetic and social fantasy whose crossovers play out on different levels and in different combinations of symbolic formations. The imaginary could be observed in esthetical situations from the point of retential mentalistic and social paradigms, comparatively explained by the temporal construction of a higher order¹ – by means of replacement of the ontologizing patterns of historiographical consistency, indicatively oriented chronologies are added to the ones characteristic of critically oriented revisionists.² Dialectics of esthetical formations which arises from the permeation of the social reality and imaginary, could be studied from different points of view.³

In a certain analogy with Hegel's triadic phases of thesis, antithesis and synthesis, the French philosopher and sociologist Lucien Goldmann derives an analogue but circular *theory of genetic structuralism* whose type of dialectical rhythm of the imaginary is made out of the phases [1] *anachronism* in which the esthetical act is observed and appreciated categorically with rejection, [2] *critical doubt* or *revision* by which the previous categoricism is destroyed, and [3] *actualization* which affirms the anachronism of the esthetical act and then postulates the entire opus.⁴ Architectural

- 1 According to Maurice Merleau-Ponty, the imaginary positions itself in discrete succession of moment ...A → B → C... (positioned as the past, present and future) which do not represent strictly distinguished multitude of protentions and retentions, but it is differentiated in the flows of intentionality whose past presence and real presence are announced as recent past or are felt as the pressure of the future in the present moment, in: Maurice Merleau-Ponty, *Fenomenologija percepcije* (Svjetlost, Sarajevo: Veselin Masleša, 1990), 475.
- 2 Александар Кадијевић, Прилог методологији тумачења архитектонске историје: карактерисање, класификовање и периодизовање издвојених појава (Панчево: Уметност Архитекура Дизајн, 2007), 45-46
- 3 According to Edmund Husserl, postulating the imaginary in esthetical situations is possible through enabling the removal of the inebriation by the referential factual knowledge which complicates access to the essential knowledge. To Husserl, the starting point of the imaginary motivations presents the nonrelevance-reality relationship, and the central theoretical point can be found in the relationship between protention (lat. *protendo* – upcoming, expected) and retention (lat. *retendo* – finalized, passed) as a projection of the idea about something that complements the present moment with the closer or long passed and future timeline. According to Husserl, immergence of one moment does not cause the passing moment or the upcoming one, but rather every new current moment is the transition of the former presence into the past and future presences into the future, in: Edmund Husserl, *Logical Investigations*, vols. 1 and 2, (London: Routledge, trans. J.N. Findlay, ed. D. Moran, 2001), 6-12; Edmund Husserl, *Formal and Transcendental Logic*, (The Hague: Martinus Nijhoff trans. D. Cairns, 1969), 42; Husserl, *E. Phantasy, Image Consciousness, and Memory* (Dordrecht: Springer, trans. J. Brough 1898, 1925, 2005), 53
- 4 According to Lucien Goldman (1913-1970), the creative imaginariums come into

esthetic platform, as per Goldman's understanding of *significant dinamical structures*, represents *the point of counting in or the point of cross-section*, over whose immanent totality the remote discursive formations are working within the social and ideological environment. Particularly significant impuls for the postulation of semiesthetic architectural dispositives in the flows of the social dynamics represents the study of the sociologist Dr. Ivan Jankovic, whose article *Technology and ideology* written in 1982 shapes the symbolic formations which operate on the principal of centrifugal forces in the continuum of Yugoslav ideology in the period of 1930 - 1980. Jankovic aims at the sociology of the imaginary, thus determining the areas of the metanarrative to Goldman's *points of counting in* which represent the cross-sections of the ideological changes of the Yugoslav self-managing socialism, dividing them into dominant discursive formations of traditionalism and etatism in the pre-war period, and into self-managing socialist humanism and liberalism in the post-war period. **(Figure 1)**

Anachronism: Imagination by *modernistic traditionalism*

One of the most noticeable and widespread types of imagination, whose structure is also the most primitive, is the one used for architectural presentations when the aim is separation from the notorious, banale or the undesirable reality and possibility which pressurizes the esthetic situation of its own time. At that point, the esthetic premises become a means of escape and critical spiritual aggression onto the social and physicalistic conventionality. Presence of Goldman's esthetic motivation which theoretically refers to the phase of the categorical anachronistic rejection, is positioned in the crisis of the esthetic of modernism which was outlined in the earliest criticism by the article *Two Modernisms* by a Belgrade writer Djordje Radenkovic in 1951. Dedicated to the intimistic relationship between the pre-war and post-war modernity and its transitional articulations, Radenkovic's criticism implied a characteristic of Husserlian retention as a pressure by the past onto the future presence. Dividing the modernity into two ideologically positioned categorizations in relation to the pre-war and post-war plane of the *modern traditionalism* breakdown, the text outlined the semi-discursive *point of cross-section* of the Yugoslav modernity.⁵

existence in alternate onthological rhythms in such a way that some spiritual milleus and even entire system in a creative area are observed and appreciated completely categorically as an anachronism. By further contingencies, seeds of doubt begin to immerge and destroy the pillars of categorical rejection of a certain imagination. According to Goldmann, notional imagination becomes some sort of a dubiousity epoch, hence, finally, we start perceiving the reasons for the analysis with gradual change of the entire esthetical projection until the moment when the previously considered anachronism is not seen in a new light as an apparent anachronism. Goldmans apparatus of chronological rhythms shapes the sediments of the social dynamics, which he calls homologies of reality, marking the points of counting in that immersed from the average of two different dialectics– the first that marks the intellectual imagological spirituality of the creator and the other one which represents the dialectics of the social life, thus determining prospects for the further sequence of exchange between the personal and borrowed experience. Georg Lukach calls the points of counting in *Zurechnungspunkt* and in franch sociology school it's calls point d'imputation. Goldman's categories of the imaginary are based on a significant dynamic structure as the central notion which has both a theoretical and normative function, in: Lisjen Goldman, *Dijaletička istraživanja* (Sarajevo: Veselin Masleša, 1962), 109-110

5 „There are intentions to make to accept a past modernism as the actual one, to shape the contemporary theme by modernistic actions between the two wars. There are people who in their effort for contemporary see the pre-war modernism as something that should even nowadays keep its right the old title, just because it remained insufficiently comprehensible without becoming sufficiently recognized. (...) By denying the old mystique, it created a new mystique by its nightmarish symbolism. Unavailable to hints, with its jealous individualism,

Merged via a combination of mechanical and physicalistic retentive dosage and subtle psychological and visual compensations, the imagination first appeared in the semiotic perspective of the local architecture at the beginning of second half of 20th century in a translation of a text written by a German architect Hans Schoszberger⁶, the same 1952 year when the socialist Yugoslavia officially abolished the then still ongoing Construction Law adopted by the Kingdom of Yugoslavia. The esthetic configurations of modernism in Schoszberger's presentation similar to the famous *Diagram of the development of modern art* Alfred H. Barr Jr. from 1936, developed from the typology of architectural codes of modeling which determines the esthetical isomorphism which, by the hypothesis of Jean Piaget, attributes the *characteristic of wholesomeness, selfguidance, and transformation ability* to every system.⁷ By using the term developmental tree, the translator and editor of the article, architect Dimitrije T. Leko, seemed to have implied the understanding of the notion architectural esthetic system which much more points to the line of classicism, which in the philosophy of esthetics is commonly understood as conservatism rather than romanticism, which would be usually identified with revolutionary and leftist ideas of that moment. **(Figure 2)**

Having a liberating effect to all future individual and liberal concepts, and renewed after temporary interruption of the evolutionary flows of modernism due to the world war, modernistic geometrical proportion was not understood only as a mimetic impulse of standardization of *metaphorical functionalism* for which the etalon of planning represented rationalism and class nivelation in the estheticization of communitarianism. Dobrović's post-war suggestions for reconstruction of the key points in the futuristic perspectivism of modernity⁸, Husserlian principal of retention which was derived from the pre-war modernistic residential-business condominiums and trade ports integrated around the promenade plaza, represented idealized points of physicalistically shaped linear city.⁹ Spiritual pressure of the post-war modernism, illuminated the need for the developmental incredibility in the monumentalization of urbanistic composition and special procedure which portray the spiritualism of a high social status through the infrastructural and transportational network, prefabricational schematic repetitiveness and consumeristic sensation in the universalism of form. **(Figure 3)**

Revision: Imagination by *internationalism* and the *high modernism*

A more developed form of imagination is not only about a simple escape from reality of our time, but strives to enable a breakthrough into certain individual or shared experiences, at the same time remaining inapprehensible and, thus, a secret for the all members of the community. In the ambitions of *tropism towards others* as Nathalie Sarraut calls it in her book *Age of Suspicion*, such type of imagination expands personal experience by the visual culture of time in a place in which that experience, by default, ceases to exist, but influences the life attitudes and analysis of events in a deeply intimate way. Under the mortgage of reality and possibility, embodying itself in the Husserlian retention, the semiology of architectural square, even in the advanced

incomprehensible expression, it created some sort of a literary autocracy even when stating its inclination towards a greater democracy.", in: Đorđe Radenković (Mostar, 1922 – Kotor, 1993), *Два модернизма* (list НИИ, no. 51, 23. decembre 1951.), 3

classical system of construction, functioned as the holly picture of the constructively-rationalistic and conceptually international procédé.

Although the standardization of the modular system in building design and construction was implemented in¹⁰, the spirit of the future time did not identify itself with the parameter standardization of technical details, exact ethalon of technological performances and unification of installation of construction profiles, but with the imaginarium of the golden ratio and geometrical proportional combinatorics of shaping the symbolic formations of the medieval *quadrivium* which, in the spirit of the Husserlian phenomenology of the retent pressure of the past ghosts onto the present time, results from the pre-war classical school of high academia and practical skills.¹¹ **(Figure 4)** The logo of the architectural semiology in the field of the post-war architectural creation reflected the constructive ideality of the square and cubic forms inherited from the obsessive post-war research of the proportional lines and numerical combinatorics of the architect Milan Zlokovic in the Belgrade and Skoplje faculty publications or Branislav Milenkovic within the frame of the meditative text *Square as an element of composition* from 1955.¹² Semiotics of square was not reflecting only the tendency of the actual constructivism, to use the critical terminology of Sonja Briski¹³, but was, alongside the removal from the academistic socialistic realism of the early 1950s, this geometrical form possessed a potential for axiological determination of esthetical situation and the essence of the spirit of *the future times*.

Negating the modern traditionalism as a rarely pointed out characteristic of the anticapitalistic spirit of Serbian socio-realistic neo-marksim represented the hidden core of the own subversive ideological self-criticism, strongly influencing onto all latter esthetic searches for further legitimizing patterns. An open possibility for self-criticism which was deepening the civil and democratic varieties of the intellectual activity in the later corrections of marksistic socialism all the way to the late 1980s, created suppositions for both the *political worldview opposition* and the creative opposition on the *islands of freedom* in individual spheres, informal groups, dense intellectual networks of civilian initiatives and *creative waves*.¹⁴ Creative anxieties from the post-existentialist and post-modern field of liberalized discursive varieties, appeared out of the presence of the *crisis tendencies or social tension* in the Yugoslav self-governing

community in the mid 1970s.¹⁵ The liberal spirit in the imaginarium of the ambitious society enabled the acceptance the concepts of the futuristic matrix of ecological functionalism from the international influence of the Delians school into the domestic urbanistic and spatial planning conceptualization of the late 1970s¹⁶, for the sake of further parametric development of Belgrade for the third milenium. But alternative fluctuating discursive formations as significant dynamic cultures, were neutralized by the socialistic system by, according to Miško Šuvaković, displace its critical activism into another cultural surroundings where their authentic sense of activity could not be completely comprehensible or rest them in cultural ghettos.¹⁷ Tensions which, in the cultural and social contradictions during the incessant corrections of the Marxist self-governing, were exhibited via a disassociation of institutional and activistically critical fields of creation, positioned themselves in the mid-1980s in the powerstruggle of creative forces and overcoming the very root of differences in the visual culture of the postmodern procédé. (Figure 5, Figure 6)

Affirmation: Imaginery by the esthetic of postmodern incertitude

The third direction of imagination make the anti-imaginary motion which is, paradoxically, directed against itself. In the postmodern esthetics not only do key personalities disappear, but there is a partial narrowing of the effects of their apologetic role of creative powers: their intellectual ideation, senses and interpretations. The postmodern esthetics is marked by the inversion and sobering up by the *universalistic*, substitution of ambition of an insatiable architect – by modesty, overdimensioned psychology – by observation, fictive sense – by absurd and the oniric delirium of interpretations – by cold inventory of data. Resulting from the far earlier ideologically based right onto *creative waves* during the post-war revolutionary neo-marxistic self-criticism, the feeling of *heroic* or *pathetic moment* of neoavantgard, in the interpreptation of Eduardo Sanguineti, it was also activistically supplemented with the *cinical moment* of action. The postmodern esthetics demystifies the mistified relationships – for suppressing the imaginary from the architectural art, not only was used the finest imagination in composition, technique and naming the projects but the presence of the apologetics of the *critical doubt* or *revision* as Bogdan Bogdanović and Aleksandar Deroko enabled significant initial impulses in the activity of the Belgrade group *Meč*. (Figure 7)

The instruments of the urban neoavantgard from the mid-1970s in an extended wave of action, after cancellation of the magazine *Danas* [1961-1963] edited by Stevan Majstorović and after the passing of Leonid Šejka in 1970 as the central dissident figure of the Belgrade artistic practice, were newly strengthened by opening the gallery of the Student Cultural Center, through the support of the Salon of the Museum of contermporary art and publication of the magazine *Polja* in Novi Sad and the Belgrade architectural magazine *Komunikacije*, as the que points of activity of the architectural *critical worldview*.¹⁸ Shaping of the postexistentialistic criticism and confrontation

18 For example, exhibition called Kameni brod (La Nave Di Pietra) in may 1984., in organization of arch. Slobodan Selinčić with guest architects Alessando Anselmi (with

with the late post-Marxist populist vulgarization of society, is enabled by welcoming the etalon of architectural postmodernity with the goal of repositioning the socio-humanistic criticism of urban sociology and ecopsychology, postmodern performative esthetics.¹⁹ Moving from the late 1980s towards the conceptualistic lines of activity outside of the countercultural character of action, architectural activism is shaped by a more *complex, ambiguous, metasymbolic and metaspirtualistic system of creation*.²⁰ **(Figure 8)**

The postmodern esthetics which hints at the universalistic situation of the European esthetic culture of the 1980s follows the final impulses of the Yugoslav community. Concluding the discussion about the spirit of the postmodern time in architectural esthetics, Dr Aleš Erjavec considers that the postmodern criticism of modernity is directed only towards an extreme form of modernity embodied in the international style, while other orientations, especially of the modernity of the early 20th century sometimes even manage to incorporate into the postmodern architecture. Aleš Erjavec notices that by copying the elements of avantgard modelling, what is achieved is their central role in the formal esthetic function and not their provocative artistic or social and revolutionary value and esthetic novelty.²¹ When discussing the activity of the Belgrade group *Meč* as of 1980, the stress is put on the key words *memory – experiment – removal*, and what we perceive is the signalistic poetics of estheticized elements of the early avantgarde as an indicator of the presence of another important postmodernistic characteristic – in the centre of the postmodernistic visual culture is located the rediscovered handcrafted architectural detail, ornament, renewed interest in symbolic elements, decorative ornature, and even the inclusion of Art Nouveau and the medieval iconological motifs. The situation is similar with the retential attitude of the postmodern architecture towards the nature – as observed by Aleš Erjavec, *if the modernism behaved as if the nature did not exist, the postmodernism brings back the consciousness about the indispensable coexistence with nature*.²² **(Figure 9)**

Conclusion

Architectural imagination of the second half of 20th century, in *bulky chronological pieces*, leads to a conclusion about the existence of three key chronological phases of the visual transformation of the architectural esthetic medium: [1] the phase of *the modern traditionalism, alongside ideological pressures* of the shortlasting

GEOMETRICAL REPRESENTATION OF SAME-SCALE ANALYSIS AMONG 3 ARCHITETURES OF IVAN ANTIĆ

Abstract | Ivan Antić(1923-2005, Fig.1) , one of the most prominent architect in Yugoslavia in 20th century, attract many foreign architects for his architectures include extraordinary spaces that we cannot recognize where we are going in the building, even though he applied simple geometry in his architectural planning.

Former studies on Antić, as Perović (2003), Vojušević (2011), Alfirerić (2016) took historical approach and detected the monograph of his works. I also read the paper written by Ranko Radović and Bogdan Bogdanović, both are architects of the same generation as Antić. Although few were mentioned in terms of architectural planning and design.

This study analyse «radical gridded-space» of Antić .Before the analysis, we made the morphological crhonicle of the architectures of Antić. Then, we extracted two works which showed architeturual grids radically. For analysis, we drew schema of the three plans and sections in the same-scale, on three realized works out of the twenty Antić's architectures, the Museum of Modern Art (1965 in Belgrade), and Memorial Museum "21 October" (1975 in Kragujevac), 25 May Sports Center (1973 in Belgrade).

First, the Museum of Modern Art, like the six cubes floating, is assumed to be caused by overlaying a large squared grids of 9 m × 9 m on the second floor rotated 45 degrees to the smaller squared grids on the first floor in the plane. Second, Memorial Museum "21 October" was built as a war memorial museum. It is a building consisting of an assembly of cubes of different heights extending from a 3 m × 3 m square. After comparison between the two, we analyse equilateral triangle grids of 25 May Sports Center. which is also emphasized visually. It uses the length of 7 m, like Memorial House of Culture "Politika".

We suppose that the grid operation of planar plan leads to the loss of space grasp in the building and it can said that Antić's late works are a common feature. The way to launch the plan is also responsible for the loss of space grasp, recognized by axnometric diagrams.

Index terms | *Architecture; Ivan Antić; Geometry; Scale; 25 May Sports Center; Museum of Modern Art in Belgrade; Memorial Museum "21 October"*

1. Ivan Antić 's biography

Ivan Antić was born in Belgrade in 1923 from his Serbian father and his Italian mother. It was supposed that Antić is the architect who represents the former Yugoslavia. In 2017, Antić and his works attracted attention because Museum of Contemporary Art was reopened and his exhibition was held.

He graduated in 1942 with primary education and secondary education in Belgrade. During working in Belgrade after secondary education, he visited his father's friend, and at that time he met architect Djordje Djordjevic. The encounter deepened his interest in architecture. From 1945 to 1950 he worked at the Ministry of Transport while studying architecture in Belgrade. From 1950 to 1953 he worked at Yugoproject Office and met Stanko Klisko (1896-1969) and Vojin Simenović (1900-1978), who Antić respects as master of architecture. In 1957 he left Red and then started his own project. At the same time, he worked as an assistant later as a professor at Belgrade University. In 1976 he was elected a correspondent of the Serbian Academy of Science and Art (SANU), and in 1983 he became a regular member of the Academy. On the Washington Post newspaper, Wolf Von Eckhardt described that the Museum of Contemporary Art as "the most beautiful building of the whole communist world."

2. The purpose and object of this study

The purpose of this research is to clarify the geometric characteristics of Antić's architecture and to specify how Antić had applied gridded plan to his design.

We gathered 20 works of Antić's architecture from magazines, books, exhibitions, websites. (Figure.2) From those works, we studied works that exist and frequently described in the literature. Specifically, we selected two works of Antić from 1960 to 1980, "Museum of Contemporary Art " and "Memorial Museum 21 October". (Table.1)

3. Two Works in Square Grid

3-1. Overview of Museum of Contemporary Art (A)

It is an art museum that collects contemporary art works of Serbia and Yugoslavia in the 20th century. The number of collections reaches 35000 points. (Figure.3)

The movement of establishment of the contemporary art museum began in 1948 after the Second World War. As part of the city planning of Belgrade in 1957, an art museum was planned at the present place near the new town of Belgrade. And it decided as a co-worked design plan of Antić and Ivanka Raspopović.

The renovation of the museum was planned from the beginning of 2000, and it was temporarily closed for renovation from 2007. However, due to the death of Antić in 2005 and the construction delayed, it took 10 years to reopen on October 20, 2017. An exhibition of Antić 's own architecture was also held at the Museum of Contemporary Art.

3-2. Overview of Memorial Museum 21 October (B)

It is a war memorial hall planned in 1955 within the war dead memorial park of World War II. (Figure.4) Like the contemporary art museum, it is cooperative design with Raspopović. It is in the town of Kragujevac where the German army slaughter was done on 21st October 1941 during the World War II. In addition to the memorial hall in the park, there are Spomenik, which is a monument for the war dead. The memorial monument as a symbol of the massacre contains a museum that collects war documents such as

victim's letters. As an exhibition, there is a sound installation where the name of the victim is read aloud.

Looking at the exterior features a symbolic red brick, which is suitable for a facility to keep memory of places where many people's blood flowed.

4. Analysis of Grids

4-1. Comparative analysis of A and B

In **A** on the 3rd floor and 4th floor, the exhibition room with a 13.4m grid on the flat surface is continuous. The height is 13.4m on the 3rd floor, 11.5m on the 4th floor, which is close to 13.4m of the plan grid. In **B**, the height of the spiral staircase room of 6.24m × 6.24m plan which is formed by gathering four grids is 5.72m, the height of the diagonal line part where the smallest grid is used for the ceiling is 3.0m, the grid is the height of the central space of 9.36m × 9.36m plan which is formed by gathering nine grids is 10.7m.

Considering the section perspective, both **A** and **B** have a characteristic in how light enters. **A** is putting light into the exhibition room from multiple top lights, and light is indirectly transmitted through the void. (Figure.5 and 7) In **B**, light changes greatly due to the relationship between the characteristic chimney type top light of a square prism and the ceiling height. (Figure.6 and 8) It is common for **A** and **B** to create characteristic light space by top light and vertical operation. Also when comparing the appearance, in **A**, the top light part formed by cutting the top of the cube makes a polyhedron like crystals, and **B** is caught as a graded volume with the height of the top light. In both **A** and **B**, the top light is a diagonal element on the outside and creates a symbolic appearance.

Judged from the same scale plan **A** has a square grid of 9.6 m × 9.6 m and a square grid of 13.4m × 13.4m inclined 45 degrees to the grid. (Figure.9) A diagonal flow line and a visual effect are generated by grid inclining and overlapping. Specifically, the line of sight is moved left and right by a diagonal visual axis and the space is recognized as a continuous one like a panorama.

The plan of **B** can also be divided into a minimum grid of 3.12m × 3.12m, but it is more correct that the plan consists of a larger square grid of 6.24m or 9.36m with the grid gathered. (Figure.10) There is a part of diagonal flow line formed by joining the vertices of a square grid, thereby centrality is emphasized.

A is located within 9.6 m × 9.6 m, and **B** within a 9.36 m × 9.36 m square grid. (Figure.11) In the sense, **A** and **B** had the grids in common. Basically, the architectural baseline is determined by a grid of repeated regular polygons.

The height of **A** and **B** is determined by the size and composition of the square grid. The height is determined by the plane grid.

It is common that **A** and **B** produce diagonal flow lines and visual axes by operation of a square grid.

4-2. Works of an equilateral triangle grid

This time we targeted **A** and **B** of the square grid, but there are Antic's works with other geometric forms of grid, other works of an equilateral triangle grid as supplement content.

The 25 May Sports Center (**C**), Belgrade was built as a restaurant building of a complex for sports and recreation located at the confluence point of the Danube and the Sava River in the northern part of the Belgrade Fortress. It has been renovated and is currently used as a sports gym.

Focusing on the same scale plan, the 25 May Sports Center is an equilateral triangular grid with a side of 7.3m. In the restaurant tower was supported by the prism in reinforced concrete without top-light, the windows sided in the three sided.

The grid of **C** was associated with the Memorial House of Culture "Politika" (**D**), which included a complex facilities with theatre hall, gallery, studio and library built by Serbian newspaper company, Politika. The Memorial House of Culture "Politika" is 7.2m side, both of which are equilateral triangular grids of about 7.0m on each side. (Figure. 13)

5. Conclusion

The size of the square grid of **A** and **B**, had the grids in common, such as that of **A** within 9.6 m × 9.6 m, and **B** within a 9.36 m × 9.36 m square grid. As **C** and **D** had 7m Grid in the triangular Grids, it was supposed that the scale is determined in the form of a grid. Comparing the triangular grid, it was supposed that the square-grid supplied more various top-lights due to the production system of window-details.

The reason of this is that **A** and **B** have a common geometric feature that the scale of the square grid is similar at about 9 m and that the height is determined by the gathering and scale of the planar grid. In addition, it is common that diagonal axes are created by operations such as arrangement of grids.

As a feature other than geometry, it is common that both **A** and **B** have top lights, creating characteristic internal spaces and appearance. In the other words, Antić intended «radical gridded-space» through the experience with the unconscious plane of the architectural grid, with the help of the sky-light.

PETER EISENMAN AND THE POSSIBILITY OF AN AESTHETIC FORMALISM

Abstract | Formal considerations constitute the core aspect of Peter Eisenman's work. Arguably, they are the only consistent theme of his work, and are based on the conception that architecture is a mediation between the embodied internal world of human beings and the external physical world which we inhabit. Eisenman thus give form a 'conceptual' rather than perceptual basis, whereby universal formal relationships are more important than sensual aspects. This leaves architecture as a syntactic operation based on reason and logic, with apparent formal relationships as is its main justification. The understanding and development of an inherent formal language becomes the main goal in such an approach, and meaning is disregarded in its extrinsic character with a reference to social, historical or other representational traits.

In this paper I am discussing Peter Eisenman's views on architectural formalism through the scope of aesthetics. Since he throughout his career has disregarded aesthetic considerations, especially beauty, it is fruitful to explore and examine his stance on the properties of architecture as a way to justify his claims of formal primacy. I am basing my analysis on Nick Zangwill's formalist theories, and thus giving primacy to the formal-spatial properties of the architectural object as being judged by the human subject. This could bring back the discussions of formalist aesthetics to architecture theory and makes the judgment of architectural quality a formal issue.

Index terms | *Aesthetic properties; Formalism; Peter Eisenman; Intrinsic and Extrinsic Properties; Nick Zangwill;*

INTRODUCTION

When thinking about the intellectual aspect of architectural design, we tend to give prominence to explicitly stated ideas and concepts about the origin of the design. These ideas are expected to provide justification for formal choices and give the architect much needed guidance through a design process. Nevertheless, we are left with a question pertaining the basis for these ideas. This concerns the well-established dilemma in both the history of architectural theory and the history of aesthetics, which pertains to the question of whether formal-spatial considerations always could be reduced to the concepts or meanings associated with these shapes, or if it is possible that the formal-spatial properties are perceived independently. Obviously, this paper cannot resolve this dilemma of formalist and conceptualist aesthetics, but I intend to discuss the division on the example of Peter Eisenman, one of the most prominent architects and theorist of the last 60 years. I do not intend to give a full record of his intentions or sources, but to identify possible theoretical dilemmas that pertains to aesthetics with a basis in, but not exclusively, his early formalist work.

Arguably, throughout his career, Eisenman has tried to suppress the role of aesthetics.¹ In his search for the inherent capabilities of architecture, aesthetics has been deemed extrinsic and thus unimportant to give architecture its value. This position opens numerous questions regarding both the intrinsic properties of architecture and the following role of the subject in assessing these properties. I will start by introducing a number of definitions necessary in order to formulate these questions, that should provide a substantial foundation for further discussion of the problems in Eisenman's work.

Even if there are many approaches to the concept of the aesthetic, like the aesthetic object, the aesthetic value, the aesthetic judgment, or the aesthetic experience, it will in the case of this paper be assumed that it pertains to some kind of subjective sensation with a subsequent response. It may seem uncontroversial to say that architects have to make aesthetic judgements in order to make decisions in a design process, but what these judgements rely on is more uncertain. This is where the division between intrinsic and extrinsic properties take place, and the question is thus: Is aesthetic value based on properties that exist in the perceived object, or is it based on properties that exists outside of that object? In architecture, this relates to either the visually perceivable formal-spatial properties or to conceptually understood properties concerning representations of function, history, culture, and so on. In this dilemma Peter Eisenman's work is not so easily classified. His complex and ever-changing theories make it possible to see his position in both the formalist and the conceptualist

1 See for instance Peter Eisenman, *The Formal Basis of Modern Architecture* (Baden: Lars Müller Publishing, 1963, Facsimile reprint, 2006), 55 and Peter Eisenman, "Processes of the Interstitial: Spacing and the Arbitrary Text" in *Blurred Zones: Investigations of the Interstitial* (New York: The Monacelli Press, 2002), 99

campus. I will nevertheless suggest a possible formalist position, based on his position regarding the relationship between the formal properties of an architectural object and subjective judgements. This relation is relevant for aesthetics, I will therefore have to make a brief definition and classification of aesthetic judgements and what kind of properties these judgements rely on, to be able to further discuss Eisenman's position. In the following paragraphs I will therefore give a short summary of Nick Zangwill's position on aesthetic formalism before I return to Eisenman.

PETER EISENMAN AND THE POSSIBILITY OF AN AESTHETIC FORMALISM

Aesthetic Judgments and Aesthetic Properties

I am basing my analysis on Zangwill's views that aesthetic judgements begin with the judgement of aesthetic merit or demerit. This is a value judgement of beauty or ugliness and is thus called *verdictive* judgements.² Zangwill interprets Immanuel Kant by claiming that these judgements are subjective and has as its goal to produce a pleasing or displeasing response in the subject.³ The function of the verdictive judgement is thus to determine whether something has aesthetic value, which makes it the fundamental aesthetic judgment in a hierarchy of judgements that Zangwill describes. The next layer is the *substantive* judgements, where "substantive properties determine value or disvalue".⁴ These judgements are characterized by our ability to recognize these properties, such as the dainty, dumpy, elegant, graceful or garish. In other words, the substantive judgments are a way to describe how and why things are attributed aesthetic merit through aesthetic properties and are subordinate to the fundamental judgement of aesthetic value.⁵

It is important to note that for Zangwill, representational judgements fall short of the previously mentioned category of aesthetic judgements (verdictive and substantive). Since a representational judgement means to recognize something in an object, it is not required that we have an aesthetic response from making this judgement, even if this may be the case.⁶

This brings us to the relationship between aesthetic judgements and aesthetic properties, and subsequently the relationship between aesthetic and non-aesthetic properties, for instance between beauty and a certain arrangement of shapes and colors. Zangwill holds that "what we know as part of understanding aesthetic concepts is that if a thing has an aesthetic property, then it has some non-aesthetic property

2 Nick Zangwill, *Metaphysics of Beauty*, (Ithaca: Cornell University Press, 2001), 24

3 See Nick Zangwill, "In his Critique of Judgement, Kant characterized what he called the "judgment of taste," by which he means what I have called verdictive judgments. In Kant's view, the most basic feature of judgments of taste is that they have subjective" universality" in Zangwill, *The Metaphysics of Beauty* 26

4 Ibid, 34

5 Ibid, 36

6 Ibid, 31

which is responsible for it.”⁷ This means that aesthetic properties depend on the non-aesthetic properties, which in turn gets us to the proposition that there could exist a direct link between the physical world of objects, and the perceiving subject making judgements based on the formal properties of these objects.⁸ There is also an opportunity for this judgement to be independent of representational properties, based on what we know of certain conventions and extrinsic signification.⁹ This has significant implications for arguments on formal decisions in architecture and could clarify the problem of which properties an architectural object should have in order to hold aesthetic value.

Eisenman’s Formalism

As mentioned above, Peter Eisenman is not interested in the aesthetic properties of architecture, but throughout his career he has made several analyses on the non-aesthetic formal properties. They were not meant to generate a subjective aesthetic judgement or any certain meaning, but as an internal mechanism generating a self-referential architecture in its pure form.¹⁰ In his constant arguments against meaning in architecture, Eisenman has obviously been opposing the representational properties such as the social, historical or functional meanings.¹¹ At the same time he has equated any aesthetic judgement with the same kind of meaning, and thus denied a verdictive aesthetic judgement based on formal non-aesthetic properties. Obviously, this formulated resistance to meaning leaves open space for the possibility of a formalist aesthetic approach, especially since it presupposes a direct link between the non-aesthetic formal properties of an architectural object and the subject’s aesthetic judgement.

In his 1963 dissertation, *the Formal Basis of Modern Architecture*, Eisenman tried to establish a general theory of form with universal validity, independent of traditional conceptualist traits, such as historical considerations, moral or humanistic grounds. Formal issues were resolved with the use of a grammar of architectural elements based on a syntactic logic where all shapes were variations of a generic antecedent. In this way architecture was evaluated on terms related to language, with syntax being a basic set of rules providing the direction for a distortion of the generic form (defined as volume, surface, mass and movement).¹² The division into generic and

9 See Zangwill’s analysis and arguments against the anti-formalist approach of Kendall Walton’s *Categories of art*, in Nick Zangwill, “In Defence of a Moderate Formalism” *The Philosophical Quarterly* Vol. 50, No. 201 (Oct. 2000), 476-493

10 See Stefano Corbo, *From Formalism to Weak Form* (Farnham: Ashgate publishing Lt), 27

11 See Eisenman, *The Formal Basis of Modern Architecture*, and Peter Eisenman, *Diagram Diaries do what you want*,

12 Eisenman, *The Formal Basis of Modern Architecture*, 87

specific forms, where “form in its generic state provides the conceptual reference for all physical manifestations of specific form”,¹³ was meant to establish a universal formal language independent of style. Consequently, form and space were structured in order to produce certain relationships which were inherent in the forms themselves.¹⁴

Eisenman wanted to avoid the semantics, and thus avoid any value judgement based on representational properties or social or historical meanings existing outside of architecture. By giving prominence to intrinsic formal relationships, could architecture be regarded as neutral and objective,¹⁵ and its true representation was through axonometric drawings and diagrams which provided this non-subjective neutral point of view. In Eisenman’s cardboard houses from the 1970s the process of the formal development of the projects, as represented in these drawings, were far more important than the final buildings itself.¹⁶ Both the diagram and the axonometric was viewed as “the mediation between a palpable object, the real building and architecture’s interiority”,¹⁷ and the diagram was the tool for a generative process which created new forms within an existing geometry. It relied on the same belief for Eisenman that architecture always has been something other than the real building or the real subject’s relation to this building. Therefore, could architecture only exist in its pure form in the drawing, and the architectural object was more a record of a process, than the final result.¹⁸

Stefano Corbo has noted that in Eisenman’s pursuit of a de-contaminated architecture, free from representational properties, the justification of the process was therefore just as important as to define the formal properties of the architectural object.¹⁹ For Eisenman this led to a definition of the architectural object through the specific sequence of formal manipulations. Is architecture then ultimately a mere representation of such a process, so that in order to fully appreciate the object one had to know the way it was produced? Or was the process just a tool for the architect to produce or uncover a range of forms to choose from? The response may be in Eisenman’s desire to go beyond the subject-object dichotomy, and to produce an architecture free from subjective judgement.²⁰

19 Stefano Corbo, From Formalism to Weak Form, 27

20 See Eisenman, *Diagram Diaries*, 37 for the argument on the diagram as the “manifestation of architecture’s interiority”

From Formal Essence to the Arbitrary

In his early works Eisenman's goal was to provide a system of order, relying on a deeper structure of formal-spatial relationships and to deny the production of what he deemed to be arbitrary forms.²¹ The arbitrary is here understood as an arrangement of shapes that lacks logical consistency or is based on a purely subjective judgement. The architecture defied this arbitrariness in its relation to a formal ideal or essential formal relationship which in turn provided the premises for a claim to universality. Eisenman stated that:

“The principles in this discussion are rather to be thought of as being universally valid. Moreover, the contention will be that formal considerations are basic to all architecture regardless of style, and that these considerations derive from the formal essence of any architectural situation. It will provide a means of communication evolved from this absolute basis; a language that will communicate the nature of the formal essence of any architecture”.²²

In this statement Eisenman proves his early position on the value of architecture. It is not aesthetic, because it is not based on a subjective response of pleasure or displeasure, but based on the conceptual understanding of formal relationships, where the reference to a universal ideal or essence had to be apparent in the form. This ‘communication’ of the formal essence could therefore establish a relationship between the architectural object and the subject having a response based on the perceptual experience of that object, and subsequently the possibility for a verdictive aesthetic judgement.

Later in his career, Eisenman abandoned the formal essence of architecture in favor of the arbitrary. Since architects throughout history had naturalized the indivisible link between form and content, or “architecture’s iconicity and instrumentality”, as the moral justification of any form,²³ there could be no universal ideal, because of its relationship with the hegemony of meaning. For Eisenman, the conception and perception of architecture, how the object was seen and interpreted, were seen as two distinct relationships between man and object. Dislocating these two relationships and separating them from each other was the new goal for an autonomous architecture. Only by admitting that there could be no intrinsic essence of architecture that provided an ultimate origin or truth, could there be a possibility for new meanings.²⁴ Since: “To

21 See Eisenman explaining an Inherent order from geometric reference and the properties of the form itself. “Elaborated to encompass infinite variations and complexities. Systems deny only the arbitrary, the picturesque and the romantic: The subjective and personal interpretations of order” in Eisenman, *The Formal Basis of Modern Architecture*, 21

24 Peter Eisenman, “Misreading Eisenman” in *Eisenman Inside Out: Selected Writings 1963-1988*, (New Haven: Yale University Print, 2004, (1987)) 221

distinguish architecture from building requires an intentional act – a sign which suggests that a wall is doing something more than literal sheltering, supporting, enclosing; it must embody a significance which projects and sustains the idea of “wallness” beyond mere use, function or extrinsic allusion”.²⁵ This created the paradox for architecture to overcome use and extrinsic signification, but without the use, function and extrinsic signification there would be no conditions which required this intentional act of overcoming. The only way to do this was by removing authority, removing the designer and allow the arbitrary.²⁶ For Eisenman this arbitrariness was to be understood as a new fight for autonomy and criticality through a “dynamic process of difference” and not as a search for the ideal and universal.²⁷ This meant canceling the subject completely, and does not at first sight allow any aesthetic judgement.

Formalism against meaning

As we have seen the architecture exists for Eisenman in-between the internal world of the human being and the physical world which we inhabit.²⁸ It is the ‘diagram’, ‘process’, ‘communication of formal essence’, ‘text’, ‘dislocation’, ‘presence’ or ‘absence’ or any other term Eisenman has been using throughout his career. This in-between state has for Eisenman provided the possibility of an autonomous architecture without any extrinsic significance or meaning,²⁹ or without any representational properties. If we think of this in-between state as the aesthetic, with aesthetic properties which the aesthetic judgment relies on, then I could propose a direct formalist position for Eisenman. Architecture in this understanding is concerned with formal-spatial properties that can be perceived independent of extrinsic content, and since there is no clue in Eisenman’s writing on the denial of this point, his hunt for autonomy is possible. This reliance on architecture’s intrinsic properties could therefore give primacy to a verdictive aesthetic judgement, based on the apparent formal properties. This issue may have been introduced by Eisenman himself in a recent comment in an interview, where the most important issue for any architectural project is that it “looks good”.³⁰ Could that be the beginning of the introduction of the subject in Eisenman’s

25 Peter Eisenman, “Aspects of Modernism: Maison Dom-ino and the Self-referential Sign” in *Eisenman Inside Out: Selected Writings 1963-1988*, (New Haven: Yale University Press, 2004, (1980)) 120

28 See Peter Eisenman, “Post/El Cards: A Reply to Jacques Derrida”, *Assemblage*, No. 12 (Aug. 1990), 14-17, stating the same in-between position for architecture as between “sign and being” or between “absence and presence” as *presentness*, 16

29 Eisenman (2000) p. 91

30 See Eisenman’s statement in Vladen Djokic and Petar Bojanic (ed.) *Peter Eisenman: In Dialogue with Architects and Philosophers*, (Milan: Mimesis International, 2017) “Every time a student presents something, and they give me this hullabaloo about process and all this, I say, you know, in the end, it either looks good or it don’t. I say, I am sorry; this one doesn’t look good”

continuous work against extrinsic meaning in architecture? It certainly opens up for the possibility of an aesthetic formalist position in his work.

Amund M. Rolfsen (b.1989) is currently a Phd candidate in architecture theory/history at the Norwegian University of Science and Technology (NTNU), where he is working with aesthetic problems in the development of contemporary architecture theory. He has a MSc in Architecture (2017) from NTNU with an exchange at Aalto University in Helsinki and has previously worked as a lecturer, research assistant and teacher at the master program in Architecture at NTNU. Rolfsen is also a partner in the small architecture firm Studio Mini Super in Trondheim.

THE ADDED VALUE OF REGENERATIVE ARCHITECTURE AND CONTEMPORARY AESTHETIC PHILOSOPHY

Abstract | Regenerative architecture seeks to impact positively on an environment. Its aim, Raymond Cole argues, is to produce buildings that “reduce the degenerative consequences of human activity on the health and integrity of ecological systems.”¹ This positioning as ‘greater than’ or additive rather than subtractive is, however, at the core of regenerative architecture’s challenge for the designer: a challenge that means not only understanding the intention, but being able to evaluate its positive potential. To add value to an environment, the real condition against which ‘adding value’ is determined has to be measured. Moreover, there is a need to reconcile, as Cole writes: “widely different interpretations of value and value-adding that exist within the sustainability movement.”² The paradigm that underlies the regenerative approach, as Chrisna du Plessis states, is one that allows this ‘greater than’ character to be conceptualized but the regenerative approach is one that also calls for radical changes to structures of society: changes to a dominant world view that “sees nature as machine, understood and managed by reducing it to its parts.”³ Thus, within the field of regenerative design, theoretical underpinnings can elevate ways of seeing and understanding that privilege the environmental, over the social and functional over the aesthetic, while at the same time all seen within the context of radical change. Aesthetics, which tend towards the biophilic and biomimetic within such approaches, are one of the domains that regenerative designers suggest can add positively to the environment. In this paper however, I examine firstly, the idea that the conversation in sustainable design diverts attention away from aesthetics, especially in the field of architecture and secondly how the rediscovery of ecological aesthetic in regenerative architecture that challenges structures of society might be understood as a social and political activity: regenerative design hence becomes a mode of aesthetic inquiry.

INTRODUCTION

At the heart of regenerative design is a challenge: a challenge to understand its ability to impact positively on an environment and to be able to evaluate its additive sum character. Regenerative architecture aims to design buildings that reduce their negative impact on the environment. Raymond Cole writes that regenerative architecture aims to “reduce the degenerative consequences of human activity on the health and integrity of ecological systems.”¹ This positioning as better than (a qualitative measure) or “greater than” (a quantitative measure) - as additive rather than subtractive - raises a question, nevertheless, about the real condition against which such added value is measured.

Widely different interpretations of what sustainable architecture is exist within the sustainability movement. Interpretations stretch from those governed by conservative perspectives to radical approaches calling for social transformation, and this means that evaluating regenerative architecture also requires reconciling what Cole sees as : “widely different interpretations of value and value-adding that exist within the sustainability movement.”²

The regenerative approach to architectural design has a broad base of concern, and aesthetics are included. These tend towards the biophilic and biomimetic as those that are attributed with positive impact. However, in the performance-dominated, engineering-heavy field of sustainable architecture, the politics of aesthetics have been neglected. While sustainable designers propose finding new ways to live, few scrutinize aesthetics as encompassing the aspiration to find new ways to live.

In this paper, I thus examine sustainable design theory that diverts attention away from the sensual; and secondly, I examine how regenerative architecture might be conceived as mode of sensory inquiry. The intention, in all these sections, is to think, in part, outside traditional understandings of regenerative design, and to include in this an examination of the aesthetic dimension.

The positive sum impact of regenerative architecture

Regenerative architecture adds more to an environment than it takes away. Its sum impact is positive. The paradigm that underlies the approach, Chrisna du Plessis states, is one that calls for radical changes to structures of society, but at the same time, allows for the conceptualization of this “greater than” character because it adopts a world view that: “sees nature as machine, understood and managed by reducing it to its parts.”³ The additive quality appears to us as a quantitative measure but what is radically aspirational in intention may not easily be measurable.

Before such exploration, I would like to take a detour from the path to delve deep into

this regenerative quality. I would like to present a story. Stories can touch us subtly and my motive, here, is to evoke a connection to some sense on the periphery of our vision, in the liminal spaces of our thinking and feeling. The story is of Inanna, goddess of heaven and earth: a Sumerian goddess and a goddess of one of the first known cultures.

Symbols of the goddess present a resistance to male privilege, but Inanna's story is more than a simple resistance. She has strength and cultural skills. She has an independent will. She is not a passive and receptive female character of patriarchal myth, and yet her strength acts not to overcome rule, not to resist progress, or to resist logos modes of thinking (logic and reason).⁴ She shares the knowledge found in her journey with the male gods and it changes them and their rule. It was her own decision to explore prohibited spaces outside of her culture. Inanna's story is a demand for recognition as an equal, in her new understanding of life. Inanna's story is about a passion for an exploration of life itself and this meant a descent into the underworld and inevitable death, but from which she returned. She is a goddess of regeneration.

Wolkstein and Kramer describe all the written stories of Inanna as stages of life. In youth, for example, the young Inanna, leaning against the apple tree, "rejoicing her vulva, wonderous to behold," as the prose states, and calls out: "I the queen of heaven, will visit the god of wisdom,"⁵ and she sets out, by herself, to Enki, the god of wisdom and a creative, sculptor god. He was an inventor and an improviser; a problem solver. He was called an "image fashioner" and "god of the original form, archetype."⁶ He was not especially bound by obedience to the other patriarchal gods and this makes him occupy, like Inanna, the space between an old (patriarchal order) and a new social and environmental relationship.

He was a god flowing with life, and with creative energy, and Inanna sought him out. The story says that beguiled by Inanna, and in a drunken state, Enki gave her the "Me,"; that is to say, he gave her all of Sumerian culture, all the laws of heaven and earth, all the ordering principles and potencies, rites of civic society, all the skills and talents. He gave the young Inanna all his creator-god knowledge. "He gave me," she sings:

the high priesthood... He gave me the art of forthright speech. He gave me the art of slanderous speech...He gave me the art of the hero. He gave me the art of power... He gave me the secure dwelling place...He gave me the craft of the woodworker... copperworker...scribe...smith...leather maker...fuller...builder...reed worker.⁷

Enki gave Inanna the art of Sumerian culture, and the story continues: "Then Inanna standing before her father [the moon] acknowledged the me Enki had given her."⁸

However, in her more mature search, she casts off these forms of culture given to her by the god to understand life beyond the gods rules and creations. Inanna, in her

descent into the underworld, wanted knowledge of what was real and what was life. The realm was forbidden by the gods: she wanted to feel and to witness-with her sister (the goddess of death), her grief for the death of her husband.⁹

Inanna's decent to the underworld was her decision: "the goddess opened (set) her ear, her receptor for wisdom, to the Great Below."¹⁰ Inanna decided to go into the underworld and was condemned to death, but Enki saved her, brought her back, regenerated her, (the only god to offer help) sending messengers made of dirt, carrying the food and water of life to revive her and allow her escape.

Inanna's story, which is expressed here all too briefly, is about a desire to understand living beyond what is known or permitted to be known in the existing system; to be able to travel outside the frame of contemporary cultures (or the me). Her stories tell us to listen to a different way of knowing, to "see" differently, imperfect ways perhaps, or just different ways. Like many other different approaches that could be suggested to us as a different manner of understanding living: she 'sets her ear'.

For the psychoanalyst Sylvia Brinton Perera, the myth holds a pattern of seasonal transformation and rebirth that has a psychological connection. Perera writes of Inanna:

She represents the liminal, the intermediate regions, and energies that cannot be contained or made certain and secure. She is not the feminine as night, but rather she symbolizes consciousness of transition and borders, places of intersection and crossing over that imply creativity and change and all the joys and doubts that go with human consciousness that is flexible, playful, never certain for long.¹¹

Regenerative architecture, political aesthetics – a new theoretical diversion

To return, then, there are three philosophers that I would like to draw on to explore further this "eye" on a regenerative aesthetic: Jacques Rancière, for his political aesthetics – a human right for all that in its freedom spills over into a criticism of social, environmental and economic conditions;¹² Gernot Böhme, for his architectural aesthetic of atmosphere – a sensory aesthetic most appropriate for architecture;¹³ and Luce Irigaray, philosopher and feminist, for her new human¹⁴ – born with its own will to live, (but unrecognized) and that demands an environment in which to grow and develop freely.¹⁵

Jacques Rancière's early academic publications looked to the journals of artisans and poets, to books that eluded history, to discover historical perspectives that had not always been seen.¹⁶ For Rancière, these were works of authors whose views were equally as valid as any other more traditional record of history. From the beginning his work was an engagement with understandings of equality. The people he acknowledged were not naïve, or ignorant. Their stories were neither inferior, nor illustrative of a lesser knowledge. In the Ignorant Schoolmaster, for example, he argues for just this,

for a levelling of knowledge in a new educational community: “one based on undoing the rigid stratification of scholars and their knowledge - a kind of levelling at the top – and the creating of a convivial, open, more egalitarian atmosphere in the schools.”¹⁷ Rancière was dismantling the inequality between teacher and student.

Dismantling the distinctions made between the world of art (available only to those educated in taste) and an art of everyday life - between the traditions of the avant-garde and the aestheticization of common existence (or life) and in the “setting of our ear” (the attitude or approach of Inanna) to life - is potentially socially and environmentally transformative. The aesthetic dimension in life, and the staging of this experience, Rancière argues, can revolutionize life.

The philosophy of Rancière aims to reframe our aesthetic experience, where politics and everyday affect share the same space: “...the original scene of aesthetics,” he argues, “reveals a contradiction that is not the opposition of art versus politics, high art versus popular culture, or art versus the aestheticization of life.”¹⁸

Preconceptions abound, and aesthetics is fraught with concerns about seduction and the “marketing” of sustainability. In the aesthetic experience, however, for Rancière, art and the spectator are caught up in a specific sensorium, cancelling the oppositions of activity and passivity. In this free play, art understood as being without practical function, and art of the revolutionary, are not counterposed, and this scene or plot, he argues, “...promises a still unheard-of state of equality.”¹⁹ However, being “political” in this context, also carries ambiguities. This both is, and is not, political: “Aesthetic art promises a political accomplishment that it cannot satisfy, and thrives on that ambiguity. That is why those who want to isolate it from politics are somewhat beside the point. It is also why those who want it to fulfil its political promise are condemned to a certain melancholy.”²⁰

Rancière’s political aesthetics are not developed with the same attention by other aesthetic philosophers but, Rancière is not necessarily discussing architecture. Gernot Böhme, a contemporary German philosopher, however, is, by contrast, in his theory of atmosphere. The theory of atmosphere is the only aesthetic theory appropriate for architecture, he argues.²¹ For Böhme, architecture has to be understood as sensory experience and as a co-production of experience between subject and environment. Architectural atmosphere is “felt” (but there is here no distinction between thinking and feeling in the lived-felt-body). His work on an ecological aesthetics adopts this same approach of co-production, challenging our usual understanding of lived bodies in the environment. Nature is ahead of us, to be co-constructed and reconstructed forever, in our aesthetic expression. Our understandings of nature (and perhaps we could also say

of life) are to be created in our stories and in our regenerative architectures.

The third philosopher is Luce Irigaray: critical of current environmental debates and arguing that they separate thinking from living. She argues that before any ecological deliberation “it would be advisable to wonder about what being alive signifies, and whether we are really living, or how we could be or become living.”²²

This is a discovery, but not as rediscovered truth of an original way of thinking and feeling about life. One of our strongest cultural motives, Irigaray argues, is this search for origin seen in academic research, philosophy, art and also in the background to theories of sustainable design. This motive for the disclosure of origin - as a foundation upon which to construct something new - is of a patriarchal societal construction. It is an equal and different relationship between two humans that goes unrecognized in philosophical traditions and patriarchal cultures. The search for original ways of feeling and thinking are symptoms of patriarchal cultures. Recognizing the incompatibility of such a search with the aesthetic construction of new notions of the human being could free humans from the desire always for (re)connection with a refound origin, and from the seduction of affect: nothing has been lost, so nothing is to be regained. In this way desire towards excessive consumption could be mitigated.

Discussions in sustainable design condemn aesthetics because they are based upon the artificial distinction of seeing and doing, but sustainable design as mode of inquiry calls upon us to journey outside traditional understandings of living to give up the security of (patriarchal) logos, the security of (mathematical) reasoning, to adopt some imperfect ways of thinking. Stories can help us draw connections. Stories can illustrate particular complications in living, but stories also level the storyteller and listener. Inanna’s stories are those of her own rights and responsibilities in life in a world otherwise full of artificial “oughts” and “should”. She has choice and will. She brought her own gifts, adding to the “me” given to her by Enki: “She brought allure. She brought the art of women. She brought the perfect execution of the me.”²³

Conclusion

To return (and Inanna did return from the underworld) to regenerative architecture, and to its character, that is to say, to give more back than is taken from an environment: the role of aesthetics takes on a new fascinating intent towards liberation. The additive character of regenerative architecture could be described as an approach giving back to logos by “setting an ear” to what lies outside our reason; to what it means to live, to die and to be reborn with new knowledge. This would be a continuous and changing movement: the intention of an ecological aesthetic and thus the discovery of a perspective very different to rational approaches to sustainable or regenerative

design or to the attribution of a calculable positive impact.

The ecological aesthetic of a regenerative architecture could also be the addition of the “eyes of life,”²⁴ seeking to see through values that are false, and beyond what is good or bad, to what is before judgement. This may not be an aesthetic that is validated by the collective,²⁵ but it would be a fresh perspective, full of affect and full of the creative intention of a never-ending exploration.²⁶ Perera writes that the current order fears it, because: “It is crude, chaotic, surprising, giving a view of the group below ethics and aesthetics and the opposites themselves: It is the instinctual eye – an eye of the spirit in nature.”²⁷ Inanna’s fate, as Perera writes, is that she must see the limits of the fathers and be witness to what was repressed.²⁸

Andrea Wheeler is an Assistant Professor of Architecture at the Iowa State University where she teaches classes on Green and Sustainable Architecture and is a studio instructor. Her work is about sustainable buildings: she cares about lifestyle change, the actual performance of buildings and challenging the sustainability agenda in architecture. Most recently she has been engaged with the philosophy of sustainable design, presenting papers at conferences organized and hosted by the philosopher Luce Irigaray, including "Thinking Love" at the University of Bristol in June 2016, and "To Be Born: Genesis of a New Human Being" at the University of Sussex, Department of Philosophy, in February 2017. Her most recent publication will be a book chapter in *Towards a New Human Being*, a collection of works edited by the philosophers Luce Irigaray, Mahon O'Brian and Christos Hadjioannou. She is currently a research

AN EMPATHIC AESTHETICS OF THE SOIL. THE DESIGN OF NO-THING

Abstract | The Jerusalem Committee was set up in 1969 by Jerusalem Mayor Teddy Kollek as his advisory body in order to discuss future urban development of the city of Jerusalem, based on the master plan prepared in the previous year by Israel's urban planning professionals which aimed to solve problems in housing, transport, commercial redevelopment, and even political unification, all of which the city urgently needed to solve, by proposing "a new, functional high-modernist Jerusalem, eight times larger" than the present state in those days. The Jerusalem Committee consisted of some seventy renowned international "outstanding friends of Jerusalem," selected and invited by Mayer Kollek himself, from different fields: theologians, clergymen, philosophers, architects, landscape architects, urban planners, artists, architectural critics, economists, journalists, lawyers, etc. The invitation was made on two separate occasions. Following the ceasefire of the Third Arab-Israeli (Six Day) War in June 1967, Kollek had initiated the development, beautification and restoration of the city of Jerusalem. It was at this point that Kollek invited more than forty members from Europe, North and South America, Asia and Africa to form the Jerusalem Committee, "a world advisory council" concerned with the future physical and cultural development of the city. The first meeting of the committee was held in July 1969 in Jerusalem. At this meeting, the establishment of specialized subcommittees in which "a particular expertise could contribute to various facets of Jerusalem's development" was suggested. This led to the convening of the "Townplanning Subcommittee" of the Jerusalem Committee in December 1970, and the inclusion of about thirty additional experts in architecture, urban planning, architectural history and theory, and art. From the fields of architecture, landscape architecture, and art, well-known figures such as Louis Kahn, Philip Johnson, Isamu Noguchi, Henry Moore, Bruno Zevi, Lewis Mumford, Moshe Safdie, Nikolaus Pevsner, and more accepted Kollek's invitation to be members of the committee. In terms of its openness to views and opinions from outside Israel, the committee was a remarkably ambitious, challenging, multinational exercise. Half a century after the establishment of this committee, in 1969, this paper examines the ways in which enhancement of "the physical beauty of Jerusalem" and manifestation of "universal spiritual truths basic to all faiths and peoples" were pursued through exchanges, often heated, of multinational views in the Jerusalem Committee.

Index terms | *Empathic aesthetics; imagination as a cognitive tool; potential metamorphic growth; Things and unfinished object; atmosphere; kinesthetic and temporal transfer; a dwelling perspective; dwelling-mobility; appropriation in use; co-creation; sustainability and resource efficiency, sensoric infrastructure strategies.*

The paper asks how to do design today, where climate changes can be seen as the ultimate product of human design, and we no longer can continue to build extractive monument but have to build with the ruins. The way we use our resources and develop our infrastructures in efficient and sustainable ways is getting more and more relevant for both academics and policy makers. The paper argues for an epistemological shift from output to outcome; from aesthetic fixating and manicured objects to things in the Old English socio-material sense as assemblies; as incomplete forms and unfinished objects in flux based on **intra-action, co-creation, appropriations**, metamorphoses, and self-investment as a way to grub alternative and sustainable passages in the ruins. By investing oneself in things bonds are made changing the perspective from commodity to gift like in today's talk about a *we-economy*. Using the sublime in its original rhetorical meaning as a state of pathos; an emotional ecstasy outside the body, the paper coins the term '*empathic aesthetics*' linking to early research in psychology of aesthetic responses, which states that being 'em-pathic' (in-pathos) surpassing the material sensory perception is a precondition for the aesthetic experience. It is about investing oneself in things using the imagination and intuition sensed at the limit of the body in its *brute being* through the *body without organs* cf. Merleau-Ponty and Deleuze similar to Goethe's use of the imagination as a cognitive tool to explore the inner potential of the *Ur-phenomena*. The paper argues that it is possible to transmute the picturesque landscape model into a lived environment going beyond the linear perspective through a dwelling, temporal and embodied perspective characterised by an earthbound sublime in order to bring romantic values associated with vast horizons and untouched wildernesses closer to home. Subsequently by coining the term *empathic aesthetics* the paper aims at linking the idea of the potential, metamorphic and imaginary with the design of *no-thing* based on an understanding of things and infrastructures as temporal unsolid forms and embodied spaces. The paper draws its inspiration from architect Aravena's 'Incremental Houses' strategy to *build half a good house*, which literally and metaphorically makes room for people to engage based on their needs, economy and imagination as well as the city's 'undesigned' non-places; unoccupied, neglected sites and industrial ruins with their inherent potential for metamorphic growth based on imagination and improvisation connected to atmosphere theory as a theoretical approach. Finally the paper considers new sensorial design approaches using artistic, inscriptive practises as empiric design tools to design *no-thing*; temporal, flexible embodied infrastructure strategies leaving unoccupied sites free for adventurous, rooted dwelling performances yet to be.

HOW TO DESIGN TO DAY

Where climate changes can be seen as the ultimate product of human design? As Bruno Latour and Isabelle Stenger state, we can no longer continue to build extractive monument but have to build and live with the ruins, because there is no other possibility, as Gaia is here to stay.¹ There exists an epistemological need for new sustainable ways of thinking and designing urban infrastructure, which makes it possible and attractive to reuse resources converting our throw-away mentality. We have to co-exist through co-creation, reuse, appropriation and self-investment. One way to think of this is through Peter Sloterdijk's description of how we today live in a heterarchical '*foam city*'; a spatial plurality of bubbles existing in a flux of assemblies in- and unfolding, which, he states, implies a new economy of movement. This echoes the *we-economy* concept based on interplay and sharing of knowledge and resources, which makes it cheaper, more effective and attractive to co-create solutions and values

1 Latour, Bruno; Stenger, Isabelle; Tsing, Anna; Bubandt, N.O..
 "Anthropologists Are Talking – About Capitalism, Ecology, and Apocalypse." *Ethnos* 83:3 (2018): 602

for current, particular occurrences.² By investing oneself in things empathic bonds can be made based on a value system beyond functionality, pure aesthetics and economical reification changing the perspective from commodity to gift adding an auratic value. Likewise design professor Erling Björgvinsson defines infrastructure as a socio material Thing: "...it is relational and becomes infrastructure in the relationships between design Things at project time and...design Things in use."³ It is both a mental and a material structure as in activity theoretician Yrjö Engeström's way of using the term mycorrhiza, literally meaning a fungus root describing a symbiotic association between the fungus and the rhizosphere of a plant, to outline a infrastructure of fluid assemblies consisting of improvised, collective performances:

"...mycorrhizae formation is simultaneously a living, expanding process (or bundle of developing connections) and a relatively durable, stabilised structure; both a mental landscape and a material infrastructure".⁴

From output to outcome

Living with the ruins implies an understanding of architecture and infrastructures as an immaterial practise of incomplete and unfinished forms in flux focusing on outcome instead of output replacing aesthetic fixating and manicured objects with things in the Old English socio-temporal sense as assemblies like Bruno Latour's *Parliament of Things* and Albena Yaneva's *Ethnography of Architecture* understanding architecture as a practice that takes place within the networks of human and non-human actors.⁵ In the same sense the speculative realist Tristan Garcia describes how a table is not in the table, but outside itself, in its environment⁶, and how the mathematician F.G. Asenjo describes inconsistent physics stating that "each object in the world is not merely itself but involves every other object and in fact is everything else"⁷ It is about how an object emerges and grows in connections with the world. Like Karin Knorr Cetina's notion of *unfinished objects* not only to be understood as open for appropriation in use and multi functionality but also as the way they enter into relations with it's surroundings gatherings in assemblies.⁸ As Celia Lury states:

8 Cetina, Karin Knorr. "Sociality with Objects: Social Relations in Postsocial Knowledge Societies." *Theory, Culture & Society* 14, no. 4 (November 1997): 1 - 30

“Think about the relationship of the unfinished object to an environment or ecology in which the individual human user is not the only or even necessarily the most important element of the environment. The “user” might thus be understood variously: as some kind of collective, mass, assemblage or ecology (including other objects and the natural environment). And of course the notion of unfinished-ness directly introduces the notion of temporality – thinking the future of the object as something to be considered as implicated in the present of the object.”⁹

As such this paper takes a non representational position in-between physicist and feminist Karen Barad agential realism, where everything comes to exist through intra-action¹⁰, and speculative realism’s belief in an a priori representations of the object in itself¹¹, believing in intra-action, where existing is carved out of an inherent ontological indeterminacy characterised by ‘response-ability’ towards the surroundings, but at the same time acknowledging the thing’s ‘thing-hood’. Like Deleuze’s transcendental understanding of existence sensed on a pre-reflective plan through the brain-subject being neither a subject nor an object but consisting of real virtual intensities:

“Indeed, the virtual must be defined as strictly a part of the real object – as though the object had one part of itself in the virtual into which it plunged as though into an objective dimension .. The reality of the virtual consist of the differential elements and relations along with the singular points which correspond to them. The reality of the virtual is a structure.”¹²

Things develop their properties and derive their significance from the relations that link them, rather than from the intrinsic features of individual elements, but objects entering into relations with other objects are at the same time partial representations of an object’s materiality defined by the ways qualities are exchanged.¹³ Like **philosopher Carsten Friberg sees a** thing as an interpretation of what we encounter in our practice instead of a fixed object.¹⁴ Different qualities and meanings emerge in different contexts actualising certain parts while ignoring others. This epistemological shift in focus from output to outcome makes it possible to form alternative and sustainable

passages in the ruins. Like Björgvinsson talks about a shift from design of objects to "... design Things that support good environments for future design Things at use time.¹⁵

An empathic aesthetic of the soil

To grasp this change the paper terms an '*emphatic aesthetic*', which focuses on the incomplete and unfinished through an embodied temporality characterised by an earthbound sublime as a way to take the romantic values associated with vast horizons and picturesque panoramas, and bring them closer to home, where the horizontal line is replaced by a vertical view in the soil. Using the sublime in its original rhetorical meaning as a state of pathos; an emotional ecstasy outside the body, the paper bases the coining of empathy with aesthetic on early research in the psychology of aesthetic responses. Psychologist Robert Vischer invented the term '*Einfühlung*' in 1872 in order to describe how being 'em-pathic' (in-pathos); putting yourself in something's place through sublime and affective insight and imagination surpassing the material sensory perception is a precondition for the aesthetic experience.¹⁶ This kind of empathic mirror play characterised by a state of being in-patos and being susceptible; *response-ability* as Barad describes it, is a precondition for the aesthetic experience. It is an emotional grip surpassing the bodily, material sensory perception by being 'outside yourself'. It is a chaotic condition sensed at the limit of the body in its *brute being* through the *body without organs* cf. the philosophers Maurice Merleau-Ponty and Gilles Deleuze¹⁷ opposite the intentional lived body's repetitive perceptions similar to Hermann Schmitz's distinction between the material body (Körper) and the felt body of extra-organic dimensions (Leib).¹⁸

To describe the empathic process, Vischer uses '*the will of phantasy*'. He wants to show what happens in us, what our imagination does in the object, and how the actual reaction of the will of phantasy is based on imitation.¹⁹ Like in *speculative aesthetic* cf. *speculative realism*, it is about speculating, imagining, and identifying with things through empathic projections reaching beyond anthropocentrism using the imagination and intuition²⁰. Similarly to how Johann Wolfgang von Goethe uses imagination in order

to understand nature, which he doesn't believe can be explained fully by science. To him nothing occurs that is not connected to the whole. His scientific method seeks to do justice to this essential insight into the connectedness of all phenomena: "*In der lebendigen Natur geschieht nichts, was nicht in einer Verbindung mit dem Ganzen steht.*"²¹ In his studies of metamorphoses in nature like *Versuch die Metamorphose der Pflanzen* (1790) he uses *Die exakte sinnliche Phantasie* as a cognitive tool to move into the thing and reach the *Urphänomen*, where the potential and the actual form exists mutually uniting the metamorphoses of a phenomena. Like the plant in all its phases is variations of the leaf: "*die innere Identität der verschiedenen Pflanzenteile, welche uns bisher in so mannigfaltigen Gestalten erschienen sind*".²²

Design professor Mads Nygaard Folkmann also proposes an *aesthetics of imagination* to investigate the dynamics of the possible in the phase of designing, and afterwards in the enabling of transfigurative strategies, which underpins an ontology of design that combines materiality and immateriality, actuality, and possibility.²³ "*I propose a foundation for design that takes into account that being is always permeated by structures of nonbeing that are difficult to grasp firmly but leave traces that are important to understand in relation to the creation of meaning in design.*"²⁴ Empathy and imagination are important reconciling cognitive tools with which to master potentiality and temporality to develop design strategies for new sustainable ways of being through metamorphic rebuilding the ruins.

A dwelling mobility

The heritage of the eighteenth-century picturesque landscape model continuous in many ways to influence contemporary aesthetics. Latour points out: "*..it is in very large part from painting – landscape painting in particular – that we draw the basis for our conception of nature.*"²⁵ This picturesque view affects our relation with nature. As cultural geographer Tim Edensor describes it: "*Linear perspective does not only frame a represented scenery as 'the landscape' in two dimensional form, but also a fixed relationship between object and subject, locating the viewer outside of the picture, and outside of the relationship being depicted.*"²⁶ But today where human-made climate

changes make geological imprints it does not make sense anymore to see the landscape as something framed and untouched, we can watch at a distance. This scenery model requires us to look at nature as if it were a picture postcard, where the environmental model involves recognising that nature is an environment and thus a setting within which we exist, as professor in environmental aesthetics Allen Carlson states in relation to the aesthetic appreciation of nature.²⁷

Like William Cronan expressed it as early as 1995: *"There is nothing natural about the concept of wilderness. In wilderness we see the reflection of our own unexamined longings and desire. For this reason, we mistake ourselves when we suppose that wilderness can be the solution to our culture's problematic relationship with the nonhuman world. (...) The tree in the garden is in reality no less other, no less worthy of our wonder and respect, than the tree in an ancient forest. (...) We need to honour the Other within and the Other next door as much as we do the exotic Other that lives far away - a lesson that applies as much to people as it does to (other) natural things. In particular, we need to discover a common middle ground in which all of these things, from the city to the wilderness, can somehow be encompassed in the word "home." Home, after all, is the place where finally we make our living. It is the place for which we take responsibility..."*²⁸

Health research describes this positive state in-between *home and adventure*, which Cronan talks about, the deepest possibility of existential well-being. Terming it the *'dwelling-mobility'* as it carries with it a feeling of both rootedness and flow, peace and possibility, the *'adventure'* of being called into expansive existential possibilities, as well as *'being-at-home'* with what has been given. When a person is absorbed in the present moment, they are tuned into a kind of temporal focus that offers *'at oneness'*, an intimacy and empathic sense of belonging and deep connection with what is happening in the moment.²⁹ The dwelling perspective situates a person right from the start, in the context of an active engagement with his or her surroundings.³⁰ We have to dwell before we can build, as anthropologist Tim Ingold states with reference to Martin Heidegger. The character of a place arises from occupation and use over time as the apprehension of the landscape in the dwelling perspective must begin from a recognition of its temporality characterised by an indexical connectedness. *The process of dwelling is fundamentally temporal* opposite the building perspective, where the surroundings are built based on a pre-existing design untouched by human activity.³¹

Research in neuro anthropology shows that vision is dependent on a culture's visual environment and socialisation practices.³² It can be both analytic/linear like in Western countries and holistic/relational like seen in Asia *giving substance to the in-between of things as described by the Japanese concept 'ma'*.³³ As such we can influence and change how we experience and see our surroundings through design. Through a dwelling perspective based on an empathic aesthetic understanding of our surroundings it is possible to take into account the metamorphic and potential growth of things, where forms arise by being in things as they emerge transmuting the landscape into a lived environment. This view is similar to the Japanese architect Mitsuo Inoue's movement space:

*"..unlike geometrical spaces, the positions...of compositional elements relative to some overall framework are unimportant; instead, as in topology, what is important are the positions of elements relative to each other; the spatial components are observed successively...the observation of movement space, therefor, is always postulated on the viewer's movement, whether actual or intellectualised."*³⁴

Walking around we not only get an image of things but an overall impression of a form and the surrounding space, also the invisible sides, you don't see,. Like Merleau-Ponty's '*perspectiva naturalis*' which opposite '*perspectiva artificialis*' reproduces the way the eye looks recording the world through a flow of fragments that can never be kept within a mathematical system.³⁵ In this sense architectural historian Lain Borden talks about a *Body Architecture*, a creation of space through bodily processes inspired by skateboarding as a way to create an engagement with the surrounding space. How skateboarding transforms the relation between the horizontal and vertical dimensions through movement. It is a gestural space, a space of flow and action, of direct engagement with the terrain. Cf. Michel de Certeau's rhetoric of walking³⁶ as well as the *dérive* strategy made by the Situationists but adding to the temporality a spatial relationship, where lines capture space creating new vertical and temporal dimensions reshaping our experience:

"A heightened consciousness of the material textures of the city, and the sounds and tactile experiences they produce with the skater, as well as a transformed relationship of the body with verticality and diagonality, challenges the hegemony of normative linear, upright bodily positions, producing a more three-dimensional engagement with

space".³⁷

The Design of No-thing

Like Borden this paper is interested in, what happens to architecture when appropriations of space are created through bodily processes opposite the conventional realm of architecture as the production of built spaces. Regarding this the paper is inspired by the architect Alejandro Aravena's 'Incremental Houses' concept based on the social strategy to build half a good house, which literally and metaphorically makes room for people to engage and invest themselves based on their imagination, needs and economy.³⁸ The concept is an example of a social and temporal design thinking that understands products as unfinished objects leading in a more sustainable direction towards reuse, adaption, appropriation in use and co-creation. As designer and researcher Lucy Kimbell's pragmatic rethinking of Design Thinking, which acknowledges the emergent nature of design outcomes as they are enacted in practice.³⁹

Likewise the city's 'undesigned' non-places and in-betweens like industrial ruins as well as unoccupied slots, brownfield sites, rubbish dumps and scrubland also possess an inherent potential for metamorphic growth due to their fragmented nature. Things fall apart and new constellations arise making different interpretation and articulations possible. Opposite the manicured landscapes the fragmented nature of the ruins makes room for surprises, tactile meetings and glimpse of the past. As cultural geographer Tim Edensor explains: *"In ruins, the linearity of narrating the past is upstaged by a host of intersecting temporalities which 'collide and merge' in a landscape of juxtaposed 'asynchronous moments'...a spatialisation of memory which evolves 'crossing, folding, piercing."*⁴⁰

This spatialisation of memory enables an embodied sensual way of remembering, which supports the apprehension of the landscape as temporal. Like in Goethe's Urphänomen the potential and the actual form exists mutually through an imaginary approach. As Edensor continues: *"They foster imaginative apprehensions of urban space, alternative modes of moving through the city and ways of encountering otherness which involve dialogue, creativity and improvisation."*⁴¹ It is a kind of relationship with space, which possesses empathic aesthetic qualities driven by affection, imagination, intuition and improvisation creating emotional grips surpassing the physical sensory system sensed through the body without organs. Like Borden points out: *"The somatic experience of the ruin might be compared to that of the 'body-without-organs' described by*

Deleuze"⁴²

This concept of 'non-places' or 'empty spaces' and their metamorphic potential for intra-action exemplified above has led to the idea of the design of 'no-thing'. Atmosphere is a way to approach the design of this kind of 'empty spaces' using it's environmental character as a rhetorical and aesthetic concept. Atmosphere can be characterised as a kind of half-thing in-between all things named almost alike by neo-phenomenologist: 'half-entities' by Hermann Schmitz, 'quasi-things' by Tonino Griffero and 'quasi-objects' by Gernot Böhme.⁴³ Following Böhme this paper does not see atmospheres as individual sensorial experiences or something floating around. Atmospheres are in themselves unfinished objects. Like non-representational theorist Ben Anderson explains: "...atmospheres are unfinished because of their constitutive openness to being expressed and qualified in specific encounters."⁴⁴ They are actualised though intra-actions in social gatherings as emergent properties of an ensemble both as an effect of the gathering and as a mediating force affecting the gathering, it arises from. They are simultaneously embodied appropriations of space sensed by a bodily presence and thinglike, as they articulate the presence of things through affective qualities.⁴⁵ Böhme describes how atmosphere can be staged through 'generators', conditions in which the atmosphere appear, by equipping things with 'ekstases' that is expressive and rhetorical qualities radiating outwards into space creating emotional sublime grips.⁴⁶ In the same sense Björgvinsson describes how sites of uncomposed and decomposing figures topographically surround or set the stage.⁴⁷

The idea of atmospheres as unfinished objects can be a starting point for the design of new flexible and sustainable infrastructure strategies that take into the temporal and potential leaving sites free for unexpected events and performances yet to be like Björgvinsson argues.⁴⁸ He refers to the architect Stan Allen's text on '*Infrastructural*

Urbanism: "What seems crucial is the degree of play designed into the system, slots left unoccupied. space left free for unanticipated development." ⁴⁹ Likewise urban sociologist John Pløger argues for making 'the possibility of the occurrence' a more important quality in urban space describing the future city as an imaginary city, which implies a greater focus on utopia, the experiment and the temporary. ⁵⁰ Folkmann is also interested in exploring the potential, the conceptual and imaginative conceptions, in the design process and as transfigurative and metamorphic strategy in the material: "where design is seen not only as processes and objects but also as an enabling of the possible and as a creative and dialectical integration of the unknown in the realm of the known." ⁵¹

The designer must become a time traveller, someone who masters kinesthetic and temporal transfer in order to work with potential and metamorphic outcome-based design parameters. Empathy, and imagination are important cognitive tools both in the design situation and in use in order to succeed in creating temporary urban empty spaces open for numerous uses and renewed purposes entering into social intra-active gatherings characterised by intuition, improvisation, and engagement based on adaption, co-creation, appropriation and self investment at the same time encompassing a feeling of home and rootedness into the adventure of potential possibilities creating *an exotic feeling of home*. To make these *dwelling mobile experiences* new sensorial design approaches are necessary.

A sensorial design approach

A way of corresponding sensorially with the world is through inscriptive practices like '*graphic anthropology*' coined as term by anthropologist Timothy Ingold in 2013. ⁵² It is an imaginary documentation tool and sensual strategy pointing away from the real in order to capture the temporality of the lived landscape offering alternative narratives, which are not grasped through metric and analytical kinds of representation. Methodologically it has been developed as a thinking tool in the field of architecture by Raymond Lucas. He works with an '*architectural anthropology*' ⁵³ along the line of visual anthropology to describe architecture in terms of its social function similar to his colleague Albena Yavena's '*ethnography of architecture*' ⁵⁴ as something within the interactive networks of human and non-human actors rather than seeing architecture

as firm, solid, and complete.

It is an inscriptive observation technique consisting of in situ and post-situ processes like drawing and painting based on field observations beyond voyeurism using different **generative processes and filters like displacement, decontextualising, cutting through solid walls to expose structural features of buildings, or capturing angles impossible with a camera. It is a way to reach beyond the documentary in order to capture and visualise temporal and sensed qualities beyond the classical frame,** supplemented by transcriptions of data like maps, photos, film scenes and diagrams using grips like notation, metaphors and non-metric diagrams to visualise sensorial experiences like movement in space, patterns and rhythms.

Notation is an instructing translating quality used to transcribe on site observations for example human movement in relation to the architectural space. The metaphor possesses a transformative quality and can be used as a tool to organise perception and create a context for the description of an object or situation by making a parallel resemblance with a seemingly unconnected object or situation generating new perspectives. The non metric diagram is a way to depict the surroundings based on sameness in internal relations or structures relative to the things, that are depicted. It consist of an operative set of non representative lines and zones through which something new emerge. It often relates to perceptual subjects like patterns, forms, colours or rhythms like the light of impressionism or the fragmentation of cubism.⁵⁵

Lucas himself uses the method as an thinking and memorising tool exploring the ability of inscriptive and transcriptive practices to produce a representation of space which remains in closer contact with the lived bodily experience and memory by transcribing for instance photographic details taken on site as a way to grasp a socially, complex constructed site more fully; to understand the forms of occupation and how space is defined. To him architecture is something to be experienced through all of our senses, which he demonstrates in a sensory notation system focusing on the visual, aural, tactile, chemical (taste/smell), kinetic, and thermal qualities of a place in order to understand our build surroundings as a sensed, embodied and social space.⁵⁶ Space is created through the movement of the body characterised by a dwelling perspective using the body in the interpretation and creation of spatial living structures as a cartography of sensorial meaning that includes vision, touch, smell, hearing, orientation and movement, which possesses an indexical, temporal quality based on the actual sensual, empathic, and simultaneously connection with the surroundings.

The designer being a time traveller, as mentioned before, the approach presupposes knowing the way things are moving using the imagination summarised in Goethe's Urphänomen. The actual practice of making the mark is of utmost importance anthropologically, as it is the way in which the mark is made that organises our thoughts

Theory of Design" Design and Culture, 1:3 (2009): 273-288

55 Lucas, Raymond. *Towards a theory of notation as a thinking tool.* (ProQuest Dissertations & Theses Global, 2007)

56 Lucas, Raymond. *Sensory Notation Handbook* (Flâneur Press, 2014)

rather than the completed artefact, as Lucas points out.⁵⁷ As art critic, painter and poet John Berger states “A line, an area of tone, is not really important because it records what you have seen, but because of what it will lead you on to see.”⁵⁸ Ingold refers as well to art critic and art historian John Ruskin’s description of the temporal quality of the awful line:

“Your dunce thinks they are standing still, and draws them all fixed; your wise man sees the change or changing in them, and draws them so — the animal in its motion, the tree in its growth, the cloud in its course, the mountain in its wearing away. Try always, whenever you look at a form, to see the lines in it which have had power over its past fate, and will have power over its futurity. Those are its awful lines; see that you seize on those, whatever else you miss.”⁵⁹

Academic research indicates that taking notes by hand, and by extension making visual notes through drawing, engage the brain in a way that increases cognitive processes and memory.⁶⁰ As such the method has the ability to heighten our awareness, and to produce alternative understandings of our surroundings. The act of careful recording can give rise to great and meaningful discovery, as you get to know a thing differently by drawing it connecting perception with imagination and memory. *Center for Imaginative Ethnography* is a research collective that in an equivalent way uses imagination as point of departure focusing on the sensorium of social life like atmospheres, textures and moods.⁶¹ The curator and dress historian Ingrid Mida has developed a similar approach *The Slow Approach to Seeing* using drawing as a method to improve observation and reading of artefacts by slowing down through drawing, which helps to reveal subtle clues and hidden narratives.⁶²

Inscriptive practise per se is an artistic act with aesthetic qualities, considerations and goals, but it is important to shift attention from the results to include the imaginative and empathic processes. It is about belonging. With reference to philosopher Martin Heidegger’s study of the concept ‘nearness’, Ingold describes, how we approach the surroundings through a ‘thinging of things’ creating a feeling of togetherness. “The thing things. Thinging gathers.” as Heidegger puts it.⁶³ By being toward something; by putting

yourself in its place, you are called by the thing; ‘bedingt’/betenget in a ‘mirror-play’, where things get present. This view is supported by recent research in neuroscience about mirror neurones and empathic simulation, which equate human and nonhumans by showing that our simulation pattern is the same be it a tree, a house or a person we interact with.⁶⁴As philosopher and sociologist Henry Lefebvre explains:

*“Objects touch one another, feel, smell and hear one another. Then they contemplate one another with eye and gaze. One truly gets the impression that every shape in space, every spatial plane, constitutes a mirror and produces a mirage effect; that within each body the rest of the world is reflected, and referred back to...”*⁶⁵

Summative perspective

To sum up: imaginary, sensorial design approaches like graphic anthropology or architectural anthropology, which uses imagination and empathy as central cognitive tools in order to create ‘*togetherness*’ i.e. dwelling embodied graphic gestural encounters with the surroundings in the form of relationships among things inscribed in gestures, poses, actions, activate our memory, increase cognitive processes and heighten our awareness of things.

The empathic aesthetic approach makes it possible to see the exotic in the familiar as a way to identify metamorphic and potential parameters for the design of new flexible and sustainable embodied infrastructures based on kinesthetic and temporal transfer, which metaphorically and literally make room for *no-thing*; that is unoccupied slots and spaces left free for potential and unanticipated, *dwelling mobile performances yet to be*. It is a kind of stage setting where topographic generators of uncomposed and decomposing figures intraact with the surroundings creating mental and material fluid assemblies of unsolid forms guided by imagination, intuition and improvisation based on reuse, adaption, co-creation, appropriation in use, and self investment. Artistic exploration using dwelling imaginary inscriptive practices can be tested further focusing on how natural processes and forces of nature can function as metamorphic and potential, infrastructural components in new infrastructures as a direction for future research in the field. Like Scott Burnham, who, with the term ‘*naturestructures*’, describes new ways to design built environment that can connect with nature. How natural processes can be embraced as integral parts of the built environment.⁶⁶ Overall the results of this paper could be useful in defining the relevance of artistic creation from a research oriented perspective as well as for designers and policy makers to identify potentials in urban planning towards more sustainable and flexible infrastructures, and to plan incentives for their development.

THE JERUSALEM COMMITTEE, AN AMBITIOUS MULTINATIONAL EXERCISE:

AN AESTHETIC JOURNEY TO THE PHYSICAL BEAUTY AND SPIRITUAL UNITY OF A DIVIDED CITY

Abstract | The Jerusalem Committee was set up in 1969 by Jerusalem Mayor Teddy Kollek as his advisory body in order to discuss future urban development of the city of Jerusalem, based on the master plan prepared in the previous year by Israel's urban planning professionals which aimed to solve problems in housing, transport, commercial redevelopment, and even political unification, all of which the city urgently needed to solve, by proposing "a new, functional high-modernist Jerusalem, eight times larger" than the present state in those days. The Jerusalem Committee consisted of some seventy renowned international "outstanding friends of Jerusalem," selected and invited by Mayer Kollek himself, from different fields: theologians, clergymen, philosophers, architects, landscape architects, urban planners, artists, architectural critics, economists, journalists, lawyers, etc. The invitation was made on two separate occasions. Following the ceasefire of the Third Arab-Israeli (Six Day) War in June 1967, Kollek had initiated the development, beautification and restoration of the city of Jerusalem. It was at this point that Kollek invited more than forty members from Europe, North and South America, Asia and Africa to form the Jerusalem Committee, "a world advisory council" concerned with the future physical and cultural development of the city. The first meeting of the committee was held in July 1969 in Jerusalem. At this meeting, the establishment of specialized subcommittees in which "a particular expertise could contribute to various facets of Jerusalem's development" was suggested. This led to the convening of the "Townplanning Subcommittee" of the Jerusalem Committee in December 1970, and the inclusion of about thirty additional experts in architecture, urban planning, architectural history and theory, and art. From the fields of architecture, landscape architecture, and art, well-known figures such as Louis Kahn, Philip Johnson, Isamu Noguchi, Henry Moore, Bruno Zevi, Lewis Mumford, Moshe Safdie, Nikolaus Pevsner, and more accepted Kollek's invitation to be members of the committee. In terms of its openness to views and opinions from outside Israel, the committee was a remarkably ambitious, challenging, multinational exercise. Half a century after the establishment of this committee, in 1969, this paper examines the ways in which enhancement of "the physical beauty of Jerusalem" and manifestation of "universal spiritual truths basic to all faiths and peoples" were pursued through exchanges, often heated, of multinational views in the Jerusalem Committee.

Index terms | *Jerusalem; The Jerusalem Committee; Johnson, Philip; Kahn, Louis; Kollek, Teddy; Pevsner, Nikolaus; Third Arab-Israeli (Six Day) War*

THE JERUSALEM COMMITTEE, THE MAYOR'S COUNCIL

The Jerusalem Committee was set up in 1969 by Jerusalem Mayor Teddy Kollek as his advisory body in order to discuss future urban development of the city of Jerusalem, based on the plans prepared by Israel's urban planning professionals which aimed to solve problems in housing, transport, commercial redevelopment, and even political unification, all of which the city urgently needed to solve.

The Jerusalem Committee consisted of some seventy renowned international "outstanding friends of Jerusalem,"¹ selected and invited by Mayer Kollek himself, from different fields. The invitation was made on two separate occasions. Following the ceasefire of the Third Arab-Israeli (Six Day) War in June 1967, Kollek initiated the development, beautification and restoration of the city of Jerusalem. It was at this point that Kollek invited more than forty experts in various fields from Europe, North and South America, Asia and Africa to form the Committee, the "world advisory council" concerned with the future physical and cultural development of the city.² Amongst those members were such prominent intellectuals and cultural figures of the twentieth century as Heinrich Theodor Böll, Lewis Mumford, Sir Nikolaus Pevsner and Ursula Niebuhr, wife of the famed theologian Reinhold Niebuhr, as well as those well-established practitioners of art and design Mario Cravo, Philip Johnson, Lewis Kahn, Oskar Kokoschka and Henry Moore.

The first meeting of the Jerusalem Committee took place in July 1969 in Jerusalem. The participants discussed "such projects as the Jerusalem Park, the rehabilitation of the Old City, and the restoration of the Jewish Quarter,"³ and they responded positively to those plans proposed by the Israeli authorities.

THE JERUSALEM COMMITTEE'S UNIQUE, COURAGEOUS AND HOPEFUL CHALLENGE

The participants were from many different professional backgrounds, *viz.*, "architects, clergymen, artists, politicians, university professors, theologians, sculptors, philosophers, publishers and archeologists,"⁴ and were from many different countries. Open to views and opinions from outside Israel, the Jerusalem Committee was indeed a remarkably ambitious, multinational exercise and, even in the participants' own eyes, the organization of this multinational cooperation appeared a "unique," courageous and hopeful attempt to overcome racial and religious antagonism and political conflicts in the turbulent days after World War II, as the statement they issued following their five-day discussion demonstrates:

Jerusalem is unique. Unique also is the invitation tendered by the local authorities to people from lands afar to come and advise them on the work being done in the city for the protection of its beauty and of the meaning attached to it by the rest of the world. We hope that, at some time, our Muslim brothers will join us in this great task which involves a deep respect for their way of life as for their most beautiful shrines and treasures. Some of us came to Jerusalem from countries where lack of opportunity and motivation, confusion and ideals, depreciation of the highest values, and even racial antagonism have created, among young and old, disorder and conflicts seemingly impossible to control. We found in Jerusalem a devotion to work and a fervor which gave us courage and hope.⁵

While "the preparatory work of the authorities' in connection with the rehabilitation and reconstruction of the city, and protection of important sites" appeared to the members to be "both valid and far sighted," they were at the same time well aware of the fact that those works and plans had to be carefully re-examined by experts in the fields of urban design and architecture.⁶ Thus, at this very first meeting, the

establishment of specialized subcommittees in which “a particular expertise could contribute to various facets of Jerusalem’s development” was suggested.⁷ This led to the convening of the “Townplanning Subcommittee” of the Jerusalem Committee, and the inclusion of about thirty additional experts in architecture, urban planning, architectural history and theory in the full Committee. As a result of this decision, in the fields of architecture and landscape architecture well-known figures such as Louis Kahn, Philip Johnson, Isamu Noguchi, Henry Moore, Bruno Zevi, Lewis Mumford, Moshe Safdie, and Nikolaus Pevsner accepted Kollek’s invitation to join together in Jerusalem in December 1970 in order to contribute, based on their professional knowledge and experience, to Jerusalem’s development program [Figure 1].⁸ Many of them had known each other well before they were invited to Jerusalem, and their prior acquaintance would have helped to foster frank exchanges of views amongst them.⁹

Actual discussions amongst the participants were mainly devoted to the examination of “practical” plans and schemes prepared by Israeli urban planners: “the Master Plan 1968, Interim Report,” “A Plan for the Central Business District,” “the Old City of Jerusalem and its Environs, Outline Townplanning Scheme, 1970,” and “the Jerusalem Transportation Plan for 1985 (1970).”¹⁰ The conclusion of the analysis of these proposed plans as drawn up by the Subcommittee, was, in short, critical [Figure 2]: the “Final Statement” of its first meeting, published on 21 December, 1970, recommended that, “in the spirit of mutual confidence which underlay [their] frank exchanges and with the desire that the best possible plan for Jerusalem should finally be formulated,” “the Master Plan should be restructured” and “the planning process [for Jerusalem’s future development] ought to be reassessed.”¹¹ The “Final Statement” declared that “[t]he subcommittee feels ... without exception that there has not been sufficient consideration of alternatives, clarification of the basic ideas, nor the exposition of a unified theme,”¹² while the collection of data provided to the Subcommittee itself was valuable and the quality of proposals was impressive. The experts who were invited to the Townplanning Subcommittee stressed “the necessity for a set of broad principles of an overall coordination of policies” as well as clearly set-out *alternatives*.¹³

CALL FOR ALTERNATIVES TO BUILD A MULTIRACE-MULTIFAITH CITY

Though there were active exchanges of views in the two-day working session of the three-day program, the Townplanning Subcommittee seemed to have no actual intention of reaching a consensus on how Jerusalem should be preserved, restored and modernised or to present concrete solutions for the issues that the city of Jerusalem urgently needed to solve.

The Subcommittee was, instead, keen on introducing several schemes for assembling various alternative ideas and proposals for the city’s development. As “the first step to be taken in this exceptionally difficult task,”¹⁴ *viz.*, the development, beautification and restoration of the Holy City, the Subcommittee decided, for instance, to set up a task force composed of “people well versed in the plans” who can bring “dispassionate perspective to bear” and were capable of consulting with any groups of citizens and professionals necessary in dealing with “day-to-day planning problems, policy and research, and the long-term planning of Jerusalem.”¹⁵ In addition, in the search for alternate plans to the government-proposed Master Plan, all participants of the Subcommittee were asked to submit their own *guidelines* which referred to “any aspect of the planning — transportation, zoning, aesthetics, etc.”¹⁶ An architectural competition for “the planning of a section of the Jewish Quarter of the Old City” was also suggested by both the Subcommittee and the full Committee, and the announcement and conditions, along with the “Information and Directives for Planning” of “A Public Competition for Designing a Block of Buildings in the Jewish Quarter,” were made public in June 1971.¹⁷

The “frank exchanges of views” amongst the members must have appeared, to some, so desultory that the wisdom any participant had to offer was utterly wasted. The architect Richard Meier, who had become involved in the Jerusalem Committee through his acceptance of an invitation to join its Townplanning Subcommittee in 1970, wrote for the April 1971 issue of the *Architectural Forum* “An eye-witness account” of the 1970 three-day Townplanning Subcommittee conference in which he states:

One of the lessons of the Jerusalem Conference is that development of any city is not simply the work of architects and planners. In fact, recent events would lead one to believe that the foreign participants were simply talking to themselves. In determining the philosophical direction and the structure for any acceptable plan for the future, the most important factors are the immediate and long-range priorities stemming from political, economic and social considerations. Obviously, the unstated political considerations were without question the most important factors in determining what was to be built, and where, and how.

As a result of the Conference, Mayor Kollek committed himself to restructuring the course of the proposed development, and had, in fact, held up construction on new housing projected for the hills surrounding the city — only to be reversed in this decision by the Ministry of Housing. Foreign participants in the conference may well have wondered what they were invited to Jerusalem to do.

It would seem that, in being isolated from the significant political considerations, and having no participants with power in the political realities, the visiting architects and planners were being given — ultimately — no voice either in the real or the theoretical planning.¹⁸

Meier was thus severely critical of the role of Kollek’s world advisory council, emphasizing the gulf between the views of the visiting professionals and the political considerations of Israeli authorities. Surely Meier was not the only one who sensed the discrepancies between the objections and assertions expressed by both sides. Kollek himself is said to have been frustrated by the contrariness displayed in the ways of thinking and argued that those foreign experts whom he invited were demanding of the people of Jerusalem “what they had failed to accomplish in their own cities,” and further expressed his irritation by saying, “You would like to drive up in big cars but you want us in Jerusalem riding on donkeys.”¹⁹ Yet one has to ask whether there was in fact such a wide gap between Kollek’s vision and those of the multinational members of the Jerusalem Committee. Weren’t they essentially serving together on the same ship, setting sail for *an aesthetic journey to the physical beauty and spiritual unity of a divided city*?

Many of the international experts had neither interest in nor any intention of giving an authoritative assurance to those government-proposed development plans and the Israeli Government’s political position; instead, they were keen to collect alternative ideas and proposals from a wider sphere on “how to maintain the identity of Jerusalem and yet convert it into a modern, viable city.”²⁰ Only in this way, they believed, could they be independent of the government’s political motivations and considerations and fully commit themselves to the day-to-day necessities and happiness of the general public of Jerusalem.

By *alternatives* to the government-proposed plans the Townplanning Subcommittee meant plans and schemes which heeded the “uninhibited voices” of the ordinary, multiracial, multifair inhabitants of the Holy City and responded to the legitimate demands of the local community.

The plans prepared under the authority of the Israeli government and condemned by the experts were, to some extent, practical solutions, “simply trying to provide for foreseeable needs.”²¹ Arthur Garmaise, the *Canadian Jewish News* Israel Correspondent, based in Tel Aviv, sums up the practical way of planning that Israeli architects and urban planners applied in the course of producing their initial plans of development for Jerusalem:

So and so many people — therefore, so and so many dwellings; so and so many cars, on certain assumptions of prosperity — therefore so and so many highway lanes to move them at desirable speeds, and proportionate parking spaces to accommodate them; such and such purchasing power and predictable needs of food clothing, and amenities — therefore, such and such space for shopping. And so on down the line: a tourist population to be accommodated — and therefore hotel space to be provided; pilgrims to be housed — and, therefore, accommodation areas to be set aside near their points of interest; a green belt of grass and trees to set off the uniqueness of the Old City and prevent the City from becoming an asphalt wilderness; underground parking to conceal the disfiguring sight of *dunams* [Israeli unit of area. One dunam equals 1000 square meters.] of car roofs — what, after all, was so horrendous in this kind of thinking? Isn’t this what planning was about, after all: the prediction of future needs and the provision for them? ²²

“The Master Plan 1968, Interim Report,” “A Plan for the Central Business District,” “the Old City of Jerusalem and its Environs, Outline Townplanning Scheme, 1970,” and “the Jerusalem Transportation Plan for 1985 (1970),” all presented to the Townplanning Subcommittee, were intended to be a pragmatic solution to both current and foreseen problems elaborated and composed in a very “practical” manner, saving time and labour by omitting “sufficient consideration of alternatives,” “clarification of the basic ideas,” and “the exposition of a unified theme.”²³

The Committee’s earnest call for “sufficient consideration of alternatives” must have been underpinned by the necessity of transforming practical government-provided plans into plans capable of fully serving the actual needs of a number of ordinary, anonymous people, not the political considerations and necessities of both the National and Municipal authorities, whose primary objective had been to forcefully advance Israeli settlement in an area that had been formerly held by Jordan and other countries.

Aggressively welcoming the submission of “alternatives” — new designs and proposals — the Jerusalem Committee thus came to acquire functionalistic planning proposals which would serve the everyday needs of the ordinary inhabitants of Jerusalem, regardless of their racial and religious differences.²⁴

CLOSING REMARKS

No one can deny that political intentions underpinned every facet of Jerusalem’s developments after the Third Arab-Israeli War, yet it was the Jerusalem Committee which eventually prevented the excessive subordination of the whole Jerusalem development project to post-war Israeli political policies (especially the Israeli settlement policy) through its call for further alternatives to the government-proposed plans.

Half a century after the Jerusalem Committee’s establishment in 1969, it is still remarkable today to see how stringently the Committee, “a valuable example of

international cooperation,”²⁵ tried to connect the development of the city with the actual state of the lives of the people and an improvement in their living standards, regardless of their various races and faiths. Devoting itself to the question of how a multiracial-multifaith community could live together harmoniously, the Jerusalem Committee was to find probably the best expression of its spirit in one of its resolutions, following the Second Plenary Session in June 1973, which reads:

The Committee noted with satisfaction the fact that peaceful neighborly relations do and can exist in the city in spite of the deep political conflict in the Middle East which has not yet been resolved and which affects necessarily the inhabitants of the city and obviously cannot be ignored. Human relations and cooperation grow at all levels between the various religious and ethnic groups which make up the population of Jerusalem.

The Committee recognizes the need for continued efforts to raise living standards and bridge social gaps among the various groups in the city. The priority given to providing improved services, housing, welfare, sewage, etc. in East Jerusalem is encouraging....²⁶

²² Ibid.

²³ The Townplanning Subcommittee of the Jerusalem Committee, "Final Statement," 2.

²⁴ It is worth mentioning here in brief that it was Sir Nikolaus Pevsner whose opinion was considered most important, as Mayor Kollek writes in his letter to Pevsner on January 8, 1971: "We do want you to know that we are taking your deliberations and comments most seriously." Sir Nikolaus Pevsner, the eminent author on art and architecture and world-leading art and architectural historian, chaired the Subcommittee panel on the Old City and also took the role of "chairman of the Company for the Reconstruction and Development of the Jewish Quarter." It was not, however, only these contributions to the Committee that made Pevsner prominent in the whole Jerusalem development project. Pevsner believed in Functionalism, and, while witnessing the rise of Post-Modernism everywhere, he was widely known as a prominent apologist for Modern architecture and design who could "say functionalism with a straight face." Admiring Walter Gropius, a chief innovator of Functionalism, who had once reflected on his Bauhaus days as "[h]ow to dwell, how to work, move, relax, how to create the life-giving environment; these were what occupied our minds," Pevsner declared: "if an architect neglects function he neglects duty." Surely Pevsner himself felt strongly the need to preserve the ancient character of the city and understood the importance of maintaining Jerusalem's oriental authenticity; yet he showed no willingness to compromise his belief that value of design, whether for a single building or for extended urban planning, is dependent on its utility to the people for whom it was designed. As for the development of Jerusalem, a living city with a population of 300,000, the expertise of Pevsner, who refused any demands characterized by overemphasis on concepts and political policies and intentions at the expense of realistic consideration of the actual lives and daily necessities of the people who made their living in the city, came to be naturally regarded most seriously.

²⁵ The experts gathered at the first meeting of the Townplanning Subcommittee of the Jerusalem Committee stated in the opening of the "Final Statement," published on the last day of their three-day program on December 21, 1970: "We should like to begin by expressing our appreciation of

what is much more than a generous invitation but, we hope, a valuable example of international cooperation beneficial to the development of a city with which a large part of the world is concerned." The Townplanning Subcommittee of the Jerusalem Committee, "Final Statement," 1.

**NEW GERMS OF GENIUS LOCI: THE SENSITIVE FOUNDATION OF THE AESTHETICS
FORMS OF LIVING**

Abstract | The purpose of this study is to bring out, from a philosophical and aesthetic point of view, through the examples of contemporary urban architecture and interior architecture, the new “*sensus*” on which the relationship between the Human history and that of architectural construction and experience, is based and on this relationship may represent today a new model of Living, without losing sight of the fundamental contribution of aesthetic harmony as a mirror in which to reflect itself.

Index terms | *Aesthetics; Everyday Aesthetics; Experience; Living; Sensus; Feelings*

The Latin word «sensus» means: sensibility, feeling, sensation, judgment; at the same time «sensus» is the foundation of the aesthetic theories. Through this meaning, we would retrace the fundamental characteristics of architecture. We would analyze also the role of the relation between the architecture and the philosophical thought.

In 1954 the Italian philosopher Enzo Paci focused on the concept of “city”. How the “Communities” born? How is City born? Taking up the words of Giambattista Vico “*ingens sylva*”, the urban space is the one that stands out from the peasant one. The social role of the city is to be first and foremost the fulcrum of society, or that of the relationship between a closed infinity and an open infinity. It is in the value of the relationship that the city represents an architectural and urban sensus where the social context remains connected to that of communication, tradition and above all of history. We should refer to Hegel who expresses through the concept of “symbolic” the absolute role of architecture that refers in all its forms to the Spirit, the ultimate and highest meaning of existence. The history of man takes place parallel to an Architectural History, where the sensus of both is found in their mutual relationship.

In this regard, with the aim of identifying with one’s own lived space, the community as well as the individual, they need a structural balance, that is, of an aesthetic harmony suggested by the architectural construction itself. The polis as well as the Pyramids stand up as symbols of reference from a historical point of view but also for the dense theoretical meanings that sublimate. In this case the meaning of “Living” represents a wide range of social experiences that are repeated over time in different ways. These can be declined through the History of Art and Architecture. Currently and especially after the post-modern crisis, the Living models have changed considerably and so has the relationship between time and space. With the advent of the virtual and the instantaneous, the social and aesthetic roles that cover Architecture has been loaded with even more dense and introjected meanings. Whereas in ancient times the primordial characters of the shelter and of the “genius loci” represented the fundamental symbols of protection, in the Contemporary epoch they became identifying reference points. For example the new Nomads are slowly regaining their origins and making their roots no longer a distant memory, but an enrichment of the present.

In this paper, we would like to illustrate the importance of sensitive experience in the context of living. We will show how a sensitive way of living it is at the antipodes of every architectural form through the following points: 1) The primordial and etymological context; 2) The aesthetic Living experience; 3) The consolidation of the feeling experience as an aesthetic way of Living; 4) For an Everyday Aesthetics theory of Living.

1. The primordial and etymological context

Through the concepts of primordial refuge and sensitive experience, we can consider the concept of Living an “original phenomenon”, expression of Goethe to determine the constitution of daily experience

In the primordial context of living we find the archetypes necessary for the concept of salvation (deliverance). The necessity of the refuge indicates that the humanity conform his space in an inhabited space. Thus, Vitruvius derives the birth of architecture, parallel to that of language, from observing the customs of the “primitive” people contemporary to him, that is, seeking confirmation in ethnology. The second

book of *De Architectura* contains the famous exhibition on the origin of architecture, in which Vitruvius recalls a primitive world in which man discovers fire and builds the first wooden shelters, giving life to the myth of the “primogenian hut” and of the column wooden as the origin of the Doric temple and of all the architectural forms¹.

In an etymological context, we find the source of the word “living” from the Latin *habere*, living could assume the connotations of the possession of space. The moment “we are”, at the same time, we possess our space, space, which surrounds us only by experiencing it. Living is the very essence of existence, the rooting of life in everyday reality: « Living in a room, what is it? To inhabit a place, does it mean to take possession of it? What does it mean to take possession of a place? From when does a place really become yours? »². Therefore the primordial concept of living is based on the nature of being. Hence the housing model is related to the possession and shelter features.

2. The aesthetic Living experience

By this point we will see how the aesthetic experience is present in the context of living. First of all, living is presented as an aesthetic experience starting from the body, that is the living way is established through the feelings. The living space is organized on the basis of tenacious geometries, whose constant reference point is the human body. The mythical nature of anthropomorphism has dissolved into anthropometry based on the theory of proportions. For Aristotle the space has a double determination: on one hand it is a common aspect in which all the bodies “are”, on the other is that particular determination in which a body exists now.

«The existence of place is held to be obvious from the fact of mutual replacement. Where water now is, there in turn, when the water has gone out as from a vessel, air is present. Therefore, when another body occupies this same place, the place is thought to be different from all the bodies which come to be in it and replace one another. What now contains air formerly contained water, so that clearly the place or space into which and out of which they passed was something different from both³».

Historically the concept of body has developed through the concept of centrality. The human body has definitively imposed itself in the design of the architectural space at the moment when Vitruvius turns it into his treatise. The Vitruvian canon refers to the architecture of the temple, apogee of the design of space. Its epistemological characteristics make it universal and applicable to every construction. The *homo bene figuratus* assumes a unit of measurement of the architectural space and of the structures that organize it. In this way the theory of proportions overcomes the direct imitation of the human body. In its mathematical formulation, the canon through a skilful composition of the parts is aimed to create a perfect work: «Beauty does not lie in the individual elements but in the harmonious proportion of the parts⁴». Subsequently, in the German Romanticism, Living was for Romantics the fulfilment of a process of intimate adherence to the world. To inhabit the space for the Romantics also means reuniting with the Universe and in this we perceive the echo of the archaic cult of the *oomphalos*, of the navel of the world. Concepts such as those of the *axis mundi* and the *genius loci* are affirmed within a new way of conceiving the belonging to the living and cosmic space. Romanticism makes the concept of living the centre of

1 Vitruvius, *De Architectura*, Book II.

3 Aristotle, *Physics*, Book IV.

4 Ancient quote of Galen.

a cosmic reflection where poetic living prevails over the awareness of the self, making that of living a complex concept. Living in this way assumes its centrality starting from a cosmic vision of the house, where the space of the house takes on the connotations of a cosmic reality. Indeed, Wandering in the world becomes a central point of being-in-the-world. Benjamin's flâneur, like the contemporary Nomad, starts from the primary concept of the world as a territory where the ancient sense of rootedness remains anchored to the concept of subjective intimacy.

3. The Consolidation of the feeling experience as an aesthetic way of Living

The original meaning of the term "to dwell" suggests the sense of remaining in a place, Martin Heidegger addresses dwelling as the way in which a man is able "to stay in the world" "dasein". Accordingly with the existential condition in Heidegger theories, it is clear that the individual, during his evolutionary process, needs to select, define and characterize some of the space that surrounds him. In the context of an aesthetic way of Living, we are free from the beauty classic dogma and we revive ourselves through the relationship with living spaces and objects. We are instinctively predisposed to "feel" the places and our belonging to them. When we talk about Living, we talk about an inner identity that we develop from the childhood home and that we bring back into living the world. But what happens in the contemporary era, and in the communities of new nomads? How do we perceive the whole world? And how are the characteristics of new models of inhabitant embodied? In *The Age of Migration: International movements of the population in the modern world*⁵ are illustrated the dynamics of a nomadism that requires a continuous development of one's Nomad identity along with the constant reappropriation of one's original space. The concept of inner space is mainly linked to the Subject rather than to the reality around him and the quest for a human dimension is getting more and more present in the various phases of continuous journey. Therefore this is an issue primarily concerning the discovery of nomad's own origin at every step.

With these premises, it's necessary to sustain how the human beings uprooted and without resources rebuild their lives in precarious homes, which can be moved according to the events. This erratic way of life raises complex issues concerning the relationship between identities, both individual and collective, and their environment, as well as between the inhabitant and feasible conformation of the space. In this context Gaston Bachelard's philosophy helps us to understand how models of spatial identity come from the individual's relation to the world around him. Natural elements and objects always favour an intimate dwelling phenomenon that can replicate in different areas. Bachelard illustrates in *The Poetics of the Space*⁶ the archetype of the house is the place where our soul is composed as a three-storey house, it develops vertically, where every floor will be suitable for every season of our life. In the same way, the primigenial space, the primordial space of refuge, becomes the absolute of living that accompanies us in our becoming. According to Gaston Bachelard our relationship with the space starts to develop through our intimate experiences with the four natural elements. Further, even if the water is often mentioned in the Bachelard's writings, the element most related to the sense of dwelling is the earth: the poetic image of the shelter recalls a protective Mother Earth that provides an asylum. Therefore dwelling implies a return to the womb, to the birthplace, to the shelter *stricto sensu* that settles down every time with different uses and taste as a consequence of the contemporary nomadic lifestyle.

5 S. Castles, M. Miller, 1933, *The Age of Migration: International movements of the population in the modern world*, Palgrave MacMillan, New York.

6 G. Bachelard, 1957, *La Poétique de l'espace*, Puf, Paris.

The cave and the womb are therefore both images of an interior space deriving the *oikos*, that is the origin from which depends our primary relationship with the world.

4. For an Everyday Aesthetics theory of Living

In this panorama, the appropriation of a living experience is the starting point to define our aesthetic way of living. For this reason we want to introduce the concept of the everyday into our aesthetics of Living.

They are just a few exponents of the Everyday Aesthetics (Yuriko Saito, Thomas Leddy) who have emphasized the routine aspect as a form of exceptionality and we will see in a moment how the aesthetic experience of the everyday can be reconciled with the Living way. To induce the relationship between aesthetics and everyday life, it is the acquisition of the concept of experience through the theories of John Dewey that contrasts the philosophy of the art of his time with a type of museum and elite conception. Dewey aims to restore the continuity between refined experience and the events that constitute the daily experience. Starting from his essay *Art as experience*⁷, Dewey, emphasizes the relationship between the human being and the environment that surrounds it. As a consequence, every experience is aesthetic, since the organism finds itself in situations in which it suffers or enjoys, in which it feels. Daily aesthetic practice must possess the main characteristic of repetition, offering the aesthetics of existing outside the conventional forms of artistic expressions. These are the activities of the routine that constitute everyday life. In the case of Everyday Aesthetics, attention shifts only to the action of everyday life.

From the aesthetic experience of Living, we want to finally hold the sensitive foundation to recreate our disposition to infinity of an inner identity, born only through our experience of daily living. Thus the feeling experience is the answer for a new theory of “inhabitation”.

INVESTIGATION OF SILHOUTTE VALUE OF BURSA AND FLORENCE IN14TH AND 16TH CENTURIES

Abstract | This study considers the formation and interpretation of the two cities in the 14th and 16th centuries comparatively. In this ages Florence was born as a renaissance, Bursa was built as an interpretation of Ottoman civilization of Islamic world. The comparison criteria can be listed as formatting the silhouette value. These are historical, topographical, socio-economic conditions and aesthetic. The silhouette is an aesthetic indicator formation and arrangement of the city. We can read the aesthetics value of monumental building and artworks. Cultural landscapes in these cities are compared and examined. These religious building, trade structures, bridges, sculptures, monuments and garden arrangements. Thus we will be able to reach original information and comments.

Index terms | *Urban Aesthetics, Silhouette, Heritage, Renaissance City, Ottoman City, Florence, Bursa*

INTRODUCTION

This article examines the relationship between civilization and aesthetics. For this purpose the study invites attention at the outset to enlighten the concepts of civilization, aesthetics and city. The topic is discussed formation and transformation of matter within the context of civilization especially in Western civilization. Following sentences describe the city from the perspective of western and non western aesthetics. In history, city is a reality that always gains symbolic equivalents beyond and above its functional meaning. Silhouette or skyline of city makes a dialogue of notations visible, which people establish themselves and transfer to next generations and times by interpreting time and space.

So that considers the formation and interpretation of the two cities in the 14th and 16th centuries comparatively. In this ages, the renaissance was born in Florence and Bursa was built as an interpretation of Ottoman civilization of Islamic world.

The comparison criteria can be listed as formatting the silhouette value. These are historical, geographic, topographical, socio-economic items and aesthetic. The silhouette is an aesthetic indicator formation and arrangement of the city. We can read the aesthetics value of monumental building and artworks.

Cultural landscapes in these cities are compared and examined. These religious building, trade structures, bridges, sculptures, monuments and garden arrangements. Thus, it will be possible to interpret the spatial history of Florence and Bursa comparatively based upon silhouette value and time layers, which is regarded as a precious accumulation of world cultural heritage. It is hoped those cities architecture and culture are analyzed and a contribution is made to related literature.

THE CITY

The city is historical and a living reality. The origin of the city are layered and complexed by the needs and functionality of the people, and the responses and symbolic values. This area which is studied with the perspective of management within the discipline of urban science, is tried to be explained by city history, urban sociology, urban economy, city, geography, city law, city culture and urban aesthetics. The city represents a demographic value and geographic reality, social structure, local codes and civilization process. From the distance, the silhouette of the city is observed on as image and horizontal line between the dark and the light. The city is surrounded by different perspectives and lived in the silhouette. It can be read as a developed architectural space, designed, developed, produced and interfered with the natural space, social place, monumental scale buildings, squares, urban furniture, garden arrangements and recreation areas. The city is not as simple as it looks. It's a complex integrity. It can be read in its historical and cultural codes.

Thus, when the city is seen as silhouette value as a collection of remote structures, the city appears to be a set of forms, while on the back of these forms there are norms, values and principles that constitute the basic assumptions. Thus the city offers a multi-layered structure with visible and invisible faces.

Forms ---- Norms ---- Values ---- Principles (including basic assumptions)

The city is experience of urban places. It is mechanism law and management. The city produces urban life experiences. It is a special area that transforms knowledge into culture and value.

ROOT OF SPACE

There are different interpretations of civilization on the cities during the 14th and 16th centuries. While Western civilization gave birth to the renaissance in Florence, the city of Ottoman civilization was formed in the east and the world of Islamic civilization occur in Bursa. Florence was the icon of the city, where the western civilization was changed and reinterpreted. In the 14th and 16th centuries, the emergence of a secular spirit from Western European thought, literature and art took place in this city. The Renaissance spirit can be traced in the literature, architecture, sculpture and painting, as well as in the urban fiction as a change in the functioning and formal characteristics of the urban organism.

Bursa, the city of Byzantine civilization was converted and expanded by a city of Ottoman civilization has established its own city. Thus, it can be read as the indicator city where the founding principles and values of Bursa have been realized and preached. These two cities, which were mentioned in their periods, gained a unique value as root spaces and interpreted cities. Therefore, they were found to be worthy of review and were subject to a comparative study. The examination of these root spaces where the formation and development periods of civilizations are exhibited will be useful in postmodern research towards urban aesthetics.

HISTORICAL AND BEAUTIFUL CITIES: BURSA AND FLORENCE

The cities primarily acquire character in natural and topographic conditions. Thus, they exist in natural, ecological and divine aesthetics. Te mountain and the rivers flowing from the mountain to the plain is very beautiful. In the focused phase, both cities are trade cities. The reality of the city, which is determined by natural and socio-economic conditions, describes the surrealism and unrealistic of cultural conditions. Thus, cities are special places where civilization is born and developed, where real and imagination are combined. (Can, 2008: 353)

The built environment with monumental scale structures, bridges, public spaces, roads, streets, green spaces and arrangements with silhouette value is monitored. It is the human element that places its soul and meaning layers in spatial reality. The human models and people who grow up in cities spend the meaning of life and death. During the period under study, Bursa and Florence are subject to comparative exercise through the abstraction of the natural environment, the built environment-form and the cultural-value environment and the signification of the structures with the representation value.

Perspective of Urban Aesthetics: Silhouette

The city's identity is significantly shaped by elements of geography and topography, being cultivated through its inhabitants' intellectual and emotional world and capacity. Urban form with both monumental and small-scale structures, as well as floor coverings and shapes formed by infrastructure services are apprehended by urban dwellers as part of their emotional world. The perspective of urban aesthetics context, geographical location and topographical conditions, historicity, spatial arrangements and architectural culture, civilization and cultural codes, identified through the criteria of functionality, evaluation and interpretations have been developed.

Ulu Cami ve Katedral

Monumantel scale buildings are seen as Ulu Mosque in Bursa and Duoma/Cathedralin Florence.The Cathedral of Santa Maria del Flori was built one of the Italian republics under the direction and patronage of the Mecidi family (1360-1589), depicts the

individuality of the Renaissance city, its central, geometrical perspective. Florence is a completely legible city. The heart of the city, the central Santa Maria Del Fiori Cathedral, the bell tower and the dome is the expression of the city's historical and architectural style. The elevation of the central dome and the dome of the cathedral and its original form made it the visual center of the urban organism. (Benevolo, 2006: 87-88) The earthly and heroic wall paintings depicted inside the cathedral, as well as the otherworldly scenes, make the appearance of the secular soul visible through the interior of the structure. The cathedral is connected to the city with a big size square. The republic of Florence refers to the guild structure and the functioning of the assemblies, and the prosperous and magnificent buildings that express the prosperity of commerce and banking, and the richness of the city.

Ulu Cami as the Grand Mosque (1396-1400) built as the Cuma Mosque in the first major capital of the Ottoman dynasty, based on the absolute monarchy, is the symbolic center of the city with two minarets consisting of twenty domes. The city fiction has a multicentre process in which the complex form is developed. In these centuries, Bursa, which is the biggest trade center of the Ottoman Empire, has been built around the Ulu Cami. The interior view of the mosque is decorated with the letter of the Islamic civilization and the mihrab with its beautiful walls and letters. The interior is simple, majestic and exalted.

Formation and perception of the whole within the multicenter is dominant in Bursa. "Kulliyah" (Islamic-Ottoman social complex), as a unique urban form developed by Ottoman city fiction. From today's perspective, they are mentioned only by its mosques forming their centers, instead of the whole kulliyah. In the high points of the city geography, large neighborhoods were built around the mosque's multifunctional complexes. Each community is constructed as a new political center, and these spatial arrangements have a different emotional-spiritual atmosphere. The distinctive position of the complexes in the city silhouette is that the mosque is a sacred space and the concept of preserving the difference between the other structures is valid. (Can, 2005: 110) There are no large squares in Bursa. The mosque courtyards and the mosque itself serve as public space. Bursa is a big garden city with its garden units, tree-lined road and street textures, surrounded treasures and cemeteries.

With the development of trade and prosperity, the city's trade organization that special name of "Ahi" has ensured the division of wealth with many charities into the life of the imaret system and the return of life with the foundation.

The principle of harmony are observed in both silhouette of cities. Uludag and rivers, the Apennine Mountain and the Arno river offer natural beauties that beautify the cities. The friendship of domes and bridges in Bursa follows forms the dialogue between towers and bridges in Florence. With the development of trade and prosperity, the city's trade organization that special name of "Ahi" has ensured the division of wealth with many charities and charities into the life of the imaret system and foundation foundation and the return of life with the foundation.

The principle of harmony are observed in both cities. Uludag and rivers, the Apennine Mountains and the Arno river offer natural beauties that feed the cities. The friendship of domes and bridges in Bursa follows forms the dialogue between towers and bridges in Florence.

The contemporary Western European civilization has shown the people the most reliable, sound and last resort. The mind is considered unique. This discovery of the absolute state is called Renaissance. Reason is all humanity. Logic, math, mechanism is the infallible way of mind. Even nature has been accepted as a giant mechanism that does not contradict the basic rules of the mind. (Durali, 2003: 54-55)

BRIDGES

The Irgandı Bridge, one of the most beautiful and oldest bridges in Bursa, was built in 1442. It is designed as a bazaar-bridge. This stone bridge, which brings together two sides of Gökdere, makes a great contribution to the silhouette with its unique appearance.

The Ponte Vecchio is located on the Arno River, which passes through Florence and divides the city into two, similar to the Irgandı Bridge. This structure is one of the tens of bridges over the river and is the most beautiful and the oldest bridge that comes to mind when it comes to Florence. It was built entirely of stone in 1565. This bridge is one of the symbols of the city.

STATUE AND TOMB

The tomb and calligraphy in Bursa and the sculpture and painting art in Florence produce an aesthetic representation and a special language. Sculptures are refreshed old life experiences. Death is condemned with the tomb. "Hu el Baki" that means of "God is infinite" presents a universal message to the world in Bursa. While Florence is whispering the joy and courage of life, Bursa brings fresh news from the certainty of death. In Bursa, abstraction is expressed in a high form. There is no picture or human and animal description on fabrics and carpets. The tomb represents the mysticism and the otherworldly, while the statue represents secularism and the earthly. There is no portrayal and sculpture in Islamic civilization. The tomb can be defined as monumental of religious of Islam, which is built to those who serve great to the science, wisdom, art and military service of the country. (Dal, 1998: 293)

The statue of Michelangelo's David in the square of Piazza della Signoria is the spirit of the city in Florence. There is a copy of the statue of David, who became a hero by combining his intellect, will and courage to protect the city from enemies and evil. The original sculpture is on display at the Galleria dell'Accademia. The expression of Renaissance represents the ideal of will and the ideal of being an individual. Sculptors scattered into the city of Florence can be compared to as a dead theater scene. The city is home to art workshops and the art academy, thus developing its competence in sculpture and painting.

Calligraphy and painting, ceramic art and fresco express the art forms and techniques used in interior decoration of monumental works. Calligraphy is a special language in Bursa. It is every moment as a fresh flowing divine river. An indication of the source of eternity. Florence has a real beauty and depth. Bursa takes its beauty from the transcendence of truth. Bursa is a city of death. The city expressed the balance of infinity and limited in urban tissue and announces "Amentü" that means of fundamental belief Islamic religion. So forms and values turns unity discourse into action in Bursa.

LITERARY WORKS AND PERSONALITIES

City accumulates and transfers. In Florence, Vasari has revealed a unique literary work that makes room for the biographical promotions of the Artists' Life Stories and Renaissance masters. In the Divine Comedy of Dante, it is said that Florence was the account of Paradise. During this period, the works of the Italian Renaissance were expressed. The birth of the individual, the experience of self-knowledge is reproduced. Michelangelo's David Statue is a story of the individual who is the strong will of the city.

In Bursa, Süleyman Çelebi, Vesilet ul s Necât (Salvation Way) work is written. Mevlid name is read, memorized, Bursa is spread. This work, which still continues to announce the smell of Prophet Muhammad, is a unique and eternal work of the city. It teaches the way for man to find himself. The sciences and learn are told a mystical way taken to

a place until later in love and affection.

THOUGHTS ON THE FUNCTIONAL AESTHETICS AND FICTIONAL AESTHETICS

Bursa Pleasure and Florence Aesthetics

Great mountain is the expression of sublime emotion and value, aesthetics of domes, dark green woodland, monument looking trees, rose smelly, reading Mevlid, call to prayer, tomb visits, metaphysics of mysticism are expressed among the beauties of Bursa.

The search and representation of truth, abstractions, spirituality, calligraphy and music and called prayer that name of "Ezan" the simplicity of the unity, useful and beautiful identity comments functional aesthetics approach.

Calligraphy is a living art in Bursa.

The birth of secular thought, design, sculpture workshops, the development of Italian native language, the development of arts and the development of craftsmen, the Renaissance philosophy is the gift of Florence to humanity.

Appearance value expresses the fictional aesthetic, the harmony of diversity, the value of the image, the development of the modern view the eye, the appearance of the richness and the manifestations.

CONCLUSION

This paper clarifies the concepts of civilization, aesthetics and the city and refers to differences between Western and non-Western aesthetics with the main lines. This comments will continue to discuss the postmodern world with new views. These two cities are the reflection of the truth. The conscience of the eye and new association of ideas on the pleasure of the heart are accumulating. The two cities have to tell the postmodern age and the people of this age. Florence is an intellectual city that awakens the light of mind, calls for temptation and transforms knowledge into consciousness. Bursa is a beautiful city that offers solutions to the whole of the existence and the solutions of the spiritual air to the humanity.

Beauty, in its simplest sense, can be defined as "reflection of the essence". Today's interpretation of our own self reflected in the beauty and beauty of the feeling of living can arise. While the founding reality of the cities of the Western civilization is the Renaissance spirit and philosophy, the Ottoman Empire in the city based on the silence of the unity based on the norms, values and principles are expressed in the background. The two cities are incomparably more beautiful.

MULTI-CRITERIA EVALUATION OF BEAUTY IN ARCHITECTURE

Abstract | The article deals with the problems of beauty in architecture found in various layers of meaning related to:

- the creative idea of the planned investment,
- the ability to determine the right place for the planned investment, harmonizing architecture in the space of the location with special consideration of the natural environment,
- communication and information with the environment,
- respect for tradition and custom, cultivated in the local socio-cultural environment, paying attention to the historical continuity and coherence of the architectural forms used,
- creativity of shaping space,
- precision and innovation of the functional and used spatial solutions,
- partnership relationship with the neighborhood,
- broadly understood of participation in the investment process,
- giving meanings triggering the philosophical message and transcendence
- proper use and management,
- achieving social and cultural goals,
- ability of planning the transformation / revitalizing existing architectural objects.

The article attempts to show that the assessment of beauty in architecture is multi-criteria and can be based largely on a comparison of what is happening in the natural world and is considered by a human to be beautiful or through a philosophical consideration of what is beautiful. The article deals with the problems of beauty in architecture found in various layers of meaning and has a dual character. On the one hand, phenomena occurring in nature (including those related to the human being) are referred to, on the other hand, contextually related artifacts related to the shaping of space. It seems that the adoption of such a method allows us to make an attempt to objectify the criteria for assessing beauty in architecture, the same scientific approach to understanding the essence of beauty in architecture, the possibility of obtaining it, etc.

The research method is the analysis of listed components based on literature sources and examples of architectural objects or urban complexes.

The considerations lead to the thesis:

Beauty in architecture is a state of harmony of aesthetic and utilitarian values of the shaped space in the relations of a creative response to broadly understood conditions of the local natural, socio-cultural and built environment.

Index terms | *Urban Aesthetics, Silhouette, Heritage, Renaissance City, Ottoman City, Florence, Bursa*

INTRODUCTION

Man is a part of the natural world, at the same time influenced by the systems of values professed in the family, in religious groups or in the nation. The concept of beauty can vary among nations, social strata, and even individual people. To a large extent, this is a subjective feeling, extremely difficult to verify, sometimes very fleeting, depending on the individual experience of the perceived environment.

However, there are premises indicating the existence of objective beauty, contained in the natural world or in the human world shaped by the Creator, guided by the creation of good and fully valuable things.

Phenomena occurring in nature may be the key to perceiving and learning about beauty, which positively inspires people in shaping the environment. It can be presumed that this influence will result in the formation of relationships and relations of the elements of the environment that cause the perception and beauty of the users to be shaped.

The symbol of beauty can be a man with harmonious, perfect proportions of his body.¹

Beauty is also contained in the depths of human personality. It manifests itself in the noble deeds of man, the attitude and conduct of behavior towards others. Beauty also manifests itself in the human community, whose functioning is based on partnership, mutual understanding, cooperation, devotion or consecration.

CRITERIA FOR ASSESSING BEAUTY IN ARCHITECTURE

Beauty in architecture can be seen in a single object, as well as in its relationship with the immediate surroundings. Criteria 1-6 relate to the values that testify to the different understanding of beauty regarding an architectural object itself and have been associated with the values of beauty found in a single human person.

Criteria 7-12 are related to the values indicating the multitude of understanding of the beauty of the object in relation to its surroundings and have been linked to the values of beauty manifesting in the family or in human society.

In the author’s conviction, the criterion list for assessing beauty in architecture can be almost inexhaustible. Everyone has a different perspective on the phenomenon of beauty in architecture. The chosen criteria are inseparable from the investment process cycle.

1. THE BEAUTY OF BEING YOURSELF VERSUS THE CREATIVE IDEA OF THE PLANNED INVESTMENT

Man	Architectural object
<i>The beauty of the purpose of human action</i>	<i>The beauty of the purpose of the investment project</i>
<i>The beauty of being yourself, manifesting your individuality in an individual way</i>	<i>The beauty of the creative plan of the planned investment, identification of its distinctiveness, originality and creative impact on the environment</i>

1 About beauty of human body we can also read in Old Testament, Song of Songs (4.1-5, 5.10-16)

The beauty of being yourself, beauty begins when you decide to be yourself. Nature prolonging life does not make clones, does not repeat and does not copy in a mindless way. The beauty of the natural world consists in the harmonious relationship between homogeneity and the diversity of living beings. Each of the people has individual personality traits, learned behaviors and tendencies. Although all people have the same physical structure belonging to two sexes, however, we can distinguish in it each time the characteristics of individual facial features, geometric silhouette construction, hair color, physical fitness, etc. What's more, we are able to see in each human person a unique individual beauty, not only material, based on impeccable body structure, but also spiritual, connected with the human psyche, strength of character, gift of friendly relations etc. Manifesting the individuality of each human person is at the root our existence. Everyone lives on their own account, sometimes imitates the behavior of their idols, but ultimately wants to implement their own life plan, follow their own decisions, at the same time be a person who is well received and noticed among the closest surroundings, perform certain roles in it, be useful and useful. This is the realization of the beauty of being yourself. However, before it is fulfilled in the human mind of a child, then a man growing up and an adult person, this vision is born, develops and ultimately subject to realization.

The concept of being yourself requires renewal. Man realizes himself in the synthesis of three attitudes or life paths: autonomy, authenticity and self-creation. (...) *Being yourself is an art, not fulfilling ready-made prescriptions. Each of us must discover our own path, because our stories, temperaments and circumstances of our lives are different, which are the matter of our life choices.*²

A man who is himself recognizes that life makes sense. This means that man is satisfied with himself, although as Baruch Spinoza used to say, this feeling is probably the most difficult to achieve in reality.

Architectural object

The beauty of the creative design of the shaped architectural work is composed of several layers of meaning, i.e.

- the accuracy of defining its application program in the shaped space, allowing for the belief that it will be fully accepted by its user,
- the ability to specify the concept of the space being shaped, to extract an individual character in relation to the environment, to highlight and highlight its values,
- defining a form allowing full identification of the dominant functions performed in the facility and its surroundings.

Program arrangements are the basis for undertaking project activities. A wrongly programmed object will not fulfill its function or it will fill partially. What captivates the user of the shaped space is often associated with the form of the perceived object, its originality and individuality. The form of an architectural object often becomes a showcase of a concrete artist, representing his own approach of the form shaping. It is obvious that we prefer the readability of functions shaped in the space of our surroundings. It is not desirable to guess them. The object should be a showcase of its functions.

2 Adam Workowski, *Sztuka bycia sobą*. Czasopismo Znak. Styczeń 2014. Nr 704.

Sometimes you can meet with the statement how a beautifully defined object fits functionally in the environment (it complements the already existing functions), stands out with an individual form and at the same time indicates the functions implemented in it ...

The man learned to build in a way that would make it possible to distinguish a residential object from public utility, an industrial plant from an education facility, etc. The identification of the object’s function in space is essential for maintaining proper communication as well as the proper orientation of the space. Despite repeated functions in the shaped space, each of the designed houses should have individual features allowing its proper identification by users. The proper identification of architectural objects is also influenced by the varied needs of people implementing them in a suitably shaped space. Although architectural objects may represent the same specific function, they differ beautifully - they implement diverse, individual needs of future users. Typical projects do not actually exist, because they are not a response to the specific needs of the investor.

2. THE ABILITY OF DETERMINEING THE RIGHT PLACE FOR THE PLANNED INVESTMENT, HARMONIZING ARCHITECTURE IN THE SPACE OF THE LOCATION WITH PARTICULAR EMPHASIS ON THE NATURAL ENVIRONMENT

Man	Architectural object
<i>The beauty of material goods sharing</i>	<i>Harmony of the place of the location with the intended investment purpose. Appropriate furnishing of the plot and facility with tangible goods</i>

Man

One of the natural human needs is the status of possessing goods necessary for its proper development. During fetal life - the unborn human being “receives into ownership” the body that he will use until he dies. The child receives clothes, toys from parents, own room with age, in which he accomplishes school tasks, and makes contacts with friends. As soon as he reaches education and maturity, he takes a job to obtain funds for starting his own family, buying a flat or a house, everyday objects, etc. In spite to the pathological cases of people striving to have as many material goods as possible, whose disposal is an end in itself, man usually acquires those material goods that are necessary for practicing the profession, the proper functioning of the family, improving or facilitating everyday activities. Realization of the need to possess contributes to the feeling of security, psychological comfort allowing the activation of mechanisms that trigger the needs of a higher order: resulting from the desire to know the world, prevailing traditions and customs, seeking the meaning of life, etc. Above all, from the ethical point of view the most essential for a human being is how acquired material goods are sharing.

Architectural object

„Designing places never starts with a “blank piece of paper” and requires taking into account many existing factors“³

3 Angelika Lasiewicz-Sych, *Miejsce jako cel projektowania: Założenia teoretyczne i uwagi metodologiczne*. http://delibra.bg.polsl.pl/Content/28980/BCPS_32823_-_Miejsce-jako-cel-pro_0000.pdf (20.02.2019)

The 3-component space model described by Tim Cresswell consists of: (1) geographically determined “location” (location), (2) physical formation of the locale and (3) “sense of place”, where users place.⁴

The harmony of the location with the planned investment objective is one of the most important conditions for the success of the investment, for getting friendly relations with the environment. Spatial planning is the art of selecting locations for planned functions. Records of local spatial development plans should become a real signpost of the planned investment projects location. In many cases, the investor does the opposite. First, he tries to buy a plot of land (while looking for the cheapest areas), often without knowing what objects he would like to implement, and then making decisions on the implementation of a specific project, often remains in dispute with the local plan, enforces their correction. Buying a plot is not enough. It must be equipped with technical infrastructure leading to the planned facility, necessary utilities, often fencing, and security systems against unwanted people. When the task is completed, it is first equipped with the necessary machines and devices, furniture, allowing proper use of the facility. Proper location of the object allowing to obtain the expected profits from the functioning of the investment, proper equipment of the building being implemented, streamlining the activities carried out in it, create the basis for the feeling of safety and comfort of its users. In the presence of the premises described here, the impression of a harmoniously entered object in the surroundings or perfect equipment may appear among people using the facility. These features give the splendor and popularity of such shaped architecture. However, in everything, yes, and here, moderation must be respected. The excessively developed territory of the plot, which is the depletion of the dwindling resources of space, irrational retrofitting of the object causes the necessity to incur unjustified economic outlays for the purchase and maintenance of furniture, devices, etc.

3. ENSURING EFFICIENT COMMUNICATION WITH THE ENVIRONMENT

Man	Architectural object
<p><i>The beauty of human contact with one's neighbor and the immediate surroundings,</i></p> <p><i>The beauty of meeting people and the world.</i></p> <p><i>The beauty of sharing your own experiences with your loved ones.</i></p>	<p><i>The beauty of the communication links between the object and the environment</i></p>

Man

Each of us lives in constant contact with the immediate surroundings. The relationships are reciprocally incorporated. The world of nature provides us with the air, water and food necessary for life, it is also a source of experience in mutual contacts. Man identifies himself with his immediate surroundings when he meets, understands and shapes his own needs. Establishing contact with the immediate surroundings is indispensable for each of us. You can not “stay in place”. The essence of human existence is to experience and getting knowledge. To achieve this goal we have to move in the space in which we are living. There are various forms of human

4 Angelika Lasiewicz-Sych: *Kreacja miejsc a forma otwarta: problem aktywnej percepcji w architekturze Placemaking vs an open form: active perception in architecture*, *Czasopismo Naukowe „Kultura i Historia”* ISSN 1642-9826 https://www.kulturaihistoria.umcs.lublin.pl/archives/5964#_ftn9 (after) T. Cresswell, *Place. A short introduction*, Blackwell Publishing, Oxford 2004, p. 7

communication with the immediate surroundings: spoken through words of thought, gestures, written words, statements in the field of art, music, etc. Each of them, in its essence, may have a different purpose, trivial conversation, exchange of views, self-advertisement, expressing opinions, etc. Every limitation of human freedom in the possibilities of communicating with the environment leads to the impoverishment of experiences that a person wants to experience during his life, as well as to his isolation and alienation.

The harmony of human contact with the outside world leads to the feeling of its beauty, similarly friendly relations with loved ones are a testimony to the beauty functioning between people.

Architectural object

It seems that in the discussed issue it's possible to see beauty in the functioning of communication links between the object and the environment.

The architectural object does not function without communication links with the immediate surroundings, implemented by means of pedestrian and vehicular routes, and the possibility of using parking spaces located in the vicinity of the location. Contact with the immediate surroundings also means opening to public spaces located in the immediate vicinity of the facility, offering places for meetings and rest, for the implementation of cultural events, equipped with a calm and balanced advertising and public information about important aspects of the residents' life. Communication with the nearest surroundings are also public transport stops, taxi stands, bike rentals. The architectural object is located on a building plot with its number. The street at which it is located has its own name, the building number indicates on which side of the street it is located, and also which is in order of the others. It is often possible to meet his plan on the streets of the city, on which are the locations of the most important objects, along with pedestrian and vehicle communication enabling collision-free access to them. The immediate environment is also natural, if it is small (eg due to investing in the downtown area), at least it should contain accents of greenery, accompanying or in the form of ponds, fountains, etc.

The communication of the architectural object with the immediate surroundings may have the characteristics of beautiful functioning of communication links, easy access (including for the disabled), commonly available information about what is happening or will take place in the future inside the building.

- 4. RESPECT FOR TRADITION AND CUSTOMS, CULTIVATED IN THE LOCAL SOCIO-CULTURAL ENVIRONMENT, PAYING ATTENTION TO THE HISTORICAL CONTINUITY AND COHERENCE OF THE ARCHITECTURAL FORMS USED.

1670

Man	Architectural object
<p><i>Beauty resulting from family traditions</i></p> <p><i>Beauty resulting from a sense of security</i></p>	<p><i>The beauty of reference to the form of the object to the current tradition and customs,</i></p> <p><i>The beauty of growing an object "from the place of location", the beauty of the continuity of historical forms.</i></p>

For many people, nothing is more beautiful than maintaining traditions cultivated in the family. These may result from the cultivating of religions, regional customs, oral traditions of the older generation, etc. The customs prevailing in the family form the basis of its consolidation, the sense of unity, also the sense of safety.

A man who contacts the environment wants to feel safety in this experience. Usually, it is a feeling of confidence that something he does - does in a way that his environment expects. It is also the conviction that these activities are correctly performed. In many cases, experience and appropriate qualifications are needed in this area. In order to possess, you need to work hard on them, some actions have to be repeated to become a master. Repeat experience is essential in the learning process. Each obtained knowledge, whether at school or on a course, must be repeated often enough to master it.

With regard to the simplest, each person builds his sense of security based on the knowledge of the elderly, parents, guardians, people who have already acquired the appropriate amount of knowledge and experience, which they could share or help on their basis.

Architectural object

The architects themselves are also blamed for the low quality of space, who are not forced to analyze the surroundings and too often submit to modern design trends in the world architecture or to investors' advice. The result is realizations that do not take advantage of the potential contained in the traditional development of the region. Accidental buildings are created, often designed in a style that refers to other regions of Poland or other cultural circles.⁵

From the first year of studies in the field of architecture, students learn about the history of architecture and urban planning. Solutions that once worked and gave an elementary sense of safety, stability, mental comfort, or lack of danger are remarkable and follow-on.

The reference of the object's form to tradition, the creation of relationships with the environment based on locally binding habits of building, contributes to maintaining the cultural continuity of the place. Building without unions with the past is shaping space without tradition. Each generation inhabiting a given space creates characteristic relationships between its culture and shaped architecture, transforming into the characteristic features of regional architecture related to:

- maintaining specific forms of building,
- using specific construction materials (usually of local origin)

Shaping the form based on the experiences of the generations preceding us, related to the place and beliefs of the local community, creating a sense of homeliness, being at home and safe living and fulfilling life tasks, is unfortunately now a vanishing beauty of continuity and uniformity of historical forms, the beauty of the regional landscape.

⁵ Piotr Zierke Odwołania do tradycji we współczesnej architekturze aglomeracji poznańskiej jako szansa na poprawę jakości przestrzeni. Acta Universitatis Lodzianis Folia Geographica Socio-Oeconomica 19, 2015 file:///C:/Users/Dell/Downloads/2-021_034-Zierke.pdf (20.02.2019)

5. CREATIVITY OF SHAPING SPACE

Man	Architectural object
<i>The beauty of individual creation, the initiation of creative acts</i>	<i>The beauty of creating new functional and spatial solutions based on the transformation of existing forms</i>

Man

Each of us is given predispositions to develop various talents. Those that multiply our work result in the expected fruit. Man’s passive attitude towards the world around him leads to his inner impoverishment. In the depths of our hearts, each of us wants to be in our creative life, perceived by surroundings as a creative person. The feeling that we have done something new, original, creating the basis for new, interesting solutions is very much needed. It builds our value and hopes that our lives will be fruitful for ourselves and our fellow men. It also creates the basis for feeling the beauty of creative life which we lead.

Architectural object

“Architecture is an inspiring atmosphere and beauty. It is a passion for creating for people in context time and place, nature and culture “ motto of Konior Studio design studio ⁶

Although the use of traditional forms functioning in a given environment is a distinctive feature of homogeneous shaping of architecture, however, it is time to make changes that not only cause a more beneficial entry of the object into the environment, but also have a positive impact on the users of the shaped space. In the extreme case, the author of the newly designed object can completely break with the existing tradition, create a vanguard of the avant-garde, which after a certain time will be perceived as something brilliant, a milestone in shaping architecture or urban planning. This does not mean that this type of action is doomed to failure. The history of architecture is full of examples of objects that were initially unacceptable and later became the symbols of the place where they come from (the Eiffel Tower in Paris). Today we start to build objects much more taller. Many of them have symbolic forms inspired by the natural environment and rich transformed historical details which we can find inside the buildings (Burj Khalifa, 2010 designed by American architect Adrian D. Smith).

The beauty of architecture, which despite the use of traditional forms strongly affects the environment, introduces new details shaped by creative historical processing, is the effect of implementing new technologies developed based on a modification previously tested and recognized as safe, is usually perceived as a result of fascination, admiration or admiration.

6. PRECISION AND INNOVATION OF THE FUNCTIONAL AND USED SPATIAL SOLUTIONS

Man	Architectural object
<i>The beauty of work focused on the need to better adapt to living conditions</i>	<p><i>The beauty of adapting solutions to events that may occur in the future, improving the sphere of operation of the object leading to precision, consistency and internal harmony of shaped functions.</i></p> <p><i>Accuracy and detail in solving architectural and construction details</i></p> <p><i>The beauty of object's construction</i></p>

Man

Prevention is a trait of a man caring for his fate, for the result of events that are to occur in the future, for proper preparation for accidents to occur. This feature is the driving force behind activities leading to many improvements in the sphere of human activities. Thus, man adapts better to living conditions.

Architectural object

Architectural detail is a separate spatial form interacting with the basic structure of the building and integrated with it into an inseparable whole.⁷

Currently, it is difficult to decorate with decorative forms. Contemporary architecture uses the achievements of technology and science, it has departed from the inspections of past epochs. Beauty of the construction was discovered, rejecting ornamentation. The detail is therefore the individual elements of the building, such as: construction, façade finishing, windows, balustrades, etc. These elements in the past also existed, but with the richness of sculptural forms (ornaments, friezes), they were not picked up in the context of eye-catching detail.⁸

The architect must be ahead of time, anticipate the conditions that will prevail in the period of use of the space he shapes. The time advance operation must lead to improvements in the sphere of the functioning of the facility, the achievement of a state in which the conditions created will be able to meet the requirements of the future user. The existing difficult local conditions may become the cause for searching for completely new solutions. New innovative solutions are still ahead of us. Their complexity will be increasing, involving the integration of many technologies, computerization of the production of building elements, building and ultimately management of the investment project. This interdependence and interdisciplinary nature of many fields of technology harnessed in the investment process requires precision of meticulousness and efficiency in the joint activities of engineers and technicians who are specialists in various industries. Shizuo Harada and his "Sky City" - an object with a height of 1 km which aim is to replace the entire district in Tokyo, to regain space in the city, intended for recreation is an example of innovative thinking about shaping the modern city. Poor soil, unprecedented construction loads, earthquakes, wind loads, threats resulting from the event of

7 Janusz A. Włodarczyk, *Detal architektoniczny, czym jest?* <https://suw.biblos.pk.edu.pl/downloadResource&mId=1074720>

8 Krystyna Strumiłło, *Detal w architekturze współczesnej.* <https://suw.biblos.pk.edu.pl/downloadResource&mId=1087616>

a fire, gas explosion or terrorist attacks are factors that influence the need to search for unusual, individual solutions that can meet such challenges - beautiful, simulated by computers, but until now unverified in reality. Supertall towers as landmarks and points of reference create symbols of growth and development of urban areas, and represent the visual character of a city.

7. DIALOGUE AND THE PARTNERSHIP RELATIONSHIP WITH THE NEIGHBORHOOD

Marriage	An object in an architectural complex
<i>The beauty of relationships taking place in a married couple</i>	<i>The beauty of interactions based on the partnership of the object with the environment</i> <i>The beauty of the dialog between the architecture and surroundings</i>

Marriage

Mature man or women intuitively looking for his or her partner. As soon as he or her begins his life in partnership, all worries and life goals are realized jointly by both people close to them. Everything that they have achieved so far in the course of their own individual development is now to pay interest in the marital community. This can only be built in an atmosphere of mutual understanding and close collaboration. We can't talk about a successful partnership if one of the spouses enforces the conduct of the other.

The beauty of relationships taking place in a partner relationship is conditioned by the need for mutual understanding and joint responsibility for the mutual fate of the spouses. In a successful marriage a balanced, harmonious dialogue takes place.

An object in an architectural complex

Contemporary understanding of the foundations of harmonious shaping urban planning and architecture requires a profound change human consciousness, indicating that balance ecological can only be achieved if the built environment will be fully integrated with natural and socio-cultural environment in which man will keep respect for the surrounding him in the world. To the Triad of Vitruvius: function (utilitas), construction (firmitas) and beauty (venustas) you need to add an environment (oikos) and functioning in it system systems (systematikós).⁹

Each architectural object co-creates together with buildings for a similar purpose a specific team (housing, commercial and service facilities, etc.). Regardless of the type of the object, each of them serves the needs of the owner himself as well as people who, for various reasons, move inside. We can talk about the need of zoning functions that serve the hosts of the facility and those who stay as clients, guests or simply being occasional in the object.

In addition to the function, the object interacts with its appearance. Excessive accentuation of newly designed objects may cause dissonance with the existing architecture. The relationships are returnable, often the environment triggers a negative impact on the object. The balance of mutual interactions is the basis for achieving harmonious relationships broadly understood partnership in the investment project.

The object should conduct a dialogue with the surroundings. The object exists in the context

⁹ Bogusław Szuba, *Systemy środowiskowe a lokalne otoczenie człowieka*, Wyd. Politechnika Opolska, 2012.

of the environment. The beauty of the interaction based on the partnership between the object and the environment consists of socializing its function (even a single-family house has a zone for guests), weighing the attractiveness of the function and the strength of the form expression.

The dialogue of architecture with the environment is harmony with the natural and socio-cultural environment, it is a system of mutually interdependent, each other supporting interactions.

8. BROADLY UNDERSTOOD PARTICIPATION IN AN INVESTMENT PROJECT

Financial partners	An object in an architectural complex
<i>The beauty of sharing and managing the common state of ownership</i>	<i>The beauty of the object's functioning in the architectural complex.</i>
<i>The beauty of joint investment</i>	

Financial partners

The partnership means that the current property acquis of each shareholder becomes part of the joint acquis. Shareholders jointly decide about their state of ownership, make decisions about investing, selling their goods, etc.

The capital that is the basis for the operations of individual companies can be combined. Many companies decide to undertake joint investment efforts because they could not realize investment independently.

The ability to collect material resources together, share it and manage it is a beautiful feature of people working together - in a company, a consortium, a holding company, etc.

An object in an architectural complex

An architect often faces the task of planning and organizing a venture funded by a team of investors. This situation is difficult because it usually involves the necessity of distinguishing several individual properties for functional objects separately, but at the same time constituting one organism. Often, the free market triggers the need to organize a construction site for several contractors. This leads to the need to synchronize their activities on one building site, dividing duties and responsibilities for the tasks carried out. The common organization of the ownership during planning and execution of the investment can go to the operation phase or the management of an architectural object. The project foreseeing the possibility of conducting investments, exploitation or management by many investors requires a careful division of roles, sometimes designation of separate land properties and architectural objects belonging to them, which in their entirety form create the compact architectural object. The architect in this process plays a very important role. It may turn out that the negligence consisting in the inability to divide the real estate into a given number of properties assigned to particular investors will not be conducive to the peaceful implementation of the task. There would be no joint investments, if the contracts, agreements, were being not concluded previously. Linking individual objects to a group, constituting the whole functional and spatial is a kind of beauty of integration of various architectural, construction and material, technical, formal and legal problems, etc.

9. TRANSMIT A PHILOSOPHICAL MEANINGS TRIGGER MESSAGE AND TRANSCENDENCE

Meditating man	Object / complex of architectural objects with significant cultural values
<i>The beauty of a deeper understanding of the higher hierarchy of values, abstract categories, the environment, the world of ideas, symbols, etc.</i>	<i>The beauty of the transmission of symbolic and semantic values inscribed in the form, construction and material structure of the object or architectural complex</i>

Meditating man

It's not enough to learn about the immediate environment for people who want to explore the value of their lives. They want to explore and develop worldviews, look for the meaning of existence, become beings as fully as possible to learn about and understand the mechanisms of functioning of the world and even the universe.

At this stage of experiencing reality, man introduces symbol systems, abstract categories allowing to describe the observed phenomena in a generalized way. This requires a new look at phenomena that have be perceiving and experienceing much far, with a "distance" view, allowing for the proper assessment of the examined things or phenomena. The practice of this type of experience is combined with the beauty depicting the generalization of the perceived world, the perception or the cognition of the ultimate things, the approach to the spiritual world.

Object / complex of architectural objects with significant cultural values

Many architectural constructions have their destiny connected with the confession of faith, a place of meditation. Since ancient times, man has built temples, places of worship, rites, etc. Whenever we enter these objects, we find in them many images and symbols with religious content or philosophical values. These contents can also be coded by the appropriate arrangement of architectural elements. An example may be Egyptian pyramids. To this day, we read more and more new meanings and content that testify to the exceptionally high knowledge of the ancient man. Contemporary objects filled with symbolism and meanings are mainly related to sacred buildings. Both the spatial layout as well as the architectural detail are treated in a special way in these objects. The sacred space is clearly different from the profane space. The rich language of architectural forms allows us to present a variety of content related to faith, the message of the Creator himself, and the history of man's relationship with God. Such objects usually have long-distance effects.

The beauty of an object containing deep symbolism and religious-philosophical content is very deep and unique.

10. PROPER USE AND MANAGEMENT

A man fulfilling his role / destiny in society	Object / complex of architectural objects
<i>The beauty of realizing man's destiny</i>	<i>Beauty resulting from the implementation of tasks performed by the object / complex of architectural objects</i>

A man fulfilling his role / destiny in society

In the life of every person, the time comes to use the acquired knowledge and skills implemented into a specific professional and social status. Implementing one's skills in work is one of the most important values in the life of every human being. It allows us to feel that we are needed for someone, that our effort is directed at things important to the community in which we live. With the age of experience in professional work, we become experts in a given profession, share our knowledge and skills with those who need it, we pass these experiences to those who will succeed us. This state allows you to maintain certain security related to the implementation of certain services and benefits in society. The scope of these services, their availability and competitiveness, allow us to think about the quality and standard of living of a given community. Everyone who makes an effort to work is subjected to specific social, political conditions, producing systems of levels and hierarchy of individual professions. Not everyone will achieve managerial positions, not everyone will be able to work in certain professions, even at the lowest organizational levels. This results not only from the required qualifications of the applicants, but also from the specific needs. The beauty resulting from fulfilling a given role in the community for many of the people is a feeling of fulfilling their destiny.

Object / complex of architectural objects

Architectural objects that we design, implement and use remain under the influence of cultural, social and political conditions shaped by a given human environment. All this means that their tasks and functions are segregated, regrouped and given a proper rank.

In many cases, the facilities are grouped into specific organizations related to education, hospitality, social and health care etc. There is a similar phenomenon here as in the life of every human being - fulfilling a specific social role. Hence, objects requiring universal access are covered by isochrones of a specific time necessary to reach it on foot or to provide organized access (primary schools).

Shaping space while maintaining the hierarchy of objects' importance is very important for a human being. An example of this is the development of the market in which the town hall raised above the surrounding buildings plays a dominant role. This creates a sense of proper identification and hierarchy of functions shaped in the human environment.

The beauty resulting from the implementation of tasks of the object/complex of architectural objects is conditioned by its proper location in the hierarchy of objects constituting its surroundings, or located in the organizational grid of the team formed of objects with similar functions. The above example also shows a simple conclusion that not every architectural object will act as a town hall, it results not only from the place where it can be implemented, but also the demand for such objects in society.

Proper regionalization of functions, logic of the availability of functions (pedestrian access isochrones, individual and mass circular communication), fulfilling the expected role of the object in the community (rural, urban, agglomeration, region, state) are the premises supporting the above defined beauty.

11. ACHIEVING SOCIAL AND CULTURAL GOALS

A man achieving life goals	Architectural object achieving intended socio-cultural investment objectives
<i>The beauty of sharing place in the outside world with neighbor and all what is close to us</i>	<i>Beauty resulting from realizing the purpose of the object / complex of architectural objects</i>

A man achieving life goals

Everyone, regardless of their social status, wants to be creative, leave something behind. Otherwise, our role would be to uncritically reproduce activities performed by others.

Individual human creativity is now to reflect on the level of social forms of existence. This activity, transforming into international movements, may even have a general human character.

Architectural object achieving intended socio-cultural investment objectives

Shaping space involves determining the living conditions for many social groups, interrelated relations arising from professional relations (administration, manual workers, white-collar workers, people staying as clients). Often, many of these groups share one architectural object. Each of them requires the fulfillment of appropriate technical and functional conditions.

This results in the necessity of prudent programming and designing of functions, in such a way that satisfaction with the use of the object would be possible for all social groups. As such, an object as fulfilling the expectations of its users achieves the purpose of its existence.

Sometimes the buildings aim to commemorate important events, achieved goals in the history of the nation. They express the beauty of the goal achieved by the nation and they usually become the image of beauty positive international influence.

The Statue of Liberty is a figure of Libertas, a robed Roman liberty goddess. She holds a torch above her head with her right hand, and in her left hand carries a tabula ansata inscribed in Roman numerals with "JULY IV MDCCLXXVI" (July 4, 1776), the date of the U.S. Declaration of Independence. This statue, one of the largest in the world, was donated to the United States of America by France

12. ABILITY TO PLAN AND TRANSFORM / REVITALIZE INVESTMENTS

Man at the end of life experiences	Object/complex of architectural objects at the end of technical life exhaustion
<i>Beauty resulting from the summary of the experiences of life and making decisions about further personality development</i>	<i>Beauty resulting from the renovation of architectural objects and revitalization of urban complexes</i>

Man at the end of life experiences

The end of the cyclic process of accumulation of human experiences can also be a success and the beginning of a new cycle at a higher level of consciousness or a loss, which disintegrates the system of existing values and the necessity to re-accumulate basic life experiences. This time in human life is often a period of anxiety. Something in life ended, it was time to sum up what was good and what was bad for a man. Something in human life is about to start again,

having rich experience from the previous phases - there is a chance that the tasks that have been resumed will be carried out with a better result, with greater benefits for those who participate in them. The beauty of time in which man sums up his own deeds of good and evil is unique. In many cases, it is time for man to say goodbye to mortality - and to enter into eternal life.

Object/complex of architectural objects at the end of technical life exhaustion

The architectural object / complex can not be used for an unlimited period of time. Sooner or later there will be a period of technical aging of the facility and the related need for renovation and renovation. While the object still meets the expectations of its users - necessary repairs become only their temporary exclusion from use. Objects are getting older in terms of morality, after a certain period of time they no longer correspond to users due to the changing trends in our lives, lifestyles, emerging new, better opportunities to satisfy the same needs. It also happens that objects have fulfilled their role, fulfilled a specific purpose and their further use is devoid of being. This phenomenon causes the users to leave facilities, change owners, introduce necessary modernizations in their interiors, and in justified cases, a complete change of the function, allowing for a new restoration of the use of the object. In abandoned buildings many times we discover their former beauty, which can be expressed in form, detail, or other aspects referred to above.

A kind of beauty concerns industrial architecture, whose traces of old technologies, devices and machines become a specific beautiful cultural heritage.¹⁰

The architectural concept of the shopping center "Stary Browar" in Poznań (Poland) can be defined without a doubt as very attractive, innovative, unusual and beautiful as well.

SUMMARY

The investment process consists of repeated stages programming, designing, realization, using, and the next modernization, revitalization, transformation, technical death, after which the program is usually rebuilt and the stages listed above are repeated anew. The process of shaping space resembles metabolic processes occurring in nature, similar to human development stages. Conceived life develops the body, leads him to the period of maturity, and after exhausting his strength, return to a state that allows him to be born and grow to new beings which inhabit our planet. It seems that nature controls the processes of exchanging matter and energy in a way that allows for the renewal of the life cycle in an unlimited way. To a large extent, man can learn from nature, which (as the world of science maintains) is determined by functioning in our reality physical laws. A man who remains a part of the world of nature, despite being aware of his individuality and the unique role he plays on Earth, remains under their influence, learning the mechanisms of their actions - he tries to use them to achieve his own goals resulting from elementary human needs. All this is a testimony to the specific beauty contained in nature, the man himself and the things created by him. Architecture that is the work of human hands, as long as it serves man and is friendly to nature, it also contains beauty. Beauty in architecture is a state of harmony of aesthetic and utilitarian values of the shaped space in the relations of a creative response to broadly understood conditions of the local natural, socio-cultural and built environment.

10 Krzysztof Gasidło., *Discovering the beauty of old factors, [in:] Beauty in architecture*, Oficyna wyd. PWSZ w Nysie, 2018.

There is a preview that there are two types of beauty:

- Subjective beauty that is revealed inside of things
- Objective beauty, perceived by the general, which is always visible on the outside.

It seems that the described components (criteria for the assessment of beauty) do not in themselves constitute the value of beauty in architecture, but their observance leads to the goal in which beauty can be perceived by users of the shaped space, or in a different way, regardless of whether it will be perceived in a subjective or objective way.

FLUID STATE OF ARCHITECTURE

Abstract | This paper is focused on the changes in architectural aesthetic criteria from static to dynamic values of both figurative and nonfigurative aspects in contemporary architecture and its cultural context. Fluid state of architecture refers to the notions of constant variability occurring in relations between architecture and contemporary cultural and technological context of globalization. Context of globalization dynamizes everyday perceptual experiences, living conditions and terms of spatial appropriations. Accordingly, new networking phenomena appearing on informational, communicational and spatial levels transform city and architecture into constant process of flows, dematerializing its elements into the new qualities of fluid, variable character. In addition, architectural aesthetic qualities simultaneously shift through events and effects affirmation over static formal whole in transformation from objective to (inter) subjective aesthetic spatial experience.

This paper is based on hypothesis that contemporary architecture is characterized by the loss of object singularity in terms of contextual conditions and assimilation of particular characters into the dynamic character of the whole. Therefore, this paper presents the research of architectural design principles shifting through dispersion of disciplinary boundaries and boundaries of inner and outer architectural space. In addition, figurative aspects of architectural aesthetic changes reflect in hybridity and typological definition loss. Therefore, such changes become the expression of architectural historical fundamentals fading and negation. The idea of this paper is to present how dematerialization of architectural values transforms contemporary architectural space into the complex dynamic system of infrastructure, flows, events and effects. The main idea of this paper is to present the potentials of design principles in produced state relying on aesthetic reading of spaces of flows and dynamisms in architecture of contemporary living. The new cultural phenomena resulting in global technological, political and economic changes are creating the potentials of the new meanings and new aesthetic reading in architecture. Therefore, the dynamic concept of flows is positioned into the spatial perspective as architectural design criteria in response to dematerialization of architectural aesthetic object and perceptual effects overproduction.

Index terms | *architectural aesthetics; architectural design; aesthetic experience; dynamic values; fluidity; globalization;*

INTRODUCTION

The main idea presented in this paper is to research the concept of fluid state of architecture, based on its relations with the contemporary cultural, socio-spatial context. Additionally, fluid state of architecture refers to the notions of constant variability occurring as a result of contemporary everyday experience dynamization, living conditions and spatial appropriations in the post-postmodern context of globalization and informational revolution. Therefore, this paper is focused on the changes in architectural aesthetic criteria shifting from static to dynamic values of both figurative and nonfigurative aspects of contemporary architecture.

Fluidity of contemporary context of architecture

Contemporary, dynamic context of global networks and consumerism is characterized by constant processes of exchange and changes of material basis of everydayness. Fluid, variable, intense processes of population mobility, information exchanges and communicational interactions change contemporary cultural and aesthetic experience. Therefore, dynamic experiences reflect on the perception and spatial experience of architecture and the city. In this paper fluidity is positioned as the main contemporary conceptual phenomenon, simultaneously causing and manifesting in contemporary transformations of social and spatial conditions into a constant process of interacting flows. In addition, contemporary networked context is characterized by increasing effects of globalisation, such as transnational, transcultural exchanges and constant flows of money, goods, people, tourists, migrants, information, ideas etc. Transfer and transport networks become the communicative devices of modern life. Therefore, (post)postmodern socio-spatial context transformed notions of mobility into the new aspects, manifested in dynamic, flowing, variable and constantly changing experiences of everydayness – aspects of fluidity.

Contemporary networking phenomena transform the urban context into the processes of constant flows and dynamics, dematerializing its structural elements into the new fluid, liquid and flowing character. Increasing technological development accelerated the everyday life, where functions of the society are based on the phenomenon of flows – “flows of capital, flows of information, flows of technology, flows of organizational interaction, flows of images, flows of sounds and symbol” according to Manuel Castells. In addition, Castells says: “Flows are not just one element of the social organization: they are the expression of processes dominating our economic, political and symbolic life”. In addition, Castells says that “global city is not a place, it is a process” and “the emphasis on interactivity between places breaks up spatial patterns of behavior into a fluid network of exchanges that underlines the emergence of a new kind of space – space of flows”. This research is based on the reading of the new sense of perceptively, sensory and experiential values of the contemporary conditions occurring in relation between architecture and its context. Therefore, the notion of flow becomes the element of fluidity manifested in sensory complexity and perception of constant movement and dynamics. In addition, fluidity is considered as new aesthetical quality based on constant perceptual sequences change and dynamic formal implications in architectural and urban space.

FLUID STATE OF ARCHITECTURE

According to the presented conditions of the contemporary context, the position of architecture manifests in the transformation of values and material basis of our contemporary everyday experiences.

Castells' opinion, poststructuralist itself, puts the ideas of difference and repetition in

the thinking of urban structure, as constants of spatial transformation into the dynamic process. Accordingly, flows articulation in the spatial perspective becomes a query of architectural and cultural relation – relation between formal representations and new cultural and social meanings. Accordingly, subjectivity affirmation, variability and structural dynamization of architectural space occur as the opposites to the historic fundamentals of architectural form and its aesthetics. The notion of flow, as kinesthetic and relational criteria, becomes the constitutive of formal spatial qualities. In addition, programmatic hybridity and typological definition lost manifest the dispersion of old and affirmation of new architectural design principles.

From artefacts to effects - Non-figurative aspects of fluidity in architecture

In the analyses of cultural and architectural discourse terminology changes after 1960s, phenomenon of flows becomes more and more present in postmodern cultural transformations, in words of Zygmunt Bauman - “fluid life”, “liquid love”, “liquid fear”, “liquid modernity” etc. The aesthetic experience of contemporary life, city, architecture and art becomes “scattered in the gaseous state” according to the philosopher Yves Michaud. In addition, Michaud says that absolute “aesthetic triumph” transforms the aesthetic experience into the experience of everydayness. In order to meet existential, consumer, touristic and hedonistic needs of neoliberal capitalist society, transit of aesthetic experience into the fluid state is a result of the pleasure occurring during the experience that is flowing, autonomous, intuitive and easy to understand.

Psychologist Mihály Csíkszentmihályi names the pleasant experience, the one requiring undistracted, continuous attention and perception, the “flow experience”. Kinesthetic experience principle in architecture is the most dominant one in phenomenological and poststructuralist thoughts of spatial perception and relation between subject and its physical context. In addition, kinesthetic, as a spatial understanding by movement occupies subject attention creating the Csíkszentmihályi’s “flow experience”, which is fluid, autonomous, subjective and pleasant.

The relation between kinesthetic, perception and subject-space interaction could be recognized in the affective dimension of perception in philosophical discourse of Henri Bergson and phenomenological elaboration of perception by Maurice Merleau-Ponty and theory of perception by Mark Hansen. Action and involving of the body into the visual field is precondition of perception and each sensory sensation, according to Hansen. Additionally, Hansen emphasizes the central role of the body in cognitive process of perception in which visual image is created by the action of the body in space in which perception is homogenized with space.

Therefore, the relation between visual, nonmaterial and material in the process of creating the perceptual experience is formed. Additionally, process of conceptualization allows logical systematizations of perception, subjectivity and intuitive experiences of space. Subjectivity, as an oppose to historically fundamentals of meaning and style in architectural form, becomes the main potential of contemporary dynamic context. Reduction of historical formal rhetoric and technological transformation of creative, design tools in architecture reshaped the non-figurative aspects of architectural aesthetics into the fluid, variable qualities. Therefore, architectural aesthetic qualities are shifting towards dynamic events and effects affirmation over static formal whole, transforming from objective to (inter) subjective aesthetic spatial experience.

The position of a form in a process - Figurative aspects of fluidity in architecture

The notion of flow in urban context is explained by Manuel Gausa as an internal interior of no defined boundaries, where users are located in the form of flow. Bernard Tschumi says that architecture is “the form of flow” consisted of sequences of events,

activities and movement occurring within static architectural elements. In addition, the book *Architecture and disjunction* refers to idea that there is no architecture without programme emphasising that social relevance and formal invention could not be separated from the events within. Accordingly, architecture is simultaneously produced, reproduced, designed and experienced. Tschumi's sequences of program present assemblages of events strung along assemblages of spaces, where each cadre changes, marks, increases the ones coming after. Therefore, Tschumi's theory affirms plurality of interpretations rather than individuality and the idea that each spatial part is simultaneously complete and incomplete and non-determinant.

Poststructuralist philosophy influence on architectural theory is notable in a change of terminology and the use of notions such as flow, flux, dynamism etc. expressing the values change and architecture becomes the synthesis of temporal-spatial elements, movement and variability. Manuel Gausa says that: "advanced architecture is the architecture of flows and exchanges between local and global, individual and culture, place and city, information, technology and behavior, time and context".

Ignaci de Solaa Morales Rubiao in the book *Differences* researches the relation between architecture and its context, which is characterized by the absence of clear value system legitimized and widely accepted to be the basis for the design practice. Additionally, Solaa Morales researches the phenomenon of aesthetic values dispersion and absence of fundamental referents in contemporary architecture, in the relation between poststructuralist philosophy and architecture.

Therefore, postmodernism appears to be the manifestation of poststructuralist thoughts on difference and repetition, suggesting the queries of subjectivity and architectural presentation. Accordingly, subjectivity occurs as the opposite to historical fundamentals and style characteristics in architectural form. According to Solaa Morales architect invokes the individual memory of the users in space. In addition, architectural form is characterized by the generic principles which reduce historical formal rhetoric, symbols and meanings leading towards formal abstraction and shifting users' focus and perception to gestures, flows, movements and events. Architecture becomes more direct to observe and use, more temporal and individually understood.

Additionally, contemporary architecture design principles are characterized by the dispersion of disciplinary boundaries and boundaries of inner and outer architectural space. Therefore, figurative aspects of architectural aesthetic changes reflect in hybridity of programs and forms resulting in typological definition loss. Architectural formal and functional criteria is based on articulation, affirmation and adjustment to the flows, dynamics and events occurring both in architecture and its context. Such architectural queries are results not just of technological shifts, but also of the new meanings and values. Contemporary architectural criteria are positioned in the process of shaping the perception of architectural and urban space, crating the relation between individual and society. Therefore, non-figurative and figurative aspects of architecture simultaneously reflect in transformations of architectural form and its meanings. Transformations of architectural form and hybrid structures result in more often disciplinary intersections and transgressions. Rem Koolhaas, Stan Allen, Martin Pawley, Keller Easterling etc. research needs and possibilities of architecture-infrastructure-landscape unification into one dynamic spatial system.

Therefore, transdisciplinary transformations overlap architecture and infrastructure with landscapes, both natural and urban, creating the poststructuralist *Deleuzian* space with softened boundaries, based on fluid qualities and continuity.

CONCLUSION

The aim of this paper was to research the hypothesis that contemporary architecture is characterized by the loss of object singularity in terms of contextual conditions and assimilation of particular characters into the dynamic character of the unique system. The main idea presented in this paper is based on the dematerialization of architectural aesthetic values and transformations of architectural space perception based on the complex dynamic systems of infrastructure, flows, events and effects. Therefore, such changes appear as expressions of architectural historical fundamentals dispersion, fading and even negation. Disciplinary overlaps, intersections and transgressions create new design principals and potentials and new aesthetic readings.

Accordingly, the dynamic concept of fluidity is positioned into the spatial perspective as contemporary architectural state appearing in response to dematerialization of architectural aesthetical object and perceptual effects overproduction, loss of spatial boundaries between inner and outer space, hybridity, typological definition loss and continuity of constant changes.

PHILOSOPHICAL FOUNDATIONS OF SOCIALIST REALISM AND SOVIET MODERN ARCHITECTURE IN EASTERN CENTRAL-EUROPE

Abstract | After WW2 the main goal in city planning was the reconstruction of the urban landscape. Relying on the results of the classical modern movement (first machine age) in architecture this was a common project all over Europe. At the beginning of the 1950s in Eastern Central-Europe a distinct socialist approach emerged with the motto: 'national by form, socialist by content'. This is called Socialist Realism, which returned to a classical architectural form-language on the surface level of decorations, but at the same time it also retained modernism under the surface in a hidden way. In fact, a modern structure has been decorated with mixed elements from the history of architecture (Facadism). This approach (a gap that only lasted for few years) was terminated and changed by Khrushchev's famous industrialisation speech in 1954.

Philosophy had an important role during this process in two ways. First, in the case of the Socialist Realist gap the philosophical foundations fostered the evolution of the new form-language in connection with the visual appearance of the ideology of the regime (Marxist aesthetics). The Socialist Realist pieces of arts and buildings had to be readily understandable to the workers, and they had to demonstrate the power of the state and the role of social responsibility. The gap is the niche between two modern periods: from the end of WW2 until 1951 and from 1954 until today. Between them a Socialist Realist gap emerged in Eastern Central-Europe. Second, after the Khrushchevian architectural turn in 1954 the materials used and the planning methods applied became more important and the reasons for this could be found in the philosophical foundations of the architectural theory of the era (positivism). At the beginning of the 1950s a new machine age started, which was based on the renewed idea of the machine city of the interwar period. This theory has dominated until today.

In my paper first I examine the historical facts about Socialist Realism and Soviet/late modern urban design. It is important to show that in the Eastern Central-European block there was a Socialist Realist Gap between 1951 and 1954 – during the processing of the modern architecture and urban design in the West. Second, I examine the role of positivist philosophy and the mimesis-based Marxist aesthetics in this process. Finally, I analyse the working method and problems of the machine cities, as well as imageability as an attempt for solving those problems.

Index terms | *Eastern Central-Europe, Facadism, Khrushchevian architectural turn, Marxist aesthetics, Positivist philosophy, Socialist Realism*

INTRODUCTION: HISTORICAL FACTS ABOUT THE SOCIALIST BUILDING METHOD

After WW2 the main goal in city planning was the reconstruction of the urban landscape across Europe. Relying on the results of the classical modern movement this was a common project all over Europe. At the beginning of the 1950s in Eastern Central-Europe a distinct socialist approach emerged with the motto: 'national by form, socialist by content'. This is called Socialist Realism, which returned to a classical architectural form-language on the surface level of decorations, but at the same time it also retained modernism under the surface in a hidden way. In fact, a modern structure has been decorated with mixed elements from the history of architecture. This approach was terminated and changed by Khrushchev's famous industrialisation speech in 1954.¹ At that point a new era began: the age of the prefabricated house block systems. Newly built socialist cities emerged, e. g. Stalin city [Dunaújváros] in Hungary, or complete districts were renewed by using the then current form-language, e. g. in Warsaw.

THE ROLE OF PHILOSOPHY IN SOCIALIST ARCHITECTURE

Philosophy had an important role during this process in two ways. First, in case of the Socialist Realist gap the philosophical foundations assisted the evolution of the new form-language in connection with the visual appearance of the ideology of the regime. The Socialist Realist pieces of arts and buildings must have been understandable for the workers, had to demonstrate the power of the state and the role of social responsibility. The gap is the niche between two modern periods: from the end of WW2 until 1951 and from 1954 until today. Between them a Socialist Realist gap emerged in Eastern Central-Europe. Second, after the Khrushchevian architectural turn in 1954 the materials used, and the planning methods applied became more important and the reasons for this could be found in the philosophical foundations of the architectural theory of the era. At the beginning of the 1950s a new machine age started, which was based on the renewed idea of the machine city of the interwar period, and this theory has dominated until today. The master plan may be considered similar to the structure of the microchips.

Urban philosophy in the machined cities appears as a result of relying on empiricist and positivist philosophical theories. This observation-based theory is dominant in HPS [History and Philosophy of Science] and STS [Science and Technology Studies] as well. Technology is always connected to scientific methodology. Philosophical thinking is necessary for working on scientific issues. The basic idea of the machine city approach is that the working method of a city is similar to the working method of a machine. Thinking about city in connection with methodology has a long tradition. René Descartes wrote in his *Discourse on the Method*:

"ancient cities which, from being at first only villages, have become, in course of time, large towns, are usually but ill laid out compared with the regularity constructed towns which a professional architect has freely planned on an open plain."²

Descartes clearly preferred planned cities instead of the ones that were organically developed. The problem, however, is that machinised cities with perfectly designed operation of the built environment do not function very well. The situation is similar to the country of scientists in Swift's *Gulliver's Travels*. Perfectly measured environments often trade mechanical operation for the human touch and for the human comfort, and for a variety of reasons perfectly measured machine cities do not function very well. The question is what we should do to solve this problem, and what

the role of philosophy is in this process.

The answer was often the total demolition of Socialist Realist or Soviet/late modern buildings and districts. Our first task is to understand these different periods and styles under the Socialist regimes in eastern-Central Europe. Socialist Realism was a propaganda movement with the motto I already mentioned above: 'national by form, socialist by content'.³ The precast house block system became the embodiment of the idea of the interwar modernism: happiness for the greatest number. Secondly, we need to understand the financial situation and the limited possibilities of architecture during this period.⁴ We are not able to understand the buildings of the era yet. Masterpiece buildings were torn down due to misunderstanding or non-understanding of the message of the building. Philosophy, the human and social sciences may help us look beyond the machine paradigm without demolition and without simply removing the traces of the past.

CASE STUDY FOR (MIS)UNDERSTANDING OF SOCIALIST REALISM

For a case study let's see a well-known example from the Hungarian capital: the soviet modern building of the Southern railway station. The original building from 1861 was bombed during WW2. In 1962 an elegant glass-walled building was built in a modern style by the plans of György Kővári. Here is the final station of the 2nd metro line (East-West direction), and the building of the station started in 1969. Due to the construction of the subway, architect Kővári started to expand the building. The original building was a modern, glass reinforced concrete structured building. Typical elements of the style were the stone walls, which created an exciting contrast with the wide glass surfaces. The hall, built in 1962, was finally built into the new curved wall building of the railway station.⁵ [figure 1]

Despite the fact that the stairs, the tilted pillars and the candelabra are the cleanest soviet modern style of the 1960s, in the public opinion it is decoded as an example for the socialist realism. This has to be examined because the building is completely different in style. The answer could be based on the historical-political background of the eastern Central-European region. Although we know that building method of socialist realism finished by the industrialisation speech of Khrushchev in 1st December 1954, and after a new style, the soviet modernism emerged; there was no change in the political system. After WW2 Hungary was under the influence of the soviets until the change of the regime in 1989. For laypeople the theory behind socialist realism was often incomprehensible. Thus, when the realistic style becomes a modernist with the same ideological background, the two different representations can be mixed. So, everything what happened in architecture between 1944 and 1989, is caricatured as socialist realism. [figure 2]

CASE STUDY FOR DEMOLITION OF SOVIET MODERN

Let's examine a history of a Hungarian building for case study: it is an office building that stands above the subway in the central square of the capital, next to the building of the parliament.⁶ It is a symbolic space for everyone (especially the Hungarians), so it is important, which it represents?

The classical question came here by Hermann Muthesius or Heinrich Hübsch: "*which style should we build?*"⁷ The style of a building represents the values of an era. Budapest became a metropolis at the end of the 19th century, when the popular style

was the historicism across Europe. Renewed styles from the ancient times, the middle ages and from the early modern reborn that times, this was a second renaissance in architecture. The theoretical background is based on the same idea: these renewed stylistic elements were related to the birth of ancient democracy in Athens. In the interwar period in Hungary – when the classical modern movement was popular in across the world – there was a second renewing of the baroque style. The result was castle-like huge buildings with baroque forefront. [figure 3]

A well-known example is the history of the mentioned building to show the processes of representation. The unified image was important, so after the building of the parliament (neo-gothic) the main buildings of the square built in neo-renaissance. The northern and southern sides were built later in the interwar period. To the southern side a 3-plot joint plan made with a unified neo-baroque facade. This was the preferred style by the government in the interwar period against all tendencies of the modernism. Only the left part of the palace-like building built, the right wing unfortunately was not ready until the end of 1960s and the beginning of the 1970s. During the years of the socialism the empty space was built with a vertical edited building above the subway. The building was a representative modern building, which brought the glamorous world of the contemporary American skyscrapers to eastern Central-Europe. E. g. the Oscar Niemeyer and Le Corbusier designed United Nations Secretariat Building (1952) in New York or the Seagram building by Ludwig Mies van der Rohe (New York, 1958). The building – of course – partially fits to the others, the scale and the base forms fits perfectly, the style was different only.

Of course, ideology radically interfered with the city, but architects tried to find the best solution for building in a historical city. From the international perspective, this building met the needs of the age, the form language and the used materials, as well. Thus the problem could be the hidden ideology of the socialist regime, because the modernist form language is accepted. The modern building was demolished, and the neo-baroque plan is building which never existed before: a neo- (second half of the 19th century) neo- (interwar period) neo- (nowadays) baroque palace.

CONCLUSION

After WW2 in eastern Central-Europe (especially in Hungary) a new era emerged. This was dominance of the soviets in politics, but in the architectural manifestation of the era has got more levels. These levels were hidden under the same political system. After describing the theoretical background in my paper I emphasised the need for the clarification of this problem. I analysed two emblematic examples from the Hungarian capitol, where the terms of socialist realism and soviet modern is mixed. Philosophy had an important role in case of the Socialist Realist gap. Philosophers and architects together had to create the new form-language in connection with the visual appearance of the ideology of the regime. The Socialist Realist pieces of arts and buildings must have been understandable for the workers, had to demonstrate the power of the state and the role of social responsibility. After the socialist realist period philosophy had to combine the previous ideological content with a new, soviet modern architecture.

ARCHITECTURE AS A TEXTUAL PHENOMENON:
ALEXANDER BRODSKY'S ARCHITECTURAL PRACTICES OF APPROPRIATION

Abstract | This paper analyzes architecture created through appropriating existing materials while focusing on strategies of intertextuality. The paper argues that the meaning of an architectural object does not derive from itself, or its poetic concepts, but rather from its relationship with other architectural objects, other art works as texts, cultural texts, and everyday practices. My aim is to show various theoretical problems of the theory of architecture and art which, as a network of overlapping texts of culture, surround the architectural production of Brodsky. Here I use different and varied theoretical concepts, selecting two case studies by Brodsky (The Pavilion for Vodka Ceremonies and Rotunda) upon which the paper is based as an interdiscursive study.

Index terms | *Alexander Brodsky; appropriation; artworld; experimental architecture; ready-made; text.*

Introduction

“It is self-evident that nothing concerning art is self-evident anymore, not its inner life, not its relation to the world, not even its right to exist”¹ [Theodor Adorno]

Alexander Brodsky (1955) is an artist and architect. In 1978, he graduated from Moscow Architecture institute, and was a member of the Russian's group **Paper Architects** in the 1980s, worked alongside with the architect Ilya Utkin². The leading figures in this group were: Michael Belov, Alexander Brodsky and Ilya Utkin, Mikhail Filippov, Nadia Bronzova and Yuri Avvakumov.³ Paper architecture is the name given to architecture that exists only in the form of a drawing, referring to utopian, dystopian or fantasy projects or concepts. For Brodsky and Utkin, Paper architecture provided an ideological segregation from the Soviet government and monotonous Soviet architecture at that time.⁴ In 1996 Brodsky moved to New York to work on public projects and art installations.⁵ Most of Brodsky's architectural projects were realized when he returned to Moscow after the year 2000.⁶

Here I will deal with appropriation as a main method in Brodsky's architectural practice. His use of found materials, window frames, door frames, etc. sets several theoretical problems in the context of period and set of ideas after postmodern architecture that will be discussed through further text.

At its core, this paper collects the traces of many discursive voices of the theory of art and architecture. My aim is not to analyze and present the poetics and concepts of Brodsky's experimental practices in their singularity, but to display the *other* to the literal material appearance of its architecture. The fundamental theoretical position of this paper relies on the theoretical platforms of Roland Barthes and Julia Kristeva

(poststructuralism) who point out that we never see the things themselves or the objects/items/buildings themselves, but the objects in the context of all the processes of cultural relations that give an object a value, a meaning and a function. This implies a network of reading and transferring of meanings that interact with each other changing their places and roles, and it is in the overlapping of these readings that we recognize an artwork as a construction, which means that the artwork (building) does not exist as a matter in itself.

The assumption I wish to make is that the models of Alexander Brodsky's actions, from subversion of cultural and social situations to the use of everyday objects and materials in architectural design, produce complex meanings that require new contemporary forms of theorization. More precisely, architectural practices of Brodsky are experimental because they point out that the aim of art/architecture is not the production of an artwork or architectural object. Brodsky's practices aim to change the nature of architecture in the sense of achieving a new and "unknown aesthetic experience"⁷.

That said, I will focus on two architectural examples.

The first example is the Vodka Pavilion (2004), the space for ceremonial drinking of vodka. Pavilion has a free inner space with a small table with a vodka bowl. There is only a place for two visitors who enter pronouncing a toast and drink vodka. The building itself was built of old window frames taken from the abandoned factory. Discarded window frames were taken from waste, and then fixed to a unique wooden frame, and then the entire structure was painted in white (Figure 1).

The second example is a small building named Rotunda (2009). Rotunda is round in plan, and is set in the middle of a field in Nikolo-Lenivets. The building was designed for the Archstoyanie festival in 2009. The walls of the entrance in the structure are framed with doors (taken from abandoned old houses) so that the visitor can access it from any direction. The structure is fully constructed of wood waste, painted in white (Figure 2).

Therefore, in order to further approach the textual analysis of the appropriation architecture phenomenon, in the following chapters the paper will deal with the conceptualization of contemporary theoretical practices.

Approaching the question: *what is the artwork?*

One of the most important contemporary problems of interpretation of architecture is how one can identify and understand architecture.

The term "Artworld" was introduced by American philosopher Arthur C. Danto in order to point out that the artwork is not only a material object that appears in front of the observer, but also the knowledge of art history, art theory, culture theory and social relations. Danto's famous statement is: "To see something as art requires something the eye cannot descry an atmosphere of artistic theory, a knowledge of the history of art: an artworld."⁸

This definition was a great critique of Western-phenomenological aesthetics that was centred around the object (artwork). The artwork is a source of aesthetic experience. What Danto says is that we never come close to the very event, because we will always be blocked by an entire network that surrounds what we recognize as an artwork. The artwork is not in itself and for itself, artwork is always a part of the artworld, or a part of our habits, knowledge, communication practices, relationships in which this work

occurs. The artworld is related to texts and cultural discourses that determine what we see. The artwork is the product of interpretation:

“Art exists in an atmosphere of interpretation and an artwork is thus a vehicle of interpretation. The space between art and reality is like the space between language and reality partly because art is a language of sorts, in the sense at least that an artwork says something, and so presupposes a body of sayers and interpreters who are in position, who define what being in position is, to interpret an object. There is no art without those who speak the language of the artworld, and who know enough of the difference between artworks and real things to recognize that calling an artwork a real thing is an interpretation of it, and one which depends for its point and appreciation on the contrast between the artworld and the real-world.”⁹

In other words, the view of a building or any kind of artwork is part of a world that does not exist without discourse. More precisely, the artworld is an (architectural) object encompassed by various texts. If we apply Danto’s observation to architecture, we could come up with the following thesis:

To observe something as architecture requires something the eye cannot descry –an atmosphere of architectural theory, more precisely: theory of architecture, theory of form, theory of style, aesthetics, philosophy, cultural studies, a knowledge of the history of architecture: the world of architecture as the artworld.

Approaching the question: *what is the text?*

In structuralism, a text is any closed and autonomous structure of signs. On the other hand, poststructuralism rejects structuralist insistence on the closeness, constraint and fixedness of the studied structure.¹⁰ In poststructuralism, the text denotes the open practice of working with signs that acquire meaning in relation to other signs or texts of culture.¹¹ Poststructuralism emphasizes the importance of dealing with the context. In other words, an architectural object (or situation, event, being, language, work of art) does not exist independently of the context in which it occurs, in which it is used, signified or understood, yet it is determined by that context.¹²

The concept of the transformation from work to text was theorized by French sociologist, writer, sociologist and literary critic Roland Barthes¹³. Barthes introduced some of the fundamental postulates in the understanding of art. The standpoint that the centre of every art is merely an artwork, is replaced in Barthes’s interpretation with the fact that the artwork is not something that is ultimate, but that the artwork changes under the conditions of exposure, viewing, reading, and identifying. Artwork is something that becomes text; the text passes through many different works creating a network of arts at the place of expectation of the finished piece.¹⁴ Barthes in his most radical form brings the thesis of the *Death of the author*¹⁵, creating the concept according to which the creator of the artwork or any kind of work is not the author himself. The creator of the work is the one who sees and reads the work. This thesis has fundamentally changed the concept that we are following the work from the creator to the source, showing that one creates a source linking a work with various cultural texts. That is what Louis Marin understands by “reading”: “Scrutinizing a graphic entirety and deciphering a text”¹⁶. Applied to architecture, the following thesis could be made: Scrutinizing a material form of the entirety of a building and deciphering a text.

For Barthes a text is “multi-dimensional space in which are married and contested several writings, none of which is original: the text is a fabric of quotations, resulting

from a thousand sources of culture.”¹⁷

Very similar to this concept, Julia Kristeva introduces the notion of *intertextuality*¹⁸, taken from Bakhtin’s idea of dialogism. Intertextuality implies a semantic relation of: “(1) two or more texts; (2) text and visual artwork; (3) any human product and language and semiotic systems (natural language, literature, philosophy, ideology, painting).”¹⁹

The idea of intertextuality denotes that a particular text acquires meaning only through relations with other texts, which means that each text contains relocated elements of other texts. More precisely, by intertextuality Kristeva implies: “In the space of a given text, several utterances, taken from other texts, intersect and neutralize one another.”²⁰ We compare one text with other texts of culture. In this regard, Kristeva speaks of the fact that the intertextuality is exchange between texts in the creation of the meaning of one text. This means that we are relating an architectural object with other objects, that second or third object we are connecting with literary or religious, philosophical, political or some other text. In other words, with the notion of intertextuality Kristeva showed that we do not have isolated objects, but that we have objects that are inserted, placed in the real world and that real world is full of texts that bear the endless meanings that will connect and transform these texts in their processes of understanding.

Framing: experiment and ready-made

The act of appropriation deals with some key artistic procedures in experimental art. The experimental is the term that signifies something which is not only different but completely opposed to traditional, conventional or academic artistic production. Italian theorist of avant-garde Renato Poggioli pointed out that: “the experimental aspect of avant-garde art is manifested not only in depth, within the limits of a given art form, but also in breadth, in the attempts to enlarge the frontiers of that form or to invade other territories, to the advantage of one or both of the arts.”²¹ Serbian philosopher Milan Damjanović observes the experiment as “an experiential verification of any, and even speculative causal ideas, in conditions that in principle overcome the laboratory situation”²². In historical avant-gardes²³ during the first half of the twentieth century, experiment receives not only affirmative value but also fundamental importance. In other words, the experiment is the feature characteristic of the avant-garde art. The conception and philosophy of ready-made emerges here as one of the key concepts.

Ready-made denotes an everyday object outside of artistic origin that had been taken over, re-signified, moved and exhibited as an artwork or as a segment of a larger whole of an artistic (architectural) work with or without additional material author intervention. The first ready-mades were realized by French artist Marcel Duchamp who exhibited various items.²⁴ Trying to see art as an intellectual game, Duchamp has shown an important situation in which one can be an artist not only if he creates an artwork using his or her hands in the creative process, but also if something is observed, if is chosen, if is de-contextualized, and re-contextualized. According to Aleš Erjavec: “It was only when art created according to or resembling that made by him (Duchamp) almost a century ago started to become the exclusive recognizable dominant trend of recent art that his work became an object of intense attention and was revealed as an early and paradigmatic instance of contemporary art.”²⁵

Ready-made is an artwork created by the artist’s decision to mark or use the existing

object outside of the world of art and place it in a gallery or museum and hence in the art world.

Duchamp chooses the object: he is no longer the one who makes it, the one who produces it, and moves it into the public aesthetic regime of sensibility. About 30 years later, Ludwig Wittgenstein says: "The meaning of a word is its use in the language."²⁶ What Wittgenstein sets in relation to the language, if transferred to the world of the objects can mean: the meaning and function of one object is the use of that object in a particular socio-cultural context.²⁷ In short, Duchamp transferred the object of the urinal from the everyday culture to the world of art.

Expanding the architectural field: design through appropriation

Alexander Brodsky appropriates found materials as finished pieces. In other words, wooden window frame is an object with a non-architectural origin (or more precisely, is not of construction origin) which is taken over and re-signified, moved and exposed as the only architectural element in design of the Vodka pavilion. Using these kind of strategies and tactics, it turns out that Brodsky's motive was to explore a new way of architectural design. More precisely, in Brodsky's architectural production the experiment is submitted as a methodological tool to improve the process of architectural design. Speaking of it in one of his interviews, he says: "I like to use simple things that I find. That is also something a lot of artists have done before me, and are doing right now, and will be doing after me. It's not like I'm inventing something new, but I like cheap materials, I love found objects, I like to give new life to something that was thrown away in the garbage. I find some of these things beautiful, so if I can use them in my art, I like to do it, or even use them sometimes in architectural pieces."²⁸

Brodsky moves, reconstructs, multiplies, and sets an element such as a window or a door as the only element in the design of an architectural object. Duchamp does the same. He takes over something that is created for a practical purpose, changes its function, puts it in the field of senses, and confronts us with an object we observe in a different way. In both cases, the way of *becoming* artistic/architectural is performed through appropriation.

The use of elements of non-constructional origin emphasizes the fact that such objects have been introduced in the world of architectural design and their unusual role and position of exposition emphasize their artificiality in that world. This act is reminiscent of the procedure of ready-made because the material moved from the un-architectural-construction domain into architectural. However, it is not a ready-made because Brodsky does not take one window frame or one door and puts it in a space with the aim of naming these objects as architecture pieces or artwork. With the found materials Brodsky does not fully comply with the principle and philosophy of ready-made, but treats it as a "motif". This means that these elements, through repetition and multiplication, project their own architecture. With this approach, Brodsky shows that the activity in the field of architectural design is not only achieved through new production of various objects in the world, but also through the use of found objects and their use as a practice of transforming the contextual aspects of the objects itself.

These buildings combine the function of a building (pavilion for drinking vodka and Rotunda as a viewpoint) with the use of avant-garde experimental techniques (use of window frame, wood waste or old doors as a design element - thus pointing to

the principle of ready-made). Nevertheless, the functionality of the object has the advantage in this relationship, and the principle of ready-made appears only as an homage to avant-garde experimentation presented as a pure technique in the service of architectural form.

Conclusion

The paper has shown that the architectural buildings of Alexander Brodsky appear as an architectural practice that applies various experimental techniques referring to historical avant-gardes (ready-made) only as a means in the service of architectural functionality. We can conclude that Brodsky's practices are not completely in agreement with the principles of ready-made, because of his relationship to the objects and found materials as a theme, not as a complete piece as it is set up by Duchamp. In other words, Brodsky does not exhibit a window frame as an object that does not belong to art, but as an object which has been placed in the world of art by the decision of the artist (which presents the main principle and the idea of ready-made), and only uses it as a building element in the design of an architectural project, relying on ready-made as avant-garde practice.

These projects shows that direct appropriation can be a justified method of architectural practices. In this way, the concept of architectural design is being expanded. Thus, the architectural practice of Brodsky remains more an anomaly than a paradigmatic episode in the field of architecture.

These chapters were aimed at understanding architecture as a textual practice through a network of traces of philosophy, theory, and aesthetics of architecture and art with a mild reflection on Brodsky's architecture of appropriation.

Boško Drobñjak (Belgrade, 1988) is a teaching assistant at the Faculty of Architecture, University of Belgrade. He holds a master degree in Urbanism from the Faculty of Architecture (2015), and is a current Ph.D. student. Drobñjak's research focuses on the interdisciplinary relations of art theory, aesthetics, and experimental, avant-gard architectural practices; he has published several articles in both Serbian and English. Drobñjak is the secretary of the Society for Aesthetics of Architecture and Visual Arts of Serbia (DEAVUS) and is a member of the International Association for Aesthetics (IAA).

THE WILDERNESS IN ANCIENT CHINESE LANDSCAPE PAINTING

Abstract | Wilderness is one of the most important primary ecological environment in the natural environment. Its existence has important natural, ecological and aesthetic significance. In ancient Chinese culture, the wilderness has always existed, however, the ancient Chinese traditional culture never paid much attention to “wilderness”, and the manifestation of “wilderness” consciousness was limited to the background or component of culture. Chinese landscape painting is one of the unique painting art in China. And it shows that in the Chinese landscape, “the wilderness” is a great way to show the infinite vitality and vitality of nature, and to show us the spirit of man and the wilderness. Compared with western landscape painting, the west pays attention to realism, while China pays attention to freehand brushwork. The wild in China is not an ecology, it is live. Not in the dust, outside the dust. Not nature, but culture.

Index terms | *The ancient Chinese culture ; The Chinese landscape painting; The wilderness.*

“The word wilderness in a narrow sense, refers to the desolate area; In a broad sense, it means that the ecological law plays a leading role, and does not have a person trace, or does not restrict or influence the non-artificial terrestrial natural environment in which the natural law plays a leading role.”¹

As the most important original ecological environment, wilderness is not only natural, but also cultural. It is a record of history. “Wilderness lands also provide us with one of the most profound historical museums because they represent the world 99.99 percent of the time,” Holmes Rolston said.² In Chinese traditional culture, wilderness is not a major and independent form, but a special and important part of nature. It is a natural phenomenon that integrates with nature. In the original primitive times, the wilderness was integrated with human beings, and with the continuous development of wilderness, wilderness is not only the ecological embodiment of the development process of natural history, but also an important manifestation of human cultural spirit. Although human beings have ignored the wilderness in history, it does not serve as the basis for the existence of wilderness.

As a country with rich historical and cultural connotations, China has its own unique cultural characteristics from ancient times to the present. With the development of human history, we can see that wilderness exists in many fields of ancient Chinese culture, especially in Chinese landscape painting, which is the most intuitive and unique.

The description of wilderness in Chinese landscape painting is mainly reflected in: First, advocate nature. Second, attach importance to nature. Third, the unity of things and me. The greatness of the wilderness is affirmed and worshipped by people, but people can't walk into the wilderness at will.

1 Philosophical Foundation and Development of Chinese Landscape Painting

Chinese landscape painting absorbs Chinese philosophy and painting aesthetics, which has independent cultural attributes and aesthetic characteristics. The aesthetic implication of Chinese landscape painting is highly consistent with the idea of silence, inaction and nature advocated by Taoism. The concept of the unity of heaven and man in Chinese philosophy is not only a simple generalization of man and nature, but also emphasizes the correct way of getting along with nature. In essence, the universe and nature are interlinked with human beings. Zhuang zi proposed the unity of man and nature and stressed that everything should conform to the laws of nature so as to achieve harmony between man and nature.

Therefore, the essence of “Tao follows nature (道法自然)” lies in that it originates from nature and surpasses nature, emphasizing its essential characteristics.

It is consistent with that mental state and meaning of the expression and expression in the landscape paint of China, and the philosophy of China has brought about the fundamental quality of China’s landscape painting and even the whole art of painting. Taoism is the spiritual connotation of landscape painting and the core of its formation and development.

In Chinese landscape painting, people and objects are mainly depicted in the scroll, so it is the scroll presented by the painter in dealing with the relationship between people and objects. Therefore, for landscape painting, we can understand that the painter pursues the harmony between man and nature in the sense of pictures and emotions, which is a state of harmony between man and nature.

The development process of landscape painting began with the initial figure painting. In this period, landscape scenery appeared as the background of figure painting, as the foil and decoration of figure painting, religious painting and story painting. Zong Baihua once said in his book that “The independence of Chinese landscape painting originated in the late Jin Dynasty.”³ At this time, “The people of Jin Dynasty found nature outward and their deep feelings inward. Mountains and rivers are not spiritualized, but also sentimental.”⁴ The description of landscape is not only simple realism, but also emphasizes the emptiness, reality and implication of space.

Later, in the Tang Dynasty, independent paintings gradually formed and tended to mature, which had become the peak in the Song and Yuan Dynasties.

Since then, Chinese landscape painting has become an important branch of Chinese painting art and the most brilliant artistic expression.

In the Song dynasty, painters pursued the authenticity of the image of the picture, so they pursued the essential characteristics of the description of the nature. On the one hand, a large number of paintings sprayed out, showing many styles; on the other hand, these painters also gave their spiritual feelings by describing the nature.

Therefore, in the Song Dynasty, more and more painters paid attention to mountains, and the mountains, rivers and rocks in the eyes of these painters are called wilderness. So far, wilderness has appeared in a large number of paintings. The wilderness is no longer just a simple background, but an important and indispensable part of the painting.

The process of Chinese landscape painting flourished during this period.

2. Wilderness in Song Dynasty Landscape Paintings

Li Cheng and Fan Kuan are the most famous representatives of landscape painters in the early Northern Song Dynasty, and also important figures in the development history of Chinese landscape painting. Li Cheng has literary talent and is good at painting. His paintings are called “The first in ancient and modern times”. His landscape painting, which combines the two traditions of North and south, shows the space and momentum of the painting by combining the detailed description of wind, rain and smoke through composition. Among them, the painter is particularly good at describing the specific climate season and space through near and far scale changes. Thus depicts “The meteorological desolation. The mountains and forests are clear, the painting method is outstanding and the technique is exquisite.”⁵ The most characteristic of his paintings is “Pictures of the Far Mountains in Mao lin”:

In contrast, Fan Kuan lays more emphasis on learning from nature and pays more attention to the expression of artistic conception of nature in his description of nature. In his paintings, the composition of a picture is full, often depicting dangerous mountains, boulders and waterfalls. Through the rich breath of the painting, it shows the strength and stiffness of Guan Shan area. Fan Kuan’s painting can be said to have a clear description of the wilderness. It is known as the epoch-making masterpiece in the history of Chinese landscape painting “Xi shan journey”, which vividly depicts the grandeur of the wilderness:

Guo Xi is a representative figure of landscape painting in the mid-Northern Song Dynasty. His painting achievement also represents the highest achievement of landscape painting in the mid-Northern Song Dynasty. In his painting creation, he paid attention to the real and delicate nature landscape, and could grasp the subtle changes of nature. He created many landscape paintings combining natural realism and emotion. His representative work “Early Spring Picture” (collection of Taipei Palace Museum) has become the object of praise by emperors and scholar-bureaucrats:

Through careful observation of scenery and innovation of painting techniques, Guo Xi’s scenery presents a flourishing image.

In this stage, the painter combines realism with lyricism, finds himself in the pursuit of artistic conception, and creates eternal artistic beauty. Since then, the style of landscape painting has diversified, green landscape painting (traditional landscape painting characterized by the prominence of blue and green colours) and Chinese ink landscape painting develop together.

Wang Ximeng, a representative of green landscape painting in Northern Song Dynasty, was taught by Huizong in the Song Dynasty. At the age of 18, he made the world-famous volume of “Qianli River and Mountain Picture”. This volume depicts elegant and delicate scenery, which can be described as a masterpiece. It is called one of the ten famous paintings handed down from generation to generation in China.

The whole painting is precise and delicate. Throughout the whole volume, it has magnificent momentum, as well as exquisite and vivid spirit. Looking from a distance and seeing from a near distance is really shocking. The whole picture depicts the beautiful rivers and mountains. It also shows the author and his contemporary people’s

respect and love for the natural world of mountains, rivers and rivers. They begin to realize the value of the wilderness and appreciate it greatly.

3.Landscape Painting and Wilderness Aesthetics

Throughout the development of Chinese painting, landscape painting replaced the figure painting into the mainstream after the Tang Dynasty, and became independent in Wei Jin period, then entered the heyday during the Song and Yuan Dynasties . Guo Ruoxu wrote in his 《Records of Picture Seeing and Hearing, On the Advantages and Disadvantages of Ancient and Modern Times:》 “When it comes to painting Buddhist and Taoist figures, scholars, cows and horses, modern times are not as good as those painted in ancient times; when it comes to painting landscapes, forests and stones, flowers, bamboos, birds and fish, it is just the opposite.”⁶ It fully illustrates the position of Song Dynasty in the heyday of Chinese landscape painting. As the peak of landscape painting, the achievements of Song Dynasty landscape painting are also the most characteristic representative era of Chinese landscape painting.

Under the different historical backgrounds, the Chinese and Western have formed their own artistic forms with different characteristics. Western landscape paintings developed later when compared to Chinese, and there were somewhat different from Chinese. In the history of Chinese landscape painting, the idea of seclusion is the main theme of all kinds of landscape painting. Chinese landscape painting mainly pursues charm and magic in aesthetics. Therefore, its expressive techniques are not confined to the meticulous and precise depiction of natural things, but are more influenced by ancient Chinese characters and calligraphy. It pays attention to agility, charm and form, which is the most direct difference between Chinese landscape painting and Western landscape painting.

At the beginning of the 15th century, the background decoration began to appear on the decorative paintings of Netherland. In the 17th century, landscape paintings with independent themes began to appear in the Netherlands. So far, independent European landscape painting began to form and develop.

Art comes from life. Chinese people pay more attention to creating artistic conception in landscape painting, while European landscape painting mainly focuses on painting objects. European landscape painting developed nearly a thousand years later than Chinese landscape painting. It developed rapidly during the Renaissance and formed its own unique side. First, take nature as a model and focus on reality.

Second, pursue the unity of the host and the guests and the integration of the situation. When depicting natural scenery and dealing with the relationship between man and nature, European landscape painters often emphasize the scenery that is attracted, and then vividly express the scenes at that time to place inner feelings.

When someone different take the same scene will get different paintings, for different people feels different or thinks different, or light, or thick, despite facing the same scene. Chinese landscape painters paint culture rather than landscapes, and they are thoughtful. Ancient Chinese culture is like a precocious child, therefore, Chinese landscape painting is also precocious.

In Chinese landscape painting, the painter usually gets into the freehand brushwork which emphasizes the painter’s subjective emotions and respects nature. Chinese

landscape painting pays attention to nature rather than artificial nature. Ye Lang wrote: "Artistic conception is not an expression of isolated objects, but a combination of emptiness and reality. That is to say, it expresses the vivid scenic scene of nature and the Tao (道)、(Qi) (气) as the essence of the universe and life. ⁷ Chinese landscape painting does not pursue realism or similarity, but advocates vivid charm, far-reaching artistic conception and return to the true. Lao Zi and Zhuang Zi both advocated the beauty of nature and simplicity. Lao Zi and Zhuang Zi 's philosophy was reflected in Chinese landscape painting.

Although we divided nature into primitive nature and artificial nature, we know that only the most primitive nature can make people feel spiritual easily, and the nature here is the wilderness. Paying more attention to the wilderness, treating the less-popular and less-interested areas as ideal realms, depicting nature and writing about the scenery, in this respect, Chinese landscape painting seem more humanistic than European landscape paintings.

Zong Baihua, when describing the role of artistic conception, said, " Make objective scenery a symbol of my subjective feelings ". This is a good summary and interpretation of the essence of Chinese landscape painting in addition to the unity of nature and self.

The wilderness aesthetics in landscape paintings has many kinds of aesthetics, which can be understood as the manifestation of different values of the wilderness. Specifically, it mainly includes the following parts: the primitive embodiment of natural ecology; the witness of alternating historical development; the lofty pursuit of vitality aesthetics; the reappearance of spiritual civilization.

Whether the wilderness depicted in Chinese landscape painting or in Western landscape painting is essentially the same, it has its aesthetic value and significance, but the wilderness in Chinese landscape painting has more particularity. The wild in China is not an ecology, it is live. Not in the dust, outside the dust. Not nature, but culture.

AESTHETICS AND CULTURAL ASPECTS OF BAUHAUS TOWARDS A NEW CONCEPTION

Abstract | In this proposal the Bauhaus school's style is seen as representative of architecture and design in the context of contemporary global society. Bauhaus has influenced generations of artists, architects, and designers – in Germany, the North and South Americas, and beyond, including, for instance, and with particular significance, the architecture and design of Brazil. The legendary Brazilian architect Oscar Niemeyer, who had German roots, designed for the Berlin Hansaviertel, and for the Brazilian capital, and other architectural projects. His architecture and design fulfilled the central demands of the Bauhaus school: that it should be functional and create a sense of community. Contemporary architecture and design in this style therefore offers new achievements and knowledge based on the current politics of sustainable development, and social and economic integration, alongside the essential Bauhaus heritage of function and community.

This proposal covers the new possibilities of the Bauhaus worldview: the creation of new forms for depicting human ideals, through a focus on aesthetics and technology, combined with Niemeyer's impact on architecture and design, still vibrant at the beginning of this century in Brazil. New styles and forms have arisen as offshoots from Bauhaus, which convey the values of each culture through the construction of a collective 'picture' world. The Bauhaus of today expresses the culture industry, dialectically considering innovation and applied art as a path from the modern design of the industrial revolution to 'eco-design'. In this sense, Bauhaus is still significant in its role of linking together art, technology, and industry. Innovation as a dynamic determination of the moment, present in all epochs, is understood as a potent force for maintaining tradition. In addition to a chronological record of the influence of Bauhaus, the significant projects of Niemeyer will be discussed.

Finally, this proposal presents two perspectives on the 'schism' between architecture and technology. The first concerns the human ability to create models in architectural practice for adoption as a configuration of the space. The second concerns the evolution of technologies leading to the imagined becoming reality through time, as described by Hegel in his *Aesthetics* (see Hegel 1823). Thus, consideration will be given to concepts relating to technological developments, such as the myth of progress and the role of the human in facilitating better interaction between tradition and innovation, subject to the influence of continuous productivity in various sectors. New representations in the accepted Bauhaus style are integrated with social critiques of humanity's resilience. These forms support an environment coexistent with technology, preserving tradition while searching for innovation and the determination of positive power, towards a new design and architectural conception.

Index terms | *Custom-made, technological developments, space-time, new forms.*

Introduction

The Bauhaus is related to aesthetics and architecture in the reflection of artistic creation, the means leading to design in this production area, where artists and artisans are technicians and experts in the manufacture of forms with a functional aim. These forms are necessarily useful, thus emphasizing its technical aspects.

According to a synthesis of Ursula Meyer, we can consider the technical aspect, from a philosophical perspective, as the medium that allows the human a capacity for imagination and representation. Individuals are conditioned to employ pragmatic forms to achieve their goals. So, in this approach, the origin of the term technology should be analyzed. This definition would have an original technical meaning in ancient Greece. At that time, the term *technè* contained, as a whole, a definition broader than that of today. In ancient Greece, it was not only used for machines or the production of objects. The word *technè*, formerly, the word did not differentiate between activities such as those of manual work, creative, art, or military strategies. Thus, the use of the word *technè* expressed as much meaning for technical actions as for the mental, such as rhetoric, poetry, and arithmetic. Today, also, the “technical” concept generates the idea of a procedure of technological knowledge. As a phenomenon, technology is also the subject of philosophy and a subject of study for sociology and applied arts. Additionally, among several definitions of the technical concept, the definition in English –“technology” – is known as the science of production and its processes. In Latin, the word *technologia* included arts education, systems, and methods of *Artes Liberales* (the seven liberal arts: grammar, astronomy, music, rhetoric, dialectic, arithmetic, and geometry). These were the most important disciplines in Antiquity and the Middle Ages.

Therefore, architecture in the configurations of medieval cities has a central strength in the construction of cathedrals, showing their “liberation” of the mechanical arts. With the *cathedra* (seat), art represents an extreme promotion of architecture, providing the medieval cities the role of capital, showing itself as a symbol of superiority and authority, not only by the well-calculated harmony of their buildings but also by the height of their vaults. This symbol is not limited to the power exerted by the cathedral, but also to the value, the perfection, and the architectural grandeur, which – since the Italian Renaissance – possess strength in France and throughout other countries, thus representing an aesthetic value through the most beautiful examples and masterpieces in the arts.

Later, a change of meaning occurred in the Age of Enlightenment; technology was used as a science of knowledge, which is today’s accepted meaning. Technique is the major ally of knowledge and science in various fields of human activity throughout history, and it is the main purpose of the analysis of changes in society. The development of mechanization and industrialization on one hand, and the progress of science on the other, led to a complete transformation of the universe. The new relationships of everyday urban life in contemporary society through art and visual communication by human activity are technical, under the aspects of space and time, and a significant contribution to the factors of perception of the individual and the evolution of his thinking ability, cognition, and aesthetics experience. In the same way that the work of art is consecrated in aesthetics as peinture, poetry, and music, so is the architecture as well as design, i.e., the work of art and the status of aesthetic values presently.

In the early 1919s, a movement was established with the concept of a “machine aesthetics” that conceptually followed the “technical aesthetics” of Russian constructivists. Such aesthetic-social theories by the Russian constructivists emerged to meet the expectations of a significant part of the population sympathetic to socialist ideals. They adopted as basic principles the production of materials that had greater functionality and technique, thus promoting a more technical purpose than style. It was the most significant characteristic for this creative practice, a kind of “Russian Bauhaus,” called *Wchutemas*, the Russian State Art and Technical School (Bürdek, 2006).

Aside from the movements Arts and Crafts and De Stijl, the emergence of Bauhaus is considered from the movements in its historical path to the latest theories of this time. With these movements, one of the most important tasks is the asymmetrical balance of elements configured to new methods in the architectural design process and the rationalization conceptualizing an aesthetic of the reduction that was marked in Weimar. This period was Bauhaus’ birth, founded in 1919 by Walter Gropius; it was an art school focused on the interests of industrial development and social needs, paying attention to the functional and technical aspects.

The basis of the aesthetic and social theory of Bauhaus was characterized by compositions and creations in the relationship between art, technology, and industry, exerting influence in the early 20th century, especially with the advent of design. From 1919 to 1920, from the housing culture and with the social principle of consolidating art to the people, Bauhaus influenced the way of life in society. Additionally, after 1933, the most significant designers of Bauhaus left Germany for the United States, influencing a new mainstream called The International Style and proposing a worldwide trend of the creation and functional realization of mass culture. From the American perspective, it was a pragmatic form of social development. The designers and architects Frank Lloyd Wright and Le Corbusier are the most significant. They stand out, because these professionals, over time, became a reference for modernity and also the Oscar Niemeyer works. Niemeyer is one of the representative architects in modern architecture¹. He became one of Brazil’s most significant and internationally recognized architects, including a collaboration with Le Corbusier on the United Nations Headquarters and invitations to teach at Yale University and the Harvard Graduate School of Design.

1. Oscar Niemeyer’s the curve of time

As a meaningful journey in the history of civilization and social life, and concerning technological change, the evolution process meets the goals of individuals for their development in large cities. Transformations are considered the main characteristics of urban visual culture as representations of worldviews by characteristics and needs, which vary according to culture, society, and economy.

Evolution leads us, mainly, to urban development, the increase of the urban population, and the evolution of architecture. The growth of cities requires that projects solve the problems of overpopulation, visual communication, and signaling. The proposals to establish different techniques for urban development are the result of the late 20th century. The growth of the city has been a phenomenon since the dawn of civilization. So, time is tied to the ability of the development of projects, the technique for solutions that can be settled according to the provisions of the growth of urban centers. The relationship of space with the transformation of the city is a great challenge.

The process of change in the configuration of cities implies a means of control in both the growth of the population, as well as the decentralization of metropolitan areas. We highlight solutions encountered by certain cities that followed the ideas still medieval, but in a new form suited to the contemporary. For example, the city of Brasília should be noted, with its urbanization project developed by Lúcio Costa, designed mainly by Oscar Niemeyer, and inaugurated on April 21, 1960. The project was called Pilot Plan (*Plano Piloto*), and the form was like the shape of an airplane. But the city of Brasília was designed and only later was it populated with the center of government – the Three Powers Square: Legislative, Executive, and Judiciary (*Praça dos Três Poderes*). The transformation of the town is more characterized by linear time for the development of society. Ideas allied only to space do not correspond to the results expected from the development of a continually growing city and its transformation and evolution. This transformation was during industrial development in Brazil under President Juscelino Kubitschek.

Sigfried Giedion presented in his work (1982) an analysis to understand the formations of cities changing. It was an effort to clarify or detail the concepts of growth in a town and transformations regarding the project and creativity for adaptations. We can reasonably see, from this work, that there were impossible ideas to solve the problems of organization in a constantly changing city, which are those of the destruction of the town and then, of rebuilding a new one, as Frank Lloyd Wright wanted. Destruction of the city would be possible only due to a natural disaster. According to Sigfried Giedion, the conception of space does not occur so isolated and autonomous, but by the organization of forms in space. In all periods of the history of civilization, the condition for projection is the perception of time and space concerning the volumes arranged in the internal and external spaces, or that of the interrelation between them. For instance, the spaces of great civilizations—like the pyramids of Giza in Egypt or the temples of Athens in Greece—have the volumes arranged in the internal and external areas. What best describes this volume relationship in space was the unlimited extent that this civilization was planning for space. The meaning of architectural form and the relationship between the internal space and external is of great importance to the space-time concept when we observe that the sense of tradition works in large spaces with architectural projects of coverage following the shape of the vault.

Also, we can illustrate the predominant characteristics of creativity using the same essential elements, relative to space, placing them in their time, where the symbolic aspects represent tradition but in innovative ways, like the creativity of Niemeyer in the realization of the National Congress in Brasília, Brazil. Take the speech of the architect: “And so, by adopting the dome—the dome that the Egyptians used, and Roman multiplied—for the National Congress building.” For Niemeyer, creativity was in the plastic intervention, the modification, seeking as the architect says “to make it lighter.” The architecture of the National Congress was carried out with the essential elements, which are the two plenary buildings where the Brazilian government makes decisions. So it was the architect’s criteria for its creation “to highlight them, was our plastic objective, placing them in a monumental terrace where their forms are distinguished as the true symbols of the legislative power.” (Niemeyer 2000).

Projects that allow the most massive dome to be in the center and the lowest points, whether concave or convex, are perceived as an image. This image displays plenty of power, as it was for the Baroque period displaying an impressive aspect by the symmetry of architecture, suggesting optical illusions, and especially a perspective

through paintings and frescoes. But over time, perception transforms the same essential elements into new configurations, expressing their values, which are also “absolute” according to their time and space, like Oscar Niemeyer by modernity when the values imagined by a nation are translated. As we can see from Giedion’s studies, shapes, surfaces, and planes define not only the interior space but also the limits of their dimensions, forming distinct volumes in an open space and interpretation, giving meaning to the design of contemporary architectural space. All questions are part of the world’s cultures concerning the past and innovation. Thus, the real world dimension of performance and space in relation to historical brands is the result of technological and social evolution. During the 20th century, many researchers studied the impact of innovations as essential and necessary in technical cultures, policies, and materials of everyday life.

However, the current consumer society – urban life, for sociologist Edgar Morin – is defined by the idea of the relationship between past, present, and future. But in such a way that it causes society to ask: Where will this path lead us? What does the current crisis mean? What is the value of old ideologies? In the face of 20th-century interests: inventions, innovations, creations, techniques, cultures, and ideologies increased substantially, change evolution or revolutionize the principles of development. Thus, we see sense in Morin’s thinking of this subject’s analysis in innovation and creation in the form of images, these configurations being the exception to the ordinary rule – in a certain way, contemporary art. A feature that reinforces a trend in visual arts and that, in its relation to daily life through exhibitions and also through its interventions, interferes in the urbanization of large cities. Therefore, consecrated spaces, classified as historical monuments by UNESCO, remain in time confirming a tradition for the conservatives. However, those who seek innovation by modernity, beginning with the Liberty style in England (1834-1896), by the humanization of the urban space through art, like William Morris, who wanted unity between architecture, painting, sculpture, and the decorative arts as a global artwork is a reference. Modern architecture, using new materials, gives thanks to new technologies, the result of the industrial revolution, which employed concrete, glass and iron frames. Innovation sets in, and the 20th century establishes a new image and aesthetic theories. Thus, the functionality mixes industry with the daily life of the metropolis from this conviction: “the form follows the function”. Then, by combining public space and power, by the word “form,” we can understand why “configuration” will be the function, in addition to the image of innovation that will play a strategic role.

Consequently, all contemporary values seek in their configurations the image that could characterize values. The question is: what is the “real” or illusion in each of these achievements in their time and their social reality? Regarding the contrast of many accomplishments that coexist with the works of earlier times, the analysis is more complex, or even when it comes to urban planning. As an example, the simplest solution is the absurdity of destruction of cities for the design of new spaces, as desired by Frank Lloyd Wright. But, for the innovative realization, others were lucky to find almost a destruction – an evacuated space, ready for the construction of a planned city, as is the case of Brasília, by the architects Lúcio Costa and Oscar Niemeyer. An achievement that, additionally, was favored by the political and social moment – Brazil’s development process. Given the vast region, other reasons have supported innovative works in the current space as a function of time –contemporaneity.

The most significant aspect of Oscar Niemeyer’s architecture is Le Corbusier’s influence

with the employment of concrete. Basically, at the beginning of concrete usage for a new architecture, two conditions are necessary: first, a tectonic expression of load-bearing walls. The second is that architects and built industries are used, within limits, to reach more solutions in their constructions with less work. That is a cheap method of build, allowing mass production. Reinforced concrete determined the principles of a new architecture; there are five points. First, there is the pilotis: support the horizontal slabs and elevate the building from the earth, in contrast with the ancient Greek temples. By applying pilotis, reinforced concrete enables more spacial and analogous floors. In this way, the pilotis are, for the new architecture, an achievement of perfection and democratic space. Second is the roof garden: itself one of modernism's object-types. By freeing the columnar structure from the interior partitions that enclose the program, Le Corbusier created the free plan. The free plan was also known as the paralyzed plan, or plan of rooms with little difference from the other, especially without the support of a wall; due to the pilotis technical achievements, the walls did not support much of the weight of the overlying parts of a building or other structure. The ribbon window, for example, is an interior window that enables a pass-through from one room to another by cutting an opening in a wall, which is not load-bearing or supporting the roof. Next is the free façade – there are open doors or windows similar to the ribbon window system. However, the exterior walls are now opened up to allow for more natural light and access to a nature view. This point of a new architecture is one of the most elevated positions of Le Corbusier's interest related to an aesthetic experience. Therefore, Oscar Niemeyer's design is possible due to the technology tamed, in these circumstances of modernity, rather than being a mechanism by which mass pressure is applied against the mass culture; it is a mechanism for taming the representatives of mass production. In this way, Le Corbusier made architecture powerful and more accessible to control through technology, and Oscar Niemeyer improved them with his remarkable architecture "the curves of time." An architect is a creator.

By analyzing the configurations of human social life throughout the evolutionary history of humanity, we realize that, in the 19th century, the separate existence of an Ecole des Beaux-Arts and an Ecole Polytechnique in Paris pointed to a schism between architecture and construction, regarding Giedion (1941). Hence, I find that "technology transfer" has always been an interaction between nature and culture for all possible realizations of human civilization throughout time – *Zeitgeist*. This schism became evident between architecture and technology when, as stated by Sigfried Giedion, "the exhibition became the trial ground for new methods. In all the great international exhibitions – from the first at Crystal Palace, London, in 1851 to the last at the end of the century – constructors attempted tasks that had never been faced before." In these ways, for me, more complex environmental aesthetics can be understood through inventions and artifices in the form of new materials composition. The most significant materials employed are stone, iron, and glass at the beginning of the 19th century, for example at Crystal Palace in 1851.

The development of industry in all its branches was accelerated by these exhibitions, in which every sphere of human activity was represented: the implements, methods, and products of mines, mills, machine, shops, and farms were on display, together with work in the fine and the applied arts (Giedion 1982, 178).

But since Bauhaus, concrete is the most significant material employed – from Bauhaus to the present with Oscar Niemeyer's architecture, which was built following the concrete technologies. Also, through aesthetic practice, Niemeyer's architecture can

integrate art with techniques and industry for modern architecture, expressed through the outline of the curve, the precision of the pieces, and the clarity of the assembly.

In this respect, for the schism between architecture and technology, two aspects of cultural transformation are important: technique – in which the term ‘art’ is included – and science as technologies. Aside from the attraction of Oscar Niemeyer’s composition with the curve, which was always emphasized in the architectural process and modern development, the technical aspects of the curves configurations is highlighted as well as in the world and *Weltanschauung* by changing as a result of scientific and technological advances. By analyzing the configurations of the Oscar Niemeyer’s architecture presented, this proposal is divided into a consideration of two different perspectives. The first is a building highlighted from the landscape. The second one, however, reveals a configuration of a structure in the environment, highlighting the curve forms. Comparatively, the two points of view indicate that the buildings have been contrasted with the environment. But the second one distinguishes more than the first, with its curve form in contrast with the environment, while in the other one, we have a similar color predominance. In this respect, two aspects of configuration as a form are important: element and space.

Overall, the general characteristic to observe in these architectural projects are the geometrical form of the curve. These forms, which always emphasized the outlining of the curve, have to be described through our perception. It should be a singular experience, with the different capacity of understanding the relationship of the forms, or not, from each of us. Therefore, we start a process of aesthetic judgment – a judgment with cultural influence and knowledge, that, even though, can be singular and also universal.

NATIONALISM IN DISASTERS: ARCHITECTURE AND MANAGEMENT IN MODERN JAPAN

Abstract | This paper focuses a Japanese structural engineer, Sano Toshikata (1880-1956). He introduced reinforced concrete as a new building material and developed a simple formula that enable to calculate horizontal component of seismic force, which connected to the legal earthquake-resistant performance code for the buildings in 1919. In the discussion below, we will focus on his tangled relationship among engineering, nationalism and the profession.

He underestimated the artistic factors in architecture in favour of national problems. He urged architects to concentrate on seismic prevention in terms of Japan's (inter) national, financial, or strategic "present situation" among the Great Powers in the colonialist times. Architects in Japan have to "build strongest buildings with most advantages and least cost" and artistic factors are "for the time being, [...] only a manner to raise our nation's power". He suggested a specific aesthetic judgment: "[...]esthetic designs must be kept simple, noble, steady and never indulge in gorgeousness."

From his viewpoint, Japanese architects must be a *kenchikuka*, not a straight transplant of the Western profession. They should correspond to the government "constructing some genuinely scientific structures, such as warehouses and factories". His tendency to split from Western system of knowledge was probably built with the Imperial Earthquake Investigation Committee. Originally, the Seismologists Society of Japan was established in 1880 by a foreign government advisor in Meiji Japan. It was replaced, however, by that Committee after 1891 Mino-Owari Earthquake under the control of Japanese Ministry of Education.

Sano take an institutional approach to prevent disaster after 1923 Kanto Great Earthquake. As a high government official, he provided primary schools of reinforced concrete construction with a small park as a firebreak. He also tried to refute the general and liberal education as purposeless, in favour of the vocational one in 1928; and he recommended for Tokyo people to compete against incendiary bombs with some water and not to escape from their post in 1938. He understood that fire-resistant construction covered Tokyo's only one percent and predict her second annihilation and new enormous victims, realised in 1945.

The buildings in Tokyo are put under training again to be a defence of the nation against the structural calculation forgery scandal in 2005 and the 2011 Tohoku Earthquake, through the total knocking down and rebuilding as the reserves to prepare for another catastrophe. The question revives: how can aesthetics resist to nationalistic tendency?

Index terms | *Architect; Disasters in City; Earthquake; Engineer; Nationalism*

INTRODUCTION

In this paper we will review a sort of nationalism held by a Japanese building engineer who specialised in structural study and materials against earthquake and fire in the first half of the twentieth century. His strong political awareness was based on an exclusion of art, itself a specific view on art, though we tend to regard engineers as politically indifferent in terms of quantitative neutrality. Indeed, a historian Gregory Clancey elaborates on Japanese awareness of *Earthquake Nation*¹ where no nation abroad cannot be a guide for them in the time of a keen Westernisation in general. Seismic science and technology were closely tied together in order to build an international leadership in the field. This self-image was partly a reason why Japanese academic society in this issue saw a few reorganisations with governmental interventions and also exclusions of influences of foreign experts.

The engineer, Sano Toshikata (1880-1956), was a pioneer in earthquake-resistant structure in architecture, especially through using the newly-introduced material of iron-reinforced concrete. His formative years as an academician revolved around a governmental committee which included a few members from broader genres of science and technology. Although the number of members does not necessarily guarantee the committee to avoid tediousness, this organisation was effective in terms of spreading earthquake-resistant structures in wood in an area hit by an earthquake. From his experience in this organisation, his dissertation in 1915 involves an idea of simple formula on statics, not on dynamics, by the parameters of vertical loads on each floors of buildings, to horizontal component of seismic force. This proposal connected to the legal earthquake-resistant performance code, first applied to the buildings in Japanese six major cities in 1919.

We will follow, at first, his adolescence which determined his career first as an architect, then as an engineer with national ambition. His decision was partly based on Japanese popular moral standards. Secondly, his status as a mixture of an academician and a government member suspended artistic factors in Japanese architecture and mobilised academic manpower exclusively to develop seismic technology in respect of national wealth. His opinion extended to the profession of architects which was originally framed in Japanese society and regime. Thirdly, we see his mobilisation amplified to the Japanese urban people which were going to suffer double disaster: earthquakes and air raids. His experience of Great Kanto Earthquake in 1923 suggests that his approach to spread earthquake-resistant and fire-resistant buildings changed from technology to administration, which had a tendency to emphasise on the protection of buildings and urban environment, not that of living people. Consequently, we can observe a history in which a common aesthetic opinion led to a (geo)political and oppressive standpoint.

1. Against Architectural Styles: Problem of “Simplicity and Fortitude”

Sano was born as Yamaguchi Yasuhei and renamed Toshikata or Riki [“sharp-edged weapon or convenient tool” in Chinese characters] by his adoptive father, Mr. Sano. Although his first choice was to enter the Army Cadet School with an ambition to be an officer, he changed his choice to naval architecture when hearing that Japanese battleships in the First Sino-Japanese War were made in Britain². Finally, he entered to Department of Architecture, School of Engineering, the Imperial University of Tokyo because Mr. Sano proposed him to work independently, if necessary, without yielding to authority. This image of the profession seems to have been appropriate in terms of the necessity of official certifications, but will be different from his view we see later.

In fact, he was soon “disappointed” at the lectures in the department because they lacked “scientific theory” and were strongly oriented to “art education” filled with training in drawings. His posthumous reminiscences published in 1957³ indicates that “[he] was raised with a motto of “Simplicity and Fortitude [*Shitujitsu Goken*, the Ethos of Austerity and Hardihood⁴]” and regarded discriminating the form and judging the colour as women’s doings, not men’s”. This motto is still popular in Japanese boys’ education to admonish against being frivolous or flashy. Sano’s changed name and his recalling of the motto showed a typical attitude among imperial Japanese male subjects to internalise the administrative viewpoints as their own moral standards. They naturalised a loyalty for the Empire in their everyday life. Sano’s ardency, moreover, turned from military service to naval architecture, electrical engineering and finally architecture by the recommendation of the paternalism around him. The same sentiment dissociate him from artistic and aesthetic elements of architecture.

The reason he succeeded to graduate such department of architecture in 1903 was also the recommendation of his teacher Tatsuno Kingo (1854-1919), one of the first Japanese architects from the Western educational system. Tatsuno complained the lack of research for anti-earthquake structure in his lecture, though Japan’s distinctive everlasting difficulty was recognised nationwide on the 1891 Mino-Owari Earthquake. This earthquake destroyed much of brick structure, Western and thus advanced technology employed at the factories of export industry, like ceramics and textiles. Tatsuno had reluctantly adopted a rule of thumb against earthquakes to design the headquarter of the Bank of Japan, finished in 1896. Sano felt enlightened to his calling: dedication to the nation through combining dynamics, elastic mechanics, seismicity and architecture. He graduated by his design of a hall of steel-frame with brick structure and a paper of anti-earthquake calculation. His graduate school days went around by listening to the lecture of science and engineering at another department and experimenting the strength of building materials to prepare his own lecture of calculation in the department of architecture.

He was also designated to the Imperial Earthquake Investigation Committee, which was established in the next year of that Mino-Owari Earthquake as seismology in Japan saw a “transition from an Anglo-Japanese to a fully Japanese science”⁵. He visited the stricken area of 1906 San Francisco Earthquake as a member of this Committee and was convinced that the most suitable building material should be reinforced concrete. Previously, the Committee had proposed to the stricken area of 1894 Shonai Earthquake to add bracings to make traditional post and beam construction and roof frame trussed, and Shonai carpenters still follow their suggestion. Considering this episode, the committee was rather compact for a governmental organisation, despite its “research bandwagon”⁶ character containing mathematics, physics, geology, meteorology, oceanography, seismology, mechanical engineering, and architecture. Sano’s interdisciplinary attitude seemed matched for this Committee. His dissertation in 1915 was also published partly as two reports from this Committee in the next year.

His rare mention to artistic element of architecture in 1910⁷ summarised such aesthetic categories as stability, equilibrium and proportion as “expressing kinetic relationship”, and rendered the principle of architectural beauty as “merely precise and mechanical expression of load and support”. Consequently, he appreciated the Classic and the Gothic architecture, compared to the decline of kinetic beauty observed in the Renaissance architecture. He also estimated the contemporary “Secession” architecture highly, not as a style of architectural form, but as a mentality to achieve a new architectural

form instead of existing ones. The Renaissance architecture in his broader meaning was brought to Japan but, according to him, Japanese sensitivity cannot discover architectural beauty directly from such “false structure” with decorations. “If you bring a sham structure without achieving a complete kinetic beauty to enlighten our nation about architectural beauty, you cannot persuade them”. He argued that Japanese distinctiveness was dignity and should avoid vulgarity by excluding the eyes of “Western evil anaesthesia”. Besides his negation of the ornament from Western architecture, his seeking Japanese particularity in architecture for the simpleness was paralleled to Bruno Taut’s modernist argument for the simple Katsura Imperial Villa and Ise Shrine against the gorgeous Nikko Toshogu Shrine in 1930s. Sano avoid discussing, however, the originality of architecture in his native country by a tautology:

It is no exaggeration to say that Japanese [traditional] architecture was reproduced directly from Chinese and Korean ones. Therefore, Japanese architecture does not match Japanese taste. But, even if we do not touch on this drastic problem, Japanese people have an anaesthesia for Japanese architecture historically, so I think their eyes can absorb a beauty from Japanese architecture.⁸

Indeed, he recommended no concrete form or colour as his motto stated. Although this discussion seems led to the gradual advancement of architectural style from the traditional one to the contemporary one, he refused to such a discussion and adhered to the newly creation of style from the beginning like the Secession movement as his understandings. It probably indicates that his motive for this unreasonable argument was only to reject the traditionally authenticated artistic knowledges of architectural form.

2. Nation and Architects: Profession under the Imperialist Era

In 1911, Sano seized on a chance to study abroad. On his way aboard to Europe, he watched the “Englishmen dominating Asia and every enterprise in such port as Shanghai, Hong Kong and Singapore, and [he was] so agitated with the possibility of Japan under similar situations if not cared. [...] This was no time for architecture, [he] thought seriously that [he] had to land there and make [his] fortune”⁹. On arriving at Germany, he was deeply impressed by the steadiness of German buildings and felt that “unless we Japanese struggle to develop our industry, we cannot rank among the Great Powers at all”.

He contributed, from Europe, an essay “Resolution of Architects” to *Kenchiku Zasshi*, a monthly journal published by the Architectural Institute of Japan. In this essay, he regarded the significance of “Japanese *Kenchikuka* [Architect]”, unlike that of “Western *Ākitekuto* [Architect]”, as corresponding to the fact that government “[was] now constructing at maximum cost some genuinely scientific structures such as warehouses and factories”. According to him, the profession must satisfy the national situation in the present, not in those days and even not in the future. Moreover, considering the wealth of Japanese government to be “no match for the Great Powers yet”, Sano was horrified by seeing the continuous expansion of armaments in other countries. “If you are Japanese people, you must hold these apprehensions all together”. Consequently, he stressed that *Kenchikuka*’s duty was to “build the strongest buildings with the most advantages and the least costs”, and as a member of the nation “in its period of Endurance of Hardships”, he “cannot be absorbed in senseless extravagances”. The “Endurance of Hardships [*Gashin Shotan*, Chinese ancient story of enduring hardships for the vengeance]” was a popular maxim spread in Japan in the Triple Intervention

after the First Sino-Japanese War in 1895, when Sano was fifteen years old.

Sano's explicit nationalism, shown above, defined "art" as follows:

Even I understand the value of art, but my interpretation of art is that [...]: "for the time being, art is significant only in order to raise our nation's power, for example by consoling people, cultivating their minds, and promoting benefits. [...A]esthetic designs must be kept simple, noble, steady and never indulge in gorgeousness. In short, utility is the principal."¹⁰

"Art" was not completely disregarded in Sano's duty, for example monuments, religious institutions, and theatres. But, according to him, public building, equaling utilitarian building, should be dealt the same as "purely scientific object like warehouses and factories". His "architectural beauty" which was "merely precise and mechanical expression of load and support" was a value that supported univocal understanding of "expression" which delivered the specific values to people, and that enlightened them without spoiling the "utility" "to raise national power" by "gorgeousness". Indeed, he succeeded in discussing "art" more concretely to mention some aesthetic categories like "simple, noble, steady and never indulge in gorgeousness", which suggest to be summarised to the word "Simplicity and Fortitude". This summarisation itself shows, however, a subordination of artistic element of architecture into paternalistic regime in the midst of Imperialist Era.

The problem was not limited to the specific individual. His academic genre itself also has a probability to hold a tendency to exclude Western influence, if not its system of knowledge. The 1891 Mino-Owari Earthquake gave birth to the Imperial Earthquake Investigation Committee, as we saw above. Previously seismologists in Japan had organised the first society in this issue in the world, the Seismological Society of Japan, three weeks after Yokohama Earthquake on 22 February 1880¹¹. This society had been prepared among foreign residents for a year. They were mainly the teachers in The Imperial College of Engineering (1873-86, now the School of Engineering, the University of Tokyo), "most of whom were not [accustomed to the shaking of the earth]"¹². By the Mino-Owari Earthquake, the warning of Western building technology such as bricks and iron-frame was proved to be true and the government shored up this academic field by organising the Committee under the Ministry of Education in 1891. The Society was closed in 1892.¹³ The foreign influence was substituted to genuinely native organisation by the government, which evolved originally from Europe and Americas, "establishing a scientific reputation"¹⁴ on its own.

Sano's dedication to this domain was, as we saw, based on this native, governmental but compact Committee and his academic tendency as an engineer was not genuinely scientific but utilitarian as to presenting a simple formula excluding dynamic behaviours of the building during the earthquake instead the weight of the building multiplied by a coefficient according to the nature of the soil, that the architects and even the traditional and more general carpenters can calculate easily. This practical attitude allowed the traditional wooden cityscape, which predictably Sano would not recommend as a building material in the future. But also predictable was Sano's affirmation of present situations, without clinging to those of past nor of future.

3. Failure in Ornament: Earthquake to Air Raid

Sano was not only in the academic field but also in the construction site: he was also a structural engineer collaborating with architects. He made full use of steel-framed structure, reinforced concrete structure and brick structure, too. The only work his name stands alone, however, was Maruzen Book Store in 1911, which was the first fully steel-framed architecture in Tokyo. Although the appearance of this building shown by **Figure 1** was apparently by brick, these walls were curtain walls, which were enough if they can bear the weight of themselves and enabled broader windows in order to make sunlight reaching to the inner part of the floor. Even though Sano had pursued the realisation of floors of his ideal building material, reinforced concrete, the doubled estimate caused the wooden floors. Similarly, the roof, designed as steel-frame structure covered with concrete, was realised as wooden roofing boards that connected steel frames with clay slate coverings.

On 1 September 1923, the day the Kanto Great Earthquake struck the Japanese capital city, which remained their wooden cityscapes, the building in this area was not so damaged and human victims were much smaller in number by the earthquake itself, compared to the accompanying big fire¹⁵. The wind was strong because of a nearby typhoon and the fires consumed 43 percents of the area of then Tokyo City. Maruzen also stood after the earthquake but the big fire spread to the piles of foreign books inside the building. Iron frames covered only with wood became also enveloped in flames and they lost their strength which ended to bend. The building was totally burned and collapsed (**Figure 2**).

Sano hold artistic education responsible for this failure. “Although if it were today, I would remove all the decorative parts but I did not devise this idea because of then artistic education”¹⁶. According to him, cutdown of fireproof material was the cause of this failure and cutdown of exterior decorative details, sculptures at the entrance and the materials of high quality had been truly required. If he might have realised a helplessness of architects in front of costs and clients, he would have changed his approach from academic standpoint to administrative one. After the Kanto Earthquake, he almost never design an individual structure and involved in affiliated organisations of administrative offices or in legal system. He had already been took part in deciding Tokyo municipal ordinance of buildings by the commissioning to the Architectural Institute of Japan by the Mayor of Tokyo City. This ordinance was not realised but such purposes as sanitation, fire-proof materials, and earthquake-resistant structure were contained in the Building Regulation Law of 1919. This was a model of the current Building Standard Law. Moreover, Sano persuaded the Superintendent General of the Metropolitan Police to make an ordinance to regulate building and construction. Building permits had been under the jurisdiction of the Police Bureau, the Home Ministry from the viewpoint of prevention of epidemics and safety factory operation.

In his various activities he continued to avoid explicitly arguing cultural, artistic, or nonmaterial factors in general. His lecture titled as “Cultural Life” explained that the benefit of the development of material civilisation had reached to food and clothing but not to shelter. He bothered to mention the difficulty to define culture, but refrained from discussing the issue. Finally, he opposed to the national development of general education in favour of technical training and contributed a proposal to reform national educational system to that *Kenchiku Zasshi*, journal of the Architectural Institute, for unexplained reasons. He targeted at the nationwide popular topic of educated high-class

idlers, *Koto Yumin*. They were commonly regarded as too educated to be vulnerable to dangerous thoughts like socialism or anarchism. Although Sano despised this tendency expectedly, he himself was also a graduate of a school of general education. These attitudes sometimes led to a rationalist policy against a sort of conservatism. When he planned to rebuild a series of primary schools after the Earthquake in Tokyo, he replaced etiquette rooms, of which the floor covered by *tatami* straw mats in order to train traditional manners, with science rooms. These schools were built with reinforced concrete to protect children from fire, and accompanied by small neighbourhood parks in case of the second disaster.

But his rationalism withdrew readily facing a national or governmental regulation, however it was absurd. Sano had realistically and successfully predicted that the air raid conducted on Japanese cities would be primarily by incendiary bomb because of their wooden cityscape in 1933. He referred a neighbourhood in Tokyo in the midst of the burnt area of Kanto Great Earthquake that succeeded in preventing the great fire through the cooperations of residents. He recommend “resolute belief, attitude of voluntary service, and brave action”¹⁷. Air Defence Law, established in 1937, aimed originally to assemble citizens legally to official drills to enlighten them. Although prohibition on evacuation of city residents was added to a clause of the law just before the Attack on Pearl Harbour in 1941, a notice of the Home Ministry in March 1938 had banned the civilian evacuation during raid. Sano, too, insisted in May 1938 on a radio show in Tokyo that “all civilians, elders or children, male or female, must be [...] a brave soldier in a battlefield”, and consequently, “any man who are able to stand ought not to think escape nor hiding themselves”. They “should make every desperate efforts to [cover the bomb with wet quilts and spray around] and struggle a hand-to-hand fight with the bomb in order to prevent each houses from flaring up”¹⁸, despite he also instructed that the temperature of ignited incendiary reaches 1000 degree Celsius (1800 degree Fahrenheit). In fact, the flame reaches 30 meters in height.

As Sano predicted, the Allied Powers conducted repeating air raids all over the Empire of Japan and the death tolls are said to amount to 300-500 thousand. However 1940s saw many earthquakes repeated in Japan: 1 thousand died in Tottori in 1943, 1.2 thousand on Pacific coast from Shizuoka to Mie in 1944, 2.3 thousand in Aichi in 1945, 1.4 in Shikoku and Wakayama in 1946, and 3.8 in Fukui in 1948, total nearly 10 thousand. Although we cannot say whether the influence on these number that Sano’s speech and action brought about was positive or negative, his approach, varied its standing points or professions from military officer to architect, engineer, and administrator, always sought for national or governmental interests. This consistent loyalty seems to have been the correct mirrored image of his consistent negation of artistic elements.

GENRES IN TRANSITION: CONTEMPORARY ARCHITECT'S BOOK AS A DISCURSIVE OBJECT

Abstract | This paper examines theoretical, graphical, and material dimensions of contemporary print culture of architecture with a focus on the Office for Metropolitan Architecture (OMA), Bernard Tschumi, Didier F. Faustino, MVRDV, Julien de Smedt (JDS Architects), and Bjarke Ingels Group (BIG). Being situated in a plural and heterogeneous context as an object and subject, the architect's book deconstructs and reconstructs textual and visual spaces of architecture. It becomes a critical site of re-evaluating established canons, producing knowledge, generating emergent ideas, and promoting architects as a brand. Reconfiguring format, layout, content, and medium, it blurs the borders of the genres of monograph, manifesto, magazine, design journal, report, exhibition guide, and catalogue. This paper articulates the contemporary architect's book as a speculative, discursive, visual, and physical design object. Through a Foucauldian reading, the paper argues that the book emerges as a social, cultural, and political tool.

Foucault notes in his 1969 essay "What is an Author?" that anonymous writings and alternative genres are conventionally omitted from the domain of an author. Thus, unconventional materials, such as invoices, bills, addresses, appointments, and draft notes are not counted in the body of mainstream literary and scholarly works. Refashioning Foucault's remark, the contemporary architect's book expands the framework of genres by comprising unconventional materials, such as official reports, building regulations, newspaper articles, advertisements, satellite images, maps, technical and scientific diagrams. The paper also reevaluates Foucault's notion of "author-function", as the contemporary architect's book includes texts and photographs from coworkers, partners, clients, and users, rather than a single author. The paper interprets the use of various forms of graphical and textual narration and the coalescence of divergent terminology and expressions as a contribution to the power of language and discursive formation, which is widely elaborated in *The Archaeology of Knowledge* (1972).

Index terms | *Architectural media, architectural monograph, book, Foucault, genre, print culture, text.*

INTRODUCTION

Architecture media, covering a wide range of constituents, such as exhibitions, advertisements, documentaries, books, journals, and magazines, contribute to the production, promotion, and circulation of knowledge in the age of image economy today. They intend to make the audience encounter with and speculate on architecture culture, as much as they emerge as personal statements and design approaches. The printed media in particular have currently expanded as a critical site of producing knowledge, generating emergent ideas, promoting the architects as a brand, and questioning established canons and norms (Colomina 1988, 23). This paper examines the theoretical, graphical, and material dimensions of contemporary print culture

of architecture, namely the architect's book, with a focus on a variety of European architects and architecture offices: Bernard Tschumi, Didier F. Faustino, Julien de Smedt (JDS Architects), Bjarke Ingels Group (BIG), Office for Metropolitan Architecture (OMA), and MVRDV. The paper tackles one book from each actor: *S,M,L,XL* by OMA (1995), *Farmax* by MVRDV (1998), *Short Cuts* by Faustino (2008), *Yes is More* by BIG (2009), *Agenda* by JDS Architects (2011), *Architecture Concepts: Red is Not a Color* by Tschumi (2012).

Monographs, conventionally, reveal and expose orthographic sets, sketches, and various big sized photographs and renders, which illustrate the buildings as finished and glossy products. Addressing to a wide range of readers, from clients to fellow architects and students, they mainly aim at advertising, promoting, archiving, and representing. They use an abundance of images, since, in our image-laden cultural domain, the built environment is primarily consumed as a visual effect. These case studies were chosen exclusively since they differ from conventional architect's books in terms of format and content, by combining various genres, such as monograph, manifesto, exhibition catalogue, and magazine. The paper articulates the contemporary architect's book as a speculative, discursive, visual, and physical design object. Through a Foucauldian reading, it argues that the book emerges as a collective, social, and cultural instrument.

THE AUTHORITY OF THE SINGLE AUTHOR

In his 1969 essay, "What is an Author?" Foucault begins unfolding the concept of author-function, which he later elaborates further in one of his seminal works, *The Archaeology of Knowledge* (1972). He dwells on the construction of an author's body of works: "A name can group together a number of texts and thus differentiate them from others. The fact that a number of texts were attached to a single name implies that relationships of homogeneity, filiation, reciprocal explanation, authentication, or of common utilization were established among them." (Foucault 1992, 304-5). As he argues, anonymous writings and alternative genres are conventionally omitted from the domain of an author; in other words, one's works are extracted from these materials. Thus, unconventional materials, such as invoices and draft notes, are not counted in the body of mainstream literary and scholarly works of an author. Foucault (1992, 302) asserts that,

"Is everything he wrote and said, everything he [the author] left behind, to be included in his work? ... If we wish to publish the complete works of Nietzsche, for example, where do we draw the line? Certainly, everything must be published, but can we agree on what 'everything' means? We will, of course, include everything that Nietzsche himself published, along with the drafts of his works, his plans for aphorisms, his marginal notations and corrections. But what if, in a notebook filled with aphorisms, we find a reference, a remainder of an appointment, an address, or a laundry bill, should this be included in his works? Why not?"

Refashioning Foucault's remark, the contemporary architect's book expands the framework of genres by including usually ignored materials as Foucault elaborated, and by comprising unconventional materials, such as official reports, building regulations, advertisements, newspaper articles, satellite images, maps, technical and scientific diagrams, office dialogues, public comments, and even clients' photographs. For example, due to its content, it is very hard to describe Faustino's *Short Cuts* as a conventional architect's book, since the pages contain architectural drawings of plans, sections, axonometry, and perspective, renderings, photographs of cityscapes, spaces,

furniture, art objects, people, and fragments of human body with no page numbers (Figure 1). Each image is placed on one or two pages, while some pages are left blank. Moreover, OMA's 1344-page seminal work, *S,M,L,XL*, which was produced with the Canadian graphic designer Bruce Mau, merges the genres of diary, novel, dictionary, history, and monograph. The dense, scholarly, and expensive book is regarded as an authority in its thesis and a significant contribution to architectural discourse and print culture. Its image-laden form and montage-like layout are created by the newly-developing digital techniques of transforming specific media into another in architecture culture, as well as the cinematic technique, which was the dominant media of the twentieth-century (Figure 2). According to Rem Koolhaas, the founder of OMA, montage is the common ground of architecture, text, and film, as it allows different media to combine but also maintain their individual representational features (Overby 2015, 169). He deals with the coalescence of film, text, and architecture, due to his profession as a journalist and screenwriter before working as an architect (McNeill 2009, 99). Following *S,M,L,XL*, MVRDV's *Farmax*, is another example of bulky but sophisticated architect's books, with a total of 736 pages. Covered with an abundance of images, it is hard to discover the texts throughout the pages (Figure 3). The book does not only consist of their architectural works, but also reveal their global research and analysis by means of photographs, architectural drawings, diagrams, calculations, and catchy phrases. It does not have a single author (though the book is edited by three people), but various authors that contribute to the book with different contents, such as texts, researches, data, images, and projects. This representation of architecture derives from MVRDV's seeing architecture as a research, situated between function, aesthetics, and a critique of the world (Betsky 2003, 13). In a sense, it associates with Foucault's argument of what can be counted as the body of mainstream scholarly works that construct the name of the author. Overturning power relations, in OMA's and MVRDV's sense, discourse seems to be formed through anonymous tags, notes, posters, photographs, as well as collaborative texts, analysis, and research. As Foucault (1992, 305) further elaborates,

"In our culture, the name of an author is a variable that accompanies only certain texts to the exclusion of others: a private letter may have a signatory, but it does not have an author; a contract can have an underwriter, but not an author; and, similarly, an anonymous poster attached to a wall may have a writer, but he cannot be an author. In this sense, the function of an author is to characterize the existence, circulation, and operation of certain discourses within a society."

Case studies under scrutiny in this paper re-evaluate Foucault's notion of author-function, since the architect's book includes texts and photographs from co-workers, partners, clients, and users, rather than being the production of a single author. They, in a sense, question the singular power attained to the name of the author that functions as a contributor to the construction, dissemination, and operation of knowledge and discourse within society. In Faustino's *Short Cuts*, this overturning of the singular power of the author is particularly observed, since the content of the book renders the author ambiguous. A short text is placed only inside the front and back covers, leaving the rest of the book to the interpretation of the reader, as it writes in capital letters:

"There is no human mind without a body. In this time of hygienapolis, you must recover your awareness of the physical world. One way is to produce fragile objects, systems, spaces which are meaningful only through the body, being all at once physical, social and political. Architecture may be a tool to emphasize our senses and sharpen our

consciousness of reality, which tends to be erased by over-information, egocentrism and control. Experiencing fragility” (Faustino 2008).

THE POWER OF LANGUAGE

The projects that are included in the books under scrutiny in this paper are assembled according to a thematic narrativity, rather than a chronological order. The only exception is JDS Architects’s *Agenda*, which is designed as an architecture diary, journal, a monograph, and a catalogue of 365 days. Both personal and subjective, the book illustrates the projects chronologically (Figure 4). The fragmental structure of other books makes the layouts differ from one another in every single page. The content of *Farmax* is organized through the term density, whereas *S,M,L,XL* is arranged in relation to various architectural scales. The absorbing layouts and distinctive typographies challenge conventional design and graphical approaches. The architects handle established codes, norms, and design methods critically, and look for a new method of design and a form of expression. They promote their ideas using media, from books and web sites to exhibitions and talks. In *Yes is More*, Bjarke Ingels, the founder of BIG, uses a slippery and shifting ground of daily language, such as the linguistic binaries of rational and irrational, serious and humorous (Figure 5). The use of the language of mass culture leads to the impression that the book is not only a media of advertising and promoting their architecture. Similarly, Koolhaas (2007, 364-7) notes that *S,M,L,XL* had sold 140,000 copies due to its ability to allow the public an access to the world beyond architecture. Like *Yes is More*, any audience, who engages in current issues that shape the architectural canon, can benefit from the book. Posing a variety of arguments ranging from the scale of an exhibition space to the urban scale, it is situated in-between architecture as a physical construction and critical theory.

Developing a subjective and personal narrative like the diary format of *Agenda*, *Yes is More* embraces the format of a comic strip. The book has comic book typography with dynamic, handcrafted, bold emphasised capitalized letters and extensive use of punctuation marks. Commentary texts are divided into two or three sentences, and are placed into text boxes or speech balloons. Ingels (2011, 105) explains that the format of the book was inspired from the method of architectural lecturing – a visual and verbal combination, which also explains his use of first person plural narration: “Most publications, because of layout reasons, separate the two. Either they have a long essay that you read separately from the images you see afterwards, or we read a little intro piece and then captions. Instead of separating the visual, diagrammatic, graphic from the verbal, we tried to combine it, simply by turning a lecture into a book.” His use of daily and spoken language in speech balloons and verbal comments in text boxes can be seen as a current contribution to the power of language and discursive formation in the context of design.

Widely elaborated by Foucault (1972, 220-1) in *The Archaeology of Knowledge*, the term “discourse” includes the spoken and written language within the context of knowledge construction and power relations in society, yet reveals differences, disruptions, and breaks:

“Discursive formation appears both as a principle of division in the entangled mass of discourses and as a principle of vacuity in the field of language. ... The discursive formation is not therefore a developing totality, with its own dynamism or inertia, carrying with it, in an unformulated discourse, what it does not say, what it has not yet said, or what contradicts it at that moment; it is not a rich, difficult germination, it is a

distribution of gaps, voids, absences, limits, divisions.” (Foucault 1972, 134).

This paper handles the use of various forms of graphical and textual narration and the coalescence of divergent terminology and expressions as related to the power of language. In Tschumi’s *Architecture Concepts*, for example, unlike BIG’s *Yes is More*, the emphasis is made to the second person singular narration, “you,” in an unconventional way (Figure 6). This kind of narrativity points to the power of language, as it pacifies the author and transforms the reader into an active subject. As Tschumi (2012, 7) explains:

“Each part presents an ‘insider’ story - the story of the thoughts and events that propelled the development of each architectural project. Much of the narrative is written in the second person as if in a talk or discussion addressed to one or more individuals. ... the text is addressed to a reader who is the protagonist in the narrative/adventure/journey in. ... the use of ‘you’ is intended to draw the reader in, bringing him or her close to some of the questions raised by architecture today.”

Furthermore, commentary and interpretation in texts, although they are dismissed from discursive formation in conventional understanding, reveal sub-textual articulations and give the opportunity to say additional words over the finalized work (Foucault 1972, 135-6). In *Yes is More*, commentary covers a large area, by a small figure of Ingels as the narrator, which is encountered frequently throughout the pages. By means of dialogue bubbles and narrative text boxes in the comic book format, he shares previously untold stories on BIG’s works, which are otherwise unavailable to the public.

CONCLUSION

Pioneered by *S,M,L,XL*, the contemporary architect’s books blend divergent media throughout the pages from their front covers to the back: Cartoon figures, speech balloons, computer games graphics, screen shots, advertisements, architectural drawings, renders, photographs, satellite views, paintings, maps, diagrams, ideograms, magazine pages, newspaper headlines, catchphrases, declarations, official reports, cut out texts, short essays, and interviews. Being situated in a plural and heterogeneous context as an object and subject, the books deconstruct and reconstruct textual and visual spaces of architecture. Reconfiguring format, layout, content, and medium, they blur the borders of the genres of monograph, manifesto, magazine, journal, analysis, report, exhibition guide, and catalogue. The current shift in the graphical communication of architecture, from orthographic drawings to an abundance of images, points to the hypothesis that the target group of these books is not primarily a limited number of professionals, but mass culture. The architects aim at reaching to a wider audience and initiating a dialogue with them. The printed medium thus becomes a crucial site of research and analysis, while addressing to general public.

Being much more than promoting and advertising the projects, the analytic and discursive contents of these books leave the tackled topics suspended for further discussions. In this sense, they act as political, social, and cultural constituents for rethinking the urban fabric and the environment, as well as they contribute to the generation of new architectural terminology. As Foucault (1972, 9) argues,

“The notion of discontinuity assumes a major role in the historical disciplines. For history in its classical form, the discontinuous was both the given and the unthinkable: the raw material of history, which presented itself in the form of dispersed events – decisions, accidents, initiatives, discoveries; the material, which, through analysis,

had to be rearranged, reduced, effaced in order to reveal the continuity of events. Discontinuity was the stigma of temporal dislocation that it was the historian's task to remove from history. It has now become one of the basic elements of historical analysis."

In this sense, with their juxtaposed mediums and amalgamated genres, we might read these architect's books as disruptions, suspensions, voids, and gaps, forming the discourse of their time.

ON THE CRITICAL REALM BETWEEN ABSOLUTE FREEDOM AND AGENTIAL SUBJUGATION: AN ARGUMENT FOR AUTONOMISM IN ARCHITECTURE

Abstract | In this paper we would like to prove that the following premises of moderate moralism: 1. A work is aesthetically flawed or meritorious when it contains an ethical flaw or merit which is aesthetically relevant and 2. A work is ethically flawed in case it manifests ethically reprehensible attitudes by prescribing or inviting their audiences to have certain responses. Unmerited responses can be aesthetic flaws for a work of art, do not take into account two very important characteristics of the architectural art. a. Architecture is a non-representational art and moral values cannot contain any intimation of their aesthetic embodiment.

On what formal and aesthetic grounds exclusive to what we call “totalitarian architecture”, do we judge, for instance, that Nazi architecture represents racism? Certainly if we are aware of the Nazi ideology, we can recognize some features as megalomania or aggressiveness. Nevertheless, megalomania and aggressiveness are not exclusive to Nazi architecture and can just be not related to a moral flawed ideology but to an aesthetic experience (Libeskind’s Royal Ontario Museum).

b. Architecture cannot, by nature, remain inert or fixed either physically or ideologically to a first agential intention, occupation or ideology. Furthermore, because of its non “representationality”, architecture can only insinuate attitudes and subtly invite responses. If architecture serves several goals, and while architects struggle to imbue buildings with- or release them from ethical, political or sociological meanings, the architectural object can speak by itself and be experienced accordingly. It can also be used, experienced and criticized in the opposite direction than intended because representation and responses in architecture work with a strong dependence on the cultural and historical contexts, societal progress, individual preferences or personal engagement with the work. La Bastille, symbol of despotism, is today the reminder of French Revolution and its values; public squares, originally symbolizing tolerance and democratic values have occasionally become the scenery of massive paradigmatic executions during totalitarian regimes; Le Corbusier’s efforts for a more ethical dwelling were refuted and his buildings altered by furious inhabitants, while deconstructivists’ endeavors to free architecture (and themselves) from any responsibility except the aesthetic one, haven’t spared them or their buildings from virulent ethical, political, financial or sociological criticisms.

Moderate autonomism grants that artworks can be evaluated morally as well as aesthetically, that a moral merit or flaw can lead to, but cannot be an aesthetic merit or flaw, but contends that moral evaluation is never relevant to the aesthetic evaluation. This premise seems to resolve the autonomy of architecture by respecting a. and b., highlights the importance of an autonomous architectural experience, while it assumes that a work of architecture is not stranger to morality. But this morality is flexible, the acknowledgment that an “architectural object, by virtue of its situation to the world, is an object whose interpretation has always commenced but is never complete” (Michael Hays, 1984).

SOME ARGUMENTS FOR AUTONOMY IN ARCHITECTURE:

TOWARDS AN OPEN ARCHITECTURAL EXPERIENCE

In this paper we aim to explore the possibility of architecture as an autonomous art and open the discussion for what an aesthetics of architecture should be. In analytic philosophy, autonomism for architecture is not widespread (Miguel, 2016), the most plausible answer to the question concerning the relation between aesthetics and morality in architecture, is that moral values can contribute, somehow, to aesthetic values in architecture (Carroll, 2015, 2016; Baumberger, 2015; Sauchelli 2012).

We will not propose a theory concerning all artistic disciplines in this paper; we will only talk about architecture. We do not want to claim that architecture has nothing to do with morality because, after all, architecture organizes the space for human beings and consequently our lives. We also acknowledge a creation process of architecture based on moral, political, social values which may lead to specific aesthetic choices. In brief, we assume that the forms of a building can be the result of an idea involving moral values and admit the importance of this information for the understanding of the building. But, we claim that architecture can have an aesthetic value independent of a moral (social, political, religious) instrumentality.

In this paper, we will present three arguments about architecture and our relation with the building environment, which show a way towards architecture as an art, autonomous from moral values and purposes, but without lapsing to formalism. 1. Non-representationality: if architecture cannot represent moral or immoral values in a systematic way, how can a building be aesthetically flawed because it is morally flawed?, 2. Durability (Lamarque, 2010): if the aesthetic value of a building depends on its moral (or other) purpose, how do we explain that the aesthetic value does not diminish when the purpose becomes obsolete? and 3. Function: part of a building's moral evaluation depends on the appropriateness of its aesthetic features in relation to its function. How aesthetic value relates to moral functional value if function is mutable and if the forms and aesthetic features cannot dictate moral or immoral use, function and appropriation of an architectural space?

We will conclude by opening the discussion for an aesthetics of architecture which considers the aesthetic value of a work of architectural art as autonomous from moral considerations but considering that architecture is not just an art that we contemplate; the buildings function, we can use them, touch them, remember them, live in them, read about them, smell them, walk around and go in them, love them, etc. All these activities and the emotions related to them are in the core of our architectural experience and become the filters and layers of our aesthetic and moral architectural experience. They should not, in our opinion, challenge the aesthetic value of an architectural work of art, but they can certainly enhance our experience.

Non-representationality

Moralists claim that a work is aesthetically flawed when it contains an ethical flaw which is aesthetically relevant. How can an ethical flaw be aesthetically relevant? Can architecture represent by its own means an ethically flawed or merited idea or proposition?

According to Roger Scruton, architecture is an abstract art, as opposed to representational art like poetry or painting. By 'representational', Scruton describes a work of art which "expresses thoughts about a *subject*" (Scruton, 1979, p. 180). And by thoughts he means the content of a declarative sentence, which might be true or false. Scruton believes that representation is not only a matter of intrinsic properties in architecture, but also a question of how we ought to understand a work of architecture. He claims that in a representational work of art, our attention and aesthetic interest is in the work of art and also on something else: the subject of the work; to enjoy the work is to reflect upon its subject. Scruton accepts that, sometimes, knowledge of a subject is important to architectural understanding, but it is difficult to say that "architectural understanding can be itself a mode of interest in a subject" (Scruton, 1979, p. 187) and this is the principal reason for saying that architecture is an abstract art. Even if we accept that it is possible in architecture that our enjoyment involves us in thoughts about other things, such thoughts have no narrative or descriptive character. This is the reason why Scruton distinguishes representation from expression: "The characteristic of expression is the presence of 'reference' without predication" (Scruton, 1979, p. 187).

Based on these arguments, we can think of some examples: a glass wall façade expresses transparency, but nothing is said about it. A transparent façade on a parliament building may express transparency, but to relate transparency with democracy (moral value) is a matter of engagement. We can have thoughts about democracy by looking at a transparent façade, but this aesthetic feature lacks narrative or descriptive character about what democracy is so it cannot represent democracy. A transparent parliament building may seem to carry some reference to tolerance or equality, but it is not described there, and transparency cannot alone be related to morality. An excessively monumental building can express power but to see racism or disdain (immoral values) in monumentality is a matter of engagement; power is expressed but nothing is said about it and power is not always related to immorality. So, monumental aesthetic features cannot represent immoral values.

Furthermore, all transparent buildings do not refer to democratic values and all monumental buildings are not based on an immoral political ideology. Moralists claim that the form of an artwork is the ensemble of choices which realize the point or purpose of the work (Carroll, 2015). This is a lighter version that we accept, meaning that a moral or immoral purpose may lead to an aesthetic choice. But the point or purpose cannot be explicitly incarnated in the means. In architecture, different means may express the same purposes and different purposes may be realized by the same means. For architecture there is no system of accepted meanings organized; we can derive associative values from its forms, but they are not fixed or organisable.

If there is not a way to connect immorality with specific aesthetic properties in a systematic way, we cannot see how the aesthetic appreciation of the work can be blemished because some forms in an accidental way, are the result of an immoral purpose. A moral flaw or merit can *lead* to an aesthetic flaw or merit, but *they are not* aesthetic flaws or merits. An immoral purpose or value can result to very beautiful buildings and moral intentions are not always translated to aesthetically meritorious architecture. Furthermore, the same moral flaw can lead to different aesthetic features and varied architectural styles, as totalitarian architecture across the globe proves it.

We do not deny the importance of the origins of a building for the experience and the identity of a work. Volkshalle designed by Nazis and designed by tolerant architects would not be the same. But Volkshalle is a bad building, because it is a bad building. A moral purpose would not have enhanced it aesthetically. This information is important so that we satisfy our aesthetic curiosity of how some ideas can be expressed in forms.

Durability

Noel Carroll claims that architectural artworks often have the purpose of provoking responses (emotional, for instance) and that the appearance or form of the works needs to serve the purpose in a morally appropriate way (Carroll, 2015, 2016). “Eliciting these emotions requires meeting certain ethical conditions. If these are not met, the intended emotion will not take hold and the artwork will fail in its purpose” (Carroll 2015, p. 153). So according to Carroll, the aesthetic value of a work depends on its purpose to elicit a particular emotion. The peculiarity with architecture is that the moral purpose is not *in* the work in an unquestionable way, like in the case of a moral purpose in representational art, in cinema, painting or literature. What if the “purpose” becomes obsolete? Can we always relate an aesthetic value with a purpose in architecture?

Durability is a term that Peter Lamarque (Lamarque, 2010) uses to argue for his version of *art for art's sake* that we will not develop here. For Lamarque the durability of art is “the ability of the greatest works to retain an interest well beyond, perhaps centuries or millennia beyond, their context of origin” (Lamarque, 2010, p. 211). The idea is that great works of art develop a sort of uselessness as the importance of their initial moral, political, religious purposes diminishes, and their value as works of art is not diminished. Lamarque does not lapse into formalism though and stresses the importance of the origin to the identity of the work of art. Nevertheless, he insists that artistic merits and demerits can be obscured and judgments distorted when attention is overly focused on practical utility. For architecture, Lamarque gives the example of the Ducal Palace in Venice, which meant to exemplify the glory, power and authority of the Venetian Republic and stresses again that this is part of the very identity of the design. Today, Venetians do not need to impress their ambassadors, so the purpose of the building is obsolete, but we still admire and gaze in wonder the Ducal Palace. Lamarque gives an example of political purpose, but his theory concerns all kinds of instrumental value: moral, religious, social, etc. We can think of Le Corbusier’s social architecture, the Cité Radieuse in Marseille, for instance, which had a moral (social) purpose back in 1950’s, designed to resolve housing problem of the lower social classes. Today, this social purpose is not relevant anymore, but the building is more than ever considered as a work of architectural art, an excellent example of modernist architecture and praised for its aesthetic value.

Function

In architecture, part of the moral value of the building depends on its function, on the way it is used and appropriated, and on the relation between the function and the aesthetic properties (functional beauty). So, we want to take the durability idea a step forward and add to durability the idea of function, and think of the cases where the importance of the moral purpose does not diminish, but changes, because the function of the building changes. There are buildings which, according to the moralists, fail in their purpose in eliciting an emotion so they are aesthetically and ethically flawed. But architecture is after all a functional art that we can appropriate. Does the aesthetic

value change in every change of purpose or function?

We can imagine, for instance, a building for a newspaper, with a glass wall façade expressing the transparency and honesty of journalistic ideals. The newspaper is, however, an organ of political propaganda and the truth is distorted. The glass wall façade deceits the readers by making them believe that the newspaper respects and communicates the truth. So the building is aesthetically and morally flawed because the intended emotion cannot take hold and the building fails in its purpose. As Carroll says, “the morally sensitive audience will resist the architectural rhetoric of the building” (Carroll, 2015, p.154). Hopefully, totalitarian regimes do not last, and the newspaper becomes a model of journalistic honesty. Is the building aesthetically better because the emotion elicited corresponds to the building’s new moral purpose of honest communication? And if bad people come to power again, will the building become aesthetically flawed once more because morally reprehensible? We propose that a building must have an aesthetic value which cannot be manifold or permeable to this kind of changes.

Furthermore, architectural space is made for being appropriated and architectural forms and aesthetic features can only subtly invite us to share moral or immoral perspectives or to act in a moral or an immoral way. That is how public squares, despite their aesthetic qualities and originally symbolizing tolerance and democratic values and inviting to a harmonious coexistence, have occasionally become the scenery of massive paradigmatic executions during totalitarian regimes; that is why a racist cannot become tolerant simply by walking across a square; that is how young people do skateboard on the monumental stairs of the Zeppelinfeld Stadium ignoring the building’s invitation or “dictation” of a military discipline.

Conclusion and future developments

We conclude that architecture has an aesthetic value independent from moral considerations of a first intention, and appeal for autonomy in architecture, but, we do not exclude other various moral and aesthetic considerations related to architecture as a “living art”.

We do not aim to neglect our moral emotions for a building regarding to a moral function, a purpose, or whatever, nor to exclude that a beautiful building and an immoral function, for example, may conflict. We assume that moral considerations may prevent us from paying attention to aesthetic merits, that there can be moral emotions of indignation, for example, related somehow with the building, its function, its origins, an anecdote, which conflict with an aesthetic appreciation. But these emotions are not about the building, we do not feel bad or outraged about the building itself. So, this does not mean that the building is aesthetically flawed. It means that our emotions override the aesthetic merits of a work. Instead of allowing to these emotions to distort our aesthetic appreciation, we could use them to enhance the architectural experience.

Human perception blends memories, beliefs, emotions and associations and this range of meanings deepens experience. And architectural experience does not only comprise perception, but also move, touch, smell, etc. Part of the aesthetic value of an oriental bazaar lies on the smells; part of the aesthetic and moral beauty of vernacular architecture lies on our emotions, our memories, something that seems external to a particular building, but totally internal to what architecture is. Architecture is not

a contemplative art, and its moral and aesthetic experience does not depend on a purpose but on complex interconnected factors. Morality, aesthetics and the relation between them need to get free from a *de facto* relation of dependence between them, i.e. a building is aesthetically flawed because it is morally flawed. This seems to limit the richness of the architectural art and of our experience of it. Environmental aesthetics, as Berleant proposes, may offer a new kind of aesthetic experience: an aesthetics of engagement that refutes the traditional accounts of distance and contemplation; where the object rejects its static condition to gain a vital active role; where the function is not a narrow, barren utility, but an active interchange of person and object (Berleant, 1992).

My PhD research concerns aesthetics and morality in architecture."

FROM FAMILIAR TO UNCANNY. AESTHETICS OF ATMOSPHERES IN DOMESTIC SPACES

Abstract | The notion of “familiar” has recently become crucial in the debate generated by Everyday Aesthetics. In this essay I will explore this concept following Arto Haapala and Yuriko Saito’s theories, then I will investigate the notion of familiar – and some antonym notions (i.e. strange, uncanny, alien) – while embracing a phenomenological approach. Referring to German phenomenologist Gernot Böhme’s theory of atmospheres, my paper shall compare a notion of a *glass house*, theorized by Modernism, and a notion of a *shell house*, seen from different perspectives by Walter Benjamin, Gaston Bachelard and Juhani Pallasmaa. I will finally draw attention to the notion of strange as possibly degenerating into the idea of uncanny or alien, for instance when the transparency of glass is used as a tool for control or when it is embodied in the digital screens of hyper-technological homes.

Index terms | *aesthetics of architecture; everyday aesthetics; strange/familiar; glass house; hyper-technological houses; Modernism.*

Introduction

The notion of “familiar” has recently become crucial in the debate generated by Everyday Aesthetics, a theoretical trend set up against the mainstream of Anglo-American Aesthetics, and focusing on the philosophy of art. Starting with Arto Haapala’s essay and consolidating with Yuriko Saito’s book, *Aesthetics of the familiar*, the notion of familiar has been used to lay emphasis on the value of everyday life, often disregarded because of its normality. In our life everyday space and objects often form a kind of background which intrigues us only when something strange happens, however the value of what is familiar should not be underestimated, inasmuch as it makes us feel comfortable and “at home”.

In this essay I will investigate the notion of familiar – and some antonym notions (i.e. strange, uncanny, alien) – while embracing a phenomenological approach that is unaccounted for within the American debate and only partially acknowledged by Haapala’s essay. Referring to German phenomenologist Gernot Böhme’s theory of atmospheres, I will review two models of inhabiting, symbolically conveyed one by the shell house and the other by the glass house. In the popular imagination, the former is linked to the idea of familiar inasmuch as it stands for protection, privacy, warmth; while the latter is linked to the idea of strange due to a feeling of coldness and impersonality.

The notions of familiar and strange clearly hint to two different domestic atmospheres and two distinct sensory paradigms: the one of touch and that of sight. The glass house is however also the emblem of the modernist style, to which we owe masterpieces of great aesthetic impact. The notion of strange in this case hints to something special, out of the ordinary, like a work of art.

I will finally draw attention to the notion of strange as possibly degenerating into the idea of uncanny or alien, for instance when the transparency of glass is used as a tool for control or when it is embodied in the digital screens of hyper-technological homes.

Two models of inhabiting: *shell house* and *glass house*

The complex set of meanings detectable in the idea and in the lived experience of a home is a relatively recent finding in Western culture. Revolving around the polarisation of public and private, internal and external, it is the consequence of the changes in bourgeois society launched by the increasing urbanism of the eighteenth century and consolidated during the nineteenth century. In the modern popular imagination, a home is the place of intimacy and affections; it is the kingdom of what is familiar to us.

I will take into account two approaches to the understanding and living of a home: the shell house and the glass house. According to Benjamin, the first is the original model of inhabiting, clearly represented by Nineteenth century homes, where the occupant was protected like a compass in its case. The second instead is the expression of modernist style, which relies on glass and steel in order to achieve inhabiting models that are more for contemplation than for living.

The original form of all dwelling is existence not in the house but in the shell. The shell bears the impression of its occupant. In the most extreme instance, the dwelling becomes a shell. The nineteenth century, like no other century, was addicted to dwelling. It conceived the residence as a receptacle for the person, and it encased him with all his appurtenances so deeply in the dwelling's interior that one might be reminded of the inside of a compass case, where the instrument with all its accessories lies embedded in deep, usually violet folds of velvet.

The shell house, as Benjamin describes it, focuses on two features pertaining to the idea of intimacy: protection and privacy. In nineteenth century dwellings, velvet curtains are there not only to fend off sunlight, thus creating a shaded atmosphere, but also to hide the inside from prying eyes. Privacy is the main feature of nineteenth century dwellings. Their closets, dressers, chests of drawers, secretaires are the many "cases" in which one can hide one's dearest and most secret possessions. It is not a coincidence that Benjamin makes use of detective-like metaphors as he tries to convey this peculiar feature of eighteenth-century dwellings, where every object, piece of furniture, ornament becomes a "trace" and a "footprint" of the identity of the inhabitants:

To dwell means to leave traces. In the interior, these are accentuated. Coverlets and antimacassars, cases and containers are devised in abundance; in these, the traces of the most ordinary objects of use are imprinted. In just the same way, the traces of the inhabitant are imprinted in the interior. Enter the detective story, which pursues these traces.

On the contrary, with its algid beauty, glass seems to reject everything (i.e. furniture or decor) that could downplay its prominence. In this regard, one of the first theoreticians of the *Glaskitektur*, Paul Scheerbarth, claims that «It will surely appear self-evident that the furniture in the glass house may not be placed against the precious, ornamentally-coloured glass walls. Pictures on the walls are, of course, totally impossible».

This minimalist aesthetics deprives the occupant of the glass house of the pleasure to

possess objects. This is why, according to Benjamin, since in a glass house «it is hard to leave traces», it is more difficult to establish an emotional relation with things.

Besides being the «enemy of possession», glass is also the «enemy of secrets». Therefore, the transparency Breton and Scheerbart take as ethical virtue («our hope is that glass architecture will also improve mankind in ethical respects») is for Benjamin the sign of «moral exhibitionism» inasmuch as it entails the disappearance of «Discretion concerning one's own existence». Thanks to glass architecture the gaze of those who are inside is no longer filtered by the window, but can turn in every direction in the seeming continuity between inside and outside. However, also those who are outside can indulge in voyeuristic pleasure since, once walls disappear, no barrier stands in between the prying eye and the most intimate domestic areas.

The glass house is linked to an aesthetics of visibility and seems to embody the expositional values that belong to a work of art. For this reason, one of the supporters of Everyday Aesthetics, Kevin Melchionne, has emphasised the limits of one's daily life lived inside a glass house: «At first glance, the *Glass House* seems to be very much a work of environmental art. Surrounded by glass walls, the occupant is immersed in, though not physically subject to, the shifting atmospheric conditions of the outdoor». At the same time, «The glass walls render the occupant perpetually self-conscious of being watched». As a consequence, the occupants will never be able to behave in a relaxed way, like actors on stage, they will always be prey of other people's gazes. They won't be able to leave dirty laundry on the floor or out of place, nor dirty dishes in full sight; like art curators they will rather have to comply to rules not to destroy the aesthetics of the composition.

It is clear that glass and steel modernist architecture has often favoured style over comfort, thus producing houses of great aesthetic impact, but of little usability. This is why the occupant of the glass house reminds us of Adolf Loos' «poor little rich man» who lives in a house, designed and furnished by a famous architect, where he cannot move the furniture from its assigned position nor add new objects, since that would jeopardise the artistic perfection of the work of art.

Each appliance had its own definite place. The architect had done his best for him. He had thought of everything in advance. There was a definite place for even the very smallest case, made just especially for it. The domicile was comfortable, but it was hard mental work. In the first weeks the architect guarded the daily life, so that no mistake could creep in. The rich men put tremendous effort into it. But it still happened, that when he laid down a book without thinking that he stored it into the pigeonhole for the newspaper. Or he knocked the ashes from his cigar into the groove made for the candleholder. You picked something up and the endless guessing and searching for the right place to return it to began, and sometimes the architect had to look at the blueprint to rediscover the correct place for a box of matches.

In Loos' story the house finally becomes un-familiar: out of the ordinary and beautiful to look at, but unable to make its inhabitant happy. The poor little rich man, in fact, «tried to be home as little as possible» because «now and then one needs a break from so much art».

Although the glass house seems to embody the aesthetic values of a work of art meant to be contemplated, one could not say that the shell house has less artistic value. Benjamin himself claims that the *interieur* of eighteenth-century homes, with all its

objects, is not only the most intimate part of the house but also «the asylum where art takes refuge».

In the interior, he brings together remote locales and memories of the past. His living room is a box in the theater of the world. The interior is the asylum where art takes refuge. The collector proves to be the true resident of the interior. He makes his concern the idealization of objects. To him falls the Sisyphean task of divesting things of their commodity character by taking possession of them. But he can bestow on them only connoisseur value, rather than use value. The collector delights in evoking a world that is not just distant and long gone but also better—a world in which, to be sure, human beings are no better provided with what they need than in the real world, but in which things are freed from the drudgery of being useful.

The difference between the shell house and the glass house does not lie in their artistic value, but rather in the fact that they exude a different atmosphere, in other words a different relation between the space and the perceiving subject. Regardless of how humble or luxurious, how cold or cosy the home is, the feeling of inhabiting lies in the emotional relation established with the objects, the same objects which contribute to create the identity of the inhabitant. Nevertheless, although with more limits, also a glass house can reflect the personality of its occupants. For instance, in the novel *Nadja* (1928), André Breton describes his glass house – a metaphor for his internal I – as a house with a surreal atmosphere, where the physical property of glass becomes the sign of moral transparency.

I myself shall continue living in my glass house where you can always see who comes to call; where everything hanging from the ceiling and on the wall stays where it is as if by magic, where I sleep nights in a glass bed, under glass sheets, where *who I am* will sooner or later appear etched by a diamond.

On this ground Mario Praz claims that «the house is the person» and one's approach to furnishing tells us more about one's character and one's idea of beauty than the clothes they wear. Bringing this idea to the extreme, in the novel *Dead Souls* (1842) by Nicolaj V. Gogol, the furniture in the house of the landowner Sobakevič not only mirrors his personality, but also his physical appearance:

Meanwhile Chichikov again surveyed the room, and saw that everything in it was massive and clumsy in the highest degree; as also that everything was curiously in keeping with the master of the house. For example, in one corner of the apartment there stood a hazelwood bureau with a bulging body on four grotesque legs—the perfect image of a bear. Also, the tables and the chairs were of the same ponderous, unrestful order, and every single article in the room appeared to be saying either, “I, too, am a Sobakevitch,” or “I am exactly like Sobakevitch.”.

The aesthetics of atmospheres

The German philosopher Gernot Böhme has placed the notion of atmosphere in the centre of a “new” phenomenological theory of aesthetics. According to Böhme the atmosphere is the result of a synaesthetic perception – therefore not only visual, but also tactile, olfactory and motor – of a “space attuned” (*gestimmter Raum*) to a mood.

Environments can pick up or oppress people, just like shapes and colours can influence us. They can be homely or unhomely, cold or welcoming, sober or cheerful, and they

convey a spurning or attractive atmosphere. However, as the philosopher has pointed out, things and their properties (i.e. shape, colour, etc.) are not the primary content of sensing, but rather the relation among things themselves and to the perceiving subject.

In the shell house, going back to the two models here under investigation, the atmosphere of intimacy is produced by opaque and warm materials (e.g. wood and bricks), by colourful wallpaper, soft velvet sofas and thick curtains. The atmosphere of intimacy is always shaded. It can be lit up by lamps or candles, as suggested by the philosopher Gaston Bachelard, or warmed up by the flame in a fireplace, as claimed by the Finnish architect Juhani Pallasmaa. This latter is the supporter of an idea of architecture which in the articulation of space is able to convey an intense feeling, almost of religious meditation, where the fireplace becomes the symbol of intimacy and comfort: «The experience of the home is essentially an experience of intimate warmth. The space of warmth around a fireplace is the space of ultimate intimacy and comfort».

This warm and welcoming atmosphere recalls the idea of the maternal womb, our first home, where we could curl up and feel protected. Furthermore, while talking about the shell house and nest house, Bachelard points out the value of the action of “curling up”, as expressing the original and most intense meaning of inhabiting: «In our houses we have nooks and corners in which we like to curl up comfortably. To curl up belongs to the phenomenology of the verb to inhabit, and only those who have learned to do so can inhabit with intensity».

The relation between the position of the curled up body and the shape of the shell house wrapping the body in soft fabric recalls one more symbolic image of the first inhabiting, that is to say the crib. It is again Bachelard who reminds us that, as a newborn, «man is laid in the cradle of the house. And always in our daydreams, the house is a large cradle».

The model of inhabiting conveyed by the symbols of the shell, the nest, and the cradle can be linked to the notion of familiar with reference to the sensory realm of touch (the softness of fabrics; the warmth of the fireplace or of candles; the meditative curled up position of the body). On the contrary, the model of inhabiting conveyed by the glass house recalls, as previously mentioned, the sensory realm of the eye and expositional values of a work of art to be contemplated from a distance. On this ground this latter model of inhabiting can be linked to the notion of strange, in the sense of both extraneous and extraordinary. By clarifying that the two models rely on distinct sensory realms, Pallasmaa adds that visibility has to do with investigation, rationality, and distance, while touch has to do with proximity and imagination; the most intense aesthetic experiences are in fact those enjoyed with closed eyes:

The eye is the organ of distance and separation, whereas touch is the sense of nearness, intimacy and affection. The eye surveys, controls and investigates, whereas touch approaches and caresses. During overpowering emotional experiences, we tend to close off the distancing sense of vision; we close the eyes when dreaming, listening to music, or caressing our beloved ones. Deep shadows and darkness are essential, because they dim the sharpness of vision, make depth and distance ambiguous, and invite unconscious peripheral vision and tactile fantasy. [...] The imagination and daydreaming are stimulated by dim light and shadow.

Strange, uncanny, alien

Granted that a home expresses the identity of those who inhabit it, whenever it is haunted by an extraneous entity (for instance a ghost) or whenever, technologically self-governed, seems to have a life of its own, it loses its familiar connotations and becomes strange, uncanny, or even alien.

Nineteenth century literature offers multiple examples of houses which, behind a welcoming and familiar appearance, hide a dark side. Here one could make reference to E. T. A. Hoffman or Edgar Allan Poe's grotesque stories, as well as to those by the French authors Charles Nodier and Victor Hugo, which feature abandoned houses, surrounded by superstitions or haunted by ghosts.

As Anthony Vidler has remarked, the uncanny in architecture is not a property of space, nor is it evoked by a given conformation, but it rather ensues from the aesthetic dimension; no single building nor design trick will be able to mathematically provoke an uncanny feeling. However, Vidler also recognises that «the buildings and spaces that have acted as the sites for uncanny experiences have been invested with recognizable characteristics». In order to explain this disquieting feeling which cannot be traced back to rational elements, one can rely on the aesthetics of atmosphere and the emotional relation established between the environment and the perceiving subject.

A paradigmatic example is provided by Edgar Allan Poe's story, *The Fall of the House of Usher* (1839). The house is described as melancholic and already at first sight it evokes «a sense of insufferable gloom». The uncanny feeling is not only the result of the conformation of the house with «vacant eye-like» windows, but it also comes from the surrounding atmospheric space, in other words the gloomy landscape, the solitude of the main character, the autumnal season: «During the whole of a dull, dark, and soundless day in the autumn of the year, when the clouds hung oppressively low in the heavens, I had been passing alone, on horseback, through a singularly dreary tract of country».

Also the glass house can become uncanny and even alien, as shown by literary and cinematographic science fiction. In this regard one can recall the novel *We* written – between 1919 and 1921 – by the Russian novelist Evgenij Ivanovič Zamjatin, who is considered the forefather of the negative-utopia or dystopia genre. The novel focuses on the totalitarianism and conformism of the soviet regime at the beginning of the twentieth century, but its setting is in the future, where homes are only built in glass so that everybody can be seen and controlled at any moment. Also the film director Sergej M. Ejzenštejn, in his unachieved film project titled *Glass House* (1926-30), saw the disquieting shadow of a future made of oppressive transparency in glass architecture. The hypertechnological home follows the same line. Here walls disappear like thin digital membranes in constant mutation. By means of a sensor network these interactive walls react to stimuli (i.e. sounds, lights, and smells), thus creating unusual communication flows between the inside and outside. A good example is provided by the unsettling project signed by two architects from New York, Elisabeth Diller and Ricardo Scofidio. Based on their design an external camera selects the shots, records the landscape, and then projects it on virtual windows, thus giving a new interpretation to the theories of Surrealism on the mechanical body in the light of cybernetic culture.

The hypertechnological house can therefore appear comfortable and functional at first sight, but it can also become alien, if not hostile, possibly transforming itself into a

self-governing prison, as it is for the Glass family, in Daniel Sackheim's film with the suggestive title *The Glass House* (2001).

Conclusive remarks

The notions of familiar and strange, although antonym, might change one into the other. A familiar and ordinary space can be made out of the ordinary, as it is when a home is transformed into a work of art. Such an intervention may well run the risk of making a home uncomfortable and unfamiliar. Furthermore, such a de-familiarisation can lead to uncanny results, as shown by literary examples of ghost haunted houses or glass houses. Finally, it can produce alienating effects in hypertechnological homes which seem to have a life of their own. The notion of home is indeed complex and connected to the feeling of inhabiting, that is to say to the relation established between the perceiving subject and the atmospheric space. It is nevertheless possible to launch a domestication process in order to make the spaces that are perceived as extraneous familiar or in order to create a welcoming atmosphere in those places that seem cold and impersonal. According to Böhme atmospheres do not exist as physical objects, but they are identifiable and therefore can be produced through some given natural elements (e.g. water, flowers, trees, etc.) or artificial elements (e.g. light, sound, architectural features).

The aesthetics of atmospheres is therefore a useful theoretical tool not only in literary descriptions and in theatrical and cinematographic settings, but also in daily life, where it can provide theoretical and practical support in the production of synthonic relations between the subject and the surrounding space. It can thus be helpful when it comes to social and individual alienation or in the issues connected to integration, contributing to atmospheres that qualify as inclusive and suitable to express the identity of single individuals as well as of communities.

RECASTING HISTORY AS THE EXPERIENTIAL CONTENT OF SPECULATIVE ARCHITECTURE

Abstract | Generally, philosophy is not concerned with specific formations of architectural production to indeed comment on more general significances. This paper observes an architectural drawing practice under the title 'Monolith Drawings' which is structured by a set of formal codes; a precise definition of rules governing the production of set of architectural figures. This paper does not present the idea of the Monolith Drawing as a procedural argument yet as an analysis of becoming and being architecture exploring the contained quality of monumentality.

The idea of monumentality is understood as a specific experiential quality void of institutional moralizing tactics. It was the pyramid that Hegel regarded as an important paradigm of architecture with its monumental qualities; a monolith interpreted to have no other function but its symbolic significance. As such, Hegel developed the possibility for architecture to exist outside the notion practical employment or even occupation.

The Monolith Drawing, in the first instance, exists as a study of architectural expression, resisting more general paradigms to indeed nurture processes of discovery. As such, the search for a ternary space as the (meta)physical location of monumentality complementing the manifestation of binary space. Binary space is understood as a situation where inside and outside exist in close proximity such as by drawing a line on paper to instantly divide space in two opposing regions. Commonly, architecture is drawn as a set of lines to delineate insides from outsides. The Monolith Drawing is not composed as a set of lines but as a set of intersecting volumes, each in reference to historical archetypes. As such, the drawing produces multiple regions simultaneously such as in a Venn Diagram where circles intersect to define common areas of overlap. The Monolith Drawing defines these common areas as void space to form a remaining architectural mass in which the interior morphology can be very different from the exterior outline.

The Monolith Drawing explores this remaining mass, this spatialising divide between inside and outside as 3rd space. This space is transitional in nature constantly negotiated although impossible to enter; creating a distance between previously adjacent spatial regions. The Monolith thus actively explores the decomposition of a binary logic to observe space as trialectical.

The 'Monolith Drawing' - Created Ex Uno Lapide.

One of the foremost construction principles of the Monolith Drawing is indeed to imagine a solidity preceding all architectonic development within the drawing. This idea of developing an architectural figure from a single solid follows the ancient technique of 'ex uno lapide'. The principle of ex uno lapide was a topos of classical literature, which first appeared in Alberti's treatise on sculpture (Barry 2013). His writing develops observations by Diodorus Siculus on the proportion system of Egyptian sculptors. This principle can be found in Michelangelo's preliminary sketches preserved in the archives of the Casa Buonarrotti Foundation, which represent quarried marble blocks in outline with indications on the future sculptural groups to be carved. The Monolith Drawing correspondingly exists as a study of architecture seemingly in search for ancestral origins; the place where we discover architecture. This urge to (re)discover classical architecture stems from a desire to participate in a renewal of the world, not through post-classicism but through the idea of loss with which we nurture our intuitive understanding of the momentum of history. With this we seek for a particular notion of history; acknowledging the fact that history is not merely a moving-on yet more like a dwelling in (or through) all time passed. Asking, how can we design architecture through historical recollection? As such, the Monolith Drawing is never in search for a singular historical reference; nevertheless, it looks for a general engagement with all that is History. This paper thus comments on the "Monolith Drawing" as a drawing protocol with which an architectural figure is extracted out of a single volume, synchronising analogue thinking with computational development to enter history through our intriguing capacity to long for; the experience of something that is absent. The Lacanian interpretation assumes there cannot be absence in an objective world, for absence can only exist through symbolic or representative means; an interpretation which takes the research from the figural towards the architectural. It is through the representational means of the "Monolith Drawing", that we enable ourselves, as architects, to design presence where there is none.

Extracting the Architectural Figure

The Monolith Drawing exists as a study of architecture investing in the question "how to design architecture through historical recollection" as opposed to following a practice of reaffirming existing historical interpretations. Any process of recollection is dynamic and inevitably non-linear. Such is the Monolith Drawing; a place where relations are drawn as intersecting solids; cutting into one another, to recompose and eventually create new formal conditions. The creation of form is thus a process of negotiating new relationships between forms as opposed to the assembly of archetypical elements. For there are no walls or floors and even with the transcription of void within a lithic core no real entrance is ever made, nor is there ever a real exit. Instead, different degrees of compositional intensity are explored during the subtraction process with the aim to uncover differential intensities that underlie the process of lithic subtraction. In turn, the process produces compositional identities – as architectural precursors - where the individuality or clarity of an architectural object dissolves into divergent series of compositional transmutations. This process stands in service of the creation of interior space; it is really about entering matter. The procedural subtraction process structuring the Monolith Drawing underlines the importance of this event, resisting the objective reality of an entrance to engage with the actuality of entering, participating to the dynamic recollection.

The adjacent set of drawings illustrates a systematic process of lithic reduction as part of the drawing construct of the *Monolith*. The *Monolith* engages with a perpetual development of retrieving history or indeed repossessing time. In so doing, the *Monolith* allows for the visualization of working through time with time. Starting with interpreting a sense of 'the material' in order to render a consciousness of a particular place through time, the drawing aims to communicate this process of developing such consciousness and its relation to materiality. This gently erases the a-priori value of an object and allows for a more sensorial relationship with that object. In turn, it allows for embodied perception as the observer and author of the drawing become inevitably enmeshed with the drawing as we are enmeshed with the physical world in which the author and drawing form part. The *Monolith* is thus developed through the craft of occupying time (and perhaps less with occupying space since one is inevitably part of that space), through a process of projection and subtraction, acting and responding, making and unmaking in order to allow new architectonic conditions to emerge. The *Monolith* is part absent, part present, as the drawing progresses through acts of remembering.

The *Monolith Drawing* starts with the composition of a primary volume or lithic-core. The lithic-core has often concave properties, due to its implicit structural capacity: both as concave and convex contour. As such, the lithic core is continuously in remembrance of archetypical form, "the psychic residua of innumerable experiences of the same type" (Jung 1922: 415). The act of sculpting into the lithic-core follows principles of 'Stereotomy'; a process in which the lithic-core is reflected to describe a secondary intersecting volume. This volume is always and inevitably smaller for that what gazes at its own reflection requires a certain distance. Such distance stands in relation to the factor by which its reflected counterpart is scaled.

The subtraction process is initiated by defining an overlap or intersection between the lithic-core and its reflection; allowing the lithic core to somewhat enter its mirror image and initiate a reciprocal metamorphosis between 'observer' and 'the observed'. The area of intersection between two solids describes what will become void after the mirror image is subtracted from its original.

The result is the part removal of the lithic core. Such drawing allows an architectural thinking through the solidity of a single volume out of which spaces are carved; a concept antithetical to algebraic architecture where the idea of building is understood as the assembly of parts. The *Monolith Drawing* negotiates the creation of architecture through the distribution of void to produce space and structure simultaneously. Such method of mirroring and subsequent subtraction is repeated to a point of collapse; the moment where a lithic core is but a collection of shreds and slivers. *Monolith Drawings* thus exist as intermediate imageries towards this moment of inevitable collapse.

The 'Monolith Drawing' – Mirror Construct

The *Monolith Drawing* is both the figuration of an architectural object as it is a diagram depicting a becoming of architecture. As such, the drawing combines two orders of vision; an external order of the senses within the realm of *res extensa* and an internal order of intuition and reflection, described as *res cogitans*. Orders which Descartes describes as explicitly separate (Descartes, R. 1973). In his view, perceptual recognition of empirical qualities is to be separated from the intellectual operation of critical vision. In its purest form this results in an approach where an expressive drawing or diagram is only capable of cultivating critical vision outside any system of

representation. Consequently, any diagram or expressive drawing should inevitably be non-resembling. For Descartes, critical vision thus rests upon a process whereby every sign within the drawing gives rise to an intellectual operation as opposed to referencing an empirical quality. An example of this would be a minimal line drawing depicting a forest to be declared a more capable expression of the essence of a forest, exceeding the representational capacities of a photograph. The Monolith Drawing is a simultaneous performance of *res extensa* and *res cogitans* for its expression does not bypass pictorial reality.

As a reflective instrument the monolith drawing aims at being self referential by incorporating a mirror construct as one of its major structuring capacities. This is not unlike the way Vermeers incorporates the idea of reflection in his canvas in which the mirror allows the painting to be both representational and diagrammatic for the work of Vermeers allows a seeing of a depicted scenery and a seeing of the act of seeing through the painting. In *Eye and Mind* (1993) Merleau-Ponty comments on Vermeers' paintings of Dutch interiors as he explains the concept of a figured philosophy of vision (Merleau-Ponty 1968: 145). To explain this concept, we need to understand Merleau-Ponty's appraisal of certain qualities held by Vermeers' paintings. One important attribute in Vermeers' depiction of Dutch interiors is the lingering quality of absence (Baudry 2007). An absence of autonomous figures, for most subjects in his paintings seems to be absorbed by the surrounding architecture suggesting a merger between object and subject. A second recognizable quality in Vermeers' works is the precision with which the reflected interior is painted in the rounded mirror decorating many of Vermeers' depicted interiors. This laborious act of a dual recording of observed qualities within a room wants to perform as an expression of labour in the construct of a critical image. The round mirror, as Merleau-Ponty explains, exists in these paintings as an instigator for an everlasting and reciprocal metamorphosis between observer and the observed. The observer, through the act of drawing, is allowed to reflect on the very act of observation. This process of reflection, through drawing, allows the observer to be changed by the drawing in the same way that the drawing is changed by the changing observer. This reflective capacity is exemplified in Vermeers' work by integrating the mirror image of an image within the painted image. The construct of the mirror thus supports the idea of a reflective capacity held by the painting allowing Vermeers' paintings to surpass the representation of an objective world and indeed express something beyond empirical observation. As such, the painting is allowed to reveal a pictorial interior through outward observation (*res extensa*) and of an inward viewing (*res cogitans*) as it reflects on its own status as a painting. In such a drawing the position and role of the author's gaze is contained within representation itself. Merleau-Ponty describes this to be one of the basic premises of creative practice in that the artist is seen as much as he/she is seeing. With this Merleau-Ponty develops a critique on the persisting Cartesian split between subject and object, observer and observed, emphasising a reciprocal relationship between subject and object to a point where a subject can only be observed as part of an objective world.

As previously stated, the Monolith Drawing is both a figuration of an architectural object as it is a diagram depicting a becoming of architecture. The progressive subtraction process allows a lithic core to enter its mirror image; again and again to a point of collapse, nurturing a reciprocal metamorphosis between 'observer' (lithic core) and 'the observed' (its mirror image). This Oedipus tragedy of reflection and subtraction is a cyclical process for the lithic core receives multiple carvings from subsequent mirror images, each time leaving a recess or exedra after the moment of subtraction. Such

rhythmic creation of exedra upon exedra eventually vacates interior space within the lithic core. Space that can only be reached through the mouth of undulating Archivolts. The creation of such multi-pediment inscriptions around the Exedra stands in admiring reference to ancient principles of ornamentation such as the blind doorways of the Preclassic Mesoamerican Olmecs (2000BC) also found in Karnak (2000BC) symbolizing the entrance to 'another' world.

The 'Monolith Drawing' – in search for a ternary space as the (meta)physical location of monumentality

The creation of space within the Monolith Drawing is modulated on presence and absence, exploring the various relationships between the making-present-of-absence and the-making-absent-of-presence. The structural principle guiding this process is the production of indirect lines by choreographing various intersections of projected volume. Resulting outlines are thus the product of the making absent of volume yet make present that what has become absent. Such thinking is based upon the idea that space can only exist within the assumed foundation of absence. The Lacanian interpretation of absence assumes that there cannot be absence in an objective world for absence can only exist through symbolic or representative means. Hence the importance of the drawing to explore this phenomenological quality that there may be a presence where there isn't one; the presence of void or the presence of a past. This constitutes a great difference with drawing methods conform to the making present of lines. In these instances, space is created as part of a binary construct; as a line divides space in two opposite regions on either side of the line; an in or out, a left or right, an under or above. In doing so, lines divide space by means of minimal matter allowing the silhouette of an inside and an outside to fuse. The Monolith Drawing counters such system of binary space in order to construct space as a ternary system; composed out of 3 regions. To accomplish such composition of space, the drawing favours the juxtaposition of volume as opposed to the tracing of lines with the aim to render a less unified relationship between inside and outside. The juxtaposition of volume allows the formation of spaces with a greater distance between inside and outside. The process of subtracting void out of a solid mass brings into being the composition of remaining mass in which the interior morphology is thus very different from its exterior outline. It is this unyielding in-between mass, this seeming barrier that performs as 3rd space. This mass defines a spatialising divide between inside and outside, a transitional space, which is constantly negotiated although impossible to enter. One cannot enter for it remains solid however as one occupies the vaulted spaces of the Monolith Drawing the synthesizing mind - pressing for an overall understanding - enters this third space. This in part allows for the dissemination of partial occupancy of body and mind; never only inside, never only outside. `such ternary system nurtures a baroque quality of dynamic spatial occupancy where body and mind meander between void and solid. In this state of flux one is allowed to occupy that what is not there; a third space. One is allowed to inhabit monumental absence.

The Monolith's geometry results from a gathering of ancient drawing techniques. History is implied through a particular quality of memory; hidden form direct view yet implicit to the embalming form or indeed silhouettes of the Monolith. Each of these compositions recover a tradition of linking geology with architectonic configuration for space is carved out of solid mass. The Monolith however is not placed in the past. It is observed as a meditative instrument where one can remain and prevail in 'nowness'. This way, history can be studied beyond scholastic notions of objectivism and serial

events. Instead, history is persistently subjected to forces of (re)composition such as in the drawing. The Monolith Drawing collects form within a field of intersectional forces where old data becomes potent again, dormant images awake just before they indeed intersect with others and intensely change. Such compositional strategy does not want to negate the implicit cultural value of historic formal languages or their significance as expressions of previous cultures. Neither does the Monolith Drawing clear the way for a practice concealed in pure conceptual space where interiors are generated through means of contained sets of formal operations. The Monolith Drawing positions itself as equidistant from both ends of this theoretical spectrum to obtain a reciprocal relationship between new spatial compositions and the historical context they arise from.

The Monolith references ancient form without having to subscribe to strategies of historicized formal continuity (neo / post) The spatial intentionality of the Monolith is to create 'room' through subtraction, which consists of a slow process of carving into stone as an antithesis to composing architecture by means of architectural elements such as column and beam. The Monolith as stone cut architecture is characterized by the correspondence between form and structure. As such, the expressive value of its form is a direct result of its structural capacity. Vaults and domes as primary 'subtractors' play an important role for there is structural reasoning with each carving of empty space. The Monolith works with the peculiar quality of 'an activated absence' in which the original object gains potency by being subtracted leaving a trace or contour.

The moment after subtraction where the area of intersection between two solids has become void.

Elevation View MM04 as per previous diagram. The process of reflection and subtraction is a cyclical process for the lithic core receives multiple carvings from subsequent mirror images, each time leaving a recess or exedra after the moment of subtraction. Such rhythmic creation of exedra upon exedra eventually vacates interior space within the lithic core. Space that can only be reached through the mouth of undulating Archivolts.

The act of sculpting into the lithic-core follows principles of 'Stereotomy'; a process in which the lithic-core is reflected to describe a secondary intersecting volume. This volume is always and inevitably smaller for that what gazes at its own reflection requires a certain distance. The subtraction process is initiated by defining an overlap or intersection between the lithic-core and its reflection; allowing the lithic core to somewhat enter its mirror image and initiate a reciprocal metamorphosis between 'observer' and 'the observed'. The area of intersection between two solids describes what will become void after the mirror image is subtracted from its original.

Elevation View MM04 after receiving subsequent carvings each time leaving a recess or exedra with a view of its interior; to be reached through the mouth of undulating Archivolts. This interior is a shadow chamber; an inside removed from its outside. The monolith is a third space.

Everything comes out of darkness and appears in the light. The Monolith within the drawing appears from the dark yet never casts an outward shadow. Shadows only exist within the contours of the Monolith for it is here where the Monolith is still in process of appearing.

NATURE AND ART: GOETHE ON ARCHITECTURE

Abstract | The proposal of this paper is to demonstrate how Goethe's writings celebrate the positive interaction between nature and art, or empiria and aesthetic. To analyze this polarity, it calls upon the German poet's emblematic essay, that have been written in his youth, entitled *On Architecture* by which he clarifies the totality in the particular and the particular in the totality, like it occurs in nature, on organic objects. Taking *On Architecture* as a paradigmatic text, it is also intended to draw attention to productive relation between art and nature in other Goethe works especially *The sorrows of young Werther*, *Italian Journey* and his critical essays on art. As outcome, the paper intends to develop a philosophical-literary discourse of nature and architecture circumscribed in conjugation of poetry with empiria particularly the contemplation.

Index terms | *aesthetic; architecture; beholder; contemplation; nature; poetry.*

Some scholars who study the works by Johann Wolfgang von Goethe organize their esthetic production into three interconnected moments: on the one hand, there was his youth, a fertile period in which literature is the center of his attention. Here, Goethe established a strong connection with the *Sturm und Drang* aesthetic, in which subjectivity was predominant against the *empiria* and the notion of genius, characteristic, feeling and creation were based on a movement from the spirit to the spirit. His moment poems, lieds and small novels that highlight expressions of feeling appeared, as well as they come out in Werther's letters written in sublime tones that disclose his exaggerated passion for Lotte. Goethe sought, in the depths of his heart, poetical representations that allowed the immediate contemplation of trivial life facts, perceived in his walks on the fields, gardens and streets.

The second phase, of the poet's renaissance, occurred during and after his trip to Italy. The Faust's author adopts another interpretation for the art of that time. The experiences acquired on Italian soil enabled him to look at the object and at the absolute complementarity between subjectivity and exteriority. Finally, his third phase of artistic production occurred in his old age. The second part of Faust was completed in this temporality, becoming the synthetic work of Goethe's artistic life that explained his poetic foundations, since the Faust gathers conceptions from his youth. This is in fact closely related to Goethe's understanding of life as a philosophical category, because it is a succession of events, disconnected in space at times, which form (*Bildung*) the human spirit, that is, history itself.

Let us put the final phases aside and focus on his youth and on possible relations existing between his writings. In this period, as mentioned before, a rich poetical production is present, especially moment poems aimed at disclosing the daily life of the German population. Moreover, the eminent work *The Sorrows of Young Werther*, which made his name known worldwide, was published. His fame faced resistance in

some places, such as in the ultra-Catholic Portugal, where the work was proscribed, including by banning its printing and promotion in the Portuguese overseas provinces. In addition to ordinary, or minor, moments, which celebrated human representations in routine situations, such as sailing on a lake, celebrating friendship in a tavern or simply reflecting in a garden, the Werther's author got inspiration from nature and from the ways nature is seen through the trained and sensitive eyes of the observer. Nature, both in its scientific and philosophical aspect, influenced his literary production, became the link binding different artistic manifestations.

Thus, what was nature from the young poet's perspective? How did art express nature by becoming the representation model of the latter? At first, it is interesting to remember the divergence between the concept of nature postulated by the Natural Sciences of the Enlightenment and that one formulated by Goethe. His botanical, chromatic and atmospheric studies reveal that scientific rationality is not exclusive when framing concepts geared to unravelling natural phenomena. To some degree, the German poet was opposed to catalographic systematizations of nature, as suggested by *Linnaeus's* botanical classification systems and images from the *D'Alembert Encyclopedia*, which show nature as a functional machine. For Goethe, the nomenclature "natural system" was contradictory and not enough to explain the visible and invisible constitutions of nature. It does not have a system, because it is life-giving life in an unlimited and infinite succession, something that transcends *empiria* itself, but still being sensitive.

On the other hand, the deified and eternal nature is also shown in small fragments, in details of its exposure. It is noticeable when Goethe defined nature as "an endless set of details that seem insignificant and trivial to our eyes"¹ when talking about his poetical choices in his youths. Then, it unveils its polar aspect, that is, nature would be the whole composed of details, but also the detail communicating the absolute. This postulate appears in a small text written by the poet in 1772 on the *Strasbourg Cathedral*, entitled *On German Architecture*, which served as analytical methodology of the Laocoonte sculpture in 1798. My approach focuses on the colossal temple. I postpone, for another appropriate time, the considerations on the Greek sculpture that encouraged Lessing and Winckelmann to write excellent essays and literary criticisms.

When the essay was written – *On German Architecture* –, the German literature was the focus of Goethe's artistic production. However, when devoting himself to visual arts, instead of observing them mainly according to objective criteria, he used concepts derived from the *Sturm and Drang* movement, such as genius, creation, characteristic, and feeling². In this regard, the effect of the originality of the architecture project on the spectator's senses must be the empirical basis for my onward explanations. For, as Dorothe von Mücke³ reflected, Goethe examines the cathedral as an artwork that allows verifying architectural effects, instead of painting or poetry, on the observer's subjectivity. That is, architecture should be understood as the art whose forms got inspiration from nature rather than subsuming the mechanical and functional exclusivity of engineering.

On German Architecture: nature and art

When Goethe arrived in Strasbourg, the cathedral of the city caused a deep and silent effect on his senses and spirit. In his words: "I had no conditions to understand what I felt at that moment, but that impression remained with me while I climbed hastily to the terrace"⁴. Indeed, that was a sublime effect that surely terrified him, but, at the same time, the giant proportions of the monument caused him comfort and

admiration. Breadth and vastness, as well as unit and detail, were qualities both of that architecture and of the region where he was.

That “shapeless and roughened monster” pejoratively called Gothic by the critics rose up before him. A style whose semantics assembled a lexicon predominantly composed of negative terms such as “indeterminate, disordered, unnatural, mended and overloaded”⁵. Goethe’s view on the “Gothic” style diverges from contemporary doctrines. While Gothic architectural models were described in a negative way as inharmonious and unpleasant objects to one’s eyes due to its several decorative parts, the poet reconciled with himself when observing that variety of forms. The cathedral became an original artistic object just because it had thousands of harmonious particularities.

The numerous details of the facade, sculpted by different hands but imagined by the genius of the architect Erwin von Steinbach (c.1240-1318), consecrated the model of Germanic architecture: “this is German architecture, of which Italians cannot brag, let alone Frenchmen.” The cathedral was the exception to the rule of canonized symmetry in the Renaissance precepts, it lacked a bell tower and its facades were designed with myriads of decorative elements typical of the Middle Ages, such as the stable lateral buttresses supporting the building structure. To the foreigner’s eyes, maybe Erwin’s project did not treasure harmony as an aesthetic principle, because the effect of that diversity of forms could confuse the observer’s mind instead of causing them delight. Actually, the ability of the cathedral to hide the truth of its proportions in excessive details and decorations enabled the sublime effect of the immense stony mass over its visitors.

Here, the sublime mustn’t be understood according to the Kantian thought found in the *Critique of Judgment*, work published eighteen years after Goethe’s essay on the German architecture have been written. We can think about it based on Longinus’s reflections, as an “echo of the greatness of the soul”⁶. In fact, the young writer projected his most intimate feelings to that enormous stone mass, and, through these forms, he could create ways to lift his spirit:

But, oh, when I hover over the sublime and gloomy openings here by my side, which seem to be empty and useless! In their audacious and slender forms, I hid the mysterious forces that should raise those two tall towers in the air, of which only one is there, sad, without the principal five-pointed ornament I assigned to it so that the surrounding provinces paid homage to it and its royal brother⁷.

In the autobiographical work *Dichtung und Wahrheit*, Goethe expressed his delight at the landscape that was for the first time before his eyes. Climbing to the bell tower allowed him to contemplate the extensive meadows, the dense groves, the Rhine’s course, the flat lands irrigated by the Ill, and the mountains interspersed with forests and prairies. The physiognomic diversity of the landscape, framed by a distant horizon and by the view, heightened his senses to a state of ecstasy. In this regard, the affinity between landscape and cathedral seems to me to be quite valid, since both were composed of interdependent polarities: diversity and unity, ecstasy and usufruct, vastness and narrowness. Admiring the landscape and closely observing the cathedral still revealed similar experiences. In its architecture, specific objects (decorative details) conformed the whole (the monument). Likewise, one can notice the landscape in its vastness, when touching the horizon line, as well as in its individual forms (trees, mountains, rivers, meadows, among others): “For many times the dusk eased my eyes fatigued

by the investigative vision with a friendly rest, when through them the countless parts merged into whole masses”⁸. However, for the young poet, the act of contemplation, whether of buildings with sublime constitutions or landscapes, is not related to the divine creation, but to the secularized human genius⁹. As aforementioned, the polarity circumscribes, among other aspects, the Goethian understanding of the organic interaction between nature and art. The poet used this category as one of the aesthetic foundations of his literary production, being found from Werther to Faust.

This organic relationship between art and nature, that is, the perception of the whole through the detail and of the detail as a whole, explained many of the aesthetic principles adopted by Goethe throughout his fruitful literary and pictorial career. Consequently, the divine dimension of both categories is also guaranteed. As the author of *Meister* says in *On German Architecture*, the fusion of nature and art comprises an eternal whole¹⁰. The art object created by Erwin von Steinbach in Strasbourg, reminded Goethe of the exemplars from nature, announcing the elevation of human genius to the divine dimension: “*Der Gott war zum Menschen geworden, um den Menschen zum Gott zu erheben*”¹¹.

The perception of the whole in the particular and vice versa appears in the Goethe’s scientific studies on Botany and Physics. In *The Metamorphosis of Plants*, the poet developed the concept of *Urpflanze*, or “original plant.” This would be the ideal form of all manifestations of nature, since it encourages people to see the general in the particular and to obtain the totality when analyzing the object¹². The form must be understood as a sensitive organic unit, which combines emotion and reason in its content¹³, as Goethe expresses in his travels to Italy: “the knowledge of the mountains and the stones extracted from them result in a great progress in art”¹⁴.

The polarity inherent in nature forms the interpretative basis for the formation of colors. In *Theory of Colors*, Goethe explores the affinities between light and shadow in the origin of colors. It is an understanding opposed to the coeval physical formulations, with special emphasis on the Newtonian theory that approached colors as results of the white light calculable using mathematical formulas. The light, *Urphänomen* (the original phenomenon), turns into shadows and colors, a deflagration that reverberates on the bodies and makes them resonate sensibly in the spectator’s eyes. Actually, Goethe seeks to explain the sensitive revelation of nature with his theory of colors, as he did when reporting the effects of the Strasbourg cathedral on his spirit. In this sense, there is a nature recognized as a unity that is in tune with its parts in a living and infinite process. This is the idea of nature potentiated or, at least, applied in several fields of the artistic, philosophical and scientific knowledge of his time.

THE BODY OF CHRIST QUA THE BODY OF THE CATHEDRAL: DECODING THE CONCEPTUAL SPACE OF MICHAEL CLARK'S FIVE WOUNDS

Abstract | Michael Clark's site-specific installation *Five Wounds*, on permanent display in Chichester Cathedral since 1994, is a portrait of Christ as the Man of Sorrows, albeit one that does not depict Christ's face. Instead, the work is overshadowed by the rhetoric of the image, concentrating on Christ's bleeding wounds now detached from the narrative of Christ's Passion. *Five Wounds* constructs a spatial code or a 'system of space' that alters the way we experience the space of the cathedral qua the Body of Christ. Drawn from Mantegna's *Dead Christ* (c. 1480), the five square panels depicting wounds in oil that form *Five Wounds*, are inset at certain positions into the walls of the cathedral configuring a pentagon: two on either side of the West door of the cathedral for the wounds on His feet; one in the North and one in the South transept for the wounds on His hands; and, one on the left side of the High Altar's sanctuary for the lance side wound on His chest. Despite their miniature size of 2.236 inches—that is the square root of five, a number which also relates to the Golden Section which would have been incorporated deep into the geometry of the cathedral itself by the medieval builders—and by using the whole cathedral as its 'canvas', *Five Wounds* could be seen as the largest art piece in the cathedral. One cannot see all the wounds at once, and however flat they seem at first sight, they open up views to another, fourth, dimension. By segmenting the image of Christ and using His five wounds as building blocks, and by attributing His faceless 'image' to His iconic 'wounds', *Five Wounds* questions the notion of perspective by choreographing the spectator through and around the mystical and the meta-physical Body of Christ. Henri Lefebvre in his *The Production of Space* questions: 'To what extent may a space be read or decoded?' In answering this question the paper moves from the two dimensional 'seen' to the three dimensional 'known' space, to argue that the work is not meant to be looked at but to be lived within; and it demonstrates how the corporeality of *Five Wounds*, with its capacity to create an 'inner' space, that is both 'conceptual' and 'physical', may be viewed as a metaphysical extension of the body of the Church and a metaphysical prosthesis of the Body of Christ.

Index terms | *conceptual space; contemporary art; fourth dimension in art; metaphysics; philosophy and aesthetics of architecture; prosthesis; relational aesthetics; theory of perspective.*

It is the purpose of this paper to take its cue from two questions posed by Henri Lefebvre:

1. 'To what extent may a space be read or decoded?'¹
2. 'Can the body, with its capacity for action, and its various energies, be said to create space?'²

Drawn from mystical contemplation rather than from theological speculation, Michael Clark's *Five Wounds* (1994) is a portrait of Christ as the Man of Sorrows (Fig. 1), albeit one that does not depict Christ's face. Instead, the work is overshadowed by the rhetoric of the image, which concentrates on Christ's bleeding wounds now detached from the narrative of Christ's Passion. *Five Wounds* is a pentptych—a five-parts painting comprising five square panels measuring 2.236 inches, each one depicting a wound made of oil on card and mounted on wood (Fig. 2). These have been mapped on to the cruciform architecture (tetraconch plan) of Chichester Cathedral, à la *Vitruvian Man*, to correspond to the positioning of the five wounds on Christ's post-crucified body, with its alignment format drawn from Mantegna's *Dead Christ*: two on either side of the West door of the cathedral for the wounds on His feet; one in the North and one in the South transept for the wounds on His hands; and, one on the left side of the High Altar's sanctuary for the lance side wound on His chest (Fig. 3). The perspective view of the five wounds in *Dead Christ* begins with his feet, then travels to the hands and ends with the lance wound to the left, as you look at it (Fig. 4). *Dead Christ*'s five wounds form the five points of a pentagon, with the top point slightly stressed to the left (Fig. 5), and so do Clark's *Five Wounds* in Chichester Cathedral, implying Johannes Kepler's Divine Proportions and the ratio of the diagonal to the side of a pentagon (Fig.6). The difference, however, is that with *Five Wounds* one cannot see all the wounds at once, panoptically, for they meant not to be seen but to be experienced through an embodied spatiality (Fig. 7).

Martin Jay remarked that Gaston Bachelard 'insisted that a modern metaphysics had to be discursive: "It should beware of the privileges of evidence that are the property of geometrical intuition. Sight says too many things at the same time. Being does not see itself. Perhaps it listens to itself."' ³ In other words, *Five Wounds* rejects the notion of perspective by inviting the viewer to literally 'see through' the cathedral qua the Body of Christ, challenging both the act and the experience of spectatorship by choreographing the viewer through and around His body (Fig. 8). As soon as we walk inside the body of the Cathedral, we walk inside the body of Christ for at the same time we become part of the work and of His body. In Foucault's words, '[...] that space in which we are, and which we are'. ⁴ Clark constructs what Lefebvre calls a 'spatial code' or a 'system of space' and opens up views to another dimension, echoing Bachelard who asserted that 'miniature can accumulate size'. ⁵ Despite their miniature size of 2.236 inches, that is the square root of five—a number that is associated with the Golden Section which would have been incorporated into the cathedral's geometry by the medieval builders, and is also related to the human form—by using the whole cathedral as its 'canvas', *Five Wounds* could be seen as the largest art piece in the cathedral. The conceptual-perceptual recombinant space of *Five Wounds* expands outside of the canvas and by invading the territory of the cathedral it directs not only our eye but also our body outward. In so doing, it rejects the illusion of space that was so critical for the Renaissance artists who used the tool of foreshortening to make us imagine as though we could walk into the space of their paintings. In this respect, *Five Wounds* supports Bachelard's claim that 'inhabited space transcends geometrical space'. ⁶

Five Wounds adverts to mnemotechnics through the architectural system. Like Robert Fludd and Pythagoras, Clark believes that numbers are like keys that open the doors to hidden secrets. Drawn from Fludd's 'magico-religious Hermetic outlook' ⁷, his occult, theatre memory system (*Ars Memoriae*), and his 'square art (*ars quadrata*)' which uses images of corporeal things ⁸ and buildings or rooms as places, the square shape of each

panel of *Five Wounds* pertains to the wound as a portal that gives access to another dimension, to another space that is unknown and invisible. Clark segmented the body of Christ into five wounds, five panels, and affixed them to the fabric of the cathedral alluding to Fludd's five memory *loci* in his imaginary stage containing five entrances at its *frons scaenae* that give access to the heavens (Fig. 9). Fludd suggested that each door has a different colour so that they are distinguished in memory: the first door is to be white, the second red, the third green, the fourth blue and the fifth black.⁹ Likewise, on the reverse of each panel, Clark inscribed the title of each wound and also assigned them a vowel, which he colour-coded, following Arthur Rimbaud's synaesthetico-alchemical sequence in his sonnet *Vowels* that leads to the philosopher's gold, life's elixir, and whose early sonnet form relates to the Fibonacci sequence: A in black, E in white, I in red, U in green, and O in blue. In so doing, he poeticised the space of the cathedral to imply the poetic imagination that is indicative of the vision of God and the alchemical transmutation of the base materials into spiritual ones as a metaphor of *μετουσίωσις*—the conversion of the body and blood of Christ into bread and wine and vice versa (i.e. consubstantiation).

By segmenting the image of Christ and using His five wounds as building blocks, and by attributing His faceless image to His iconic wounds, the result is not a dismembered body but a *representation* of the *metaphysical* face and body of Christ. After all, it was the Five Holy Wounds that drew the pain upon Christ's Holy Face. Ultimately, headless and bodiless might seem, at first sight, *Five Wounds* conveys the presence of Christ's Holy Face, and despite its fragmented form, it pertains to unity. For Heidegger, '[b]ecause building produces locations, the joining of spaces of these locations necessarily brings with it space, as *spatium* and as *extensio*, into the thingly structure of the buildings.'¹⁰ To this end, the wounds act like a metaphysical extension to the body of the Church and a metaphysical prosthesis to the body of Christ. As the New Testament puts it: '[f] or as the body is one, and hath many members, and all the members of that one body, being many, are one body: so also is Christ. [...] For the body is not one member, but many.' (1 Corinthians, verse 12-14). According to the biblical understanding, it is we, the members of the Church, who is the physical representation of Christ, whilst the Church is the organism that keeps him alive. In this respect, *Five Wounds* revisits the common phrase 'the body of Christ' (1 Corinthians 12:46) that stands as a metaphor for the Church and in so doing it renews our engagement with the Life of Christ, in order to question human life after the death, and in relation to the absence/presence, of God.

If we assert that the cathedral is the pre-condition of the material existence of Christ, what, then, would *Five Wounds* be in relation to the cathedral and the ontological status of Christ? Is *Five Wounds* concerned with the materially or the mentally constructed (immaterial) existence of Christ? In answering these questions, one is to view the cathedral as a body without organs and one that, like Deleuze's, projects an ontology that oscillates between materialism and idealism, as Žižek asserted.¹¹ In other words, although 'God is Dead,' the body of Christ has *materialized* in His five wounds: the wounds are the *undead* autonomous partial object which represents the 'organ without body', not the other way around. Affirmative of the Church being the organism that keeps Christ alive, the five wounds create a dimension of a kind of a diabolical undeadness; they are undead, the living dead, something which remains alive even after it is dead, something that it is immortal in its own death, something that you cannot destroy, it goes on and persists, it has a life of its own.¹²

In the sacred poem 'On the Wounds of Our Crucified Lord', the metaphysical poet Richard Crashaw writes of Christ's wounds: 'O these wakeful wounds of thine! Are they mouths? Or are they eyes'.¹³ Clark follows from Crashaw who compared the wounds of the crucified Christ to mouths and eyes in that, like Crashaw, he *humanizes* them, anthropomorphizing the building of the cathedral. The difference, however, is that Crashaw makes us 'imagine' them, whereas Clark makes us 'experience' them. It is the rhetoric device of conceit that Clark is using here with the prioritization of the symbolic meaning and the spiritual characteristics of the body of Christ over the physical and material ones. *Five Wounds* suggests that, whilst His body dissolves, it symbolically leaves nothing but the wounds. But does this reaffirm that God *is* dead, or even, that he *literally* died? Are we to conceive of theology as a form of poetry in which the immanence of God could be experienced by means of transcendence? And, , from the postmodern viewpoint of weak theology, what is the ontological status of *Five Wounds* for those who reject the idea that God is a metaphysical force?

The term 'conceit' derives from *concept, to conceive*. It is for this reason that one could argue that, the space produced by *Five Wounds* is a *conceptual space*, that is, 'conceptual' in the metaphysical meaning of the term, serving as a *place for contemplation*, of some kind, and one that develops the physical sense of a metaphor. But are these 'imaginary ambiguities' of the spatial metaphors that Descartes sets out in homogeneous space, or do they belong to the heterogeneous space of Heidegger's topology? *Five Wounds* transcends the mental space (*cogito ergo sum*) and resonates with Heidegger's ontology that finds parallels between building, dwelling and thinking¹⁴ for at the same time it suggests that wandering within the building, and the improvisation that this might involve in terms of the route one chooses to follow, is a mode of thinking too. From this perspective, this conceptual space is not a two-dimensional seen space (as in painting) but a three-dimensional known space (as in installation) not meant to be looked at but to be lived within; it is a heterogeneous space in that it refers to a 'certain realm of extendedness in which a multiplicity of places, and so of entities, can be located.'¹⁵ To this end, it is a representational space in the way that Derrida thought of space as a metaphor that bridges the notion of the conceived with the lived space, reality with ideality.

The perplexing space-place dialectic is at stake here. Is this spatial language used as a process of space-making to question how art practices might encode new territories and construct systems of spatialization, or, perhaps, how they might reify, expand or repair our physical relation to space and place? The *architectural space* of the church is one thing, but the church's *place for worship* is another. What is our existential relation to the space and the place of the church in relation to our religious beliefs and Being-in-the-world? Isn't the place that has much more impact on human experience than space has? With these in mind, one could go as far as to interpret *Five Wounds* as a symptomatic response to the current notion of displacement: scattered across the space of Chichester Cathedral, the humanized wounds resonate in an era whose political climate is fuelled by migration crisis and cultural displacement. In this regard, one could argue, they ventriloquize one's experience of no fixed locality, becoming a *locus*, which sets one free, mobilized and capable to drift from and to places and to engage with religions other than his own. To this end, *Five Wounds* creates a place for contemplation in which to rethink the ontological function of the church qua the Body of Christ on the one hand, and as a *communio*, on the other, to point that the church should be a safe place for all. And as they do, they also try to bridge the religious-secular divide, to defend freedom of religious belief, and to repair the dehumanising

effect that the loss of place has upon humanity, one instituted by the binary thought of ecclesiology. *Five Wounds* turns the 'invisible' church into a 'visible' church by turning the spatial ontology of Chichester Cathedral into an ideal anthro-symbiotic-cosmology of the future.

IDENTIFICATION OF THE FAIENCE DECORATIVE SYSTEM IN THE PALACES OF THE OTTOMAN PERIOD IN ALGIERS AND INVENTORY

Abstract | The study of ornamentation is experiencing a great revival of interest within the scientific community. It is no longer a question of limiting oneself to the repertoires of motifs to feed stylistic grammars, but that it is advisable, on the contrary, to envisage ornamentation as a complex phenomenon going beyond mere aesthetic considerations. It is therefore interesting to take into account the role of ornament, by its place in the architectural work. A wide view was taken on the models of faience tiles imported in Algeria during the Ottoman era. Indeed, what dominates the architecture of this period is not only the decoration through the marble columns, the carved wooden doors, but also and especially this decoration in earthenware tiles at the level of patios, galleries and stairwells. The faience decoration is one of the heritage values to preserve and transmit to future generations, it represents the conservative aspect of the aesthetic value combined with an architectural heritage ensemble. This identification and the understanding of the composition logic of the tiles allow the correct reconstruction of this decorative system in restoration works but also the transmission of know-how useful for contemporary architecture.

Index terms | *Aesthetic, Decorative system, faience Tiles, Identification, Ornament, Role.*

INTRODUCTION

Mansions and palaces of Algiers's historical centre of the Ottoman period are considered to be the gems of the architectural production of this period, based on simple introverted forms, result of the configuration of an uneven plot plan of the vernacular urban fabric of the time. They are organized around a central courtyard which provides a calm and cool atmosphere in contrast with the heat and dazzle of the light outside.

The architectural art of this period was distinguished by the extreme richness of its architectural details, it is based on the symbolism, one of the main vectors of the architectural expression. This architecture is stripped of any superfluous element, where each component takes on its full meaning.

"Everything is planned in advance! It is a thoughtful architecture, completed to the smallest detail." (RAVEREAU 1989).

The Palace is characterized by its decorative system which is based on its valuable architectural elements, its wall and floor coverings, its openwork wooden balustrades ... Its completeness, the coherence of its design, the know-how, the work's testimony, are qualities that can be recognized by everyone.

“What moves in some works of art and not in others is something deeper and more complex than the value of a masterpiece, and which is perhaps the aesthetic value proper.” (TRICAUD 2010).

The composition of this Architecture is provided with a rich decoration stated by the following materials: enameled terracotta or earthenware, carved marble, wooden joinery, and carved or open stucco To be to reliably restore the heritage authenticity of palaces, the study of this decorative system is a necessity. The aim of this research is to study this decorative system through its components, particularly that of faience

Our interest was in the understanding and study of this aesthetic value of the faience decorative system, in the architectural composition of the palaces of Algiers of the Ottoman era.

For lack of archival documents, and the lack of mastery of this ancestral know-how of this decorative component, the treatment of this portion of the restoration of these buildings, remains unreliable and sometimes erroneous, even going as far as altering these palaces image and specific identity.

During the colonial period, after the demolition of the lower part of the historic center, tiles were recovered and placed in some restored homes. They were, in most cases, poorly arranged and their composition was reinterpreted, going so far as to imitate or supplement the representations in their own way, and not according to the original configuration.

These decorative elements have been delocalized from their original space, considered solely for their intrinsic value art objects, and not as part of a puzzle of a global, logically assembled artistic work [FIG1]. designed by someone and combined with its support that is the architectural work.

Despite being nationally and universally listed, and despite attempts to restore and protection, this site continues to suffer degradation of its built.

With the 98.04 law on heritage and its chapter III, the concept of protected sector was born and gave rise to the “PPSMVSS”, Permanent Plan of Safeguarding and Enhancement of the Saved Areas.

Among its concerns, the analysis of the architectural construction process that will help to understand the constructive and aesthetic processes throughout the history of this site.

The earthenware tile, its role and its order of presence

Ceramic is above all an eminently hygienic coating, it is suitable for hot countries. From the entrance appears a multitude of tiles. [FIG2].

“It was garnished around the galleries and rooms to a greater or lesser height, the doorway, the interior of the cabinets and even the walls of the stairs.” (MONTAGNE 1834).

The composition also describes thinner vertical strips of only two tiles wide, separating the arcs forming the inter-column, in the vertical extension of the columns, to mingle with the upper frieze.

The tiles run along the lower part of the walls, and frame the windows. In the staircase, the walls are also covered with half-height tiles and dress the counter-steps. The Ceramic tile pavement is the most visible decorative repertoire, not only because of its abundance, its different colors, but also because of the choice of its locations.

Identification of models of faience tiles in Algiers and their origins

The faience tiles generally produced between the sixteenth and nineteenth centuries include several models that, when arranged, can give one or more botanically inspired motifs for the majority of the models, but rarely geometric.

This reference to plants can be found on earthenware tiles as well as on marble and carved wooden palates. The colors that dominate are, the blue that symbolizes wisdom and serenity, the yellow that is the color of the sun and the green color that is most present in nature. These colors and floral motifs represent nature, absent in this historic center. We find the principle of introversion, from the simplest house to the palace.

The dimensions of the earthenware tiles vary between 9cm and 13.5cm for the tiles of the wall coverings, and from 15cm to 20cm for the floor tiles. [FIG3].

According to the works consulted by some authors, all tiles are not produced locally, but have various origins. They come from mainly from Spain, Tunisia, Italy and Holland, where the know-how and manufacture of this product has reached its apotheosis.

“The various travelers who described Algiers during the Ottoman era make no mention of the existence of ceramics workshops. Certainly, brickworks, pottery factories, tiles and clay water pipes existed very close to Bab El-Oued, but we do not know for sure whether these manufactures made tiles” (AISSAOUI 2007).

This production, supposing it existed, was to be rather weak and not sufficient to decorate all the houses and palaces of Algiers and its provinces.

We also note a strong presence of imported tiles from Spain, Italy, and the Netherlands, cited by many authors from the eighteenth century. Venture Paradis, who lived in Algiers between 1788 and 1790, describes their origin as being Tunisian and Hispanic. In 1927, Georges Marçais also mentions Tunis, but also Italy, Spain, the Netherlands (Delft), as locations for suppliers of ceramic tiles for the constructions in Algiers. In the publication of 1930, Broussaud presented the drawings of the Algerian tiles produced according to him initially in Italy and Delft, then in France and Spain.

For Jean-Couranjou, a specialist in earthenware tiles in Algeria, the Hispanic tiles of Catalan and Valencia, are the most abundant.

The faience tiles fit perfectly with the Algerian architecture of the Ottoman period. They are found in frieze or bandeau, in base of the vertical walls, and in frame of the windows, the whole forming a harmonious formal unit, between architectonic elements and this set of tiles of earthenware, through a will of reflection in the composition [FIG4]; “Everything is planned in advance; it is a thoughtful architecture, completed to the smallest detail” (RAVEREAU 1989).

In this type of architecture, the cutting of tiles is a prohibited thing. The implementation of these is conditioned by respect for the formal unity of their representations, which imposes a finite pattern. Faience is present in integer numbers.

The entrecolonnement, window frames and wall plinths are not selected solely from an apparatus of the masonry, but also for the arrangement of a ceramic decorative system in integer numbers without any cutting,

The identification of earthenware tiles, through surveys, allowed us to draw tables by period, from the 16th to the 19th century. Each table presents different models of tiles of the same period, specifying for each model, its typology, dimensions, and mode of arrangement. [FIG6].

These tables allowed us not only to list the different models, but also to identify through them the period of production of the models of tiles used in the decoration of the different palaces and residences of Algiers, to confirm or not, the authenticity of the existing tiles in the palaces compared to the period of construction of the latter, and in doing so their dating. [FIG7]. The oldest models of earthenware tiles found in the Algiers are from the early sixteenth century.

CONCLUSION

Preserving our heritage, its development, remains a delicate and complex mission that must appeal to different expertises.

Any restoration project of a historical monument must respect its authenticity from a decorative point of view, while considering the latter as a complex phenomenon going beyond mere aesthetic considerations, and not as a formal decoration devoid of meaning. The decorative system is an integral part of the architecture that contains it.

This study may contribute to the restoration of the palaces of the historical center of Algiers regarding faience decoration, guaranteeing the integrity of their aesthetic representation mode. This decorative component, remains essential and necessary for understanding our heritage, a skill to transmit to future generations.

IS THIS BUILT? THE LABILE LIMIT BETWEEN ARCHITECTURAL PHOTOGRAPHY AND RENDERING, A NEW AESTHETIC

Abstract | Nowadays, as a result of a global process, architecture is being communicated mostly by images in a global trend that even for architectural competitions ask to the architects for images in order to evaluate the project more than for drawings or traditional models. Architectural photography and its relationship with architecture itself has been long and deep studied, but the academy is still reticent to admit that there is a different kind of architectural images, those that are produced in a synthetic way, so called rendering, that are strongly influencing the aesthetics of architectural photography, and so, of our aesthetical concept of architecture.

We have studied the generation and composition of architectural renders since its origins, focusing in how the evolution of different softwares has led to produce both more realistic renders and to manipulate digital photography beyond limits we didn't expect.

Nowadays, it's hard for us to distinguish an architectural render from photography. At the basis of this confusion there is not only an improvement of the realistic possibilities of the 3d rendering engines that tend to reproduce reality, but also the post-production and the framing of the architectural photographs, which are coming together into a new aesthetic, hybrid between natural and synthetic effects of the light. In our research we analyse the publications of several architectural magazines and competitions both from an artistic and composition perspective but also from a technical point of view of its creation and we confront it with the work of the most outstanding architectural photographers of our time. We also make a deep study of the most recent artistic practices which put at the centre of its research and message the actual panorama of architecture. It seems very clear that there is a sort of contamination between disciplines, rendering, photography, and architecture and that this mix has a characteristic aesthetic that plays in an undefined ground between the imagination and the reality, between photography and rendering.

Index terms | *architectural competitions, architectural magazines, architectural photography, image postproduction, rendering.*

INTRODUCTION

By *rendering* we mean the graphic rendering (or restitution), resulting in applying the equations that simulate light to a three-dimensional model. So that basically, it is an image generated from a mathematical description of a three-dimensional scene interpreted by algorithms that define the color of each point of the digital image. Thus we obtain a raster image.

Therefore, we must first clarify that we are not directly dealing with the architecture designed in 3D, but with its derivative in the form of a two-dimensional image. Also it is important to specify, that sometimes, these architectures have been designed in the “traditional” form, that is, re-proposing existing types and using design elements that do not use the most advanced calculation and generation techniques, but which are then transported to a three-dimensional ambience, where the designer rises, extrudes, etc. the plants and the elevations, to model a three-dimensional scene aimed only to obtaining then a two-dimensional digital image of this building, as needed in most of the real estate products.

As the art critic Luca Panaro points out in his article “Arte in 3d” (Panaro, 2013) we must not therefore confuse the three-dimensional modelling, with its “still”, the rendering image. Therefore, the research we are presenting here will deal with the change of paradigm that supposed the introduction of the computer in the architectural studio, as regards the design phase of the project, but since this is not the focus of the paper we will just underline the highlines necessary to understand that a new way of designing brought a new way of representing.

Although architecture rendering is today a fundamental tool for the representation and communication of architecture, unlike what happened on photography, there are no comprehensive studies to analyse its history and evolution from a historical-critical point of view.

THE HISTORY OF RENDERING

We can find in some essays, and references to the evolution of the software that allows us to create renderings, among which we can name *Handbook of Digital Image Synthesis. Scientific foundations of rendering* by Vincent Pergoraro (Pergoraro, 2016) or Dan Ryan’s *History of Computer Graphics* (Ryan 2011) that analyse rendering from a rather technical point of view referring to the techniques that make it possible and do not deal with its configuration as a new and unique language within the architecture.

It is therefore difficult to establish a true origin of its use for the representation and communication of architecture. On the other hand, there are not a few critical voices¹ with this way of representing architecture, which, given its technical complexity, is often confined to graphic artists outside their architectural studies. The criticisms, however, come especially from those who still do not understand that it is not the only image with its potential to have ‘good or bad’ intentions or to produce architecture disconnected from reality. We need to integrate the image of architecture in today’s context, defined by Marc Augé, Lipovetsky or Nicole Aubert as *hypermodern*, where the culture of the image has near the top, “making images and screens”.

Therefore, the hypothetical abuse of the image of contemporary architecture is not a direct consequence of the existence of rendering or digital photography, they were not the only tools we use to produce this overabundance of image, but we must understand and assume that architecture is a discipline with a high visual component, and not only that, consequently, is part of what happens in the image world.

At this point we can try to shortly make a brief history of the architectural rendering. Mario Carpo (Carpo 2015), places this origin in “some” moment of the beginning of the 90s, when the digital design and industrial production tools began to inspire new theories about design and the architects and theorists began to think that we could design and

build something digitally again with an unprecedented form. The theorist of software history, Lev Manovich, points out in his book *Software takes command* (Manovich xxxx) that the work with 3D animation software has conditioned the architectural imagination from both a metaphorical and a literal point of view. The forms that began to appear in the projects of young architects and architecture students during the second half of the 1990s seemed to be in the process of animation, which would capture them while they were changing from one state to another. Project presentations and architectural research have begun to include variables generated with parametric software. We can report projects such as Gregg Lynn's New York Metropolitan Transportation Authority (1994), generated by a cloud of points and moving them into space to meet a number of restrictions, Lynn captured these movements and has turned into curves that make up his building proposal"².

A NEW AESTHETIC FOR ARCHITECTURAL REPRESENTATION

The diffusion of the use of computers in architectural studies and also the revolution in the way of designing the most important ones, or as others have defined it, a paradigm shift in architectural design coincides with the image "velvet revolution" defined by Lev Manovich. With this term, the author refers to the transformations occurred in the aesthetics of moving images approximately between 1993 and 1999.

Manovich tells us about the fact that in 1986 the "computerized memory banks" had a very limited storage capacity and a prohibitive price, so the designers could not cut or paste different image sources quickly and easily. Even when they managed to accumulate several visual references, they could only place them side by side or one on top of the other. They could not modulate these juxtapositions by precisely adjusting the transparency levels of each image. In other words, the lack of transparency limited the number of different image sources that can be integrated into a single composition.

The change that took place during this "velvet revolution" was the new ability to combine different levels of images with different degrees of transparency through digital composition.

As Fontcuberta says regarding the aesthetics of photography (Fontcuberta, 2002), we should think about the line of thinking supported by Newhall and Szarkowski, according to whom, the aesthetic discourse is basically a consequence of technological evolution even if most photographers aren't aware of it. He wrote this text in 2002, pointing out that in that moment they were witnessing a true aesthetic rupture in the photographic field.

This fact becomes fundamental for architecture rendering, which at the time begins to be strongly postproduced in programs for the treatment of raster images after its realization with rendering engines. Here we begin a process of hybridization with the digital photographic image, which precisely in these years began to open its way among the architectural photographers.

To post produce rendering with programs designed for photo editing allows to work with different levels of transparency led to a new figure of representation. And here we can situate the birth of a certain type of language characteristic of this compositional technique, which, as we shall see, in many of its strands, architecture photography tries to replicate.

These reflections are therefore extremely important for our analysis. From here we can start by stating that today, about 20 years later from this “revolution”, the architectural render has become for many reasons, the favourite form to represent future architectures. However, it has acquired its own language, which does not always try to resemble a realistic photograph as much as possible. As Stan Allen (Allen 1998) pointed regarding representation through rendering, we find in his work a first definition of “what it means to render in architecture”, and, more importantly, a first reflection on its limits:

“The premise here is that if computer technology can create more and more realistic simulations (photographically realistic renderings, simulated “walk throughs” or “fly throughs” of proposed buildings) design mistakes will be avoided. What is left unaccounted for here is the fact that the reality simulated is entirely mediated through the visual conventions of already existing media, primarily cinema and photography. A rendering of a building is deemed successful if it looks sufficiently like a photograph of a building” (Allen, 1998).

The author introduces us to the fact that, rendering, is, in effect, a sort of “synthetic photograph” of the scene, created and composed under the photographic rules. And here precisely where it enters our full research, because not only architecture and rendering photography are treated at the end with the same tools, but also already in its generation, starting from similar assumptions, from the fact that to “make” the virtual world, it has been chosen by programmers to offer the user the possibility to navigate on interfaces that represent the menu of a normal photographic camera.

“Us move toward the conventions of realism is also evident in another aspect of the day-to-day use of the computer in the design studio. CAD programs have facilitated two important shifts in design practice that have yet to be examined critically. First is the renewed use of perspectives, which once had to be laboriously hand drawn, but can now be effortlessly generated. Second is the use of color. Color in the computer is either extravagantly false or attempts to simulate photographic representations through sophisticated rendering programs incorporating reflection, transparency, or texture mapping. In both cases, the ease of achieving seductive effects has as yet overwhelmed any impulse to question the relationship between the means of representation and its architectural instrumentality” (Allen, 1998).

In this case, Allen highlighted two of the problems that still today present architecture renders, especially those created by those who have a poorer technique, which are the difficult election of the right perspective to present a building, due to the extreme ease with which we can move the camera in the three-dimensional model, not conditioned by any physical limitation, unlike the real one. Then opens the great debate on colour, which as we will see, becomes a figure of rendering, for the complexity of faithfully reproducing the real ones, and that will then become an aesthetic figure of the same renderings, sometimes adopted by architectural photography.

IS THIS BUILT?

We refer to the choices of certain well-known architectural studios, such as Snohetta, MVRDV, OMA, and many others, who present images of his future architectures with computer graphic languages that do not tend to photorealism but rather to openly declare their digital origin, and which have greatly influenced today’s architectural photography.

We can see as an example both the renderings and the later photographs of the project of a Highway in Seoul made by the Dutch studio MVDRV. It is at least surprising to see how the final images from the photographer Ossip van Duivenbode (2017) add up to the contest project renderings (2015) not only in the frame cutting but above all in the lighting and the surface treatment, so, the applied postproduction, seems to bring them back to the state again rendering state. This fact shows us, that there is a new aesthetic figure for the communication of architecture that is directly influenced by the rendering. We can find many other examples in contemporary architecture photography. We can also name several examples of this phenomena like the aerial photographs of the Lego House in Billun, Denmark, taken by the famous architectural photographer Iwan Baan, so similar to the original renders of the Bark Ingels studio BIG.

On the other hand, we can name the work of important artist (most of them with an architectural background) whose work is based in this undefined space between rendering and photography like Philipp Schaerer, Filip Dujardin, Josef Schulz, Dionisio González, Olivo Barbieri, Xavier Delory Espen Dietrichson, Víctor Enrich... that use this situation to trigger a reflection on some of the main themes of contemporary architecture.

A FINAL CONSIDERATION

Finally, we believe it is important to underline that if from a visual point of view the difference between rendering and digital photography becomes more and more subtle, the differences remain substantial for what concerns the procedural side. In fact, if the photograph is the result of a separation action, the render derives from a purely additive operation.

With photography, matter is removed, with the render added. Let's explain better: the photographic operation, analogical or digital, is based on the frame and then choose what is beautiful, important and worthy of being "framed" and on cutting out, to exclude eliminating all the rest. The shot is a process of elimination, it is "to cut away", the part of the world that does not interest is eliminated to concentrate the photographic act on what is considered important. Like the sculptor who removes from a block of marble what is in excess to pull out the form that is hidden in it, so the photographer eliminates what is not needed to extract the form that is hidden in the real world.

To make a render, you work in the opposite way. We add matter, we start from an empty space, virtual but rigidly three-dimensional and Cartesian, and we act by adding matter. Fictitious matter, made of complex geometries but at the end always referable to a mesh, that is to a set of triangles. The act of rendering is an act of addition. We work by addition, not by subtraction, adding faces, edges, vertices. Like the sculptor who works with the clay, matter is added, and parts are modeled, and the shape is obtained by adding piece by piece. Do not deceive the fact that we must then, of this model, make a photo \ render. The action of rendering is certainly photographic. As mentioned here, the act of rendering provides that a frame is made and that there is a virtual camera within the software with settings that are completely analogous to those of real cameras. However, we said, during this operation of virtual photography, due to the fact that the additive nature of the process remains prevalent, the framing

does not cut off a part of the world, as in the case of the photograph of reality, simply because this world does not exist, and it hasn't been created. The object navigates in an empty space and is framed with the simple intent of exposing what we could define its best side.

To conclude, we can argue that it is true that the render uses and shares with photography the same language and a substantial part of operations, to the point that the boundary between one and the other becomes every moment more labile and difficult to define but it is also true that the nature of the two operations, photos and renderings, is profoundly different, the additive and the subtractive, like a Ying and a Yang that complement and confuse each other.

FROM BIG MAC AND IKEA SOCIETY TO THE ENVIRONMENTAL AESTHETICS, SMART CITIES AND STORYTELLING ARCHITECTURE

Abstract | Today our global society is encountering the different challenges of 21st century. Our cities are in processes of constant transformation influenced by urbanization, globalization, advanced technologies, environmental and ecological changes, social, political and economic crises. While corporative capitalism is leading, world population is growing and our cities are sprawling, architecture is reaching almost utopian visions and the boundaries of aesthetics are becoming more and more loose and permeable.

The aestheticization of everyday life is phenomenon that started with the rapid progress of technology, science, industry and production at the beginning of 20th century. Today our contemporary society lives and acts aesthetically. From art, architecture, music, religion, politics, social communication, technological gadgets, homes, gardens, clothes, cuisine to sport and life coaching, everything is a subject of aesthetical consideration.

Descartes' *cogito ergo sum* basically determines our epoch of technology and interconnections. Everything is in the arms of global economy and politics. The individuals in this technologically superconnected world are connected to each other more than ever, but emotionally are extremely distant.

Aesthetical perception of architecture and urbanism in constantly changing world demands critical and interactive approaches, that will not only deal with theoretical aesthetic opinions, but also the practical ones. According to that, this paper seeks to discuss aesthetical problems of contemporary architecture and urban planning from global, environmental, technological and social points of view.

Through this study aesthetics of architecture is recognized as *Storytelling Architecture* that could be read through various transcultural and transnational stereotypes all over the world. Analyzing achievements of contemporary architecture and urban planning, the research focus is on a different aesthetic values, such as: expressivity, new structures, advanced technologies, changeability, new materials, intelligence, sustainability, exuberance, grotesque, disappearance of form, digitality, universality, allegory, symbolism, fantasy, utopianism, hybridity, metamorphosis, etc.

This study also aesthetically examines the Smart City concept and global urban policies based on advanced technologies and communications, economic, social and environmental sustainability and underline contradictions between technological innovations and environmental and ecological aesthetics positions. Nature is no longer seen as a paradigmatic object of aesthetic experience, but as our unique collective environment upon which we humans depend. Therefore architecture emerges and aesthetic approaches in order to reconsider burden of our cities and possible ways of their future development.

Index terms | *Environmental Aesthetics; Storytelling Architecture; Globalism; Sustainability; Advanced Technologies; Smart Urbanism; Intelligent Architecture; Beauty of grotesque.*

INTRODUCTION

Almost two centuries ago, a famous Danish philosopher and the progenitor of contemporary existentialism, Søren Kierkegaard, argued that the aesthetic stage of man's development should be exceeded by the ethical, and then the religious.¹ Nowadays this Kierkegaard's idea has turned upside down. The aesthetic has become the highest principle of life and the essential place of human emancipation in society. By problematizing the boundaries of philosophical and artistic thinking, aesthetics has expanded to almost all aspects of human life in modern global society. While the aesthetic field of art has reached the level of amateurism, architecture retains the integrity of the aesthetic based primarily on advanced technologies and the progressive improvement of new techniques in design and construction of architectural projects. Current architectural trends such as: intelligent architecture, smart cities, experimental architectural practices, digital architecture, architecture of exuberance, global architecture and planning, etc. are based on their aesthetic and technical achievements in various BIM (Building Information Modeling) softwares, robotics, artificial intelligence and nanotechnologies. New materials and increasingly perfect building techniques support the most extreme architectural ideas. Therefore, one of the main goals of architecture in its aesthetic domain today is to make things special. This specific aesthetic, political, economic and cultural necessity of architecture for attractiveness, establishes its ethical antithesis in the form of environmentalism, ecology, sustainable development, requirements for the protection and preservation of the environment and the conservation of energy and natural resources. What seems much more urgent to us today and is the main future long-term goal of the entire humanity is not related to the most astonishing technological wonders of architecture, but precisely to the environmentalistic goals that architecture can fulfill in terms of aesthetics, but above all ethics. In today's time of Kierkegaardian existentialist anxiety and concern at all levels, the ethical and aesthetic spheres of architecture must work together. In its philosophical, ethical, aesthetic, cultural, sociological and anthropological essence, the architecture of the 21st century should strive to harmonize the relationships of people with their natural and social environment. Although the philanthropic and environmentalistic demands of architecture aesthetics may sound like pure utopia due to our awareness of the power of the global political-economic goals of neoliberal capitalism, architecture in some cases retains its ethical-aesthetic autonomy and manages to resist the prevailing waves of general globalism.

GLOBALISM AND STORYTELLING ARCHITECTURE

The global network of politically and financially powerful participants regulates the entire world market, economy, politics, resources, environmental goals, the world of media and information through state-of-the-art technology. Today's world cities are distinguished by the Western consumer culture, which is the result of cultural and economic imperialism, above all the dominance of American influence around the world. Simulacra of power concentrated in global influencers such as the American McDonald's or Swedish IKEA create values, habits, standards, life style and the whole aesthetics which is implemented globally. A similar situation occurs in architecture, which adopts transcultural features under the influence of cultural globalization. The transfer of global influences to local architectures has been increasing since the time of the Renaissance and the first geographical discoveries. By affirming the architecture of modernism throughout the twentieth century, the globalist character that architecture has retained to date was achieved. The German Bauhaus (1919-1933), the first modern

architecture school whose centenary is celebrated this year, played the key role in the globalization acceptance of modernism. Through the integration of theory and practice, combining art and craft with modern technologies, Bauhaus revolutionized architecture, design and art. The modernist globalism of architecture accomplished its rise before the Second World War, and after the war, with the emigration of the leading modernist architects to the United States, modernity as *International Style* got its confirmation all over the world.²

The fundament of the aesthetic revolution of architecture realized by modernism was in innovative technologies of construction and new materials (cast and reinforced concrete, glass and steel), which led to a radical change in the shape and form of architecture. Today, with increasingly perfect performance of new materials and construction techniques, the main revolution in architecture takes place at a speculative and scientific-epistemological level, from the moment when architects replaced hand drawing with CAAD (*Computer-aided architectural design*). Since the 1980s, entering the era of computer technology, the methodology of designing has completely changed, as well as the realization of architecture in practice. In the past, the most vivid representations of the architectural work were made up of models and drafting axonometric drawings, and today digital 3D architectural models, in addition to being visually convincing, have a direct correlation with engineering software, which allows information from computer 3D models to be directly used in the construction and building of architecture.

The aesthetics of architecture, in addition to its speculative-philosophical side, is largely related to the issues of technical and technological development of architecture. The general globalization of the world, even the world architecture, evolves through technologies that carry out the diffusion of homogenized ideas. Today, in the architecture world, it is no longer about superstar architects (Zaha Hadid, Rem Koolhaas, Norman Foster, Peter Eisenman, Frank O. Gehry, Santiago Calatrava, Daniel Libeskind, Jean Nouvel, Renzo Piano, Massimiliano Fuksas, etc.) - the main transmitters of globalism are large multinational engineering and architectural companies that provide a wide range of services (architectural design, urban planning, engineering, landscape architectural design, consulting, construction, management, etc.), employ over 1000 people, have their offices and conduct projects all over the world.³ Therefore, architecture is the leading asset in the hands of world capital. The prestige and influence of global participants in neoliberal corporate capitalism opens through the most current markets for architecture, economics and tourism concentrated in the Middle East, Asian and Arab countries.⁴

The pure, simple, "less is more" aesthetics of modernism, the philosophical and anthropological concern of postmodernism and the metaphysical game of deconstructivism, are all behind us. The architecture of the 21st century has turned to the "new Baroque" in view of the many crowded forms and shapes, and in terms of celebrating the power of their global patrons. In the domain of aesthetic experience, today's architecture should cause the climax, catharsis, and initiate the general exaltation of all senses. The real example of this architecture are buildings that arise in Dubai at an enormous speed, racing in height, luxury and extravagance.⁵ (Figure 1) And not only in Dubai, but from the general position of today's architecture - architects turn to expression, fantasy, imaginary, the unusual and often the allogical. New technologies open up new horizons of aesthetics of architecture. In addition to globalist architecture whose aesthetics works in the service of the capitalist ideology

of progress, the sphere of digital architecture provides opportunities for autonomous, independent multimedia practices that experiment with architecture and art.⁶ These small “intimate” architectures represent a kind of *storytelling architecture* - they are publicly exposed, in contrast to the rules of business, marketing and politics, and their global impact is transmitted through the Internet portals and social networks.

The scope of meaning of the term *storytelling architecture* can relate to multiple levels of meaning. In its broadest sense, *storytelling architecture* relates to the general meaning of *storytelling* as a social and cultural activity of conveying the oral heritage of a community. As architecture is one of the reflection of the culture of a nation or community of people, the narratives that architecture transmits can move from historical, metaphorical, symbolic, educational, ethical, ideological, political, mythical, folklore, ethnological, anthropological, etc. Architecture is a visual memory transmitter, and in its archetypal domain, storytelling architecture may be understood as the precursor of writing. The constructed structures as a “recorded” oral story in the medium of architecture through their duration in time constantly achieve new emancipation through which they extend their meanings. In the broadest sense, storytelling architecture acts as a document in time and history, or might involve avant-garde aesthetic practices of experimentation in the media of architecture and art. Within the framework of architectural profession, the term *storytelling architecture* is most often used in connection with different ways and techniques of presentation and explanation of the architectural project to the audience, clients and investors who are usually not from the world of architecture. Today there are numerous resources and media that enable the most efficient explanation of the project (sketches, diagrams, models, computer 3D renderings, films). The most effective architectural storytelling tools are certainly digital softwares, which allow architects to present the scenario of their project more convincingly in order to sell it better on the market. Storytelling architecture is one of the most important stages of the project, with architecture gaining the role of narration and expanding the field of its aesthetic action that includes a new philosophical, psychological, social-behavioral, marketing and cultural level of the narrative development of architecture through the scenario compiled by the architect and his working team. The storytelling phase of the architecture becomes a place of architecture meeting with other arts, music, theater, literature and various multimedia approaches.

ARCHITECTURE IN THE CONTEXT OF ENVIRONMENTAL AESTHETICS

Today’s beliefs about the fragility of nature and the critical consequences of human activity, primarily urbanization and pollution of the environment which we live in, have contributed to an increasing awareness of the importance of conserving nature and its resources. Therefore, many sciences develop their research in accordance with the principles of environmentalism. One of the relatively young branches of aesthetics development is environmental aesthetics, based on the principles of sustainability and appreciation of natural, human and human-influenced environments. Environmental aesthetics explores the aesthetic positions of balancing relationships between people and their environment (both natural and human), through exploitation of resources and technological development that does not disturb the natural, sociological and economic system. Environmental aesthetics is especially developed in the area of Anglo-American aesthetics and analytical traditions. Although the main theme of environmental aesthetics is the natural environment, the importance of aesthetics of built environment, aesthetics of social environment, and the aesthetics of everyday life

has increased lately.⁷

The ideas that environmental aesthetics deals with can be traced through the history of aesthetics from the age of antiquity to the present. After the founding of aesthetics as an independent discipline in the second half of the 18th century, the aesthetics of nature was considered, which was a progenitor of environmental aesthetics. During the 18th and 19th century, Kant's *concept of disinterestedness* was especially developed when it comes to aesthetic appreciation of nature. However, with the focus of aesthetics on art issues in the 20th century, aesthetics as a discipline became almost equal to the philosophy of art. After the emergence of environmental and ecology movement and the awakening of general conscience of protecting the environment, after the 1970's there was a particular interest of aestheticians and philosophers for environmental aesthetics that emphasized the importance of aesthetic considerations of nature, and shifted the focus of aesthetics from art into the domain of nature and the general environment. At the beginning of the 21st century, environmental aesthetics covers the study of the aesthetic significance of almost everything other than art.⁸ The research domain of environmental aesthetics highlights the need for restructuring the theory of aesthetics in line with the various circumstances and applications beyond the art world.⁹ Therefore, environmentalist aesthetics represents one of the most important challenges of today's aesthetics.

Architecture occupies large quantities of environment, and the unstoppable rise of urban environment at the expense of the natural environment points to the great importance that aesthetics of architecture can accomplish as one of the branches of environmental aesthetics. Modern architecture stresses the appreciation, preservation, restoration, maintenance, improvement and conservation of all environments - natural, urban and social as one of the most current conditions of its ethical, aesthetic and humanistic achievement.

Architecture is most often defined as the art of space modeling or the art of volume modeling. Architecture determines the environmental space in terms of interior and exterior. In contrast to the Euclidean space, a space that "closes" and "opens" with architecture is possible to perceive by one's body senses. Corporal perception of architecture in various cases may include the synthesis of visual, audio, tactile or smell sensory experiences that are involved in the construction of a specific atmosphere that a particular architectural work or set of works expresses. As receptors of the environment, space or architecture we are limited by our corporal space which is related to our sensory and cognitive abilities. Although the environmental aesthetics in terms of its themes dissociates itself from aesthetics of art, the environmental aesthetics of architecture raises the issues related to architecture from the position of art. In addition to this, the environmentalist aesthetics of architecture represents an extensive field of research, since it is intertwined by social, cultural, artistic, economic, ideological, ecological factors that emphasize the most important fact of an environmental approach: neither natural nor human and human-influenced environments exist separately, but they are in a mutual relationship and coexist as such. This leads to a general conclusion about the impossibility of self-establishment of environmental aesthetics, since it arises and connects with various fields of research, primarily with ecology, philosophy, psychology, anthropology, cultural studies, geography, architecture, urban design, environmental design, and ultimately art.¹⁰

The article *Contemporary Aesthetics and the Neglect of Natural Beauty* written by a Scottish philosopher Ronald W. Hepburn was crucial for the development of environmental aesthetics, since it advocated the view that, within aesthetics as a philosophical discipline, the difference between aesthetic appreciation of nature and art should not lead to neglecting the study of nature in aesthetics.¹¹ To this end, Hepburn claimed that the prevailing orientation of aesthetics to topics in the field of philosophy of art leads to a partial and incomplete consideration of the problems aesthetics as a philosophical discipline deals with. Hepburn's renewal of interest in the aesthetics of nature, examined through a complex interplay of emotions, imagination and thought, provided the basis for new views and foundations of environmental aesthetics, which were further elaborated by Allen Carlson, Stan Godlovich, Noel Carroll, Emily Brady, and others. Environmental aesthetician Arnold Berleant believes that the aesthetic experience begins with the perception of the environment, either natural or humanly modified, and continues to art.¹² Berleant develops an idea of aesthetic engagement, and considers that environmental perception is in the quality of engagement of our senses in perception, that is, participation in environmental experience. Finnish aesthetician Yrjö Sepänmaa expands the notion of environmentalist aesthetics beyond nature to the field of art and contextuality.¹³

One of the aspects of the environmentalist approach to the aesthetics of architecture is biophilic architecture. A man nowadays spend most of his time indoors, and therefore feels a lack of biophilic activities.¹⁴ For that reason, man tries to connect in different ways with nature and living systems, and architecture is one of those ways. The lack of time spent by humans in nature, ecosystem degradation and fast urbanization direct the urban aesthetics of architecture to focusing on the development of smart cities, which are biophilic cities with the increase of green spaces in and around cities.¹⁵ Therefore, biourbanism focuses on the urban organism, as a hypercomplex system in which internal and external dynamics exist, as well as their mutual interconnections. The city is viewed as a system of perceptive information that we receive from the environment.

As mentioned above, apart from the visual experience, the perception of the architectural environment can include various interactive aesthetic experiences caused by smells, tastes, emotions, music, sounds, light, etc. In other words, architecture is able to form a specific aesthetics of the atmosphere. German philosopher Gernot Böhme, who approaches environmentalist aesthetics from the point of ecocriticism, considers the relationship between culture and environment.¹⁶ Böhme establishes the notion of the *aesthetics of atmosphere*, through which he restores Baumgarten's founding of aesthetics as a science of sensibility.¹⁷ Böhme's aesthetics of atmosphere represents a new approach to aesthetics, in contrast to the classical aesthetics from Kant to Adorno, which was primarily the aesthetics of judgment and mainly related to the theory of the work of art. It is, on the other hand, a reference to the questions raised by aesthetics at the beginning of the 18th century when it was defined by Alexander Gottlieb Baumgarten. From this perspective, Böhme's aesthetics of atmosphere is above all a theory of sensory experience. It is not only aesthetics of reception, it is also related to the production of atmosphere. Böhme's term "the ecstasies of things" is based on the theory of atmosphere. Things are characterized by their qualities and the qualities are those that distinguish them from other things, and the term "ecstasies" refers to the way things affect the space, or how they emanate in space.¹⁸

The term atmosphere originates from metrology and signifies the pregnant upper layer of air. It is not until the 18th century that this term began to be used in a metaphorical meaning, primarily for states which are “in the air” in the sense of emotional space description.¹⁹ The term atmosphere today is very widespread in the various contexts of physical-material, socio-cultural, psychological, historical-temporal and aesthetic determinations. In terms of architecture, the aesthetics of atmosphere in its basis implies an emotional perception of contemplative and real space, hence it is reduced to the “emotional climate” that prevails inside and outside an architectural part or urbanistic entity. The new perspective provided by the aesthetics of atmosphere in the aesthetic consideration of architecture focuses on intersubjectivity as a form of general and synergistic aesthetic communication. In this sense, the aesthetic experience provided by architecture is not only individually subjective, it also possesses a much more complex intersubjective character. This intersubjective level of aesthetic communication of the environment created by architecture reaches the unambiguous level of visual perception of architecture and enriches it with ethical, sociological, psychological and semiological values. In this regard, the important issue of contemporary aesthetics of architecture is particularly emphasized: How do the atmospheres produced by some architectural or urban space perceive and cognitively connect with contents that are not explicitly given through the physical characteristics of architecture? We may conclude that the atmosphere created by architecture causes us to feel and imagine what is impalpable, the ideas and impressions that our mind, unconsciously, intuitively and emotionally realizes as a whole aesthetic experience inspired by architecture.

According to Böhme’s view, the atmosphere represents a typical phenomenon that is in between, something between subject and object.²⁰ This intangibility makes the atmosphere even more complicated and interesting concept for research. Creating the atmosphere by architecture implies material conditions, things, instruments, colors, lights effects, music and sound effects, while the atmosphere itself is not a thing, it is between the object and sensory perception of subjects. Therefore, creating an atmosphere implies arrangement of the conditions under which the atmosphere can be achieved. Architectural work affects space on multiple levels with its formal characteristics (mass, volumes, surfaces, symmetry, asymmetry, rhythm, relation between the full and the empty, style, etc.), but also through informal aspects: music, scents, sounds, movements and people’s presence in the architectural environment. The atmosphere in architecture is created through a complex relation of the object (formal and informal characteristics of architecture) and the subject (audience, users) that makes the perception and is brought into a certain emotional state. Therefore, the atmosphere expresses the character of architecture that is recognized through various aesthetic qualities, for instance lovely, strict, elegant, melancholic, grotesque, delicate, cheerful, witty architecture. We can conclude that the aesthetics of the atmosphere in the context of architecture can become a significant building element of architecture that is not material in nature, such as stone, glass or concrete, but is created and developed in a philosophical, aesthetic, sociological, psychological, and cultural collaboration of architectural or urban creation and users.

THE BEAUTY OF GROTESQUE

One of the specific ways of creating an atmosphere by architecture is revealed by the aesthetic field of grotesque that can be recognized in contemporary architecture at different practical and theoretical levels. The grotesque acts on a specific aesthetic

level, and in architecture we can mark every form of opposition to generally accepted norms and values as grotesque. The grotesque is an particularly aesthetic term and is based on the expression, structure, style and method of creating an architectural work. The term grotesque originates from the Italian word *grottesco* (*grotta-cave*), emerging at the end of the 15th century as a mark of the then-painted monumental animal-plant metamorphosis of late antique Roman ornamentation that decorated the walls of the Roman Thermae. Since its creation, the grotesque signifies a caricature-fantastic or distorted, unnatural display of reality that causes feelings of horror, fear, and it borders with the irony.²¹ The aesthetics of grotesque in contemporary architecture is most prominent in digital architecture, hyperbolic exuberance architecture of globalist landmarks, but also in avant-garde experimental architecture. The specific discourse of the grotesque in architecture is reflected through expression, surreal, alogical, hyperreal, transaesthetic, and absurd. Grotesque architecture is dynamic, multi-significant, it plays with meaning and problematizes the standards of the beautiful. It establishes the architecture of the simulacrum, which constructs the atmosphere of exaltation and exuberant excitement through the animated digital images of architecture or architectural structures in real space. In this paper we will shortly discuss three manifestations of grotesque discourse in architecture: “Dubai style storytelling architecture”, “digital architecture of exuberance” and “ephemeral architecture”.

Dubai style storytelling architecture is based on the transaesthetic concept of architecture, whereby Dubai as a physical-geographic space and its designing architecture constitutes a separate environment - a world that is more real than the reality itself.²² It is an inverted image of the world, a picture of the technological power of architecture, a picture of prestige shaped by the economic power of capital. Dubai is a place where architecture reverses logic, and grotesque marks aesthetics. There was nothing but a desert for decades, and today it swarms with the architectural globalist metaphors of “modernization” and the globalization of the Islamic world. *Dubai style storytelling architecture* is a dominant expression of the contemporary architecture of extreme technological reach that is globally promoted around the world. Under this model, hotels, business buildings, traffic stations, airports, commercial centers, etc. are designed. The goal of this grotesque architecture is to be noticed, to attract as many users as possible and to cause catharsis of perceptive experience without cessation. (Figure 2, Figure 3).

The new media of architecture, computer software and modern building technology, have provided new opportunities for experiencing architecture and new possibilities of aesthetic contemplation of architecture. Through digitalization, architecture has stepped beyond the aesthetics of form and solid space into the imaginary, hyperreal, simulacrum, and transaesthetic space. One of the most extreme examples of grotesque digital architecture of exuberance are the projects of the Argentinian architect Hernan Diaz Alonso, the founder of the design studio Xefirotarch. (Figure 4a, Figure 4b, Figure 5a, Figure 5b) Diaz Alonso uses digital technologies to design grotesque forms of architecture that provoke communication with the environment. The aesthetic effects of Diaz Alonso’s projects highlight the multiple possibilities of computer rendering of 3D architectural models that are reduced to the perception of architecture as image-perceived through color, shadow, reflection, and hyperbolic forms which are associated with monstrous and xenophobic images. Geometry is eliminated, the form is split, it degrades the rigidity and volume of architectural forms, and the image expands as the essence of the aesthetic experience of Diaz Alonso’s architecture. These projects nullify beauty as one of the basic concepts of aesthetics and establish a grotesque discourse

in architecture by creating an atmosphere of fear, monstrosity, distortion, decay, illness and horror. By designing through animation, Diaz Alonso introduces the movement to architectural design, so the architectural creativity favors the relationship of time and space dimensions, and becomes like filming. The peak of the grotesque was reached in Diaz Alonso's project for the Museum Pavilion in Patagonia (Figure 6). Diaz used the animal meat from the slaughterhouse as the main conceptual motive, and at the same time as the building material of the Museum Pavilion. This is an extreme form of the aesthetics of ugly in architecture, but not in terms of kitsch or inadequacy in the environment, but rather in the creation of a specific atmosphere of horror, which is deviant and distorted in order to create the grotesque that shocks and causes the atmosphere of absurd. This is an exact manifestation of architectural aesthetics of the atmosphere, which in this case is created not only by architectural means, but by complex emotional-empathic means. In the 3D model of the pavilion, the observer visually, but also emotionally perceives the architecture of beef that, like a tumor, metastases, leaks, breaks through and spills through metal spherical and conical-hyperbolic forms resembling prostheses. The aesthetic point of Diaz Alonso's project of the Patagonia Museum is not the destruction of reality and the structure of imaginary hyperrealism, nor is it extravagant eclecticism of shape, forms and materials, but it is an attack on the very aesthetics of the form which is abandoned and disintegrated. The grotesque atmosphere of the Museum project tackles the concept of the form in architecture, and brings aesthetics in touch with semiology - in the framework of the meaningful and metaphorical.

The architecture of grotesque works on the inner, often implicit level. In the works of Marc Fornes, Volkan Alkanoglu, Ronald Snooks and Robert Stuart-Smith, the digital architecture of exuberance conducts the abolition of solid, rigid materials that had served the architecture for centuries such as stone, wood, bricks, blocks, concrete masses, metals, glass. The increasingly perfect performance of new materials, such as super thin aluminum, various types of biorubber and bioplastics makes it possible to transfer the aesthetic impression from 3D computer models to the realization of architecture in practice. The materials are becoming increasingly soft and flexible, and the grotesque aesthetics is based on the physical and materializational properties of the material itself, and not only on the shaped and formal level. These new materials undo the division between the exterior and the interior of architecture, since the inverted appear in both cases the same (both inside and outside). Contemporary architectural projects are becoming more and more curved thanks to computer software that allow the implementation of complex curves in construction. Softwares and computer tools have affected changes in the aesthetics and production of the global design work in general. Today it is possible to model millions of surfaces through computer models at the same time, which was previously not possible due to limited possibilities of computer software and hardware.

Digital architecture of exuberance accentuates the hyperbolization of closed volumes of architecture, denying details such as windows, doors, structural division to floors, etc. This tendency of architecture towards favoring the mass in a certain way performs depersonalization of architecture through a grotesque emphasis on the interplay of large scale volumes.

One of the best examples of the avant-garde spirit of architecture expressed through the grotesque is the work of the French architect Francois Roche, the founder of the polymorphous architectural organization New-Territories. Roche and New-Territories

expand the boundaries of their work outside of architecture, and realize multidisciplinary, theoretical, movie and robotic laboratories, architectural experiments, psycho-architectural case studies, bio-architectural constructs, etc. In a broad program of his accomplishments, Roche and his group implicate strategies of disobedience through the grotesque aesthetics of contempt for populist elements of culture. In this case, the grotesque in architecture operates on an implicit and explicit aesthetic level. Explicitly by means of direct expression in the forms, installations, actions in the space, film scenarios, etc., and implicitly including the influences generated by New-Territories synesthetic works: manifestos, theoretical texts, ephemeral installations, architecture related to ecosophy, biology, technology, robotics and human psychopathologies. (Figure 7, Figure 8, Figure 9)

As we had the opportunity to see on the previous examples, the source of the grotesque in architecture is often in the aesthetics of fright and horror. However, there is also an optimistic side of the grotesque in architecture that finds its source in the culture of humor, wit and inventiveness, and is related to the forms of small-scale architecture, prefabricated and temporary installations of the so-called “ephemeral architecture”. Ephemeral architectural structures express a kind of storytelling architecture that has the role of bearer of meaning and narration. This type of architecture includes various short-lived structures, temporal exhibitions, pavilions, architectural-sculptural installations, experimental architectural designs, etc. Storytelling ephemeral architecture usually promotes cultural content (traveling theaters, cinemas, exhibitions, pavilions designed to promote local culture, folklore and tradition), new architectural materials and technologies, and the frequent grotesque role of this architecture is to intrigue and test the social environment and record aesthetic experiences of people.²³ Although every aspect of revolutionary potential in society, art and culture is lost before the economic goals of global politics, architecture manages to defend its creative social and political freedom in these positively grotesque forms of ephemeral architecture. (Figure 10)

CONCLUSION

Modern architecture in its aesthetic domain resists Nietzsche’s nihilism, which is still present in the 21st century in the crisis of philosophy, aesthetics, art, and human society in general. Long-term predictions such as those of Marshall McLuhan about the importance of the role of the media in terms of decentralization and global distribution of information have fulfilled at all levels of human action. The global merging of the intimate and public sphere of society has had a great influence on aesthetics and its subject matter of research. As a result of globalism, transculturalism and “inter(all) disciplinarity” as a general approach of modern times, the basic difficulties of today’s aesthetics have emerged: the boundaries of aesthetics have become very loose, permeable and sometimes invisible. Digital media and social networks represent aesthetic, artistic and cultural scenes in which amateurism coexists with relevant scientific contributions. Baudrillard had already indicated the transaesthetic character of our world and its movements towards general aesthetization, commercialization and transformation of everything, and even architecture itself turning into consumable goods.²⁴ Although the reality is often masked by globalist goals, and the original reality no longer exists after its transaesthetization, architecture understood as a simulacrum opens an unlimited scope of new possibilities for aesthetic research, interpretation and practice of performing architecture as a social, cultural, technical and artistic discipline. Contrary to Baudrillard’s pessimistic view of culture and art of the 21st

century, transaesthetics in the domain of architecture can be interpreted above all from an optimistic standpoint. Parametric and digital design in architecture is able to produce a hyperreal reality based on freedom and creation that the architects had never known before. Therefore, the architecture with the qualities of transcultural and transaesthetic succeeds in overcoming the unilateral global goals of neoliberal capitalism with the power of its creations, providing the maximum of creative charge.

On the previous examples in this study, we have seen that the digital architecture of exuberance of Hernan Diaz Alonso or the experimental architecture of Francois Roche and the New Territories group represent two extremely creative ways of using modern technologies for the purposes of aesthetically, ethically and politically free architectural and artistic expression. The orientation of architecture to the digital methodology of work has highlighted a new positivist belief in the richness of transaesthetic experiences given through architecture. Computer design and modern technological practices of architecture confirm the benefits of transaesthetic architecture which is realized in the philosophical interface between utopia and reality. Through animation, virtual perception, digital simulation, direct transformation, modification, and interactive perception of architecture, digital architectural information is established as the basic equivalent of aesthetic value. At the same time, digital architectural information is a technical-engineering value based on which the realization of architecture in practice is carried out. Therefore, depending on the point of view, digital architectural information determines the aesthetic extension of architecture - which can be regarded as hyperrealism, which is neither a lie nor truth, since it exists as architecture in the domain of the transaesthetic.²⁵ On the other hand, digital architectural information is a simulacrum that has practical potential and is transferred from the domain of the hyperreal to the domain of real and existential when it comes to the realization of computer models of architecture in the built objects. As the technical possibilities of concrete, glass and metal structures were examined in the twentieth century with fascination, today, in the second decade of the 21st century, digital media have completely transformed the way of thinking and the very philosophy of architecture. Digital architectural information also works in the field of social cohesion, which best reflects the concepts of intelligent architecture, smart cities and environmental aesthetics of architecture. Technology should not be understood as an antagonist and destroyer of nature and natural environment. New technologies are precisely the basis for a more human and ethical approach to modern architecture that seeks to reconcile economic goals with the general development of society, bearing in mind ecological and environmental goals. Therefore, the highest goal of architecture aesthetics should be *phronesis*, which is reflected a combination of practical and thoughtful work in architecture. This is why environmentalist aesthetics of architecture revitalizes issues that were forgotten and strives to rethink the general values of true, good and beautiful which have constituted the basis of humanism and individual and collective responsibility from antiquity to this day.

2 International Style was the name of the exhibition organized by architects Henry-Russell Hitchcock and Philip Johnson in 1932 at the New York MOMA Museum, assuming under this name a modern style in architecture that had been developing since the 1920s in Germany, France, the Netherlands and other European countries. Shortly before the Second World War, Mies van der Rohe, Walter Gropius and Marcel Breuer emigrated to America, Hannes Meyer to the USSR, and then to Mexico. The principles of Bauhaus and Le Corbusier's modernism after the war in the fever of the great construction of new life through the new architecture started to gain their worldwide affirmation.

3 We will mention some of the largest architectural companies operating on the global architecture market: AECOM (USA), Gensler (USA), IBI Group Inc. (Canada), Nikken Sekkei Ltd (Japan), Aedas (UK), Perkins and Will (USA), DP Architects (Singapore), HOK (USA), Samoo Architects and Engineers (South Korea), Foster and Partners (UK), etc.

NATIONAL BANK BUILDING IN CETINJE VERSUS SELF VANISHING MODERNISM. PROMOTION OR MAINTAINANCE

Abstract | This paper is part of complex research devoted to creation of art and culture through and independently from political and economic conditions in Southeast Europe, and is thus a particular case of that research. This paper provides an examination of aesthetics and science conceived for the National bank building in Cetinje in Montenegro, whose author is the Yugoslavian architect Petar Vulović. Furthermore it explains how this important monument of Montenegrin modernism was lost during the period of transition from socialism to capitalism to, paradoxically, become a space for exhibiting and promoting, not maintaining, art in the 21st century, a space serving the state and public cultural purposes. Through an analyse of the buildings constitutive elements such as roof and pillars, areas of comparative interest such as Yugoslavian economic model SDK and selfmanaging socialism, my goal is to demonstrate the importance of social value of the organic reciprocity between aesthetics, art, architecture, environment and society, and how in socialist Yugoslavia this reciprocity has harmoniously served society and reflected the role of institutional function despite the already ongoing institutional transition itself. In methodological terms, the paper offers a critical examination of the strategic uses of the public space in socialist Yugoslavia versus the interest based uses of the same in capitalist societies even if they, paradoxically, might serve culture and art. If architecture is art, then the original bank building with its function and history was a perfect prelude for art maintainance via planned art institution and should have been preserved as cultural monument of modernism. Only then, in this particular case, we could have spoken about maintainance and sustainability and not mere promotion in art and culture what we can also call a self vanished modernism when it comes to highlighting papers principal results.

Index terms | *art, aesthetics, architecture, capitalism, devastation, economy, social value, society, paradox, public space, sustainability.*

In our everyday consumerist life approaching the end of the 2nd decade of the 21st century there are not so many elements that are making the relation between economy and art, or culture and economy in a broader sense, perceivable. At least in post-socialist countries, for an ordinary citizen, art is still something exclusive and deprived of any tangible relation when it comes to influencing real life. These two sectors of reality construction, economy and culture, are perceived as distant and unconnectable. But if we look more attentively in the past of both, we can find traces of a time and of thought when the opposite was taking place, i.e. the times of socialist progress and thought in the case of the Yugoslav state, whose unused potentials are still being scrutinized for development and understanding of our present day in terms of both culture and economy.

Building of the National Bank in Cetinje was conceived and designed by the architect Petar Vulović (figure 1(a), figure 1(b), figure 1(c)). It was constructed between 1960 and 1964, partly in parallel with development of the architect's project of a bank in Makarska, in Croatia between 1960-62 with which we can trace aesthetic parallels (figure 2). Being a National Bank employee from 1959 until 1965 at their Architectural Bureau, and then SDK architectural studio employee, he got the opportunity to construct some of his key achievements such as SDK in Belgrade in 1969 (figure 3(a), figure 3(b)), SDK branch office in Kraljevo in 1973 (figure 4) and SDK in New Belgrade in 1987. But the perception that he was an architect interested in creation of bank buildings and in economic sector only, is rather wrong. His interests and sensibility for spatial issues in the case of the National Bank in Cetinje span between issues of theory of proportions, harmony, golden ratio, local urban specificities and those of the ambient. In the interview given to Borislav Vukićević, the Montenegrin architecture writer, the architect explained that he thought of his Cetinje building as an homage to Njegoš's poetry:

My pillars that descend down to the ground are my first homage to Njegoš, not only to his Gorski vijenac.¹ (figure 5)

Architectural theorist and philosopher John Rajchman explains how the way we reside on the ground is poetic and that poetry explains that process.

That is why the Earth matters not only in the origin of the work of art but in the origin of its very concept, and hence in the concept as well as the work of architecture.²

To follow the trace of development of Vulović's interdisciplinary thought, it is important to notice that in the same interview the architect states that in case of the SDK building in Kraljevo his research is a devotion to the issue of pillar and that the building is an ode to the pillar i.e. that he did not conceive the building starting from prefabrication as a process. There is also a third relevant point in the same interview explaining his poetic, lyric and alternative approach to architecture when the architect narrates how he admired the observation of a Croatian critic who wrote about his SDK building in Belgrade stating how the building deeply stared into the Pannonian Plain; or yet another one, when he agrees with analysis by Ivan Kucina that the same building, seen in the context of Belgrade, can be thought of as a clear and fine white canvas (figure 6(a)). Unfortunately, we allow for canvas to change too (figure 6(b)). Departing from Vulović's relational and historical approach to aesthetics, we might argue that his Cetinje edition of the National Bank with its western and horizontally oriented main facade is gazed towards Mount Lovćen on top of which the poet Njegoš was buried (figure 7(a), figure 7(b)). The preparatory works for erecting the Mausoleum on top of Lovćen had already begun when he was conceiving his approach to constructing in Cetinje.³ We may argue that aesthetics of the Cetinje National bank is aesthetics of reflections and relations. If we observe its frontal main façade or lateral sides, we will notice modules that are multiplied and reflected. Sometimes that reflection is not immediate, but like in the case of the roof and its triangles it can even be distant or diagonal (figure 8(a), figure 8(b), figure 8(c)).

In all this lies, above all, Pythagoras and the philosopher Plato and, of course, lies Euclid. I am a student of professor Milan Zloković⁴, and he was a great mathematician and geometrician, and geometry is the essence of the whole world... I accepted that geometry is the essence, but only after I studied the subject well... The law of the square root of three, in the whole building, is valid here. And not only the law of the

square root of three, one other dimension is complemented. Even someone who does not know the theory of proportions feels it very quickly...⁵

Richard Padovan writes that a number must be experienced in a concrete way in order to be architecturally expressive, what now we understand as close to Vulović's conception.⁶ But what is that other dimension that should have been felt while we were observing the building? We might argue that the incorporation of the golden ratio is present in building's conception. With its light and harmonious disposition of modules, the building gives to an observer an impression of stability and protection. When one stands at the ground floor next to the base of the colonnade (figure 9) and under its three floors that then become the roof i.e. a cantilever space, one also feels and relates its own presence to the economic function the building was originally given. One establishes the connection and "sees" that an individual is a pillar of society. There is a presence of belonging and protection that could be felt.

The pragmatics of Yugoslav *soft* socialism gives foundations to such friendly-yet-authoritative architecture vis-à-vis ideology.⁷

If for Le Corbusier, the man in the Modulor – derived from the golden ratio – represents the essence of harmony,⁸ then for Vulović's conception of the bank the man and his time, history and built environment is the substance of its economy and culture. That is why he would not start the project without first studying Montenegrin history, poetry, and the environment in which Cetinje valley is situated, which confirmed relational aspect of his work. Apart from that, we should research if Vulović's modules, which he multiplied to achieve the volume of the bank were each, as the Modulor was, also based on golden ratio as well as the whole building as such (figure 10).⁹ The originality and specificity of the roof solution, the rhythm and repetition of modules along the façade, in a time of developing industrialization, shows that Vulović was not only reflecting the past, history and existing urban specificities of the town and its natural mountain environment but that he was already thinking of the future and how to go beyond the present and demands of modernism in terms of international style, use of the glass and prefabricated elements. While remaining modern (figure 11), he reached the specificity and integrity in proportions¹⁰, uniqueness and rarity that might defend his authorial approach in the conception of this building what according to Elisabeth Grosz is referred to as the *architecture of invention*. She argues that architecture has tended to conceive itself as an art, a science, or a mechanics for the manipulation of space, indeed probably the largest, most systemic and most powerful mode for a spatial organization and modification.¹¹

And for Vulović as well, architecture is the first of all arts,¹² that relates to music and poetry and where the light is an important element of form.

In self-governing Yugoslav *soft* socialism where the SIZ – a *self-governing interest community* – was functioning and controlling the area of health, social protection, culture and sports, working class was not seen as an object for exploitation like in neoliberal times. On the contrary, between 1946 and 1963,

proletariat as the new class becomes, for the first time, involved in political, economic and cultural decision-making and as a new force it initiates creation of the political system according to its position, new economy and new cultural politics.¹³

This cultural politics wanted to educate the masses and create educational and cultural development for its wide society. Architecture, with its immediacy, presence and availability in public space was respected and esteemed. And this kind of belief in the power of art and culture coincides precisely with the finissage of Vulović's bank building in Cetinje, with its scientific, theoretical and above all aesthetical qualities. Šuvaković's statement about complexities in architecture and culture can be useful in this context. He writes that architecture as the consequence of the practice of producing habitats etc. is an effect endowed with the function of, first and foremost, articulating and rearticulating human life and its visibility. However, articulations or rearticulations of human life are not the expressions of simple functions but of the complexities imposed by the type of culture and its specific historical and geographical organisation.¹⁴

In 2012, the Vulović's building, so organically connected with its environment and history, was renovated and turned into the Montenegrin Gallery of Art (figure 12). The 4th floor was added and the roof was removed - facts that permanently changed the character of the object. A close reading of the Montenegrin Law on Protection of Cultural Goods provides some interesting elements. If a cultural-historical object is a single immovable object of architectural, archaeological, artistic, technical, paleontological significance or other social significance¹⁵

then with Vulović's implementation of golden ratios, antique theory of proportions, authentic relation to environment, poetry and urban specificities of Cetinje, it is obvious that the object, if it was preserved in its original edition, could have been a potential candidate to achieve the status of a cultural-historical object. But in George Kubler's words, we often encounter a delay between discovery and application and that is found in almost every field of knowledge. Kubler explains that our ability at any moment to accept new knowledge is narrowly delimited by the existing state of knowledge.¹⁶ (figure 13)

Cultural value of the Vulović's building is historical also due to the fact that after its use as the National Bank it was serving to an economic model of SDK (*Služba društvenog knjigovodstva*) – the Financial Controller for the Lawful use of Social Assets – which had an important role in the development and responsibility of and for the economy. It was an extraordinary regulatory and controlling institution that enabled the further development of self-managing socialism in the FNRJ and the SFRY. The SDK Law states that SDK is a social book keeper, a registrar and a controller of the legality of the use of social assets. Therefore, financial resources and all other assets could not have been owned, but they were social and they were managed directly or indirectly by the working people and other self-governing and socialist associations to the benefit of each individual and all people together.¹⁷ Another important observation in this regard comes from Rudolf Arheim who states that we see as much as we know.¹⁸

Therefore, this text stands for the critical defence of art, architecture and culture in those cases when there is evidence supporting artistic, historical, technical, archaeological, and scientific spheres as stated in the Law for Protection of Cultural Goods (figure 14 (a), figure 14(b)). If it was originally a structure serving the state and public institutions dealing with economic affairs, while at the same time it was an object whose conception could aesthetically and theoretically be seen as an art itself, then today, in these globalized times we have to wonder what are the factors that made us fail in giving it the cultural recognition, especially during the process in which we were given the chance for conceiving it as a space devoted to presentation of art.

Consequently, this brings us to the question whether today's art, architecture and culture should serve for their maintenance or just promotion. If architecture is art, (figure 15 (a), figure 15(b)), then the original Vulović's bank building with its function and history was a perfect prelude for art maintenance via planned art institution and its aesthetics should have been preserved as a cultural monument of modernism. Only then, we could have spoken about maintainance and not mere promotion in art and culture, a phenomenon that can also be named as self vanished modernism due to the fact that Vulović's creation is not the only one that is not present any longer in its original form in Montenegro. Before such lost heritage, we are left with a sensational wonder why have we renounced a treasure that could have become another jewel in a continuum of historical objects in the town of Cetinje. In comparison with our present time when banks, audit companies or corporations can be located anywhere, which is often decided based on the price of the rent, we cannot help but wonder how was the impression of a passer-by in the socialist era when each of those institutions had its own aesthetics. What impact on a citizen has the architecture of today's economy institutions in comparison with the same impact in the post-war WW2 period? The importance of economy in our lives has not changed, but the place of aesthetics did. Now that Vulović's building has witnessed both: a rapid Yugoslav modernization and its even more faster failure – the question is who is a bigger loser, economy or art? And who has more rights, politics or culture – now that they still want to work apart?

ARCHITECTURAL SUBLIME: DOME ABOVE DOME

Abstract | The European concept of the architecture of sky oscillates between the differences of the two worlds. In the period of classical antiquity, that was a leap forward from the perfect towards the unique, on a course set by the philosophy which began with the thought of nature (physics) and progressed towards the reflection of the essence of matter (metaphysics). The *poiesis* of the whole, as an architectural potential for the range of a higher scale, was born from the projection of cosmopolitan tendencies, but only after this perception of the world had included universality. For antique thought, whose boundaries and geometry were linked to the sphere, universality referred to the shape of the Universe, thus the geometric sky expressed the ideal One. Parthenon and Pantheon, unified through the thematisation of the geometric dome, uncovered possibilities for sublime architectural worlds. One world offers pure geometry, while the other one is ruled by the visual presentation. One projects the depth of the sky, while the other sees the sky only as its illusion. The sky is an absolute category for the architecture of both worlds, it is placed out of reach, and its symbolic sublimity is achieved through spatial opening, outwards. Sublimity is a constant metaphysical challenge in European architecture. It connects aesthetics with the spatial secret: the idea that it takes more than perfect technique to bring matter to life. In that sense, the connection between the antique ability to reduce the Universe to an object using weight, and the modernist antigravity which leaves the orbit of the Earth, may be interpreted today only if the limits of the visibility of architecture were expanded to reach the esthetic dimension of digital infinity, the same infinity which is stamped by pictures of Voyager on its journey of no return. That proves that only those who abandon their own position may come close to that which has remained sublime.

Index terms | *Parthenon, Pantheon, dome, geometry of the sky, antigravity, digital infinity.*

There exists an esthetical experience of architectural unity, equivalent to a sentiment of sublimity, which only appears unrelated to current professional challenges. The form which could define such an experience is not expressed through the entirety of contemporary architecture, what's more, it may seem that such formal character is indeterminable at present. We have to admit that, as architects, we belong to an epoch characterized by utmost historical instability, where dysfunctionality is an established common condition of practice. There remains very little aside from the awareness of the loss of the pivotal moment within the theoretical capacities, where everything has already been said, used and produced. It is the very recognition of that deficiency that

is quietly neglected by the contemporary architectural discourse. Besides, let us not forget the obscuring of the substantial emptiness, as well as disguising and ignoring the deficiencies which are all manifested in the quantities of the everyday architectural production. Therefore, it seems that by piling up architecture, an attempt is being made to substitute the insufficiencies of the key characteristics of architecture, or the very thought of it. This situation could be deemed legitimate if architecture could demonstrate the qualitative differences between the power and the condition. But the intensive preoccupation with the everyday leaves little or no room for discursive settings. Therefore, the legitimacy of the practice is not analogous with its theoretical conditions. Even if the discursive inertia and the efforts wasted on liquid politics would become entitlements awarded to the practice, the theoretical rigidity of the historical experience still poses questions of the architecture's agility. The contemporaneity of this disbalance is understandable, but the confusion is caused by the absence of a reaction to the awareness of its existence. The image which accompanies theoretical discourse lost the glory which architects customary took for granted. The variability of the conditions against the condition of variability remains a levitating rhetorical question blurred by interdisciplinary conditions, which are casually referred to as cultural, political or social circumstances, but never considered to be esthetical. The esthetical character of this situation remains unchallenged, owing this to the abstract values of its intellectual establishment. In other words, even if there is an objective weakness of an architectural place, it remains outside the esthetical judgement. The unity of the creator and the work, just as that of the time and language, exists in the form of the corpus of memories which remains inactive, due to the inertia of the historical consciousness. This does not invalidate recurring questions of architectural language, natural order or the shaping of the spirit of the time. They may resonate differently, but they refer to the same world. The world of architecture of refined style, or of the style in general. The broken unity of theory and practice is proven time and again by the ideas about their unity, in spite of the awareness that such unity is exhausted as a temporal category.

I SKY AND ILLUSION

The European concept of the sublime, ever since the Pantheon, concerned the design capacity of an elevated concave-convex structure which incorporates an entire symbolic space of a unique common sphere. Its immediate content was transformed on the metastructural level of its imminence. In such sublimation, the primary esthetical function of an architectural order is exceeded, and the unity with universal spatial order is pursued in the centrally positioned geometrical associations. If Pantheon was *it* – “the symbolic strengthening of the grand political space of the empire” (Sloterdijk, 2014) – then we must consider what it epitomized, and what Sloterdijk describes as “the Roman solution to a Greek problem”. The architecture of the higher extent in the case of both Parthenon and Pantheon* literally referred to the “building of the sky”, albeit only the latter materialized the spherical concept. Both structures establish an obligation for future European development, in construction and in culture, which fundamentally influenced the status and the significance of the vault as well as of its constitutive elements. The bias to elevate roofs and ceilings to the metaphysical level is what gave the sky a valid rival in the architecture of a symbolically unifying region – a region above which it rose and left its heavenly mark.

Centuries later, in an entirely new technological system, Bruno Taut wrote about the dreams of the generation of the earliest modernists. Elevating culture to the level where it became able to respond to the infinite development of new forms, he highlighted the obligation for architecture to be fundamentally reformed. He claimed that this is only possible if we forget the enclosed character of rooms and introduce glass architecture which “would allow the sunlight, moonlight and starlight, not merely through windows but through every possible wall materialized in (coloured) glass. Only a radical transformation of the environment conducted this way could deliver new culture” (Taut, 1919). In “Die Stadtkrone” Taut refined this need for new architecture in the concept for his Chrystal Palace (Kristallhaus) “where architecture can renew its beautiful relationship with the sculpture and arts”. That new architecture of sublime spaces will enable cities to reimburse culture for all the constraints and the evil caused by mere utilitarian forms and other embodiments of the industrial era. Expressionism, the artistic direction which gained prominence by rebelling against all previous dogmatic forms, be they formal or functional, offers an understanding of a collective industrial work as a new alchemy. This is due mainly to the fact that the matter reached unprecedented levels of perfection – as shown at the Cologne fair by Taut, crystal became purer and clearer than ever before. Crystal is simultaneously a material, a structure and the form. The “ideal” understanding of the functionality was born out of the desire for the synthesis, but unlike in the functionalism of Loos, it is not an answer to a real need but an expression of spirituality which will soon confront the practicalism – the utilitarianism of that age, and especially of the age of the industrialization.

Taut’s “Alpine architecture” saturated with parabolic domes appears as a molded mass rather than as an architectural plan. This is why it can be understood as a succession of figures or shapes in an unconditional reality of an image, rather than recognized by the characteristics of its construction, typology or statics. We can refer to Argan’s notions about expressionism, and see an architectural image stretch into infinity, discarding every link between matter and nature, and incorporating all existing realities into its ideal world. It becomes an ideal of a progressive society which generates space through its new organizing structures, emphasizing spirituality, rather than utilitarianism, in architecture (Argan, 2006). It is precisely at this historical point that we can see the link between the expressionism of the “Alpine architecture” and the planetary rationalism of the Bauhaus, including the work of roughly the same artists who appeared at the famous exhibition of Novembergruppe, accompanied by the words of Gropius that “nothing is by itself any more”.

But let us return to the “City Crown” where we find Taut’s views on the unifying and transforming roles of architecture. Here, we also see his understanding of the sensibility with which the citizens of medieval Florence observed the erection of Brunelleschi’s architecture, the work to which Alberti, in his “De Rae Aedificatoria”, refers to as “a structure” (Alberti, 1485).

II HOW DEEP IS YOUR LOVE

Florence renewed the metaphorical potential of perspective geometry, which found itself at the formal threshold of the European Modern and its love for pure forms and the Sun, as a result of a sublimation of the roles of Parthenon and Pantheon. Reaching above the hills which framed the horizon of Florence, the city which aimed to symbolically abandon the boundary walls of its medieval fortresses¹, the dome became

both the morphological and the technological proof of the possibility to “reach beyond the skies”. This phrase, chosen by Alberti (*On Painting*) was not a mere figurative speech, considering that the “structure” comprising of ribs which all gathered at a single point defined the visible boundary of the infinity. It was a gigantic instrument of perspective—a machine, like the spherical roof of the Pantheon, which employed all contemporary knowledge in support of the (materialization) of a philosophical understanding of the “whole”. The opening on Pantheons dome, on an esoteric level, shines the light on both worlds (Sloterdijk, 2014). Its projection sublimates Aristotle’s physics (*On the Heavens*) and Plato’s ontology (*Theories of Soul*) by illuminating the perfect interior, allowing the Sun to dissolve and gather—reminiscent of the Supreme Deity. The modern equivalent of such an opening (bearing in mind that the Parthenon becomes the paradigm of high style only as an open structure liberated from the primary spatial order) can be found only in the parabola of the entrance roof, which referred to all previous arts by the materialization of its glass pyramid. The modern Louvre, as a global cultural heritage, expresses renewed love for the daylight which, by means of transparency, enlivens the link to Egyptian forms, figures and obelisks. The Louvre pyramid uncovers its deep historical character as the landmark of the “capital of modernity”, brought over from Egypt at the beginning of the XIX century. Pharaoh, who named himself Akhenaten (Amenhotep IV) was not only “the first individualist” in global history, but also the first modernist (revolutionary and reformist) who went against the rigidity of the archaic style, turning naturalism into an artistic programme in line with his personal fight against all, including religious, traditions. His new found love for truth is visible to this day, in the portrait of his queen Nefertiti. Her representation, almost as a suggestion of a new anthropology, stamped a moment in which a subjective experience of reality becomes more real than the apocryphal truth about eternity. That uncompromising sensitivity and the intellectual tension of the portrait is on a par with Mona Lisa’s smile, but the spatial feeling of the reliefs of Akhenaten’s era is closer to the visual impressionist experience. Here, the language which can defeat the unstable state of reality, turns the figure into an intellectual operation of artistic outlines which is weakening under the superior order of matters. The glass pyramid, while mapping the heavenly depth, symbolizes the disintegration of the visible horizon—the temporal and spatial liberation of the structure is attacked by the loss of its ontological core, and a consciousness that it can only confront its own finality by further liberating itself. Akhenaten’s migration to the modern era, which ended with the arrival of monotheism, is unmatched in the history of marked love for the world, even if we can only see it from the position of the (pharaoh’s) eternal beauty.

III ANTI-GRAVITY

Structure is the word which, in the modern era, changed the house of Gods into an open sky above the city. It used to be, and remains, the purest mark of the essence of architecture. Brunelleschi’s Dome was a structure (of volume with no supporting sub-structural elements), but so was the Parthenon with its inner sky dispersed in an explosion, at the time when the science dismissed the concept of the sky in a form of a dome (discovery of the telescope and the dismissal of celestial spheres). Ever since, modern architecture is developing its “appreciation of deficiency” related to this deep void which corresponds to the architectural understanding of the cosmos. European architecture, in its romantic fervor, finds ruins to be the last splendor, whereas all buildings strive to, through their comprising forms, uncover what lies in the depths of their history. This new capacity to uncover the past is developed in parallel with the unconscious tendency to do away with unnecessary weight. The opening of the

“modern sky” and the tendencies towards a universe with no spatial or temporal limits, along with the modern perception of reduced distances on Earth (Arendt, 1958), brings, for the first time, an architecture which is characterized by the transparency of an esthetic quality similar to that of ruins. It could be said that the character of such architecture sublimates the trajectories of the gothic tradition of directional space, except that it is not towards the empyrean (heavens above) but in all directions of the meta-ecumene of the modern era.

Since the XIX century people have to face their own finality in an infinite space and time, similarly to the new image of the world which was left without artistic presentations of its *heavenly twin*. Foucault also claimed that the XIX century scrapped the essence of myths in favour of the Second Law of Thermodynamics. The entropy of the system, metaphorically speaking, is nothing more than the loss of an atmosphere which was firstly scientifically proven, and then became evident in the empirical space. The Contemporary understanding of *the greenhouse effects* belongs to the inverted spectrum of the same terms, representing, in the domain of Rationality, the outcomes of the architectural green houses of the past. In the XIX century an idea was developed which claimed to be able to utilize new technologies to reconstruct the global protective envelope. This should have warranted the preservation of the ether which was, even in those days, destined for an infinite decay.

Architecture finds its new cosmic paradigm in the design of the “world’s interior” – Joseph Paxton’s 1851 Crystal Palace. This marks the commencement of the march of the new esthetics through modernity, when the critical threshold of immanency was crossed. Whitman’s poetics, in a similar way, accept the format of the World as an exhibition, thus becoming the container of all heterogenous exhibitions which his era allowed for.

The engineering architecture of glass and steel becomes the new expression of a form of an exponential relationship between shape and mass, but liberated from the solidity of matter this time. The style which displayed the organic essence derived from the geometrical skills is sublimated in the western world. In the wider architectural programmatic field, which was formed at the time of world exhibitions and the intensification of traffic, the Earth became available and explorable, we could say, as an object held in a hand². The esthetics and the spirituality of the society achieved a new, appropriate, expression, except that this time it was additionally marked by the speed of movement *. We could say that an observer moved through Gothic architecture as if on a journey, as the image of reality transformed into a panoramic overview. The Crystal Palace (Paxton, 1851) and the Eiffel Tower (Eiffel, 1889) symbolically represent the view over the exciting industrial landscape which was made of (Mars’s) fields, bridges and arches, train stations and funfairs, balloons, zeppelins and all that preceded steam boats and airplanes (which Le Corbusier will later consider to be the symbol, esthetic and programme). What reflects the sublime here is the feeling of a true liberation from the thought of the Earth’s heavenly shell, the idea which was thrown out by scientists at about the same time when the roof of the Parthenon was destroyed (the Morean War, 1687). The view became the factor which merged the Points of the World into a unique Time. If the Pantheon symbolically linked the territories of the empire, then structures like the Brooklyn Bridge or the Eiffel Tower, the Chrystal Palace or the Statue of Liberty prepared the world for the state of excessively interconnected reality in which we are still living today, endlessly. In this regard, the name of Nouvel’s infinite tower (Tour sans Fines, 1992) contains the reality of ‘Eiffel Towers life’, which is that all

of its steel elements were replaced over time while retaining its original geometry. Jean Nouvel's tower, besides its narrative about infinity, evaporates in front of eyes which have never seen it before.

IV DEPARTURE OF BELOVED OBJECTS

The middle of the XX century has been marked by a Galilean event. Amongst numerous discoveries, the density of which was hard to follow by mankind, one which is particularly relevant for this topic, appears incredible. For the first time the Earth has been seen by human eyes in its spherical wholeness. The following journey to the Moon only confirmed the extraterritorial character of this image. Undoubtedly, the Earth was finally discovered. But somehow, it went rather unnoticed. The human remained interested in earthly horizons (Arendt, 1958) despite the fact that his links to Earth are diminishing. The discovery of America suggested that all the trajectories on the planet are defined, while the modern era began by the clearing of continental paths and by unifying all the seas into one. On the other hand, the astronomical landscapes on the Moon were named after the imaginary seas, and prepared for new Great discoveries. This shows us that, even after five hundred years, the real and symbolical capacity of trajectories on Earth is not exhausted, and the old dreams about space journeys were replaced by an interest in the creation of a new image about ourselves. This is how the discovery of the telescope changed the way we see ourselves and the Earth more than it influenced our vision of the Cosmos, and subsequently left us awaiting new findings about our own lives. This time the images are dispersed polycentrically, aiming towards the depths of darkness, and not towards the hues of blue atmosphere of the yesteryear. The nonexistent dome of the Ultimate Home only proves the eternal character of the myths, despite our reliance on scientific knowledge.

The history of departures is the history of new worlds. After forty years of their journey, Voyagers 1 and 2 finally left the Solar System and inhabited interstellar space. The doubts of the 1970's was replaced by the 90-minute delay of the image which Voyager 1 still emits on its journey of no return. All the evidence of the exclusivity of life on Earth, engraved in gold, have never been further apart from its creators. The idea that man finally created something and placed it in the space inhabited by stars can easily be considered an inconceivable dream of cosmical scale, and the images which are still reaching us can be deemed the replicas of thoughts belonging to any observer of any of the domes ever created to support the idea of sublime. That history is equally the history of the revolution of a single architectural form. Dispersion of the dome's geometry and the linear character of its trajectory define the universal character of all matters, including the directions of all forces which cause our love for the sublime architectural objects to grow as our distance from them increases.

ENVIRONMENTAL EXPERIENCE AND SCALE:

BETWEEN HOUSING UNIT AND LANDSCAPE ECOLOGY

Abstract | There is a general tendency in contemporary architectural discourse to think about the built environment as objects and, consequently, about the perception of objects, rather than environmental perception. In other words, the emphasis is on dealing with objects as art, rather than as an environment. The paper focuses on the environmental experience as an aesthetic category that manifests itself at different spatial and temporal levels from micro to macro scale. The central research question examines the relationship between aesthetic of ecology and ecology of aesthetic. Theoretical framework of landscape ecology is considered as a connecting domain of territorial, morphological, antropological, social and ecological studies. The importance of development and dynamics of spatial heterogeneity and hierarchy is discussed through the holistic and systemic perspective, which have a significant position in the study of complex relationships between the environment, spatial patterns and humans. The research is carried out through on three main aspects that contribute to understanding the complex relations between ecology and aesthetics: (1) *Orientation and hierarchy*: refers to the understanding that people engage their environmental experience on a certain scale within which they can perceive the surroundings, although both environmental and aesthetic indicators are expressed at different spatial and temporal levels, (2) *Processes and patterns*: refers to the understanding that the intensity of interactions between processes and patterns at the previously established spatial level significantly influences the creation of aesthetic and environmental experience, and (3) *Context*: refers to the position of the contextual framework as an important criterion for the aesthetic experience of the landscape. The question of environmental experience and scale is placed in the context of the housing landscapes through identifying opportunities of Third Nature concept for creating sense and identity of place from architectural to geographical scale, or specifically from the scale of housing unit to landscape ecology.

Index terms | *aesthetic, context, ecology, holism, pattern, Third Nature.*

INTRODUCTION

Understanding, perception, as well as approach to the study of landscape elements and structure, has shifted from basic understanding of the landscape as *an area, as perceived by people, whose character is the result of the action and interaction of natural and/or human factors* (Council of Europe, 2005) to importing holistic dimension where the landscape is determined *as a holistic entity of aesthetic perception* (Haber, 2004). In order to achieve identification with place and establish a hierarchy and orientation in a heterogeneous spatial construct such as a landscape, a conceptual framework based on a parallel understanding of the three dimensions of the landscape - morphological, aesthetic and functional - is proposed. The paper deals with the debate about the integration of these dimensions of the landscape between different scaling levels – from architectural to geographical at the focus of social ecology and socio-environmental changes.

In this sense, the landscape ecology can be considered as an important territorial and morphological determinant, as well as an important criterion for studying cities in line with environmental theoretical framework towards generating sustainability and resilience. The role of landscape ecology is to study and discover complex relationships between living communities and their environments in a certain part of the landscape, on the basis of which new perspectives for studying the city morphology can be identified through linking ecological and territorial studies (Troll, 1950). Over time, landscape ecology has been set as a complex discipline that cooperates with transdisciplinary fields such as geography, ecology and social anthropology (Wu, 2012), equally achieving a holistic, humanistic and social view, versus analytical and biological (Wu & Hobbs, 2005).

ECOLOGICAL RESTORATION:

BETWEEN ARCHITECTURAL OBJECT AND BUILT ENVIRONMENT

Aesthetic spirituality – the idea that beauty lies not in the eye of the beholder but in living in harmony with nature, and it underlies a wide range of environmental values and practices, certainly including ecocentric restoration.
(Jordan III & Lubick, 2011)

The complex and accelerated development of cities requires the exploration of new morphological and typological patterns and their relations with the landscape, environmental and natural conditions. Also, it is important to consider the autonomous position of landscape ecology in architectural discourse through consideration of several important thematic frameworks: (1) the relationship of functions and spatial patterns (Turner, 1989), (2) the temporal perspective of studying the landscape (Delcourt & Delcourt, 1988), (3) studying the hierarchy and the landscape scale (Jennings & Reganold, 1991), (4) relationship of spatial patterns and ecological processes (Wiens & Milne, 1989), and (5) integration of people and landscapes into *total human ecosystem* (Naveh, 1994). In this sense, the conceptual framework of ecological restoration is recognized as a connecting construct for the integration of ecological and social mechanisms of the landscape, which can provide the dialogue with nature in order to define aesthetic perception and cognition.

Environmental Aesthetic: Processes and Patterns

The discourse of interrelations between social and environmental construction of landscape is influenced by various disciplines such as architecture, design and art in line with studies of naturalness, and built by hybrid methodologies which provide *triad of spatiality* (Rendell, 2006) - spatial, temporal and cultural inside into landscape matrix, structure and elements on different scaling levels. Observing the indisputable discursive relationship between art and landscape, the dichotomy of nature and culture is observed, that is, through the temporal perspective of the landscape - the synergy of the continuance of nature and the constancy of ecological processes versus spatial patterns as a reflection of the cultural sequences.

By overlapping the spatial patterns, environmental processes and social agents, it can be approached to the development of integral concepts, images and metaphors, which builds a certain *systems aesthetics* (Collins & Goto, 2003). Thus, landscape combines two perceptions: (1) environmental experience built within the interface of nature-aesthetic and social-aesthetic on different scaling levels, and (2) built environment as an object without synergy and harmonization between patterns and processes.

Environmental scales of housing patterns: Towards Third Nature

Environmental experience can be classified as an aesthetic category that manifests itself at different spatial and temporal levels from micro to macro scale. In order to equally descriptively and principally understand this relation, a method of scaling is introduced in order to identify the relevant scale and level of visibility, sensitivity and perceptivity of the environment. An environmental architecture that is designed on the principle of visibility is based on reading an environmental idea in the aesthetic approach to design (Ristić Trajković, 2015). Whereas, the principle of the aesthetic experience, that is, of the active aesthetic mind - engagement esthétique - the existence of an active knowledge oriented towards the environment. The necessity of intensive consideration of processes and patterns is recognized in order to establish the relationship of function in relation to human behaviour and needs, so those aesthetics are in relation to their desires, experience and perception of the environment.

Reflecting on the comprehensive structure of the urban landscape and the tendency of the future transformation of the rural into the urban, or natural into cultural landscape, the typology of a housing can be distinguished as the leading spatial entity of studying the aesthetic category in relation to the environment. Housing patterns represent the largest share of the morphological image of the city and the highest level of the ideology of everyday life from the level of landscape ecology in which housing settlements build a relationship with a comprehensive ecosystem to the level of housing unit within which the ambient and sensual experience of the environment and the natural environment of living space is reflected. In this respect, in terms of the interaction between man and environment - environment, and especially the artificial architectural component, can have a deterministic influence on many aspects of human life: behaviour in the space, formations of social organization, and thus aesthetic experience. The environment can be explained at the same time as a stimulator, while user behaviour can be explained as environmental and natural sensitivity response.

Three types of landscape or nature can be identified: The first Nature - the primordial landscape intact by humans, the Second Nature - the landscape modified by humans, and the *Third Nature* (Jencks, 2004) - a landscape created by humans or controlled

environment. In relation to this differentiation, cultural belief in nature can be recognized as primordial and intact. Within such a belief, people are inclined to see themselves as part of that nature and, accordingly, take responsibility for it.

Starting from the two perspectives of the Third Nature conceptual framework (Ristić Trajković, 2015) - (1) the Third nature as complex system and space of mediation between different actors and materiality, and (2) the Third Nature is based on a complex, comprehensive and an interdependent system of interaction between people, architecture and nature – unequivocally the potential of this concept in architecture is initiated. The Third nature can thus be defined and recognized as a complex ecology that has a mechanism of interrelations between people and spatial patterns within different scales in space and time. In this way, architecture and nature are generators of urbanity that achieve the synergy of ecological and social mechanisms in a certain part or comprehensive framework of the landscape.

AESTHETIC OF ECOLOGY OR ECOLOGY OF AESTHETIC?

The influence of the aesthetic values on the ecological processes is reflected in the equally spatial and programmatic parameter of the planning, design and restoration of the landscape. The relationship between aesthetic and ecology from the environmental perspective includes the conceptual framework of *Eco-aesthetics* (Guy & Graham, 2001) based on the construct of postmodern science that includes a pragmatic new and naturally sensible sensibility. In the light of the new ecological knowledge and the transformation of the relationship and consciousness of people towards nature, the strengthening of the aesthetic and ecological relations would be established by integrating global environmental aspects into conventional design and planning strategies focused on methodological symbiosis: programming - scaling - designing.

THE JAPANESE CITY – A VIEW OF AN ARCHETYPAL ORDER

Abstract | This paper analyses cultural and aesthetic phenomena and their inherent meanings in the Japanese city. I will approach the theme from a comparative point of view by examining Japanese urban features and archetypal principles in contrast to the European city.

Early Japanese urbanisation centred around imperial palaces, with the first cities founded by successive emperors from the 7th century onwards in the Nara region, near present-day Kyoto. The orthogonal plan for the imperial capital was copied from the contemporaneous Chinese dynasties. Spatial organization was hierarchical, imperial quarters were located at the northern end of the central south-north axis of the city, and the most prestigious plots around the Emperor's palace. Kyoto, the historical Heian-Kyô, was founded as the imperial capital in 794.

Tokyo, the historical Edo, became a "castle city" in 1457 when a military castle was built, and subsequently the capital, when the Shogun moved government from Kyoto to Edo in 1603. The Shogun's castle, the centre of power, intertwined with the hierarchical urban order spiralling around it. Edo gradually became a modern capital, named Tokyo, while Kyoto remained the traditional centre of high culture and the seat of the powerless Emperor until 1868.

The Japanese city is a cultural metaphor. Psychological uncertainty, due to the country's location on a precarious earthquake and volcanic zone, and an awareness of the perishability of life based on Buddhist philosophy, have all deeply influenced the Japanese culture and mind. Emptiness, the Taoist ideal linked to Buddhist thinking, is also reflected in the urban space. For instance, a Japanese city has no designated urban centre whereas in the European city this is a culturally and economically accentuated place.

In this paper I will also analyse the Japanese spatial concepts *ma* and *oku*, and their archetypal manifestations in urban tissue and street scape. While *ma* means experiencing space in time, *oku* refers to the hidden dimension of the urban experience, or the psychological state of processing a path whereby the urban core remains hidden and only partially discovered.

Regardless of Japan's recent historical and economic development, the cultural characteristics of urban spaces have not changed a great deal. Tokyo is still a mosaic city of small village-type communities with an inherent feeling of togetherness. Hidenoby Jinnai has called this phenomenon an "ethnic continuity", whereby the new and the old are mixed in an ethnic order.

Index terms | *Aesthetics of meaning; Cultural archetype; Japanese city; Japanese culture; Japanese spatial concept; ma; oku; urban space.*

In this paper I analyse certain cultural and aesthetic phenomena in the Japanese city. Cultural and aesthetic meanings inherent to Japanese cities will be analysed in parallel, including Japanese spatial concepts and their structural manifestation in the strata of urban tissue and street scape.¹ I will approach the theme from a comparative point of view by examining urban features and archetypal principles characteristic of the

Japanese city, contrasting them to the European city.

Historical Urban Formations in Japan

Kyoto and Tokyo offer examples of two different historical patterns of urban space in Japan. The first Japanese urban communities emerged around imperial palaces, and the first cities were founded by successive emperors from the 7th century onwards in the region of Nara, near the present-day Kyoto. Japan's first historical era, the Asuka period (538-710), marked the arrival of Buddhism from China and Korea to Japan and is renowned for its high-quality art. According to the rituals of the era, the Emperor's palace was rebuilt after the death of the old emperor. In the early days, the administrative town grew randomly around the Emperor's palace. The early Japanese capitals before the feudal era were known as the imperial *miyako* cities (都).

Chinese art as well as city and temple techniques were used as a model for the Japanese imperial cities. After Emperor Kōtoku's rise to power in 645, for the first time a plan was made to build the imperial capital in Naniwa, the current Osaka area. However, in 667 the capital was moved to Ōtsu on the shore of Lake Biwa, and then in 694 back to the Nara area, to Fujiwara-kyō.

Fujiwara-kyō (694-710) was the first Japanese capital built according to the Chinese-style grid plan. Its dimensions were 3,8 km on the north-south axis and about 2,1 km on the east-west axis. Although Fujiwara-kyō was designed as a permanent administrative town, in 710 the capital was again relocated to the site of the present-day city of Nara. The new capital founded by Empress Gemmei was larger than the previous one and was named Heijō-kyō, the Citadel of Peace. Heijō-kyō became the first "permanent" administrative centre and served as such during the reigns of several emperors (710-784).

In 784 Emperor Kammu set up a new capital in Nagaoka, north of the present-day Nara, as he wanted to keep some distance from the great Buddhist temples of the time. In 794 he decided to move the capital further north on a new site he called Heian-kyō, the Capital of Peace and Tranquillity. This was the beginning of the Heian period, the last period of Japan's early Middle Ages. Heian-kyō remained the residence of Japanese emperors until Meiji reform. The name of Kyoto came into use in the 11th century.

The plan of Heian-Kyō was built on a regular grid plan similar to the Chinese capital Chang'an, albeit much smaller. It also resembled the plan of Heijō-kyō, crossed by a wide central north-south axis, with a block size 120 m x 120 m. The street network of Heian was hierarchically subdivided into the broader main avenues or traffic lanes and into smaller streets. The major lanes were where ceremonies, processions, and all manner of power manifestations took place and where all movement could be controlled.² These were not actual streets however, because the enclosed residential areas were surrounded by earth-fill embankments. High mountains protected the capital to the north, east and west.

The principles of geomancy, itself based on Chinese cosmology, were the guiding principles of city planning. The orthogonal check plan for the imperial capital was copied from China during the periods of Sui (589-618) and Tang (618-907) dynasties. The plan was clearly delimited and almost symmetrical with respect to the central north-south axis of the city, with a hierarchical spatial organization.³ The imperial quarters were located at the northern end of the central north-south axis, and the most

prestigious plots, e.g. Buddhist temples and abodes of nobility, were placed around the Emperor's palace. The plan reflected the centralized imperial power as well as the city's administrative and social structure symbolizing the prevalent order of the time. The adoption of the Chinese grid plan in Japan has also most likely been affected by the traditional pattern of rice paddies with their rectangular path networks, since also the street networks of rural villages were often built to be compatible to the field grid.⁴ After the Heian period (1185), Japan was a feudal state under military rule for almost 700 years, until the Meiji reform (1868). Urban communities grew around the castles of military chiefs and developed a new city type, *jōkamachi* or "castle town". Most castle towns were built according to a predetermined pattern. The Warlord's castle was in the middle, and in the hierarchical order around it, were samurais, merchants and artisans, and farthest were the classless. Moats and roads were carefully planned. The blocks were built radially toward the centre around the castle. The street network was intentionally irregular, as opposed to *miyako* towns with temples usually located near the outer moats of the castle.

Tokyo, the historical Edo, became a castle town in 1457 when a military castle was built there. And when the military leader of the country, shogun Tokugawa Ieyasu, moved the base of governance from Kyoto to Edo in 1603, it became the capital of Japan. The shogun's castle denoted the centre of power in the city, and the hierarchical urban order intertwined spiralling around it.⁵ – Edo gradually developed an identity of modern forward-looking capital, while Kyoto remained the traditional centre of high culture and the seat of the politically powerless Emperor until the Meiji Reform of 1868. Most current Japanese cities were founded during feudal eras, especially around the castles built during the Momoyama and Edo periods, such as, for example, Osaka and Nagoya besides Tokyo itself.

Other historical city types also developed from different functional starting points. These include, for example, port cities, religious pilgrimage towns linked to Shinto shrines, and linear postal towns. Postal towns (*shukuba* or *shuku-eki*) played an important role in the Middle Ages and the Edo period. They were built for example along the roads between Tokyo and Kyoto, where goods were transported by horse. Many postal towns have preserved their historical atmosphere and are popular as tourist destinations nowadays.⁶

Tokyo – from Edo to A Metropolis

While Kyoto is considered to be the centre of traditional Japanese culture, Tokyo expresses the dynamism of the modern, future orientated and secular society. This has its historical reasons. During the nearly-thousand years of its history, Tokyo has grown from a small fishing village to one of the world's largest cities. In the 1720s Edo was already the largest city in the world when its population exceeded one million.⁷ Today the Metropolitan Tokyo has a population of about 13.8 million (2018).⁸

Apart from the fortress, the historical Edo was a traditional Japanese wooden town with quarters built hierarchically around the castle. The samurai's upper-class villas were located hierarchically as per the social order on the western side of the castle; while the eastern side was a damp wetland, which was filled up to become building land for the needs of craftsmen and merchants' and for the port.⁹ Many of the moats that spirally circled around the castle were later filled, but they have left their mark on the urban tissue of Tokyo. Still today, Tokyo's mosaic identity is characterized by a locally diverged socioeconomic structure, which has its roots in Edo's historical layers.

The quarters on the western part of the Emperor's Palace are called Yamanote (Towards the mountains) or the Uppertown, which comprises wealthy garden city-style residential areas. In the eastern part of the city, in the deltas of Sumida and Arakawa rivers on the shores of the Tokyo Bay, is the Downtown, or Shitamachi, which is still a bustling shopping area and business centre.

Over 250 years of peace prevailed in Japan from the beginning of the Edo period to 1867, when the last Tokugawa shogun resigned, and the power was restored to the Emperor in 1868. The Meiji reform meant the Emperor moved from his Palace in Kyoto to Edo Castle, and Edo was now renamed Tokyo, the Eastern Capital (Tōkyō). The restoration of power to the Emperor came, in many ways, to mark the modernization of Japanese society, as the country opened itself once again to the outside world. Over the following decades, Tokyo continued its steady growth, both physically and in importance, as the political, administrative, and economic centre of Japan.

In 1923, Tokyo encountered the greatest disaster of its history when almost the entire city was destroyed by an earthquake. However, in a few years it was rebuilt and extended further in 1943 when large suburban areas were annexed to the administration of the metropolis. Another disaster took place during the Second World War, especially in 1945, when about half of the city was subjected to American bombing. The damage was almost as large as that of the combined atomic bombs in Hiroshima and Nagasaki.

After the war Japan experienced an unprecedented rapid urbanization process. As Japan traditionally had only a few urban planning regulations and the cities were built in a *laissez faire* manner, land prices rose to a peak. As a result, over-efficient construction gained ground especially in business-dominated urban areas. The economic boom of the 1950s, however, meant a new time of a strong growth and development for Tokyo as the centre of both administration and large corporations. Simultaneously, Japan became one of the centres of modern architecture in the world.

The Tokyo Olympics of 1964 provided a new impetus to already intense construction activities, especially to solve the housing problem caused by the growing population. In 1965, there were 10.9 million inhabitants in Tokyo, and housing and plot prices rose dramatically.¹⁰ The same trend has persisted despite momentarily recessions, and Tokyo is still one of the world's most expensive cities today. Yet in an international comparison, Tokyo is considered to be the third most comfortable residential city in the world after Zurich and Copenhagen and belongs also to those which are functioning the best.¹¹ As the problems of the 1970s were pollution and traffic, today the waters of the Sumida River are relatively clean, and the Tokyo transport system works well.

Tokyo forms its own prefecture, being one of Japan's 47 prefectures. Tokyo Prefecture is a giant urban cluster and yet it is only a part of a wider, continuous city network that covers, from the European viewpoint, many large cities and has more than 35 million people living in it. As such, the Greater Tokyo region is the world's largest metropolis and economic area (New York is the second).

Although the many social, economic and administrative causes affecting urban development processes in Japan are comparative to the rest of the world, the cultural meanings inherent in urban environments are always local and differ from each other. The kind of Tokyo's "Empire of Signs"¹² can give an impression of uncontrolled chaos, but beneath the rich texture, there exist spatial and aesthetic deep structures that give the city its content of cultural meaning.

Megalopolis and Urban Identities

To understand the Japanese city and architecture, we must view it from within. The visual concepts of Western architecture and urban art – form, symmetry, perspective – are unfamiliar to Japanese culture. The traditional Japanese house and town are both open organisms, which functionally grow from the inside out. The demarcations between different areas are important, for example, the areas of temples and shrines are always marked by certain kinds of gates, but the external frontiers of buildings and cities are flexible and can change.¹³

In Japanese culture, the relationship to nature based on Shintoism is an essential feature: for the Japanese, nature is both a model and a partner with whom they want to live in harmony. Thus, in the Japanese city there is nothing absolutely predetermined or controlled, and in a similar way as in nature, its external character is subject to constant change. Except for security aspects, not many building and town regulations exist in modern Japan.¹⁴ In Tokyo, the life cycle of an average building is estimated only about 20 years, and thus, the city's transformation process is extremely fast.

However, the Japanese city is characterized by a type of continuity. Although Tokyo has grown into a giant international city and penetrated by Western architectural influence since the end of the 19th century, its urban essence has still a very Japanese character. How can this be identified? According to Hidenoby Jinnai, there is an ethnic continuity. This means that the disappearing city's "genes" are constantly transferred to a renewing city, whereby "the new and the old are complexly meshed," and "its old ethnic elements live in the vernacular."¹⁵

Ethnicity means something that is characteristic of a particular group of people or culture.¹⁶ In other words, the cellular microstructure and macrostructure of urban tissue, in which the functional and socioeconomic urban structure is filtered in its own way, stays preserved, despite the fact that disappearing old buildings give way to new ones during the constant change. In Tokyo, the new and the old are ethnically and harmoniously mixed, although in their external shape they may differ radically and do not form any unified ensemble of architecture or urban art.

Ethnic continuity also means cultural continuity of local urban village communities. Tokyo includes hundreds of urban villages, each with its own socio-economic structure, local lifestyle, and physical character. Urban villages form urban districts, and each of the 23 districts in the metropolis, as well as its 39 municipalities, have their own local cultural identity, which is reflected in the areas' functions and their physical form.

In the central area of Tokyo, according to Edo's historical model, urban quarters twist orbicularly around the Emperor's palace and its large park surrounded by a wide moat. Although the metropolitan centre has its own public character in relation to the Emperor's palace, in other parts of Tokyo the urban villages bear a close resemblance to each other, astonishingly, regardless of their socio-economic status. Tokyo's residential areas are small and quiet in scale, and their lifestyle is like that of a rural village or a small town.

As in the Edo period, inhabitants of urban villages formed communities who took care of common issues also providing the basis for official administration; and still today the residents of an area are bound by a shared sense of inner cohesion. Urban festivals, Shinto matsuris and processions are old-style traditions that reinforce the inhabitants' inner solidarity. The security of the residential areas in Tokyo is often praised, and

one reason for this is the strong internal control that traditionally exist in urban communities.¹⁷

The centre of an urban village is usually a railway station surrounded by various service shops, stores, and restaurants. Narrow alleys form a labyrinthine network. Residential areas are located between larger traffic routes, which are named, and bordered by buildings of a larger scale. Small residential streets are usually unnamed. An address consists of the name and postal code of the city, the name of the area, the block number and the building number, which does not refer to the adjacent houses along the street as in Europe, but to the chronological order of the date of building.

Greenery – trees and vegetation – in residential areas is also important. The garden is central to Japanese habitation. In urban environments gardens are often more of a symbolic reminder, like small plant groups, or only a few potted plants at the entrance in the street, depending on the available space.¹⁸ The result is picturesque village milieus in the heart of a huge city.

The three central districts of Chioda-ku, Chûô-ku and Minato-ku form the core of Tokyo. The first two are mainly occupied by offices and commercial buildings as well as large hotels. Chioda includes the Imperial palace area, numerous state-owned buildings and the huge complex of Tokyo Central Station. The Chûô-ku district is home to the famous shopping area of Ginza with its elegant commercial buildings, department stores and restaurants – one of Tokyo's colourful business cards. Minato-ku is structurally a more mixed area with businesses, cultural activities, embassies and well-groomed residential areas, and is also one of Tokyo's nightlife and entertainment centres.

Other neighbourhoods in central Tokyo comprise Shinjuku-ku, Shibuya-ku and Bunkyo-ku. Shinjuku is the Tokyo Metropolitan Government Centre with its many skyscrapers and large department stores. The city's silhouette is crowned by the Tokyo City Hall complex designed by Kenzo Tange's Architecture Office (1991). Its 243-meter-high double-tower building was until 2006 the tallest building in the metropolis. Shinjuku is also famous for its small-scale streets with tiny shops, and its crammed bars and restaurants of nightlife,¹⁹ as a memorial of Edo's "floating world."

Shibuya, for its part, is an area of youthful urban culture, especially the surroundings of its central station and the Yoyogi Park subway station which is one of the younger generation's preferred weekend gathering places. Shibuya has exquisite fashion boutiques, department stores, hotels and restaurants in the midst of well-to-do residential blocks. The milieu of Aoyama dōri and Omotesandō can be described as the centre of creative elegant urban culture in Tokyo.

Bunkyo-ku is a quite typical mixed-use district in Tokyo, full of small-scale residential areas, nestled in the islands between larger traffic streets. In the eastern part of the area is the central campus of Japan's oldest national university, Tokyo University (Tōkyō Daigaku), built in Western style at the end of the 19th and beginning of the 20th centuries. The Tokyo University campus area is bordered by Ueno Park in Taito-ku, which houses several major museums such as the National Museum of Tokyo, the Historical Gallery of Horyū-ji Treasures, the Tokyo Metropolitan Art Museum, the National Museum of Western Art (1959) designed by Le Corbusier, as well as Kunio Maekawa's Tokyo Music Hall (Tokyo Metropolitan Festival Hall, 1961), which is one of the pearls of Japanese Modernism.

Tokyo is its own world, each of its neighbourhoods hides stories and meanings.²⁰ They cannot be understood, however, or found without a deeper search, as they do not open up at first glance and do not cease to fascinate with their mysteries. Under its rich urban texture there is a secret order. And perhaps precisely because of that, Tokyo functions well both at the micro and macro level. Tokyo is a city of great opposites, but despite its scale and the problems this brings, it is a dynamic, optimistic and future-orientated metropolis.

Manifestations of Cultural Meanings in Urban Space

The Japanese city may also be regarded as a cultural metaphor. Geographical and historical circumstances have shaped urban spaces with their prevalent forces. A permanent psychological uncertainty due to the country's location on a precarious earthquake and volcanic zone, and an over-all awareness of the perishability of life based on Buddhist philosophy, have deeply influenced the Japanese mind and culture. The Taoist ideal of emptiness, which is linked to Buddhist thinking, is also reflected in the urban space. For instance, in a Japanese city there is no designated urban centre in the sense of the European city centre which, on the contrary, is a culturally and economically accentuated place.

When compared to European spatial concepts, the Japanese sense of space is totally different. There are two basic spatial concepts, *ma* and *oku*, depicting the Japanese understanding of space. The original meaning of *ma* is interval, but it can also denote a silent moment, or a "meaningful void."²¹ Its meaning in urban space is even more complex, and may be experienced, for example, as a series of intermediate spaces, a spatial rhythm, or an empty space, which provide the city a rich morphological appearance. There is no equivalence to the word *ma* in Western languages, but it always refers to some sort of void experienced in space and time – in fact, its meaning is "space-time." Different researchers have given different definitions to the space-time concept *ma*. For example, Günter Nitschke calls *ma* the Japanese sense of place.²²

間

According to Arata Isozaki, the ancient Japanese concept of space was based on their aspiration to give a visible and formal figure to deities, *kami*, that were believed to fulfil the cosmos.²³ *Ma* still means a way to mark a sacred place, *himorogi*, where *kami* can settle down. It is done by dividing the space: four columns or piles erected on the corners of a square or a rectangular area, and a rope, *shimenawa*, attached around them. A column, *yorishiro*, is then placed in the centre of the space where the *kami* is supposed to live. The interior of the bounded area is called *kekkaï*. White paper strips symbolize the sun. The Shinto shrine Izumo Taisha has a long stairway bridge, *hashi*, which is supposed to lead from the platform on the ground to the realm of the deity. This stairway bridge symbolizes the connection between heaven and earth, and between gods and people.²⁴

奥

In addition to *ma*, the experience of *oku* in Japanese urban space is also essential, in fact, they complement each other. While *ma* is a concomitant concept of experiencing space in time, *oku* refers to the innermost space or depth,²⁵ or to the hidden dimension of the urban experience and the psychological state of processing a path. It means that the goal of the path is hidden and will be only partially discovered. *Oku* is not visible, it rather refers to an invisible urban heart.

The word *oku* has three types of meaning: relating to something private, intimate, and deep; holy or sublime; or encrypted and in-depth. In architecture, *oku* refers to spatial layers in which the innermost is encrypted or can only be found gradually in an experiential manner in time and space. *Oku* thus refers to the Japanese concept of layered space – or the “onion character” of space.²⁶ *Oku* is manifested in the interaction between the empty space and the layered space.

Fumihiko Maki has written a seminal article about the impact of *oku* on urban space – “The Japanese City Spaces and the Concept of *Oku*” (1979) – which is still the best article on the subject written and translated into a Western language. According to Maki, *oku* may be manifested as a centripetal space structure,²⁷ however, its centre is hidden or may be something providing an orientation to further distant or at the end of a pathway. It may be within an area, or a centrally located place, or maybe a sanctuary or a temple on a mountain slope. *Oku* itself is not something important, it is not dominant, nor a centre in the western meaning, but rather it is a hidden core, an “invisible centre.” According to Maki, “the *oku* is nothing but the concept of convergence to zero.”²⁸

Meaningful for *oku* is thus the spatial layering and the experience of depth. This happens step by step, by moving in streets, like experiencing a transition into a hidden place. Essential is not the place itself, but the psychological process of approaching it, which happens in time, in stages, while the experiential depth of urban space becomes emphasized. Here again we see the layered character of the Japanese sense of space, which has its equivalence in the Japanese way of wrapping packages and coating them with beautiful multi-layered paper or cloth. A similar “layered wrapping” of the inner space is archetypal in Japanese architecture and urban space.²⁹ For example, the routes leading to Shinto shrines and Buddhist temples are seldom straightforward, instead they make 90 degree turns and change their character in sequences when moving inwards.

In describing the manifestation of *oku* in Tokyo’s urban space Maki chose the example of Yamanote, the residential area located west of the imperial palace and park. Here there are still remains of the Edo period samurai stone walls and old lush trees, and the streets are still as narrow and winding as before. Even though there are new higher buildings among the old houses, the spirit of the place is enigmatic - as if it conceals something profound. Maki poetically depicts this former samurai villa neighbourhood: “One gets a rather peculiar sense of depth from the dim spaces between the old walls and the newly built high-rise buildings that now stand squeezed among them.”³⁰

Noteworthy in Maki’s description of the *oku* phenomenon in Yamanote area are the “dim spaces”. Kisho Kurokawa has described the concept of “Rikyu Gray” as a term that refers to the undualistic, ambiguous and equivocal character of Japanese culture, often regarded as a central feature of the *Japaneseness*.³¹ In architecture and urban space, this is manifested, for instance, by the “dim spaces,” which may be intermediate (cf. *ma*) or multipurpose spatial zones that may combine conflicting things. The layered

“onion” structure of Japanese architecture and urban space, as well as the rich local morphology of urban villages, hide many such ambiguous and equivocal situations and details.

In Japanese, there are several other words related to the notion of space that have no equivalence in Western languages. Such terms which are also related to the architectural concept of space, are for example, *kûkan* and *en*.

空 *Kûkan* 縁 *En* 縁側 *Engawa*

From the 19th century on, the term *kûkan* was used to mean objective, metric geometric space in the Western sense. The first part of it, *kû*, means empty space, and the remainder, *kan*, in Japanese (also *ma*), means intermediate, so the meaning of the word literally means “empty space” or empty place. The word *en* can be translated by the word interaction, but it has several meanings depending on the context. For example, in Buddhism, it means the connection between cause and effect, or the law of *karma* (in Japanese *in-en*), and in the social context it can refer to a relationship between people. In Japanese architectural vocabulary, there is the term *engawa*, which means some kind of intermediate space, for instance an open corridor or a veranda. As an architectural spatial element, *engawa* relates to the Japanese layered space concept. Often a space between an interior and the exterior is called *engawa*. In English, the term “transactional space” has also been used.

In Japanese architecture, history can be divided into two distinct traditions: the Chinese style Buddhist temple architecture and the Japanese style profane architecture crystallized in the feudal era. The transition from temple architecture to the Japanese style has been described as a transition from a closed geometric space to a movement-oriented space.³² Special features of the Japanese style architecture are opposite to the Chinese style tradition, among others, asymmetry and irregularity. The communicative entanglement of the movement-oriented interior space and the exterior space has become a characteristic feature of both traditional and modern Japanese architecture and urban space.³³

The Japanese City versus the European City

Perhaps the most obvious way of thinking about the deep structures of the Japanese city is to highlight the features that separate it from a typical European city. One major difference between the Japanese and the European urban cultures is the idea of a city centre. The city centre is essential in European culture, while as an urban idea, or component, it is completely missing from the Japanese city. This applies to both the imperial towns built according to the Chinese model and the castle towns built in feudal times. In the *miyako*-type city the axial north-south main street was a central ceremonial lane representative of the imperial order. Likewise, the fortress in the midst of the Japanese medieval castle town was merely a central representation of the feudal system and shogunate power, with the mission of military defence – and not corresponding to the needs of the citizens and urban life, whether social or cultural. Temples and shrines were built here and there in the urban structure, often in peripheral areas.

The Japanese urban structure is multi-centred in its own way. The city’s various areas, the urban villages, form a mosaic map, where each area has its own local socio-economic identity. The centre has a different meaning in the Japanese context than in

the European city, where it has the task of gathering the citizens and maintaining the values of society.³⁴

In fact, in the European city there has always been a clearly defined centre built for the urban community and where the most important institutions, services, and monuments are located. Thus, the representative religious, administrative and cultural buildings are erected in the city centre, often in an artistic urban composition emphasizing their public value. In Japan, however, traditionally no squares or public monuments for the value of urban art have been built. Outwardly controlled urban forms or monuments that maintain historical memory are strange to Japanese culture. Japanese spatial thinking is completely different from its Western counterpart. On one hand, it is based on the Japanese concepts of space and the Japanese relation to nature in reference to Shinto and the open order of nature; and, on the other hand, to *oku*, as described earlier, as well as to the concepts of emptiness in Buddhist philosophy, which is also a strong influence on Japanese culture. Similarly, the centre of the city is “empty,” meaning it is unmarked and thus non-existent.

It should also be noted that in Japan space is understood as space-time but visually regarded as two-dimensional planes rather than as three-dimensional volume. Perspective is unknown in traditional Japanese painting, where depth is expressed in sequences with the aid of pictorial planes. Similarly, for example, the viewing point of the Japanese painting scroll changes in sequences as the scroll is opened. Kisho Kurokawa has described the Japanese relationship to space-time as follows: “At the heart of all creative manifestations of traditional Japanese culture there is a sense of two-dimensionality or frontality, an attempt to crystallize consciousness out of the sensual in frozen instants of stopped time.”³⁵

Reducing the sensual “tangible reality” of a three-dimensional space into an abstract two-dimensional space reflects, according to Kisho Kurokawa, the ambiguity and “synthesis of contradictions” characteristic of Japanese culture that he calls with the term “Rikyu gray”.³⁶ Examples include the fading of boundaries between different spaces and the allowance of opposites or alternative interpretations. In other words, reality is accepted as such with all its contradictions, but in symbolic representation, such as painting, it is reduced to fragmentary and sequential pictorial planes, the seeing of which gives the viewer a chance for sequential interpretation only.

Similar to traditional painting scrolls, Japanese architecture is characterized by a diagonal, or rotating, spatial structure that cannot be perceived at once from solely one place. When looking from a garden or passing through a series of spaces, the views and spaces or places unfold one by one, like the planes of images in painting scrolls. Structuring space in the way of “Rikyu gray” converts sculptural physical space into a two-dimensional space. This kind of aesthetic sensibility is considered to be one of the common characteristics of all Japanese art. The space is lived and consists of fragmentary parts. It is structured topologically, not according to geometric principles.

Certainly, the best example of a dim or gray space is the traditional Japanese street. The urban street scene is that kind of “gray zone,” a common ambiguous space of communication between the inhabitant and the city, between the private and the public that Kurokawa referred to. Through it, the Japanese sense of community and social commitment, but also privacy, exist simultaneously. In spatial terms this can be seen in cellular continuity and transformability, as well as in intermediate spaces, such as sheltered sidewalks, little alleys or, for example, verandas under the eaves, the

engawa.³⁷ According to Kurokawa, even the beauty of the Japanese street scene is so far only expressed in the special graying light of dusk.³⁸

The above-mentioned “gray” ambivalence is both a functional and an aesthetic characteristic of the Japanese street. The street space is likewise comparable to the painting scroll, the images of which unfold in sequences as two-dimensional planes to the viewer’s consciousness. Experiencing the traditional Japanese street scene as a series of images provided by semi-open facades covered with *shôji*, like laid in sequences of different views, is an aesthetic experience as such.

As already stated, in the Japanese city there are no squares or other urban artistic compositions in the European way. Instead, the basic urban component is the inner street in residential areas, primarily the walking street or the so-called *roji*, which also allows for social exchange but as an urban space has a meaning and functionality which is more multidimensional than the traditional European street.³⁹ In fact, the concept of *kai-wai* describing the Japanese street has the meaning of a functional space.⁴⁰ It means a flexible and vague urban space by its shape and boundaries and is usually a linear pedestrian area generated by human activity and motion.

In principle, all urban street space, i.e. exterior and intermediate zones between buildings, are *kai-wai* space whereby the interior and exterior spaces communicate with each other, and there is not necessarily any clear boundary between them. When the *shôji* panels of the houses’ street fronts are opened during local festivals and religious processions, the urban space expands inside.⁴¹ In fact, the street front of the *machiya*, the Japanese town house, is light and half-open even when closed. *Kai-wai* can also be a temporal phenomenon and movable as a procession because it is not bound to physical boundaries.⁴² In this way, the Japanese traditional street space is more of an event, a happening, than a geometrically or physically measurable space.

While the street is undeniably the basic component of the Japanese city, another cultural base is the private interior of a house, or you could simply say a home, where the basic intimate activities of life take place. Yoshinobu Ashihara has described how the fact that when entering a Japanese home, shoes are always removed from the feet, is of such a fundamental cultural significance that the Japanese city cannot be understood without it.⁴³ The question is first of all about the appreciation of cleanliness, which is a reflection of both Buddhist teachings and the Shinto religion on everyday life.

On the other hand, it is question of a life-style that at its best is reflected in the architecture of the traditional Japanese house. The floor and the ceiling are its basic elements; instead the walls are light and slide and have no structural significance. Horizontality is the dominant feature, while the floor is of vital importance. Since the floor is also used for sleeping and eating, its cleanness is the basic criterion of a Japanese home.

Ashihara’s thesis, however, goes beyond the description of trivial functionality. According to him the entire Japanese city or its residential areas are like a home’s annexes. By generalizing one could say that the home address means only a bedroom, as all other activities take place mainly in urban space, in streets, parks, shops, restaurants and so on. This is referred to by what Ashihara’s calls the “horizontal city” – or rather, he speaks of a “ground-oriented lifestyle” emphasizing horizontality and horizontal views,⁴⁴ which in its own way also supports the theory of “gray space” of Kurokawa. The concept of street as an ambiguous living space, or even as a living

room, is still a powerful factor in the analysis of the Japanese city. More generally, down-to-earth with importance given to the ground level is, in Japanese culture, symbolically the basis of all existence.

Some Remarks at The End

Japan and its capital, Tokyo, can be looked at two ways. For example, as seen from a train window, it appears as an endless heterogeneous urban carpet, a modern and confusing environment that, at first sight, is difficult to say whether it is beautiful or pleasant.

However, a deeper acquaintance with the country's culture and urban history opens a different view. Ethnically speaking, Tokyo is a quite traditional Japanese urban environment, with countless urban villages continuing the centuries-old tradition of local urban culture. In residential areas, there is an internal coherence and a sense of togetherness. By their scale they are usually small, often resembling rural villages with small houses and green plants.

The basic element of an urban village is the street, which above all is a space of activity and motion, the *kai-wai*-type of social urban space. The Japanese street is said to be a process. But it is also an extension of the home, as Ashihara has described in his analysis of the Japanese city. In Tokyo, like in other Japanese cities with a historical background, there is a cellular-type structure that grows and is renewed from the inside out, and whose shape is spontaneously formed from parts of continually changing components, without any externally controlled or predetermined form.

I have referred several times earlier to the fact how the Japanese way of thinking deviates from dualism and has led to fundamental differences in Japanese aesthetics in comparison to Western countries. This also explains the basic features of the Japanese urban space – the primordial significance of the street, the cellular urban structure, the city's centreless-ness and multi-polarity and the rapid urban change or instability. Such an ambiguous blend is typical of Japanese culture and the Japanese city. Philosophically speaking, the apparent chaos may in fact be considered an imitation of nature. In its own way nature is chaotic, but its structure is open and flexible; as is the Japanese city.

INTERCULTURAL INFLUENCES AND AFFINITIES IN VERNACULAR HOUSING ARCHITECTURE IN THE CYCLADES AND ATTICA

Abstract | The aim of this presentation is to contribute to the discourse regarding the notions that define the present and the attitudes towards the future of the “small” and vulnerable traditional architectural heritage –in contrast to the monumental heritage. In this respect, we shall examine a unique architectural element, which proves the absolute self-value of the distinctive forms which derive from the osmosis between different cultures.

Various intercultural factors determined in the past the local distinctiveness that occur in the anonymous vernacular architecture of the Aegean Sea and contributed to its diversity. Historic and social changes, and especially the Venetian presence, were decisive regarding the form of the houses in the Aegean islands, which is mainly characterized by the flat roof and the austere cubic shaped volumes. In some housing types, a stone arch supported the roof terrace, replacing the usually imported, long wooden beam – because trees on the islands are short trunked. This distinctive type of the “house with interior arch” is found in many islands.

Nevertheless, a variation of the same type appears in the Attica (a mainland). There, the use of the arch resulted in an ingeniously more functional arrangement of the interior, but, in contrast to the island type, it is not necessary for the support of the roof. The construction of the vernacular house was definitively interlinked with the locality of materials and of technical competency. Moreover, the quality of living space was affected not only by cultural elements, such as the *modus vivendi* of the residents but also by several extrinsic formative factors. In the places under examination, the different residing nationalities, contributed to dissemination of cultural elements, as well as technical skills, and thus, enriched the form of the then existing architecture.

In Attica, from 1418 onwards, the Arvanites, descendants of workers and soldiers, were allowed to settle, by the Florentine rulers.

In the islands, the presence of the Venetians since 1204, left a strong cultural imprint. With their technical expertise, they reinforced the local structural knowledge regarding stone arches and vaulting. The architectural typology of the house with the arch in the Attica constitutes a characteristic result of the dynamic cultural influences and the interactions between different architectural traditions. Additionally, it is an example of selection of those elements that improve space functionally, as well as aesthetics.

Index terms | *Attica traditional rural house ; intercultural influences; Aegean islands; vernacular architecture; stone arch;*

1. Introduction. The basic aims of the presentation.

The topic, pertains in the wide area of architectural tradition and encompasses both spatial and sociological concepts of architectural interest. It is a “de facto” obsolete topic while the interest in its essence has gradually decreased in our accelerated and fictitious world, where tradition, remembrance and even experience itself tend to be abolished as values. In addition, this theme relates to a minor phenomenon in authentic architectural tradition which survives in just a few examples.

Nevertheless, in presenting this topic, I shall have the opportunity of demonstrating that, with the simple tools of the Architectural morphology and Aesthetics, it is possible to discover works of the anonymous popular architecture which were not constructed within the norms of Art, but, those of a technique that does not always lead to Art. To give an example of how the architectural review, based on the localization of the composition’s principals determining the construction and on the essential elements forming its figure, can prevent the sterile dogma regarding of a folkloric tradition.

On a second level, and with the certainty that the past is a tool for understanding the present, we must underline the role of architecture’s historic dimension, and, undoubtedly, it’s obvious usefulness, not only as functional art, but also as a channel to interpret the world that it has itself created.

Within these parameters, we can examine a peculiar type of architectural phenomenon which verifies the above characteristics of architecture, whilst, simultaneously, is indicative of the absolute historical, sociological, aesthetical self-value of the peculiarities, which the co-existence of different civilizations creates.

What we have is an architectural mismatch built without aesthetic rules with the exterior looking like a shack (figure1) whilst its aesthetic qualities are all hidden in its interior (figure2). During its building stage, the priorities were to construct something functional. Its cultural value manifests itself afterwards.

In essence, in this house, we find combined, in a very particular way, the elements from the two distinctive architectural traditions of the Greek popular architecture (figure 3a,3b), namely: those of the “mainland” with their closed forms completed with roofs and those of the “islands” with open picturesque compositions. One of the most fundamental differences is the manner in which the buildings are covered.

2. The “kamarospita” (i.e. the vault-houses) of Attica.

The “kamarospita” were the manifestation of the pre-industrial architectural tradition of Attica’s agricultural areas and were built approximately between the early 17th and the end of the 19th century. During the above period, the population of the villages was made up of an amalgamation of: the original inhabitants, Turkish conquerors who became landowners and the “Arvanite” immigrants, whose ancestors originated from the Dominion of Epirus and the territories of the mountainous and infertile Arvanitia (South Albania). Their settlement in Attica’s strategic, agricultural and military regions was promoted by the French rulers and, as a consequence, by the Turkish landowners, in order to augment the economic and military power of the region.

The “Arvanites” adapted themselves¹ to the main economic character of the area and switched from cattle-breeding to farming, although many kept the tie to cattle-raising. They also kept many elements of the way of life and mentality from the place of

their origin, such as: rigid patriarchal norms, with their everyday lives confined inside enclosed family compounds² (figure 4) where the parents and the families of the sons (inheritors of the paternal wealth), cohabited, undervalued women's roles and scarcity of spaces for social gatherings. Amongst the Greeks and the few Turkish³ inhabitants of Attica, the "Arvanites" constituted a third social class of poor field workers⁴. As M. Collignon, describes : ⁵ "...they live many together in huts, they sleep on the floor wearing their working clothes, next to their animals, they eat, sitting in the middle of the room round the fire, from a kettle...".(figure 5).

Indeed, till 50 years ago there were existing homes where the family co-lived in direct contact with the means of production; the stable for the few animals, the wine-press and the storeroom. In the general characteristics of the structures, there is a relatively primitive view for the apportionment of the household. The construction is oblong (5-7 m), low (3-4 m high), on one floor with, sometimes, a two floor section called "Pyrgaki" (figure6). The construction of the house was plain with no artistic details or decorative elements. Offhand plastered, covered with a two part, low, simple made tiled roof, a few small openings, one or two narrow windows and two low doors – one for the inhabitants and the other leading to the stable for the indoor animals.

Exceptionally, in some villages of Attica, in the interior of this kind of house, the space is comfortable, the proportions pleasant and the "surprise" of one stone arch in the main living area of the house prevailed as form and altered the initial impression of the external appearance. Due to the existence of the stone arch, the space of the shack was impressively upgraded and appeared higher and diverse (figure 7).

The stone arch (i.e. the vault), is a pure support bearer (figure 8a.8b). with an opening of about 4 m and always constructed in the main living area of the house – in a few, it is repeated two or three times in adjacent spaces (figure 9). – along the large axis of the rectangular plan in order to act as the central support of the limited length beams of the roof and to enable the duplication of the surface's width⁶.

This supporting solution is to obtain sufficient space, to allow the coexistence of humans, animals and crops and to act dynamically upon the arrangement of the plan as well as in the form and the aesthetic quality of the area. With the insertion of the stone arch and the wall onto which it opens, they are creating additional rooms that can function independently (or can be easily isolated by dividers), whilst at the same time, the opening of the vault unifies the divided spaces. With the effect of the diligent construction as well as the geometric form of the arch, the space becomes more interesting as well as acquiring compound and extensive variety. Its borders become almost nebulous and its optical perception changes when viewed from different angles. The actual form of the vault: large, simple, and, simultaneously, strongly distinctive, enriches the place of the simple agricultural house and analogically bestows a certain feeling of luxury. (figure 10a,10b, 10c).

The vault houses are evolved housing forms from Attica's original settlements.

3. The islands based vault house.

In Greece, the distinctive "house with the internal vault" first originated from the Aegean islands (the Cyclades and Dodecanese) as well as in Cyprus (figure 11a). It combines the plain cubic volumes with the flat earthen roof that, in some instances, is supported by a stone arch, similar to the vault-houses in Attica (figure 11b, 11c.).

The stone arch (vault) which is used as a way of supporting the roof (figure 12), has a historic past and a wide use in the regions which suffer from water scarcity and lack of timber. This is known from observing the simple basic architecture of the desert zone, from Mesopotamia up to the countries of North Africa⁷. It constituted the basic form of Asia's Hellenistic-Roman⁸ formal monumental architecture as well as that of Byzantium which illustrated it as an example.

Thus, the constructional tradition of the vault and the creation of the Cupola was "born" and expanded extensively in the Mediterranean and in the Near East.

It is difficult to establish the exact starting point (both in time and in location) of the stone arched support of this popular building tradition either by examining the category of invented and studied solutions of the perfect technique which they made them accepted, or by examining in the category of the improvised popular constructions where they were completed.

The lengthy Venetian occupation of the islands (from the 13th until the mid 17th century), left strong cultural traces, and, of course, influenced the society of the islands.

From the cartography of the distribution of the stone vault in the Aegean Sea⁹, one can verify that the "Westerners" restored the customary arched constructive elements in local building practice, because even though, they were never ignored, they were previously only used in simple buildings.

The vault is a reinforced and enduring construction able not only to uphold the heavy earthen roof, but also the additional loadings which materialize as a consequence of its use as an open living space. It is also present in "mainland" Attica where it also supports a tiled roof, which, contrary to the earthen roof is not admissible. As the strain in the transversal beams is sensationally reduced, this makes the building of the vault for its support unnecessary (figure 16). This was an unusual exaggeration in popular architecture which states that the essential is served by rules.

4. Comparisons

The similarities between the vault houses of Attica and those of the Aegean islands are limited only by the presence of the vault and consequently, in the resulting form and quality of the space (figure 13). As to the general combination, the differences are substantial, as are, in addition, the differences of the social conditions and their influence on the way of living.

The inclining roof provides a different character and diverse analogies. It completes and "seals" the synthesis and through its shape, accentuates it visually, in contrast to the synthetic neutral "open" cubical volumes of those with a flat roof (figure 3a,3b) .

As to the social conditions: in contrast to those in Attica, the society in the Aegean islands is open, extrovert with a matriarchic structure and with the endowment of the females with at least one room in the disposable area of the family house.

These social customs, to a great degree, influenced the building formation, which was characterized by the density and creation of picturesque settlements, by the dynamic development and by an openness in the synthesis of the whole (figure 14). In the dense buildings, there were small open areas ("square"), stone bench and steps which constituted areas for social unions. The agricultural character of production is difficult

to discern due to the fact that the indispensable pack of animals was not kept in the house but was lodged in the outer perimeter of the settlements.

The island homes made available sleeping areas next to the spacious reception room, i.e. the parlour, which was an essential space for the islands social customs. In some types of houses, a stone arch engages the centre of the reception room, adding interest and variety to that space (figure 15). Its main purpose, however, was to form an in between support to the earthen roof's beams. It was, first and foremost, a *support element* that substituted the long wooden beam which was very rare and had to be imported to the waterless islands (figure 16)

The houses with vault in the central area were the homes of either townsmen or workers. Attica homes of that type, on the other hand, were adapted for the needs of a clearly agricultural/cattle raising population with no exuberant social life. The existence of a spare central indoor space in the house was a useful blend along with the co-habitation of humans, animals and (farm) products. The vault in this room, whilst adding both interest and variety, was not an indispensable support of the tiled roof's beam. This essential method of the construction process was both expensive and demanded building skills but was unmatched with the general construction of the farming vault house.

Attica as part of the mainland directly received the influences of the zone's architectural traditions which were augmented by the presence of the northern immigrants. Their influential role in the local architectural peculiarity of the vault-house is limited to social influences. Yet in the house models which they brought from the forest places of their origin, there were no localized samples relevant to the substitution of the wooden beam by the stone arch¹⁰. Nevertheless, as Attica is a peninsula in the Aegean Sea –seashore as is the meaning of its name - with cultural and commercial relations with the islands, it was also influenced by their architectural traditions. The presence of the stone arch in some Attica's houses refers to the Aegean islands and, indirectly, to the Venetians intermediate role in it's spreading. Yet Attica was not the conquest of the Venetians.

5. Conclusions.

The Attica vault house combines the construction methods of the islands until the roof and the "mainland's" construction practices for the formation of the roof. With this peculiar and original combination, a distinctive type of dwelling is created and leads to the meeting in Attica of the two major branches of the "diverged" Greek architectural tradition which derives from the Balkan area as well as from the Aegean. In a certain manner, it obliterates their set geographical boundaries and amalgamates their civilizations.

The peculiar architectural synthesis of the vault house with the tiled roof, appears in Attica in the "boundary" zone where the geographical and civilizing co-ordinates of the mainland and the Aegean Sea's areas intersect.

It is, therefore, logical, that the specific Attica house, should be the survivor of an older model with its origins in the Aegean islands. Its presence in Attica, probably also reveals an older identification of the architectural traditions of the two territories¹¹ (figure 17a, 17b). There is a great possibility, that the vault house which was covered with a flat roof, was later substituted with a tiled roof although the vault was kept for

both practical needs (the stability and the durability that it gave to the building, the functionality of the lay out) as well as a sense of the quality and the aesthetics that adds to the space and its integral existing form (figure 18).

This house in the first place is a sample of the selection and the survival of the architectural elements that upgrade qualitatively and aesthetically the space, as does the intensively peculiar intergraded form of stone arch inside the modest rural house of Attica.

“THE TACTILE VERSUS THE VISUAL” IN ARCHITECTURAL AESTHETICS: DEFINING THE LEVELS OF ANALYSIS IN ARCHITECTURAL DESIGN AND HISTORY

Abstract | Since the discipline of architecture is established upon a theoretical background intermingled with its history, architectural history and theory are integrated. The philosophical frameworks through which architectural historiography is constructed directly affect the methods by which the contemporary built environment is designed. Besides, the most characteristic aspect of architecture is that in any context it encompasses human life by being experienced through all human senses. Hence there is a strong reconciliation between architecture and aesthetics because “aesthetics”, which is considered in terms of its original meaning, stands for “sensuality” or “sensed perception”. Although this bodily experience of architecture relates to all the senses, since the 19th century, conventions of the Western history and theory have privileged visual assessment as a sufficient method for understanding space. Principally through visual analysis of plan drawings, historical examples of architecture have been categorized in accordance with typologies, periods and styles. Likewise, new buildings have been designed through abstract formal language of plan drawings influenced by the models derived from historical categories. Both activities recognize visual and mostly planimetric rules as the essential determinants of architecture. Starting from the second half of the 20th century, however, more humanistic views relying on empirical analysis, social context, human content and inductive understanding of space has started to challenge the determinist and deductive approaches of the past. In this change of intellectual climate, aesthetics has become an important field for reviewing architecture in tactile rather than solely visual terms and to conceive the built environment with respect to the human scale. By referring to relevant examples exhibiting how architecture is conceptualized, thought and practiced, this study aims to highlight the philosophical backgrounds of a critical and aesthetic review of architectural history and theory and tries to position the proposed level of aesthetic analysis with respect to conventional ones. The results of this study indicate that the theoretical, educational and professional conventions established by planimetric analyses of architecture constitute a preliminary basis for disciplinary knowledge upon which an aesthetic framework may be implemented. The most significant points made by this study are summarized as follows. From the viewpoints of architectural design and history, aesthetic framework defines the last and upper level of investigation which is enriched by means of interdisciplinary perspectives and when recognized as an upper level of investigation, critical and aesthetic analysis has the potentials for correcting the biased or erroneous points of the basic conventional assumptions.

Index terms | *architecture, aesthetics, visual, tactile, design, historiography.*

INTRODUCTION

This paper argues that three levels of analysis in design and history of architecture seem to be relevant when the historical background as well as the educational curricula regarding the discipline is taken into consideration. These levels constitute a sequence through which architecture is taught and architectural works may be researched and designed. Although their theoretical and methodological frameworks seem to conflict, they coexist in the mind of tutors, scholars and designers as layers of thought and therefore they form a sequence. Starting with the first layer, which is at the very bottom, a fundamental understanding of an architectural work is constructed in terms of basic design principles. Then the second layer contextualizes this intellectual construction of pure form within the discipline of architecture and associates it with disciplinary features such as structure, material, function etc. with regard to historical typologies and disciplinary conventions. The third layer opens up new perspectives to position the subject in a more comprehensive and interdisciplinary context. At this third level aesthetics of architecture has critical importance and it is the objective of this paper to unfold the significance of aesthetics within this framework. Of course, the above-mentioned sequence is not compulsory for every activity of design or historiography since most of the educational and professional and a considerable part of the academic activities are limited within the first two levels. I argue, however, that successful processes of education, research and design are caused by such sequences of thought spanning all of the three proposed layers.

THE PROPOSED LEVELS OF ANALYSIS IN ARCHITECTURAL DESIGN AND HISTORY

The proposed levels of analysis can be assessed from the viewpoints of education, history and design. These three constitutive fields of the architectural discipline provides a framework to assess each level of analysis. History is inextricably intertwined with theory and these should be reviewed together.

Level 1

The first level is purely formal analysis which relates to the principles of basic design. It is accepted that the knowledge of basic design provides the common foundations for every specialized field of design.

The first level, in terms of architectural education, is related with the 1st year course of basic design. As a heritage of early 20th century curricula such Bauhaus, basic design introduces the rules of pure form as common foundations of artistic fields. Therefore this level is inevitably common for the curricula of design fields. Almost all of the design programs start with basic design.

The first level, in terms of architectural history and theory, relates to formal analysis for comparing architectural works representing different historical periods. Many historical examples illustrate that successful design should conform to principles of basic design. Therefore such examples are approved by the criterion of basic design.

The first level, in terms of architectural design, sets up formal standards for commencing the design process. Traditionally architects think through drawing and this activity is underlined by forms and basic design principles. Harmony, balance, hierarchical rapports between design components, use of colour and texture are significant factors considered by architects during the design process. Therefore, architectural criticism may follow the same sequence since at first an architectural work may be evaluated

according to its performance regarding basic design. Basic design's compositional principles of harmony, unity, hierarchy, rhythm, modularity, repetition and variation are relevant essential criterion for criticism.

Level 2

The second level represents the association of the pure spatial composition of basic design with the disciplinary knowledge of architecture.

The second level, in terms of architectural education, is generally related with the last three years of a 4-year curriculum. The spatial compositions discussed in terms of basic design, are analyzed, during these years, as initiators of architectural spaces associated with functional programs, constructional materials and technologies, site characteristics and historical and urban context. This association requires basic professional knowledge conforming to the undergraduate degree. The design studio is supervised through studio critics producing a master – apprentice relationship which is a common heritage of the profession. Within this dialogue between the master (tutor) and apprentice (student) is realized through graphic communication based on universal professional conventions. Scaled drawings and models, which are abstractions of the projections regarding architectural solutions, formulate the vocabulary of this dialogue. The studio critics are based upon the discussion of the design problem and proposed solutions on an abstracted medium. Although projects sites are visited during the first weeks of the curriculum, the studio relies on abstracted projections of the model and the drawing rather than direct, in-situ and bodily experience of the context, materials and spaces.

The second level, in terms of architectural history and theory, relates to the contextualization of spatial compositions with regard to historical canon and typological repertoire of architecture. The term "canon" stands for "a general law, rule, principle, or criterion by which something is judged" and / or "the list of works considered to be permanently established as being of the highest quality"¹. Canon has been a prevalent organization principle in conventional architectural historiography inherited from the nineteenth century philosophical perspectives². The canon of architectural history as "the list of [so-called] highest quality buildings" representing different historical periods were thought to constitute evaluation "criterion by which [a given work of architecture may be] judged". Only a limited number of buildings satisfying the "high quality" standards of the canon deserve to be the subject of architectural history³. "Type," on the other hand, stands for a spatial pattern associated with certain form, function, construction system and historical period. This definition relies on the argument that the juxtaposition of form, function and structure is embodied by the "type". Introduction of architecture as an autonomous discipline has been based upon the assumption that "types," which are indeed generated by the "canon", construct the disciplinary subject matter of architecture.

The second level, in terms of architectural design, sets up disciplinary conventions of the design process based upon the above-mentioned historical canon and typological repertoire of architecture. Apart from specific interdisciplinary research on material technology and structural systems, of which it becomes an associate, the discipline of architecture hardly becomes a medium for inventions. Facing specific design problems within given sites, a great majority of architects refer to the historical types for adopting agreed-upon and already tested solutions to their own problems within certain building legislations. Implicitly they search for solutions approvable by the historical canon. The

canon and its constitutive types are conceived as individual “high quality” buildings placed on a chronological line. Canon in the practicing architect’s mind is the collection of separate buildings. This collection reminds the books standing on the shelves of many architectural offices. Generally these books are concerned with certain styles, “high quality” examples or illustrated biographies of famous architects.

Level 3

The third level represents the review of the disciplinary knowledge of architecture through critical and interdisciplinary perspectives⁴.

The third level, in terms of architectural education, can be realized, for the most part, in the scope of graduate studies or, into a limited extent, during the last phase of some undergraduate programs. The architectural compositions, discussed before in terms of the disciplinary conventions, are questioned according to their meaning and effects in social, cultural and urban context. Rather than abstracted projections of an individual building, this level discusses how the building should be integrated with its context, its performance in terms of in-situ and bodily experience of the designed spatial context and a detailed understanding of the tactile qualities of materials.

The third level, in terms of architectural history and theory, relates to the critical perspectives in these fields, which have been developed since the second half of the 20th century. These theoretical transformations led to the differentiation of architectural history from art history or the history of styles. Architectural history has been a gradually differentiating and specializing discipline by its discussion of the built environment as a part of cultural history. In his renowned architectural history survey Kostof speaks of “an environmental approach which is new to architectural history” where the “grand canon” is challenged and the building is thought “in a broader physical framework” since it “derives much of its character from its natural and manufactured environment that embraces it.”⁵ In this respect, “aesthetics” as the discipline of “sensuality” or “sensed perception”,⁶ plays an important role for the interdisciplinary assessment of architecture.

The third level, in terms of architectural design, is influenced by approaches trying to relate the design process with specific environmental, historical and social context rather than already established models of historical canon and typological repertoire of architecture. This approach can be exemplified by “critical regionalism” as referred by Frampton.⁷ Amongst Frampton’s six points which may constitute an “architecture of resistance” against the modernist disengagement between building and context, “the visual versus the tactile” becomes critical in terms of architectural design. In this framework the “object-oriented aesthetics of traditional theory”⁸ based upon isolation by privileging visual assessment is contested⁹.

CONCLUSION

As a result of this overview in terms of architectural education, history, theory and design practice, the first and second level of analyses, in terms of philosophical approach, is based on the enlightenment belief in absolute truth, Cartesian model for the conquest of space through graphic rationalization on paper, and in our time on the computer screen¹⁰, and consequently, intellectual construction disengaged from the experience of “place” and contextual realities of the building site. On the other hand, the third level of analysis, in terms of philosophical approach, is based on the

postmodern criticisms of the above-mentioned approaches. Consequently, it can be argued that “environment” as “physical – cultural realm in which people engage in all the activities and responses that compose the weave of human life in its many historical and social patterns”¹¹ becomes the underlying concept and “environmental aesthetics” as the philosophical study of environment in spatial design becomes an underlying philosophical framework of the third level of analysis encompassing education, history, theory and design practice of architecture.

AESTHETICS OF THE ARCHITECTURAL PHILOSOPHY AND/OR TRANSFORMATION OF THE PERCEPTION THROUGH THE PROCESS OF ARCHITECTURAL DESIGN

Abstract | The processes of perception of architectural design are determined by a number of different factors that influence the specific way of understanding the architectural design. For the purpose of understanding this phenomenon, the aim of this research will be analysis of different transformational potentials of the space, in relation to the specific processes of perception of architecture. In comparison with the dominant degree of determination of different, mechanical, formal, and program characteristics of architecture, the perceptual characteristics are unpredictable, because they depend on a number of subjective determinants, which are based on individual concepts and understandings of spatial characteristics. The model of change, expressed through a series of complex processes of perception, thus determines a conceptual framework through which we can observe architectural design process. One of the main objectives of the research is valorization and analysis of perceptual potentials, and examination of different models of change of perceptual characteristics within which the perception of architecture is transformed. It is important to mention the possibility of an unlimited number of different subjective interpretations, which emphasize the openness of the process of forming an impression about a certain space, and at the same time, it is positioning architecture in artistic discourse. The most visible contribution to this assertion is that visual perception of objects is never constant, but can depend on the position of the observer, or on changing atmospheric influences during the day and the year. This type of specific indeterminacy simultaneously suggests a deeper analysis of the conceptual frameworks under which the creative process takes place. After analyzing the theoretical framework, which will serve to determine the definitions and criteria for analysis, this research will use the case study methodology, where different buildings from the platform of contemporary architectural discourse are analyzed, through previously determined criteria. The research also seeks to analyze and determine the specificity of certain authors views on perception, i.e. the issue of authors thinking and decision-making in relation to perceptual processes, which will initiate a new field of knowledge in the domain of architectural discipline and the methodology of architectural design. In this way, it points to the key concepts that authors use in order to create variable perceptive characteristics of a specific architectural experience. By defining certain attitudes about the characteristics of space, through the subject of perception of architectural design, various varied, complex, and subjective impressions can be re-examined which are usually abstract and difficult to represent.

PERCEPTIVE CHARACTERISTICS IN ARCHITECTURAL DISCOURSE

Unlike the high degree of determination of different mechanical, formal, and programmatic characteristics of space, perceptive characteristics are unforeseen to a great extent, because they completely depend on a great number of subjective determinants which are based on the individual concept of the comprehension of spatial characteristics. Perception¹ refers to general sense with a subjective process through which man becomes aware of his environment based on gaining different information through senses. In the context of deliberating the perception of architecture, this process is formed through the interaction of space and users. Sigfried Giedion points out two tendencies that are highlighted throughout history in the context of experiencing architecture, the first directed towards rational, or geometric, and the other directed to irrational i.e. organic (Gidion, 1969: 267). In that sense, the perception of architectural form cannot be completely perceived as a certain process, because of the dialectical relation of real and virtual i.e. concrete and abstract. That process is sublimated through the perception of architectural work in the context of the environment, as well as through complex synthesis of former experiences and cognition (Vasilski, 2013: 6).

The position of rational in the perception of architecture, as expounded by Nelson Goodman, starts from the most general stance that architecture, as well as natural sciences, deals with the way the world was created, populated with subjects and objects, by which "the way" is always historically determined (Goodman, 1978: 15). Adding to this stance, Antoine Picon implies to a relation between the subject and its environment, by which architecture is one of the fields in which this relation is defined, primarily in the domain of created environment. It is noticeable that in certain historical processes this relation is more meaningful and productive, and Picon links it to those periods when architecture and other natural sciences contributed to the creation of a specific system of the perception of the world (Picon, 2003: 294). The way of observing and the idea of the environment primarily relates to the environment as a cultural category. This stance could be confirmed with the interpretation of Michael Baxandall that life in culture means getting the senses used to specific spatial relations (Baxandall, 1985: 81-104).

It becomes obvious that the concrete spatial experience is the result of complex cognitive process and it is related to the profound deliberation of not only visual but different sensual characteristics of space. This complexity is not only caused by influences of different stimulative processes, but their understanding and the flow of time. In the context of deliberation of principals of transformation, perceptive potentials will be valorized i.e. the models of change of perceptive characteristics that transform a specific experience of architectural objects.

THE POTENTIALS OF TRANSFORMATION IN ARCHITECTURAL AND ARTISTIC DISCOURSE

In relation to the general context of research, determined by a continuous model of change, the concept of transformation can be understood through its basic meanings such as conversion, transformation, alteration, re-shaping. Through various interpretations of the above meanings, it can be said that the term is of a multiple character, which

1 „Perception“ (lat. perceptio) psychology: observation, observe, wide range of mental processes that are directly caused by sensory stimuli. (Вујаклија, 2002: 697)

allows it to be used in different contexts. In architectural discourse, this term is also interpreted in a twofold manner and can refer to the mechanical transformations of the form, as well as to various functional or perceptual characteristics. In the context of research, it is very important to note the potential of transformation in the domain of various artistic practices. In this sense, the most obvious example is the different types of spatial installations, since they transform the space in a twofold manner, but also the perception of observers (Bishop, 2005), (Rosenthal, 2003). If we look at transformation in the context of erasing the boundaries, the performance as a form of action art is also significant; it is a consequence of linking the specific synthesis of the theater, rituals, and art, because it is not precisely determined and defined, and constantly eliminates the boundaries between the artist and the audience. Performances affirm actions, movements and processes, and change as a constant. Action painting, the style of modern abstract painting, with a specific method that helps splatter the paint on canvas in an automatic principle, and emotions are expressed through non-subjective forms, produces unforeseen results with production color, whereby the canvas becomes the action surface of transformation, and the image becomes a product of a dynamic process. It is important to point out that the principle of transformation exists only in the part of the creative process.

Reiser and Umemoto make an interesting analogy with architecture, where they contemplate the paradox of permanence, where the content and program of each image remains the same forever, while architectural works must relate to the eternal changes in user requirements, which is a significant claim for the context of this research. (Reiser + Umemoto, 2005: 33)

What is essential in the context of the development of dynamic concepts in architectural discourse is that the works of various artists are within the Futuristic movement. Through his sculptures, a prominent Futurist artist Umberto Boccioni expresses ideas about dynamism, by joining sculpture with the immediate environment. In the artistic works of Futurist artists, mobility is shown through the repetition of the frames, the permeation of the form, the dynamics of the movement, vigor and dissolution of colors. Besides the analytical and optical impression that is characterized by mobility, the introduction of perceptive experience through this concept is also important (Linton, 2005). In relation to the consideration of the transformative potentials of such techniques, the affirmation of the environment is shown dynamically, and not statically, which simultaneously transforms the specific perception.

THE PRINCIPLES OF PERCEPTUAL TRANSFORMATION IN ARCHITECTURAL DISCOURSE

The principle of perceptual transformation in the architectural discourse is affirmed through the theme of movement. The transformative potentials of the movement in architectural design, that is, the idea that the user creates an impression of space changeability through the movement, appears in the 18th century, and it was also confirmed at the beginning of the 20th century by Le Corbusier by introducing the “architectural walks”, where the movement through the object suggests a change in the experience through the shift of different frames. The theme of framing in the context of the transformation principles is significantly related to Cubist experiments, i.e. by abolishing the perspective and relativizing the reference points of observation of the object, thus creating a polygon for creating spaces corresponding to a different

perception. The influence on architecture can be seen precisely through the themes of personnel, where simultaneously represents the interior and exterior of the building. This theme has been developed in the course of the 20th century in various ways, from the creation of various plans that show the layers of space, to various framing techniques that reveal the complexity or hidden characteristics of space.

Kostas Terzidis, explaining the notion of kinetic form, adds that movement is an act or a process that changes the position or place over time, and that the motion involves the temporal component that represents the unit of change (Terzidis, 2003: 33). Starting from similar definitions, Greg Lynn points out the need for systemic capturing of time and motion when defining the form, identifying a cinematic model when speaking of movement indication in architecture. The cinemactical model implies the multiplication of the static film sequences to simulate the movement, so that by using the set of frames shown, a certain memory of the form is created, which is spatially and temporally simultaneous. That is, an idea about architecture is being built by constructing the temporal component through the memory of time (Lynn, 1999: 11). Rivka Oxman identifies the same technique of displaying the transformation process on the architectural object, through a sub-category of the design process that she calls dynamic design. It is based on animation, morphing and similar techniques² that are based on the display of multiple isolated images over a certain period (Oxman, 2006: 251).

In the first half of the 20th century, theories related to the perception in architecture rely on the theory of Gestalt - the psychological discipline developed by German psychologists. Gestalt theory describes the process of visual observation as a process in which visual elements of perception are perceived in a group, that is, the process of observation includes the context. In architectural discourse, the Gestalt theory develops a phenomenological approach through the perception of objects, their interconnection, and the connection with the environment. In general terms, phenomenology refers to examination or study of human experience and descriptions of different phenomena that people experience like objects, situations or experiences that can perceive through all senses, that is, its goal is to examine and recognize knowledge (Seamon, 2000). In this sense, in the context of the research, the phenomenon of the space, light, color, environment, places, materials, from the position of the variability of these characteristics aiming to create a specific experience which influences on human senses. It is particularly important to consider the correlation between the object and the environment, through materialization and atmosphere in order to transform the user's subjective experience of this connection.

In the complex process of perceiving the architectural work, the visual experience is certainly the most dominant. Steven Holl in the book "Questions of Perception. Phenomenology of Architecture" affirms the potentials of architecture that relate not only to the visual experience but also to the simultaneity of experience through all senses. In theoretical settings, Holl insists on the phenomenon of perception, which he uses to unite the interior and exterior of the building. He interprets the external

2 The morphing technique in architecture has its predecessor in fine arts, where Charles Csuri made the first digital images in 1967, and then animations using Fortran software on the IBM 7094 computer. Csuri experimented with vector image transformations that we recognize today as morphing. Janice M. Glowski, Charles A. Csuri, *Beyond Boundaries, 1963-present* (Boston: SIGGRAPH, 2006), 32-33.

perception as intellect, that is, the idea, while the internal perception is realized through sensory experience, a phenomenon. Although for Holl the complete experience of the architectural work is reflected in the unity of concept and feeling, or the interweaving of the idea and phenomenon, it is important to note from the standpoint of this research that the transformation is most often done from the outside to the inside, with evident influence on the internal organization of space.

Rudolf Arnheim also points out the syntheticity of all sensory processes, which in the context of a true experience of architectural work is indispensable (Arnheim, 1990). Pallasmaa further explains this through the assertion that the way of experiencing the architectural object cannot be perceived as the sum of isolated visual images, but simultaneously in relation to the spiritual presence and the materiality of the notion. In the book "Eyes of the Skin", Pallasmaa also examines the concept of multisensory experience, and states that the eyes in collaboration with the body and other senses create the most dominant experience of space (Pallasmaa, 2007: 44).

In the context of considering perceptual potentials, a significant factor is the specific materialization, i.e. how the use of various materials influences the transformative characteristics of the space experience. The transformative characteristics of specific materials are expressed through interaction with the light that enables them to be dynamic, in direct relation with materials, and allows the detection of color and surface, thus creating the expressive character of the object (Vasilski, 2013). In the context of the research, it is important to highlight the potential of natural lighting that, through its variability, or the period of day, generates a series of transformations depending on the character of the material, its reflectivity, transparency, color, texture, etc. Apart from the dominant visual experience of materiality, it is also important to introduce a tactile experience, that is, the use of different textures aimed at perceiving additional information that creates a complete mental image of space (Pallasmaa, 2007). Merging different types of materials further generates different perceptive experiences. In this context, Peter Zumthor discusses the compatibility of materials through their encounter, which creates an unexpected and unique experience. It introduces concepts of tangible, odor or acoustic properties, above compositional characteristics, as language elements that produce specific effects and are always used differently depending on the context and concept (Zumthor, 2006). Considering the transformative characteristics of the materiality of architecture, Jean Nouvel sees the abolition of materiality as a potential through which the architectural work points to the existence of certain effects that are impossible to see. He affirms the notion of dematerialization as a defect that guides the perception from material to intangible. In the context of design, he tries to create a space that is not obvious, but it represents a mental extension of what we see (Baudrillard, Nouvel, 2008). What is essential in accessing materials as instruments of expression of immateriality is the perception of architecture as a variable category, at a higher, artistic or metaphysical level.

In the context of the digital paradigm, the application of different technologies develops complex, variable characteristics of the material, and effects can be generated that affect the perception of objects. Digital media through the processes of various cinematic procedures such as projections, or creating multisensor spaces, also affect the development of transformative potentials. In addition to that, using the developed

digital technologies, there is a spectrum of opportunities to develop the morphology of objects that have a completely specific visual character. Nature and organic forms become a metaphor for generating new forms, whose perceptual characteristics become part of a transformable process that develops in parallel with the evolution of form and function. Introducing the concept of moving geometry, Lars Spuybroek explains that using the interactivity of architectural structure can achieve an adequate level of perception and human movement. Spuybroek represents mobile geometry with a term that does not refer so much to the shape of an architectural object, but rather to the relationship between the interactive structure and the human body in it, which is under the influence of digital technologies (Spuybroek, 2008). In the essay “It and I: Bodies as Objects, Bodies as Subjects” Karen Franck alludes to the potentiality of incorporeality when speaking of visually saturated spaces that exclude other human senses and create a break between body and space. This introduces the subject of the body’s relation to the spatial emptiness in which it is located into consideration, where the experience of space in the context of the position of the body in it is fundamental for this research.

Summarizing the shown principles of perceptual transformation, the key concepts that affect the change of perceptual characteristics of specific experience in architecture are noticed (Pantović, 2016: 61):

Framing

- Directing the viewer’s vision

Fig. 1: Diagram 1. Framing (Author: K. Pantović)

Plans

- Space succession
- Stratification

Fig. 2: Diagram 2. Plans (Author: K. Pantović)

Phenomenological approach

- Atmosphere
- Materialization
- Light

Fig. 3: Diagram 3. Phenomenological approach (Author: K. Pantović)

CONCLUSIONS

The processes of perception in architecture are conditioned by a number of different factors that influence the specific way of understanding the architectural work. The most obvious contribution to this assertion is that visual perception of objects is never constant, but can depend on the position of the viewer, or, for example, of variable atmospheric influences during the day and the year. Technological innovations, the development of new media, the virtual space, represent new elements from which the spaces are constituted. By developing the paradigm of digital and new building technologies, the perception of objects through motion has gained significant contemporary interpretations (Jormakka, 2002). Ephemeral phenomena that arise in the collaboration of technology and new design techniques also transform the visual and sensual perception of space. The perception of an architectural work arises in the interaction, between the various factors user-object-nature-technology. By defining certain attitudes about the characteristics of space, through the subject of perception of architectural creativity, different variables, complex, and subjective impressions can be re-examined which make it abstract and difficult to represent. The observed principles of perceptual transformation of architectural structures have shown that the notion of transformation on architectural works, apart from pointing to the use of certain design methods, also shows the wider context in which architecture contributes to the creation of a specific system of perception of the world, but insists on the flexibility of a structure that can be a subject to easy changes dictated by the moment.

Ksenija Pantović, is an architect, educator and author. She holds Ph.D. degree in Architecture within the field of Architectural Design and Contemporary Architecture (2016). She is an Assistant Professor at the University of Belgrade – Faculty of Architecture, where she is involved in architectural design courses, as well as in several scientific research projects. She is the author of more than 30 scientific papers in reputed journals and publications.

Maja Dragišić, Ph.D., is an architect and teaching assistant at the University of Belgrade - Faculty of Architecture, participating in several design studio courses, as well as in the wide range of seminars and workshops. Her research interests lie primarily in the field of contemporary architectural design, exploring methodologies of deformability in architecture, specifically the influence of topology and higher geometry in adaptive design strategies. Her research work is highly practice-based, since Maja Dragišić is one of the founder of Spring Studio, Belgrade based architectural group focused on conceptual and main architectural projects. As part of the team, she developed specific design approach, based on the exploration of new experimental spaces and promotion of architecture as complex social system. Through participation in architectural and urban design competitions and exhibitions, her work was several times rewarded.

CENTRIPETAL URBAN FORM AND SPATIAL EXPERIENCE AS EXAMPLE OF MILAN

Abstract | The cartography is the outcome of space aesthetic in human history. The oldest known city map is preserved on clay tablets from Babylonian city of NIPPUR about 2300 BC. With the development of regional difference and cultural difference, from the old maps we could see that the form of cities appears diverse. The form of Milan is centripetal from antiquity so called Mediolanum. From middle ages to Napoleon period, both religious power and imperial power constantly strengthen the trend of centralization. For instance, the Great Plague brought the Black Death, the Duomo di Milano become the highest point in city center, which symbolized the power of faith and spatial orientation. The church and square are the most important open space for public activities in each parish. Outdoor activities influence the lifestyle from Kingdom of Italy to now. Industrialization promoted urbanization, new districts were planned by the road extension of the old city. a large number of square blocks improved urban efficiency. Because of the preserved centripetal old city, roundabout solve the non-ninety-degree angle problem of each block. Although with the expansion of the urban scale, single center becomes a multicenter city, skyscrapers replace the Duomo to become new directional landmark. The centripetal urban form still exists and enhance the directivity. Cities are the artificial artworks by accumulation of civilization. The urban aesthetic refer to the user experience of spatial orientation within the built environment. Kevin Lynch presented the five elements in his 1960 book <The Image of the City>: Paths, Edges, Districts, Nodes, Landmarks, he also defined wayfinding as “a consistent use and organization of definite sensory cues from the external environment.” Compared with the grid urban form with non-central development such as Xi’an, the centripetal urban form provides democracy of individual activities in contemporary society. On paths, centripetal urban form has graded road system, the shortcut always leads to the city center. On edges, blurred and intersective edges are flexible for accessibility. On districts, non- square blocks reduced the walkable circumference and urban unit scale. On nodes, nodes have different forms such as station, square, roundabout, which become multiple functional public space such as weekly mobile market. On landmarks, orientation depend on relative direction towards to city center through spatial experience, not absolute pointing like compass.

Index terms | *Milan; Historical cartography; Centripetal urban form; Spatial elements; Built environment; Spatial experience;*

INTRODUCTION

“We shape our buildings, and afterwards our buildings shape us.” -- Winston Churchill

City is the memorial organ created by human being, which contain the accumulation of civilization. The cartography is the outcome of space aesthetic in human history to reflect some aspect of the city, especially the spatial characteristics of one city.

The form of Milan is centripetal from antiquity so called Mediolanum. From middle ages to Napoleon period, both religious power and imperial power constantly strengthen the trend of centralization. For instance, the Great Plague brought the Black Death in

mid-century, the Duomo di Milano was built to become the highest point in city centre, which symbolized the power of faith and spatial orientation.

The figure 1 shows orographic and picturesque panorama of Milan with the Duomo di Milano located in the centre. Space is a concentric circle to extend from centre to surrounding (buildings/ cities until mountain). It is not a precise map with legend and compass, but the cartography is a reflection from human aesthetic. Before, the aesthetic created by scientists/ architects or artists. In contemporary society, the aesthetic belongs to personal spatial experience.

Through fragments of historical urban development, comparing the contemporary urban space, the change of urban aesthetics will be seen.

FRAGMENTS OF URBAN FORMS OF MILAN

The city itself is a museum with huge amount of spatial information. With the time goes, that spatial information shapes the urban aesthetics. Milan is one of cities like this in the process of transformation, which inscribed in the long-lasting opposition against the contingency of planning proceedings. Between 'real city' and 'possible city', we could see the population expansion/ industrial upgrading/ transportation system/ public activities and so on. Urban space gets involved in process of dialectical solutions.

The city of Milan started from Celtic period about 600 BC, it has been a huge change in 2600 years. Except several ancient roman heritage remained, most urban space had been built from 1800. However, as we know in the design of Leonardo da Vinci, the layout of urban form of Milan has originated from the geometric prototype.

Against to comprehensive homogeneity, we try to discovery the spatial character by history of urban development. Now for central areas, the projects are almost all on a small building scale, with themes of urban regeneration, on the other hand on urban scale, the tendency of large projects remain the existing structure, cancelling the differences. Through the recognizing the urban form in history, we could understand better about the spirit of urban aesthetics how we face to current design practices.

In different phases of urban development, the city of Milan has different topic. We focus on road structure establishment/ population expansion/ railroad network reform/ factory prosperity and multiple functions to show how the urban form is generated.

Road structure establishment

Giacomo Pinchetti, former draftsman of the bureau of census, and subsequently work for the press 'Lombard Territory' of the Astronomers of Brera, gave his first version of the Milan plan to the press in 1801.

The figure 4 map declares itself 'a plan for the reorganization of the entire city', rectifying and aligning existing streets and opening new ones on the model of the new north-west to south-east on the Sempione-Ca'Granda axis, now it is the road from Lanza to Garibaldi connecting with Corso Porta Romana running out to the via Emilia. Radial roads and concentric ring road (bastion) form the urban structure. Extremely accurate and precise in the representation of the blocks and individual buildings in the map were conducted by Giacomo Pinchetti. However, the castle area was a new project for the Foro Bonaparte: a new large urban and territorial scale structure, in the form of a crown around the castle, destined to host the new services of the bourgeois

city, according to the revolutionary principles brought with it by the French. Finally, not realized, at the fall of Napoleon, the project of the Forum will be cancelled by Giacomo Pinchetti in the next edition of the 1808 plan, with a faithful reproduction of the Castle and the surrounding areas in its place.

From the map we could see, early industrialization promoted urbanization, new districts were planned by the road extension of the old city. a large number of square blocks improved urban efficiency. Because of the preserved centripetal old city, roundabout solve the non-ninety-degree angle problem of each block. Thus, the road establishment confirmed the basic urban form structure.

Population expansion

Numerous interventions determinant for future city lay-outs were carried out between the mid-century and 1884.

Figure 5 was published in 1885, for the types of Ulrico Hoepli, a book on the main urban transformations that took place in the city following the Unification of Italy and the consequent entrepreneurial development. technical-scientific of the capital.

The volume attaches the plan of Bignami Sormani which highlights in carmine, with the layout of the railway circle, the newly built neighbourhoods, some infrastructures of service, such as the panoptic prison of San Vittore, the Monumental Cemetery and schools, as well as the first real estate operations: first the Galleria Vittorio Emanuele and the neighbourhood built on the ashes of Lazzaretto.

In 1884, the population of Milan numbers 214000 with an additional 108000 residing in the outlying communes. The town planning scheme with expansion envisaged. Foreseeing a population increase to 526000, necessitating urban expansion from the 8 km² within the bastions to the approx. 28 km² of its new boundary lines.

The engineer Cesare Beruto drafted two versions of Milan plan in 1884 and 1894 (figure 6). The basic hypotheses of the 1894 are concentric expansion of building fabric contained by an outer ring road 40m wide and 18 km long. A new network of large street blocks 200-300m per front, varied in function (residence, service, production).

We could see that the concept of ring road (Circonvallazione) is a valuable way to connect old town texture and modernity of new urban expansion. And it is the prototype of urban form of Milan today.

Railroad network reform

With an increasing housing demand, the new master plan drafted by Pavia-Masera is launched (1911). Angelo Pavia and Giovanni Masera stretches the net of its predecessor by a further 22 km² (tot. 50 km²) while retaining its lay-out and formal structures. It hypothesizes a further population in take of 560000 persons.

The figure 7 does not only respond to the increasing demand for new housing facilities, but it also stands out for its intention to reorganize the transport infrastructures (the "Infrastructural Chart of the City").

This plan contains the moving back of the Central Station. The railroad network is for the regional urban railway instead of only city centre, built in Lombardy between the

nineteenth and twentieth century, makes Milan a polycentric city as figure 8 shows. The growth of Milan and of its surrounding municipalities corresponds to the overall growth of the entire region, and its highest increase is registered in the ten years between 1901 and 1911: The city and its surroundings account for 260,000 inhabitants, while the Lombardy region's population rises from 4.3 to 4.9 million. The polycentric urban network was already a thousand-year-old, when the industrialization of the region made area surrounding Milan as a whole, the "regional polycentric city" aimed at transforming it into an industrial metropolis centre in Milan.

So, the urban form was influenced by the development of both Milan and region. Railroad network enforce the centripetal form constantly.

Factory prosperity

Consequent to the expansion of city boundaries in 1923 (from 76 km² to 184 km²), in 1926 a competition for a new town planning scheme was held and won by Piero Portaluppi and Marco Semenza. The figure 9 envisages urbanization of 170 km² and capacity for a population intake of 3650000 (as compared with the existing figure of 1 million, rising to 1280000 in 1953 and 1738000 in 1976). We could see that there are all the large areas of social housing, first Quarto Oggiaro and the Gallaratese, while the new areas (Affori, Niguarda, Bruzzano...) are still very distinct from the city.

The industry promoted the bloom of population, especially during the World War I and World War II. For example, the ex-Ansaldo factory was built between 1904 and 1923, a time of dramatic growth in heavy industry. The factory started out as a mechanical firm before being bought by Ansaldo in the 1960s, which is when the production of engines, train carriages and tramways began. The transformation that the production system underwent in the 1970s resulted in many factories being abandoned, with whole factory lying empty. Now it is renovated to the BASE, the most important event site during Fuorisalone in Tortona district.

Multiple functions

With the diverse industries, Milan appeals for planned reconstruction of the city. function subdivide the area into zones. In 1950s, its basic tenets of city territory are tripartition into a zone subject to a building code embracing the built city almost entire, the figure 10 shows the 'Racchetta' in the central area creation, structuring of the transit system based on two serviced axes interlocking at Porta Volta

Until now, the economy enforces the fragments of urban space. The cultural economy such as Milan Design Week/ Milan Fashion Week and so on rediscovery the urban space. The urban form of Milan stops outward expansion but area renewal and urban regeneration. Spatial subdivision is enlarging the individual activities space instead of changing the centripetal form.

CONTEMPORARY URBAN FORM OF MILAN

The centripetal urban form still exists and enhance the directivity. Cities are the artificial artworks by accumulation of civilization. The urban aesthetic refers to the personal experience of spatial orientation within the built environment in contemporary society.

"In fact, from the point of view of the city as a whole, there is a remarkably interesting proposition in the Image of the City: 'The paths, the network of habitual or potential

lines of movement through the urban complex, are the most potent means by which the whole can be ordered'. Compared with this network, he adds, the 'edges, districts, nodes and landmarks' are the 'design of other elements.'"

Kevin Lynch presented the five elements in his book <The Image of the City> in 1960: Paths, Edges, Districts, Nodes, Landmarks as figure 11 shows, he also defined wayfinding as 'a consistent use and organization of definite sensory cues from the external environment.

These five elements do not only stand by personal perspective to understand the images of city, but also for researchers to study urban issues in a scientific way. In my opinion, using five elements to rethink urban form help us understand space configuration better. As focusing on the personal experience in flexible and changeable urban space, we take an example of an area (Largo Claudio Treves) in Brera district during Milan Design Week, as we can see from figure 12 and 13.

Urban analysis

Largo Claudio Treves is a small square in Brera district. There are five paths in different direction. It is residential area around this square, but during events public space extend to private space such as courtyard of block. So, on the ground floor activities blur the boundary of private and public. On architectural scale, the urban space is also centripetal form.

On paths (figure 14), centripetal urban form has graded road system, roundabout oriented lead to the movement of people (pedestrian/ bicycle/ cars). Indeed, the radical road network in old city is quite different from the metric blocks outside the ring road of Milan, but the main street extended from city centre become the axis of new blocks such as Viale Zara/ Via Gioia/ Corso Buenos Aires and so on. The form of Largo Claudio Treves is the epitome of the whole city, which is the aesthetic of Milan.

On edges (figure 15), blurry edges are flexible for accessibility. Along the street around Largo Claudio Treves there are full of stores. The edges are resiliency boundary for public, especially during Milan Design Week.

On districts (figure 16), Because of the elastic boundary, the courtyard inside block provide more possibilities for spatial extension and longer route for experience. For instance, at the south side block of Largo Claudio Treves, the courtyard is always held activities for brand BOFFI.

On nodes (figure 17), nodes have different forms such as station, square, roundabout, which become multiple functional public space such as weekly mobile market. Duomo di Milano is a kind of roundabout, here it is the same. the concept of roundabout is normal in Italy. Roundabout is an effective approach to solve the traffic diversion, meanwhile it is the open space for multiple activities.

On landmarks (figure 18), orientation depend on relative direction towards to city centre through spatial experience, not absolute direction like compass. In city centre, you could always see the top of Duomo di Milano before urbanization. However, now lots of skyscrapers are built on the node between blocks. Maybe people cannot recognize the north side, but they won't get lost with relative position. For instance, the north side street point to Unicredit tower which is the highest point in area Garibaldi.

The image of Milan

Comparing the figure 19 and figure 20, we could find what the flexible boundary of urban form looks like and how centripetal urban form influence personal experience. The image of Milan is not the imagination from architects, it is generated by each person. Afterwards to diverse images from public, the centripetal urban form of Milan is still enforcing the feeling of urban space.

The more important is the form of urban space delivering the information, the process is also a kind of urban aesthetic excepting the form itself.

CONCLUSION

Figure 21 is the draft drawn by Le Corbusier, which embody the centripetal form of Milan.

To sum up, looking at contemporary urban issue by learning from history is an approach to study urban space. The centripetal form of Milan embodies three aspects: regional scale/ urban scale and architectural scale through history until now. The morphological continuity reflects the identity of urban development of Milan, and the process of spatial accumulation is the unique spatial aesthetic of the city.

AESTHETIC ISSUES ON USING DIGITAL MEDIA AND DISPLAY IN ARCHITECTURAL HERITAGE PROTECTION

Abstract | This paper analyzes and arguments three perspectives on aesthetic issues on using digital media and display in architectural heritage protection. First, aesthetic experience of traditional architectural culture on using digital media and display in architectural heritage protection. The priori aesthetic experience of audiences for traditional architecture, should be considered during exhibition design. Second, digital technology enrichs means of presentation, objectivity of content should be valued as well as artistic charm and aesthetic intention. Third, virtual technology brings immersion to promote pure aesthetic experience.

Index terms | *Aesthetic issues; Digital media and display; Architectural heritage protection; Relationship between technology and aesthetics; Aesthetic emotion, aesthetic ideals and aesthetic experience and aesthetic value;*

INTRODUCTION

Nowadays, emerging digital technologies like three-dimensional laser scanning technique, digital photography, virtual reality, network technology, computer animation, and database technology are gradually being used in architectural heritage protection and display more and more often, hence, more and more scholars started to rethink and survey from aesthetic aspect, especially centered on these two issues: First, is there new aesthetic experience being triggered by digital technology? Second, is this new form consisted of technology, culture and art contribute to aesthetic experience of traditional architectural culture? This paper will discuss on issues above.

1. Digital display of architectural heritage

In digital protection of architectural heritage, two aspects were involved in digital display of architectural heritage, one is theory and methods of architectural heritage protection, second is digital media technology and computer graphics.

First, from the perspective of architectural heritage protection theory, the system of its theory and methods has already obtained significant development on perfection of laws, ideology, criteria and evaluation system. During protection on ancient architecture, historical site or relics of modern times, representative buildings, stone cave temple, and stone inscription that identified as architectural heritage, aesthetic and artistic value should be emphasized other than historic, scientific, social, cultural, functional, and authentic value.

For example, The Burra Charter(1999) indicates that aesthetic value should be highlighted in preservation work, and especially different from artistic value, but more concentrate on sensory perception, including appeal of dimension of vision, smell, and

auditory sense. In the Venice Charter(1964), “ The process of restoration is a highly specialized operation. Its aim is to preserve and reveal the aesthetic and historic value of the monument and is based on respect for original material and authentic documents.”¹ In addition, in Criterion for Cultural Relics and Historic Sites in China which was enacted by ICOMOS China, also affirmed artistic value of cultural relics as significant value, and explained that “artistic value of cultural relics means its function of witness of art, aesthetics, typical styles in particular periods that created by human being.” ² Based on protection concept above, in preservation and restoration of multiple architectural heritage, “artistic restoration”, which is protection measure based on evaluation of historical critic and meanwhile aims at reconstruction of aesthetic quality, has always been a sort of significant methods of restoration.

Second, digital media technology and computer graphics is being used more and more frequently in preservation, display and recordance of architectural heritage, on account of physical limitation of which. During this process, first step is data collection and measurement of the original architectural heritage, second step is 3D modeling, other ways of digitization and representation based on original data. Digital presentation forms includes text, audio-visual materials, digital art, video games, VR, image, internet, scientific analysis, and research statistics. Along with the improvement of technology, the technique for data collection became more and more efficient and precise, presentation more diverse. Especially digital technology nowadays can unify all kinds of presentation and service including voice, data and image on one technology platform, collect all user facilities, and provide more value on publicity and display.

Since digital presentation of architectural heritage is oriented towards to the public, it has to be educational. Therefore, besides transmitting information that consistent with objective fact in digital display of architectural heritage, inspiration of intuitive feeling from the audiences on appreciating aesthetic and artistic value should also be considered.

2. Traditional Architectural Culture and The Priori Aesthetic Emotion

In regard to digital exhibition of architectural heritage, even though the method is digital technology, the core content that of great importance is architectural heritage itself, the aesthetic connotation of architectural heritage is especially needed to be continued and reserved.

As Karl Marx and Friedrich Engels indicates, “ The ideas and thoughts of people were, of course, ideas and thoughts about themselves and their relationships, their consciousness of themselves and of people in general — for it was the consciousness not merely of a single individual but of the individual in his interconnection with the whole of society and about the whole of the society in which they lived.”³ On one hand, aesthetic perception on classic architectures, which by all means follow the principle of formal beauty and meet the needs of unification of both function and form, are delightful. On the other hand, those classic architecture usually have profound aesthetic and symbolic meaning, which can also be found deeply inside their cultural mechanism, in their beautiful form, people who come from other culture may find it hard to notice or understand.

Take Chinese ancient architecture as an example, Chinese nation have long history and rich experience on excellent heritage of traditional construction and wisdom of architecture. Based on archaeological sites which have been discovered, archaeologists

indicates that Chinese ancient construction activity can be traced back to 7000 years ago, and mature timber structural techniques in construction also have history of over thousands of years. Nowadays, postmodernism and neo-regionalism have contributed to great importance of the traditional elements and style being attached to architectures nowadays. As a result, architectural form, technology and spirit that came from national and regional characters frequently appeared in contemporary architectures, which originated from cultural and aesthetic identity, and end up in constitute the priori aesthetic emotion of human.

For those who understand the deep aesthetic content of certain architectural heritage, since there exists priori aesthetic emotion, the digital presentation already have basics in thoughts, aesthetics and emotion, digitization can be great help for them to get better understanding about architectural heritage. For those who are not familiar with certain architectural heritage, their cognition on architectural heritage rely on experience that digital exhibition creates. Therefore, not only should we pay attention to authenticity of exhibited details, but also construction of aesthetic atmosphere, which means to create artistic conception space.

3. Digital technology and aesthetic dimensions

Chinese ancient art emphasize on artistic conception which rely on comprehensive dimensions of aesthetic perception, which can be even easier by application of digital technology, aesthetic perception can be expanded by bringing in digital technologies. However, during the process of digital design, if attention is more put on technology and tools but thoughts and spirits, the audience will hardly comprehend deep essence of culture and aesthetic connotation of architectural heritage, which seems to be a reversal of the order of host and guest. In digital exhibition of architectural heritage nowadays, technology is excessively focused on, many scholars put their energy on research of digital technology in heritage protection and display. However, despite the plentifulness of technological means, audience focus more on the feeling of freshness new technologies bring about, but not be touched by the content.

The viewpoints above does not mean to deny the value that digital technology bring to the enrichment of artistic expression, in fact, many cases show that technology helps a lot in creating exquisite and complex exhibition effect. Especially during virtual reality reestablishment of architecture sites, by using digital image to analyze visual perception, as well as color, material, texture, lighting effects in space, can various digital substitutes be worked out without changing the architecture physically. This can provide a new approach for broadcasting content and significance of culture heritage.

For example, during digital protection of cultural relics of Longmen Grottoes, researchers first acquire the three-dimensional data of existing grottoes, and then study the reason of corrosion, weathering and cracking, based on that, three-dimensional information management system of cultural relic is developed. All the work above lay a solid foundation for virtual reality and digital exhibition.

However, in some exhibition of digital art or digital museum of architectural heritage, there still exists some issues, one is overly focusing on specific data information, rather than artistic influence of ideological content and aesthetic culture, second is overly emphasizing on animation in exhibition, rather than leaving space for imagination.

Take Chinese traditional architecture as an example, which is of high artistic value and

great aesthetic content, based on preservation of unity in design, its digital exhibition should reflect characteristics of which. The difference between digital media and traditional media are mainly on ways of expression and material, but their art taste and aesthetic intention remains the same. Digital technology should not only provide more information and make duplication of the details, but also bring into correspondence with the artistic and aesthetics quality compared to the original cultural relic. Details of information and artistic charm are both important.

4. Immersion and Aesthetic Experience

As Immanuel Kant put it: “This definition of the beautiful can be deduced from the previous explanation of it as an object of satisfaction without any interest.”⁴ A judgment of taste on the beautiful “has for its determining ground merely the purposiveness of the form, is a pure judgment of taste.”⁵ Therefore, judgement of appreciation on the beautiful is pure, meanwhile is based on sense perception, and a process which leads to a sense of pure joy.

The beautiful in art lies in form. In exhibition media that take digital technology as design language, it accommodates synthetic technique of expression which includes dimensions of vision, auditory sense, smell, tactile sense and gustation, and interactions of multi-platform as well. Digital technology bring about multisensory aesthetic induction, which aims at creating a sense of immersion that virtual art diligently strive after. As with the intensification of aesthetic experience of immersion, all sensorial pleasure are intensified. In essence, this kind of immersion without utilitarian is really close to what Kant called “pure judgment of taste” or “object of satisfaction without any interest”.

Many digital methods that are used in architectural heritage exhibition are aimed at creating sense of immersion. Take virtual reality as example, It is actually a combination of multiple technologies which key technology includes dynamic environment modeling technology, three-dimensional display, sensor technology, system development kit application technology, real-time 3d graphics generation technology, and system integration technique. Besides visual perception, virtual technology also follow the tracks of auditory perception, tactile perception, motion perception, as well as sense of smell and taste, and then give feedback.⁶ In many digital exhibition of architectural heritage, virtual reality is being used, for example, virtual reality project of cultural heritage of “the Forbidden City beyond space and time”, “digitalization of The Old Summer Palace”, as well virtual reality system of The Grand Canal. The purpose of virtual reality is to achieve authentic and nature-oriented experience in interaction, which is human-based interactive model, that aims at imitating the interactive mode between people and between human and environment, and creating sense of immersion as a result. As with the optimization of interactive device, the operative difficulty are being reduced constantly, the environment and modes of interaction are becoming more and more intuitional, so as people’s aesthetic experience. However, the disadvantages are, the way of realization relies on VR headset or other gears, and wearing interactive devices for long periods of time easily cause illness and lower aesthetic experience.

Among many projects which apply virtual reality technology in architecture heritage exhibition, project of “digitalization of The Old Summer Palace” provides great experience, it recreates original appearance of The Old Summer Palace in virtue of VR and AR technology. Especially in rendering of 3D model, the project use material, texture and color from existing palace of Qing dynasty for reference, in order t

the recreated virtual architecture heritage more closely to The Old Summer Palace visually and aesthetically. Despite the space organization, architectural form, structure model, ratio scale, landscape pattern, plants and water, color and pattern, or interior furnishing, they all have historical and archaeological evidence to rely on, such as picture files kept in feudal official of Qing Dynasty, ancient ruler painting, and photos from the late Qing Dynasty. The artistic conception of this site of imperial garden is implicated in its form.

5. Conclusion

The aesthetic subject of digital exhibition of architectural heritage is no longer the original architectural heritage, but the new production of technology, art and culture, which aims at creating immersive aesthetics that based on integrated dimensions of vision, auditory sense, smell, tactile sense and gustation. Aesthetic emotion and ideal is decided by elements of form, structure, art, and environment in traditional architectural culture, meanwhile the cultural background of human is the priori part in aesthetic judgement. On account of the difference between media, the digital technologies in preservation and exhibition of architectural heritage, can not only aim at restoration and simulation of the originals. New aesthetic induction and experience will be developed during the process, therefore, it is crucial to make precise textual research, value the materials of art criticism and historical record, and accessibility in interaction, to provide immersion for the audience.

Liu Si-jie is a lecturer and teacher in School of Media and Communication of Wuhan Textile University in China. She got her doctor's degree of architecture in Wuhan University, and master's degree of design in Wuhan University of Technology in China. She has published numerous papers in journals and international conferences. She has also participated in many research-based projects, such as 2013 major project of National Social Sciences Fund, and she is mainly in charge of the research on environmental aesthetics of architecture in Song Dynasty. Her main areas of interests include architectural aesthetics, architectural history, digital media art and technology used in historic preservation.

HEAT: Hermeneutics and experience in the aesthetics of temperature

Abstract | The extension of aesthetics to aisthetics and the increased interest in embodiment in phenomenology and cognitive studies are likely to stimulate the retrieval of sensory modalities that the aesthetic theory previously overlooked and even the phenomenology of perception addressed only accidentally, such as the sense of temperature. Even there is no art of temperature, its feeling is nevertheless diffusely present in several arts, as well as in the aesthetic experience of natural environments. Thermic perceptions are involved in various situations that form a continuum from pre-aesthetic to aesthetic values. On the elementary level, the thermic comfort is merely a general precondition for making and experiencing art, as it is most obviously in the performative arts; along with light, humidity and air circulation, temperature is a parameter of the natural medium in which the aesthetic experience takes place. Farther on, a thermic comfort (which Kant reduced to pleasantness, while Hermann Schmitz and Gernot Böhme include it in the atmospheric value) is produced deliberately in specific applied arts and participates to the aesthetic value of textile design, architecture, landscape design, and urban planning. Besides, a pleasant temperature is always implicit in the evaluation of a “beautiful weather”. In other cases, the feeling of temperature is involved in intermodal experiences, and qualities of other senses are described as warm, cold, hot or refreshing (e.g. colors, materials, fragrances, aromas, spices). It is well-known that architects create atmospherically “warm” or “cold” environments with the aid of elements that do not rely anymore on tactile-thermic sensations, such as size, materials or echo. The “temperature” of such spaces is neither perceived through tactile sensations nor merely imagined, but felt in-between them. Even in painting the “temperature” often transgresses chromatic aspects and achieves expressive values depending on its subject, dynamics and intensity, a typical case being Turner’s Rain, Steam and Speed. More recently, melting is used in installations and non-representational art in order to draw attention to the climate change (Mathias Kessler, Olafur Eliasson & Minik Rosing) or to defy artistic-religious conventions in olfactory art (Peter de Cupere’s Pink Madonna). Both the cultural and political debate around the Anthropocene and the challenge of representation and hermeneutics in contemporary art let us expect that the topic of temperature will “rise” also in the aesthetic theory, with implications mainly for the environmental and the urban aesthetics.

Index terms | *Aisthetics; temperature; synaesthesia; architecture; contemporary art; Anthropocene;*

Warming aesthetic theory

The abstract of the present paper was written during one of the hottest summers ever in Europe, the text itself during another heat wave. However, the topic has been accompanying me for some time in relation with the project of outlining a meteorological aesthetics on the basis of aesthetics (theory of sensory perception), with focus on multisensory perception and with the aim to reinforce the social and moral relevance of aesthetic theory in the context of the Anthropocene. The theoretical underpinning of this aesthetics of the weather and climate brings together the phenomenology of atmospheres¹ with natural sciences and has various fields of application, from the experience of weather phenomena in everyday life to contemporary art and the meteorologists' implicit aesthetics.

However, phenomenological descriptions mention temperature only incidentally² and aesthetic theories overlook it because of its vital function, the logocentrism of aesthetics and the tendency to perpetuate the Kantian dichotomy between pleasantness and the real aesthetic value. A notable exception is Jean-Marie Guyau, who ascribed in 1884 every pleasant sensation the possibility of becoming aesthetic if it reaches a certain intensity and existential depth³. For example, argues Guyau, the "coolness" and "warmth" of the air contribute to the aesthetic emotion unleashed by descriptions of landscapes, and beautiful is not only the light of the sun, but also its warmth, which is the light perceived by the whole body. In his polemics against Kant and Maine de Biran, Guyau even regards a reinvigorating thermic contrast as more aesthetic than music.⁴

Without going so far and even if there is no art of temperature, it is evident that thermic values are spread over several arts, not to mention the experience of natural environments. This diffuse presence of temperature in various kinds of aesthetic experience and its involvement in intermodal associations or even cross-modal perception correspond also to the present interest in the holistic unity of a functioning body. Moreover, the inclusion of thermic perceptions in the aesthetic experience and artistic practices requires to replace the ideal of clear boundaries between aesthetic and non-aesthetic experiences with a continuum that has to be disclosed first in a descriptive way. For reasons of time my paper is confined to temperature in different arts and media and describes five stages of "warming aesthetics".

1 Hermann Schmitz, *System der Philosophie III.2. Der Gefühlsraum*, Bonn, 1969; Gernot Böhme, *Asthetik. Vorlesungen über Ästhetik als allgemeine Wahrnehmungslehre*, Munich, 2001; Christiane Heibach (ed.), *Atmosphären. Dimensionen eines diffusen Phänomens*, Munich, 2012; Jürgen Hasse, *Was Räume mit uns machen – und wir mit ihnen*, Munich, 2014; Tonino Griffero, *Atmospheres: Aesthetics of Emotional Spaces*, Burlington, 2014, etc.

2 See Hermann Schmitz on "climatic space" in *System der Philosophie III.1. Der leibliche Raum* (Bonn, 1967) and Martin Basfeld, „Phänomen – Element – Atmosphäre. Zur Phänomenologie der Wärme“, in : *Phänomenologie der Natur*, ed. by Gernot Böhme und Gregor Schiemann, Frankfurt, 1997, 213-231.

3 Jean-Marie Guyau, *Les problèmes de l'esthétique contemporaine*, Wentworth, 2019.

4 Ibid.

Natural precondition of living bodies

On the most basic (i.e. vital) level, thermic feelings are only a precondition for experiencing and making art. Temperature represents along with light, humidity and air circulation one of the parameters of the natural medium air in which the aesthetic experience takes place. In absence of a basic thermic wellbeing (as a pre-stage to Kant's pleasantness) no aesthetic experience and even no experience at all would be possible. Yet media remain concealed and are taken for granted as long as they reliably function; temperature too surges to the light of consciousness in artistic experience only when it becomes excessive. As a matter of fact we deal here with two natural media of experience that are like communicating vessels: the air and the body. Extreme heat both outside and inside the body block from the start any possible aesthetic experience. In particular performative artists are expected to be aware of the importance of thermic comfort as a prerequisite for satisfactory enactments. Only the oblivion of the humans' facticity and bodily exposure to contingent weather could lead aesthetic theory to ignore temperature. Usually the thermic proprioception in the background remains the silent shadow that let emerge other focused sensory perceptions and develop their interplay with imagination and understanding.

Functionality

In other cases, thermic comfort is no more a starting point, but one of the goals of aesthetic experience. This goes for several applied arts that deliberately design objects and environments to be worn or inhabited, such as textile design and fashion, architecture, garden design, and urban planning. However, for a long time temperature was considered of minor importance for art and was repressed by a theory that endorsed the hegemony of vision (at least in the Western culture). Still, urban planners and architects who disregard climatic features compromise the final *aesthetic* value of their projects, since liveability is irreducible to visual beauty. In this respect, vernacular architecture is less prone to mistakes than modern, spectacular architecture, let us think of the Borgo Teresiano in Trieste, which was projected during the Habsburgs corresponding the climate of a Central-European town. With the global warming emerged also a stronger awareness of the embodied subjects' dependency on climate. Regarding the strategies to cope with the rise of temperature, the *seclusion* from nature relies on technology to produce thermic isolation and thus enhance our autonomy from nature (e.g. air condition), whereas the *dialogue* adapts urban environments to global warming by greening roofs and facades and paying more attention to water areas. More sophisticated mechanisms of thermoregulation were developed in the industry of smart textiles that react to the body temperature. In all these cases thermic aspects are practical and are intrinsic part of the aesthetic value.

Intermodality

The everyday language often describes sensory qualities as warm, cold, hot or refreshing. Apart from warm and cold colours, temperature is assigned also to materials (wood and bricks are warm, cement and glass, cold), fragrances (scents are described as warm-spicy or fresh), as well as food and beverage (mint and lemon cool, spices are hot). Thermic impressions are widespread in intermodal associations both in art and daily life, and the growing body of research on atmospheres, in the meaning of emotional qualities of spaces, is expected to raise awareness also for the "temperature" of spaces.

In general the manner how temperature enters an art depends on the medium. In architecture

various factors converge to produce “warm” or “cold” atmospheres: the size and acoustics of a space, light and shadow, materials and chromatic, even scents.⁵ Like other intermodal qualities such as heaviness/lightness, this quasi-temperature of spaces, colours and fragrances is not merely imagined, but definitely felt and its experience is even intersubjectively confirmed; however, it is not perceived on the skin, but via other sensory receptors and thus it appears rather in the modus of an as-if-temperature. Moreover, its values – e.g. “refreshing” – are qualitative in the phenomenological meaning of being experienced, and not measurable.

Expressive and fictional warmth

One step further, warmth and cold are evoked, yet not really felt. For example, the “temperature” in painting is suggested not only by the temperature of colours, but is induced also by the dynamics or rigidity of forms, the intensity or brightness of the hues, the gestural features of brushstrokes, and the title or subject. The representation of sources of heat calls to mind the similar experience in everyday life and activates thermic memories, like in Turner’s *The Burning of the Houses of Lords and Commons, 16th October 1834*. In another example, *Rain, Steam and Speed*, Turner prepares the transition to abstract painting by expressing the atmospheric condition through the dissolution of stable forms, chromatic and movement.

The medium language has at its disposal other mechanisms for inducing feelings of heat and cold. In *L’Étranger* Camus describes the unbearable heat and its devastating effects on the protagonist in a way that enables the empathic reader to transgress the observer’s role and be fictitiously present in the scene. Heat has here a narrative function, being the catalyst of the crime. More difficult to explain is the general thermic impression produced by fictitious worlds, be they literary, plastic or musical: The febrile-Dionysian universe Dostoevsky’s is definitely “hotter” than Valéry’s Apollonian serenity, the romantic Delacroix is “warmer” than the classicist Poussin, and Schubert or Chopin more passionate than the intellectualist Xenakis⁶. Such impressions result from the reciprocal potentiation of several factors, such as subject and narrative structure, the characters’ psychology, lexical registers, the rhythm of the phrase and other stylistic features. It may be assumed that each artistic medium has its specific means of producing expressive or fictional temperature⁷, the analysis of which goes beyond the scope of this paper. Instead I prefer to dwell in the last part of the paper on temperature in fine arts in the context of the Anthropocene.

Contingent agency

The first example returns from the suggested to the real heat after the end of representation. In 1985 Joseph Beuys created for a London gallery the installation *Plight* (at present in Centre Pompidou) in which, probably as a response to the disturbing noises in the rest of the gallery, he enveloped two spaces in plight, placing in the first one a piano and leaving empty the second one. However, plight does not only absorb sounds, but has also a heat-storing effect which was

5 Peter Zumthor, *Atmosphären. Architektonische Umgebungen. Die Dinge um mich herum*, Basel, 2012.

6 Specific criteria for the thermic evaluation of music are related to the title of the piece and indications for music players, such as „presto con fuoco“, „allegro con fuoco“ or „appassionato“. I owe these suggestions to Ana Szilágyi and Luigi Manta.

7 According to Siegfried Kracauer’s basic principle of aesthetics regarding the specificity of each medium (*Theorie des Films. Die Errettung der äußeren Wirklichkeit. Werke Bd. 3*, Francfort, 2005, 27).

indeed calculated by Beuys, since he placed a thermometer on the piano.⁸ The low entrance in this isolated environment, the mutism of the closed piano, combined with the soundlessness of the visitors' steps, the lingering dry heat, and the smell of plight produce altogether the impression of a "claustrophobic" space of multiple negations, in consonance with the fascination of that time for allusions and absence. Finally, *Plight* is a space of death, because it does not only suspend the relation with the outer world and other people, but it also abolishes the spectator's perception and even presence: there is nothing to hear, in the second room there is not even something to see and not even an exit – *Plight* is a warm and sticky dead end.

If Beuys' installation invites to a ghostly existence without the body, younger environmentally committed artists use warmth in the opposite sense and warn of a *real* death precisely because we cannot isolate ourselves from a world that becomes increasingly inhabitable. In December 2015, during the United Nations Climate Change Conference, Olafur Eliasson and Minik Rosing shipped 12 ice blocks from the Greenland coast to Paris which, disposed in the form of a clock, began to melt. The political message of *Ice Watch* was reinforced by the artists' declaration. Few years before, Mathias Kessler exhibited in *It'll blow over* (2008) the map of the Arctic etched on a mirror hanging on a wall. The map was connected to a heat exchanger that transformed the condensation heat into ice; as a result, the map of the Arctic was covered by ice when the space was empty; when however visitors entered it, the ice melt and the visitors could see them in the mirror⁹. The ecological message is once again evident. In this case, heat is neither concretely felt, like in Beuys' *Plight*, nor imagined, as when reading Camus, but it is only ascertained or inferred due to its visual effects on the mirror. If on the first level of thermic aesthetics the experiencing and performing body was forced to become aware of its dependency on the outer temperature, Kessler's interactive installation inverts this relation and raises the question regarding the agency of the body temperature itself. Art (no less than natural environments) becomes exposed to the human intervention, which in this case – unlike most interactive installations based on the spectator's movement – anonymous, unintended and uncontrollable, yet by no means accidental: it is the *nature* in the spectator that acts upon the image of the *nature* in the mirror.

On the contrary, in the final example of Peter de Cupere's *The Same and the Other* (2009), also known as *Pink Madonna*, the human intentionality abdicates in favour of the nature's agency. De Cupere modelled a female statue comprised of paradichlorobenzol, which, exhibited in the open, melted within few months under the action of sun and rain. The form is subordinated to a vulnerable material, being deformed as a result of contingent weather processes, and temperature becomes a co-shaping (or rather corroding, destroying) agent. In this ephemeral art, warmth does not serve to express environmental concern anymore, but to challenge aesthetic and even religious conventions related to the ideals of perfection, beauty, and permanence. The aforementioned examples dismiss altogether the modern philosophers' objection, starting with Kant and Hegel, that other senses (including the sense of temperature) are not capable to provide the basis for works of art since they cannot transport meaning.

It is obviously difficult to find a common denominator for all these artistic settings in which real or imagined temperature conditions, affects, triggers and contributes to the aesthetic experience or even co-creates the physical artefact. The present outline is meant only as a basis for further research that would have to clarify the art-specific modalities in which temperature works in various media and identify other examples for the deliberate use of temperature with different meanings and functions in art. Personally I am interested in the way how temperature challenges conventional artistic practices after the end of representation and goes along with mutations in the understanding of the subject in posthumanism, privileging a subject that energetically communicates with the environment. Another desiderate is a detailed phenomenological examination of the thermic experience. The previous considerations are meant to convince that the sense of temperature has wide fields of applications and deserves more attention from philosophical aesthetics in the present artistic and ecological context.

PHILOSOPHY AND AESTHETICS OF BERLIN'S ARCHITECTURE FROM THE PERSPECTIVE OF OUR CONTEMPORANEITY

Abstract | This paper aims to illustrate the analysis of the aesthetics and architecture of Berlin from today's perspective on the ideological, dominant and decennial effects of power structures. Our starting point is that one of the key characteristics of the city of Berlin is certainly the ambivalence of its developmental architectural capabilities and the turbulent changing history. We will analyse the architecture of Berlin after World war II, which was influenced by the ideology of the opposite political dominances. When we consider the question of power, i.e., in this case, the ways in which art is played in relation to the power through which human relations are regulated, and it maintains and realizes the order of human relations, we see that the relation between politics and art is interwoven and not separable. The function of art in this case of the architectural image of the city is the propaganda of hegemonic politics. Germany after World war II was divided into two states and Berlin on two sides separated by the Berlin Wall.

Today, the ruins of the Berlin Wall are one of the most visited tourist attractions in Europe, and we have this open passage where there were two completely ideologically different and opposing states leaving the possibility of analysing the ideologies and ideological regimes that were current and left their influence. On one hand, Western Germany is influenced by the United States and the entire Western civilization, and on the other hand East Germany is under the influence of the Soviet Union and Russia. The architecture of the East and the West was dominantly different. Although the Berlin Wall has been demolished more than two decades ago, the division it has made remains in the capital of Germany. Especially if it is our starting point that all the political and military power of Germany came from its capital, and that this way Berlin directly influenced the tailoring of a whole new history of the world.

In this paper we will analyse the impact of the Berlin City Palace (Stadtschloss) on Berlin's architecture and aesthetics, as well as the influence of Karl Friedrich Schinkel's Neoclassicism, and further also the influences of the Nazi regime and today's modernism reflected, for example, in the Federal Chancellery building.

Proof of restoration on the case of Potsdamer Platz

Looking at Berlin from the present perspective, we see a fusion of the reunification of Berlin, which includes avant-garde experimentation, explicit commercialism and the refined practice of the world's best architects. It can be freely stated that this is a unique expression of post-war architectural expression in Western Europe. This cannot simply be regarded as an artistic-historical development. This is rather the expression of conscious affirmations of the values now considered hegemonic: they symbolize capitalism in its contemporary form. Many buildings in Berlin illustrate this, but those at Potsdamer Platz are the most prominent and, therefore, convenient for analysis. After the fall of the Wall, Berlin is more and more like a huge construction site, cranes

and scaffolds can be seen all over the city. But the image of Berlin as a cosmopolitan center owes much to Potsdamer Platz. The proof of the reconstruction there is the most obvious, and for this reason, the example of architecture as a spectacle event is analyzed on the Potsdamer Platz case. It became a visual signifier for Berlin after the reunification, as the representations of his reconstruction circulated in many media from newspaper magazines and articles to recommendations for travel, guides and postcards, as well as exhibitions and numerous scientific studies. From the moment when its architectural transformation began in 1990, it was written about “New Berlin”, the successive phases of reconstruction of the area were widely published both in Germany itself and abroad. The constant circulation of these paintings and various types of media pronouns ensured the very value of the Potsdamer Platz area as the central icon for the renewal of Berlin. But we will be asked what does it mean to us that the transformation of Berlin is represented by the transformation of Potsdamer Platz?

It will be shown that the urban paradigm highlighted by the reconstruction of Potsdamer Platz depends on contemporary global capitalism, and in return, this glorification also encourages the reconstruction of the German identity after reunification as a whole. Finally, I propose that this affirmation of global capital at Potsdamer Platz not only does not address the historical complexity of the area, but rather that it actively suppresses this history by the fact that the new-fashioned forms of capitalist mega corporations will, with their spectacularity, give a new modern environment cleaned of any kind the past.

If our starting point is that architecture has always been closely related to politics, since the first civilizational achievements, from the Egyptian pyramids to our everyday life, we cannot deny the fact that in fact architecture has the greatest and most direct effect on man, it can freely be found more than any other art.

This articulation of the political and economic power of the hierarchical structure of social relations becomes sensually visible through the spectacle of spectacle. The spectacle arises when social / state apparatus, political parties, the capitalist market of an institution or cultural formation reach a visible degree of accumulation, and demand and impose a public sensuality (Šuvaković, 2012)¹ And by Guy Debord, the spectacle is in capitalist society the capital the degree of accumulation in which it becomes the image. Which would mean that the relation between politics, art, and spectacle can no longer be regarded as separate entities in the context of architectural practice, but exclusively as integrally related concepts. Politics in the context of architecture and architecture spectacle is a form of work that focuses on orientation, positioning in society and its structure and distribution of power.² This could be interpreted in concrete terms that architectural objects are mostly ordered by the ruling ideologies, in addition to the fact that through it can be seen expressions of the attitudes of the contractors and those for which the objects were built, they actively form the opinion of the public. Whether it was the 20th century, the influence of the Nazi regime or today's dominant ideology of capital owned by mega corporations. In fact, in order to understand how this works, we can only grasp the individual situation of historical architecture if we put it in a wider context, in this case architectural objects are placed in the architecture of the city of Berlin after the fall of the Berlin Wall. But in order to adequately analyze and monitor how the development of the political economy and the development of the city are intermingling, we must go back a bit.

If we look at Berlin under the influence of the Nazi regime, as the embodiment of

power, we can say that the history of architecture is the same as the architecture of the ruling class. Because everything that was built and commissioned for construction was under the jurisdiction of Hitler and his associates. It can be freely said that it tended to the architecture in accordance with the ideological goals of the state, which is uncompromising and propagandistic, simplified and template reproductive. The construction had to reflect the idea of a thousand-year-old Reich, pointing to its size and power. But as Šuvaković points out to us: the sensual predisposition or visibility of power, identity and capital or of any segment of sociality is not and must not always be a direct, literary or unambiguous act of perception. The spectacle can be explained as a noticeable and observed event in which the accumulation of economic and / or political power become sensibly presented in the organization and performance of the public and private, working and free lives of citizens in a capitalist society.³

Potsdamer Platz of the 1920s and 1930s was one of the most influential squares in Europe. It was considered a cosmopolitan center that unfortunately was destroyed by a powerful bombing during the Second World War. When Berlin was divided in two parts after the war, the square itself was also built on the western and eastern parts, where in 1963 the Berlin Wall was built. From that moment, the Potsdamer Platz becomes an empty, isolated place. However, after the fall of the wall, it is again reanimated, reorganized and transformed by the needs of new capitalist dominant ideologies.

The above considerations rely on one assumption: that architecture symbolizes and, in that way, executes political, social and economic functions. Nevertheless, I will now conclude this assumption by discussing the ideological role of architecture in the context of contemporary democracies - specifically, private architecture sponsored by clients apparently or formally separate from the political sphere.

In the past, totalitarian regimes such as Nazism, Fascism and Stalinism used architecture to convey certain ideological messages, to animate their audience with monumentality, strict symmetry, repetition and didactic devices, such as reliefs and inscriptions.

Šuvaković emphasizes that it is possible to point out architecture as a spectacle event.⁴The use of architecture for political and democratic purposes is an old skill as much as it is itself. The dependence of architecture and architects on the executive political and financial power, the investor and the general cultural context at a certain historical moment has caused the breakthrough of new ideas and visions to be slower than in other artistic disciplines. Under totalitarian regimes, many of its meanings were forgotten, while others were functional. The desire of the regime to build forms that represent political ideology caused a rigid attitude towards a different one, hindering the development of individual development and free ideas, determining the boundaries of space in which art as well as architecture can be expressed.

Today Potsdamer Platz is revitalized in a very short period of time and is not owned by different companies and individuals, but by four international mega corporations. The complete "diversity" of buildings, functions and businesses is controlled by these four companies.

We are witnessing the fact that the right to the city falls into the hands of private or pseudo proprietary interests of mega corporations, and in this way, the attempt to create a city as a picture of something that should be a cultural conceit is actually in the possession of a new dominant ideology is just now the ideology of capital.

Buildings represent the identity of the identity according to which one region and its community want to form. For this reason, Nikezic defines the built environment as an act of artifact, or as the material (artificial) manifestation of a culture that actually created it, assuming that it contains all the material assumptions that conditioned its existence.⁵

Neoliberal urbanism is an integral part of this wider range of functions, activities and relationships. It is characterized by an important emphasis on the link between production and financial capital, but also on the issue of social reproduction.⁶

Today, culture and art are not only elements of historical idealization, they are used by multinational mega-corporations as a form of advertising only. These companies sponsor cultural events, buy art objects and collections, and participate in cultural programs as a way to conceal the “dark” side of their main goal, and under the “dark” it is thought that their main goal is to promote the accumulation of capital. On the site, for example, Daimler Chrysler explains the links between corporate image and cultural sponsorship at Potsdamer Platz:

In order to re-establish the importance of the site as an international meeting point and cultural center in the German capital, DaimlerChrysler is this year again presenting its “People’s Festival”. It is a weekend of cultural events, first set up in 1999 as a continuation of the annual summer fair held at the Potsdamer Platz site. It masked the fact that the reason for the existence of this corporation is the production and increase of own capital. On the contrary, this capital does not return back as a form of collective benefit for the entire society, and indeed often increases the social inequality.

In other words, the promotion of cultural events is interpreted as a form of social benefit for Berlins, aimed at the vague term of the “public”. But the “public” of these events is not a collective social body - that is the paying audience. It includes those who can afford to know and visit the commercial-orientated Potsdamer Platz.

For this reason, Nikezic defines the built environment as an act of artifact, or as the material (artificial) manifestation of a culture that actually created it, assuming that it contains all the material assumptions that conditioned its existence.⁷

This is accompanied by special rituals, ceremonies, forms and symbols that are part of architectural objects and through which the political project seeks its legitimization. Altiser, speaking about the connection between power and architectural practices, says that the state, through ideological agendas, is trying to achieve the desired architectural culture.

The archetypal object in space becomes part of everyday space and time. It affects the space by shaping it in a cultural, phenomenological and ideological (i.e. ideological) sense. Although architecture on the one hand implies an autoreferential relationship between lines, materials, surfaces, structures, etc., on the other hand, these elements in their combination and interaction make up the physical and visual form on the basis of which the new space and context are defined. And there is a field of action, i.e. the realization of ideology. Architecture has the power to transform and represent words and concepts. To control and regulate space with specific constructions that surround us and define in a certain way.

INTERRELATION OF FORM AND STRUCTURE

Abstract | If we define form as the visible shape of an object, and structure as its barring elements, inevitably the conclusion will be that they cannot exist separately. This unbreakable bond is what creates architectural space. Architectural space possesses certain regularities differently explained through various theories. Everything in nature has structure. In Mondrian's art it is the regularity underneath the changing nature, and for Fuller it is the pattern of the universe. When we talk about structure, we talk about geometry and the interrelations of elements. Geometry of space is visible in the work of both architects and artists. Emerging technologies have changed the face of architecture. New methodologies have put structure as one of the key points in design. Even just through observation of buildings, it is impossible not to notice that structure creates new ornaments. This gives each building a characteristic spatial expression. In this paper, the focus of the analysis will be the relation between form and structure in order to show the effect of new technologies on architectural design. The purpose is to emphasize the importance of structural design and the impact it has on architecture. By giving a broader definition of the elements of space, it will be possible to connect various ways of seeing into the analysis of architecture. This kind of analysis systematizes the existing views of the proposed problem and opens the discussion for further research.

Index terms | *computer modeling; structural optimization; contemporary architecture; geometry; ornament; pattern;*

INTRODUCTION

While trying to define the geometry of space, one can realize that by connecting two elements, a relation among them is created. The established relations help create a visual image of space that can be interpreted through geometry. In architecture, if these relations are carefully presented to the observer, the geometrical grid would allow the user to read the proportions and dimensions of space, as well as the idea behind the design. As John Ruskin says: "...building will generally be the noblest, which to an intelligent eye discovers the great secrets of its structure..." (Ruskin 2012, 75). Structure in architecture has various meanings, but if structure is defined as organization of elements into one whole, then it becomes the all-present element of design.

In this paper, the relation between form and structure will be presented through interpretation of the use and analysis of geometry in architecture. The foundation for case studies will be based on this analysis in order to show the relations between structural design and ornament in modern architecture. New technologies have enabled the design and construction of complex geometries in architecture widely used for structural elements in buildings. Historically, complex or compound curvilinear forms have been created with a demonstrable awareness of geometry, while nowadays this process is preformed by softwares. (Ostwald 2015, 633-634) One of design methods is the process of complex modeling which combines the empirical approach - through physical models and the numerical one - through different softwares. The implementation of these methods in the design process is essential in order to have control over the design. This paper aims to discuss the aesthetic of structure generated with different softwares used for complex geometries.

The relation among *geometry - structure - design - ornament* is the key point of this research. Its analysis is used to present the interrelation of form and structure in architecture in this paper. The idea is that the combination of these elements create a specific form in architecture and a completely new aesthetic. The concluding arguments will focus on the relations presented in the paper in order to show the advancements in structures and its impact on architectural design.

GEOMETRY - STRUCTURE

Geometric concepts

Searching for regularities in the world, Platonic solids have been spotted, harmonies were expressed with irrational numbers and the geometry of the golden section was defined. (Lawlor 1982, 6-14) It seems that geometry is hidden beneath each and every element of nature, and it is, because of that, an eternal inspiration and a tool for design. In art, geometric structuring of the plane or space isn't necessary for the creation of the artwork, but still, a number of artists can not create without it. Some use it for proportioning, others for the abstract presentation or symbol of the *real* world. The artists such as Malevich, Kandinsky and Mondrian create an independent universe of geometric images which concentrate the sense of meaning and logic, regardless of the external reality. (Trifunović 1994, 62) They use geometry for representing the relations in nature, aiming to produce an emotion, instead of mimetic presentation of the outside world. This shows the strength of geometric presentation and the effect it produces. "Human mind always tries to define a sense behind the pure optical impression...Our mind together with the eye always seeks for understandable structures which show or seem to show sense in themselves." (Balz 2009, 112) If geometry is perceived as

means of visual presentation, the most significant geometrical principles would be proportions and harmonic relations between the elements of space. (Petrović 2018, 71) For Mondrian, the only unchangeable relation is the one between two straight orthogonal lines. He emphasizes the importance of their position on the plane (or in space), because only the position enables stability. Basing the composition on straight lines that form a geometrical grid, Mondrian constructs the structural relation of balance and harmony of opposites. (Šuvaković 2005, 139-141) When this concept is compared to the ones in architectural structures, the conclusion emerges that each element has its position in the geometrical grid. If a structure does not seem logical it cannot be good.

Geometrical grid is one of the methods for defining complex forms in contemporary architecture. Even though there are many ways of using geometry in architectural design, the one that stands out is the use of geometry for structural system of buildings. In the structuring of architectural space, structural elements play a significant role in the final form of the object. Directions of transferring forces, due to the object loads, have a direct impact on the stresses in construction elements and their dimensions. (Petrović 2018, 70) Special type of structures, based on Platonic solids, are space grid structures, mostly used for curvilinear long span structures. This type of structures are characteristic for Buckminster Fuller whose projects can be perceived as form and structure at the same time. His work was based on five-fold symmetry, derived from nature, animal exoskeletons and microorganisms. (Gorman 2005, 115-117) The relation between nature and geometry is constantly present, whether in sciences or art, which guides to conclusion that geometry is the underlying layer of everything that surrounds us. It can be used as basis for design, the analysis and comparison of different typologies, artworks or interdisciplinary fields.

By looking at the evolution of geometric concepts, one must notice that the basic principles of geometry haven't changed until the shift in perception of time and space in physics. When Einstein defined time as relative, the same as space, there have emerged new concepts of geometry. (Hoking 1988, 20-22) The non-Euclidean geometry is becoming more and more present with the advancement in computer science. New softwares help shorten the time needed for complex calculations and modeling of free-form structures. BIM (Building Information Modeling) programs can export all the necessary data for construction of complex building forms. Which was once the matter of craftsmanship, nowadays it has become the matter of technology. Nevertheless, it is important to understand the geometric iterations behind these processes in order to have control over the architectural design.

Geometry in structural analysis

Structural analysis has always relied on mathematics and extensive formulas for the calculation of loads within different structures. Because of the complexity of the calculation, certain buildings couldn't be constructed before the development of computer science. Curvilinear structures and free-forms also needed new technologies in design and construction, besides the complex equations for the exact calculation of loads within a structure.

The emergence of software packages for structural analysis has sparked a wish to test their limits for the development of complex forms. Researches are conducted using two design processes: *structural optimization* and *complex modeling*. [Complex modeling is the process of constant loop between computational design and physical models

and it isn't relevant for the research presented in this paper, so it won't be mentioned further.] Computer programs necessary for realization of above mentioned processes incorporate all theories of structures and geometric variations used in the past for structural design. "Computational tools have now given architects the means to design and build spatial concepts that would have been inconceivable even ten years ago." (Hemmerling, de Falco 2018, 20)

Structural optimization is a numerical method and it covers all computational tools involving form and structural analysis. The goal is to look for the most optimal solution for the architectural design in means of evenly distributed stresses, small material consumption and cost-efficiency. (Bletzinger et al. 2005, 3438-3439) Form-finding is the method of structural optimization that brings into relation form and structure. The primary criteria when using form-finding as a design method is the distribution of loads within a structure - *form follows force*. This method is based on the observation of processes in nature, and, every pattern in nature has a specific mathematical formula. (Goldsmith 2014) Form-finding has strong foundations in a specific type of geometry that maps the process of creating the geometrical grid called Voronoi digram.

The form-finding process of designing grid structures is based on the geometric analysis of loaded structures. A 3D model is imported together with loads, supports and material of structure and by using FEA (Finite Element Analysis) various solutions of structural meshes are defined. (Rokicki, Gawell 2016, 156-157) When designing the structure for grid shells, a starting form is assumed and loaded, usually only with evenly distributed loads because they are the dominant load case. The total load of the cladding is then transferred to the nodes and is proportional to the horizontal projection of the surface area carried by the node. It is a function of the geometrical positions of the nodes, which are variable. An automated scheme, such as a Voronoi decomposition of the horizontal plane projection of the grid, allows for the calculation of the loading at each point in the design space. A Voronoi diagram is a spatial decomposition based on distances between a set of points - nodes. (Richardson et al. 2013, 234) As it was shown in the analysis of grid shells, there is a geometric link between structure and form, even during the process of design.

STRUCTURE - DESIGN

The exoskeleton: Morpheus hotel / Zaha Hadid Architects

Built on the existing foundations of a condominium tower, this jade-inspired building is supported by first of a kind free-form high-rise exoskeleton. The concept for the hotel was made by Zaha in 2012. Located in Macao, following the tradition of Chinese jade carving, it inspired Zaha to experiment with the form of the hotel creating a special relation between voids and mass. Limited by the existing foundations and the function of the building, a hotel with 770 rooms, that included multiple restaurants, meeting spaces, and a rooftop pool, the number of voids had to be minimized to three. (AD 2018) Shape-finding design process, characteristic for the architect Zaha Hadid, is also visible in this project. Starting with the idea of a jewel for Macao, the exoskeleton contributes to the overall impression of the building, emphasizing its shape. (Fig. 1) The opposite of form-finding, shape-finding process begins with a fixed shape of a building, while the structure comes second. What makes this exoskeleton special, is that it adds to the desired aesthetic and puts structure first.

Structural design of the building was entrusted to BuroHappold Engineering. They were

given the design of a building encased in steel and glass facade that was sculptural in its appearance. Using advanced software and Finite Element Analysis for structural elements they successfully completed the task in front of them. (BuroHappold Engineering 2018) The solution was to form an exoskeleton that would carry most of the building loads, leaving the interior spaces free of columns. By observing the building it can be seen that the structure is denser near the ground and around the curvilinear shapes, while it seems almost regular on top and just before the foundations. This is the consequence of the transfer of loads, the position and number of the foundations, and the shape of the building. As it was previously explained, while forming grid structures, all fields with same stresses are grouped forming a Voronoi diagram. The edges of these fields are structural elements of the grid structure, in this case, the exoskeleton. All of complex connections of different structural elements were drawn by a program both in 2D and 3D in order to be precisely constructed. Around curvilinear voids the elements form a triangular dense grid (Fig. 2), while on the towers the grid is almost regular, becoming more dense as it comes closer to the ground due to the concentration of loads from upper floors.

It cannot go unnoticed that this building has a very characteristic appearance. The grid shell exoskeleton becomes the structural ornament that inspired even the interior design of the building, thus making the whole building an expressive symbol of the city that *has evolved from its unique environment and site conditions as a new architecture*. (Dezeen 2018) New technologies have made possible the construction of this building and the evolution of the complex geometry of its outer skin. They have brought a new aesthetic of high rise buildings, based on the tradition of the site, unique and different that anything seen before.

The lattice dome: Louvre Abu Dhabi / Ateliers Jean Nouvel

The dome, 180 meters in diameter, creates a perfect *rain of light* over the museum on an artificial island in Abu Dhabi. The geometry of its nine overlapping layers was inspired by middle-eastern patterns. Relying on the traditional Arabian architecture - the dome and the patterns - Jean Nouvel, together with the engineers at BuroHappold, made a modern proposal. (ArchDaily 2017) The dome is symmetrical on one axis and it spans 110 meters. It is supported by four columns hidden inside the museum rooms in order for the dome to appear as if it's floating above the *museum city*. (Fig. 3) The structural layer of the dome is a steel lattice five meters high with an irregular star like shaped base, in a combination of triangles and squares. The same pattern, but scaled and rotated, was used for other layers to create the *rain of light* effect.

In this project the structural problem was in fact visual. The specific demands from the architect Jean Nouvel regarding the creation of the *rain of light* have been put as foundation for structural design. The interplay between light and shadows had to be created through the dome's structure not to compromise the architectural concept. The solution was to place the structure in between the layers of patterns that would form the ornamentation of the dome in order to create this phenomena. The constructed dome has become a kaleidoscope both by day and night giving a certain expression and ambient to the museum while reflecting traditional architecture.

What made the structural design complex is the fact that they didn't want to use the standard space frame for the structure of the dome. The inventive design of the structure carried with it several problems regarding construction and assembly of the elements for the 180 meters wide dome. The dome's lace-like structure is a perfect

example of the contemporary use of technology, in computational design as well as construction. It took the engineers at BuroHappold five years of research, employing a variety of software tools, technology and methodologies to orchestrate the dynamic rain of light as envisioned by the architect. (BuroHappold 2017) They have also built a scale model of a section of the dome in order to analyze the best geometrical pattern that could allow just enough light to pass through not to compromise the museum's function, to provide shade, but also to create the desired effect. The engineers have made a combination of traditional patterns that has created a new ornament made of various overlapping layers, specific because of the interplay of light and dark under the dome. (Fig. 4)

DESIGN - ORNAMENT

If an ornament is defined as decoration or embellishment of a building, which used to show the skill of craftsman working on them, new structures can also be seen as ornaments. Both case studies have shown that structural building elements have complemented the architectural concept and design of the building, giving it a new kind of modern aesthetic. The structure of the curvilinear forms of these buildings, free-form shape of the hotel and the regular curve of the dome, could have been made by using the space frame design, based on the Platonic solids, with already established nodes and construction system, but it seems that the engineers have wanted to go further and explore new possibilities. The geometry hidden inside the software for designing the exoskeleton, based on the Voronoi diagram, makes a very specific disposition of elements in a structure, thus creating a new kind of *decorative* architectural element. The created pattern of the elements cannot be repeated in any other building, because the software is programmed every time for different forms and loading conditions, making every building unique. The dome's design was guided by the architect's idea, but also by the site specific traditional architecture. All of these elements have been incorporated into the structure of the dome, testing the limits of new technologies and succeeding. So, can it be concluded that structural design changes the face of architecture? It influences the building aesthetic, creating a new kind of computer-modeled ornaments, replacing the craftsman of the old century.

CONCLUSION

Following the proposed relation *geometry - structure - design - ornament*, one arrives to the conclusion that they constantly overlap. Analyzing them separately gives an insight into the relations among form and structure. Starting with different geometric concepts that can be used as basis of design for various structures, to the relations between architectural and structural design and its final appearance, the inseparable bond between form and structure emerges. The engineer Rene Motro defines form as a set of organized structures, before perceiving the details. (Motro 2009, 20) Based on this definition, it is no wonder that, however they are analyzed, they cannot go separately. The analysis of form or structure depends on the depth of perspective. This research has shown the elements that make different forms, its origin and design concepts, from geometry to ornamentation. It has also opened new questions regarding the use of new technologies in design and construction and its impact on the building aesthetics.

New technologies used for structural design of buildings shown in case studies have had a strong impact on the final shape of the structural elements. They have made possible the detailed design of every connection between steel elements of the

exoskeleton, as well as precise defining of the segments of the dome in order for it to be constructed on site. Besides that, softwares for structural analysis, based on Finite Element Method, have helped in the calculation of loads in every point of these large structures with more than 400,000 individual elements, in case of the Louvre Abu Dhabi dome. It has to be emphasized that the impact that structural design has on the final shape of the building is enormous, for every high-rise or large-span building, where structure is of great importance. Structure, its size and shape, defines specific patterns, ie new ornaments, that change the way of perceiving architectural form. It *talks* about the relation of elements, the flow of forces, and what's most important, it *talks* about the concept behind the architectural design.

Milica Petrović (1993) graduated from the University of Belgrade, Faculty of Architecture after which she inscribed to PhD studies to continue her research in design principles for spatial structures. During her studies she worked as a Student Teaching Assistant on different subjects and is now a Teaching Assistant on subjects regarding Architectural Engineering. In the meantime she worked in several architectural firms. She wrote and presented a number of papers in international conferences, and published some in scientific magazines. She was one of the organizers for a seminar and has participated in several workshops. She is interested in photography, art shows, travel and furniture design. She speaks four languages.

Radojko Obradović (1966) graduated from the University of Belgrade, Faculty of Civil Engineering with a major in Constructions. He finished PhD studies at the University of Belgrade, Faculty of Architecture with a PhD Thesis: Theoretical and Experimental Analysis of Straw-Bale Applications in Constructions. He worked in architectural firms as a structural engineer and is the author of a number of built objects. He is an Assistant Professor at the Faculty of Architecture and is engaged in several subjects in the field of Architectural Engineering. He authored a great number of research papers, published in peer-reviewed journals and presented at international construction- and finance-related professional conferences. He is a lecturer at PhD studies at the University of Nis and is teaching at the University of Montenegro on the subject of Construction, dynamics and earthquake engineering. He is a member of editorial board of the journal of international importance.

Ana Kantić (1993) graduated from the University of Belgrade, Faculty of Architecture after which she inscribed to PhD studies. At the same faculty, she is employed as a Teaching Assistant. Ana's research interests are in the field of protection of cultural heritage, which is a continuation of her Master Thesis research. As a member of the team of authors, she participated in a few student competitions. She is a participant of a number of international and domestic workshops and author of a few articles in the field of digital documentation of architectural heritage. Also, she is engaged in scientific research of Institute of Architecture and Urban and Spatial Planning of Serbia.

MOBILIZING THE IMAGE: IDEOLOGICAL NARRATIVE IN THE INTERIOR DESIGN OF THE SAVA CENTER

Abstract | The paper will examine the process of design and construction of the Sava conference center in Belgrade and its role in the creation of the ideological narrative on the disciplinary level through the conceptions of space. During the Cold war, Yugoslav cultural space was in a unique position between East and West, building its international image on the idea of political neutrality and the Non-aligned movement. The Sava center was built in 1977, for the purpose of hosting the second Conference on Security and Co-operation in Europe, and the Non-Aligned Movement in 1983. The building of the conference center was not only the functional necessity but was also an important factor in presenting Yugoslavia on the international level. By questioning the critical theory and the postmodern condition in the domain of representation of architecture, the main aim of the research is to trace the possible aspects of reading the aesthetic and symbolic layers within the interior design of Sava center. The main hypothesis is that that interior space was a crucial element in the creation of the continual simulacrum, which embodies the idea of political neutrality and self-managing socialism, presenting the Yugoslavian politics as diplomatic and open unlike its communist counterparts in the USSR. The Sava center is typically considered through the prism of political and economic aspects while neglecting the design approaches, images and conceptions of space. The idea of building the new center can be related to the postmodern understanding of losing imposed centrality in the vision of history and the dominance of the single image as a condition for the unquestionable way of interpretation. By analyzing primary sources stemming from the period of its construction and numerous visual materials, the research aims to discover the possible influences and conditions by which the architectural approach to designing was determined. In general, it the awareness of the importance of critical examination of the socialist heritage in the modern context for the current understanding of the discipline.

INTRODUCTION

“This wonderful facility that will serve us both for international meetings and our internal meetings shows the high capacity of our builders. This means that in our country we can build everything that is created in other highly developed countries.”

Josip Broz Tito, May 15, 1977. The opening of the Sava Center

The Sava Center was built among 1976-1977 with the aim of becoming a hosting venue for the second forum on security organized by The Organization for Security and Co-operation in Europe (OSCE) in Belgrade, Yugoslavia. The initiative by Yugoslav president Josip Broz Tito came after the first meeting of OSCE was held in Helsinki in 1975. At this critical international political event, the representatives of all European countries were present together with Canada, the USA and the USSR, discussing the future steps towards the strengthening of the world peace and security and the promotion of fundamental human rights, economic and social progress and well-being for all people. (Kongresni centar u Beogradu, 1977). Since Belgrade did not have a building with the capacity to host the international conference of that scale, the new project had to be designed and built within a year. The government avoided standard processes of planning and design, by prioritizing the Sava center construction as the state project of the utmost importance and choosing the architect from the Belgrade Land Development Public Agency to complete the task. In the period preceding the start of the building, the Government had the architect sent to examine the building of the same typology mostly located in Western Europe, among which are Finlandia Hall in Helsinki, Pompidou Center in Paris, and Bella Center in Copenhagen. Additionally, different teams of experts from leading construction companies in Yugoslavia were dedicated to the architect Stojan Maksimović.

This research focuses on the aspects of the interior design of the aforementioned case, in order to analyze the ideological narrative behind the image of architecture. Starting from the theoretical background in postmodern theory, the aim is to offer a possible reading of the design as an expression of the unpolarized politics of the state and its subsumed identities, which was fundamental for the understanding the loss of its apparent purpose. The period of socialism, from 1945 until the dissolution of the Socialist Federal Republic of Yugoslavia (SFRY) in 1992, is one of the most influential historical periods in the Balkans, whose influences are still visible in all segments of social life. After a period of great socio-economic changes that caused the crisis after the Second World War, the idea of returning to the unity of society and the security of the community were the main goals of the political establishment. In addition to the empowering the community, unity and equality, through new products and new spaces, the new identity of the society was being constructed. The desire for prosperity is also noticeable in the stylistic and typological characteristics of architecture and urban spaces, by the rejection of the social realism and the turn towards the modern approaches of the Western countries (Blagojević, 2007). The residential architecture of New Belgrade, department stores and hotels that form new city centers all over the country, residential buildings with wide common spaces, represent only some of the tremendous spatial changes that have strongly influenced the creation of the identity at that time.

This research focuses on architectural praxis which emerged on the territory of Former Yugoslavia, questioning the purpose, function and meaning of the style, tectonics and

concept, as ideological constructs. Additionally, it discusses the utopist conception of „a city within the city“, which was employed to represent a message of modernity and social prosperity via the design of the specific renowned object, the Sava center. The central objective in this paper stems from the discourse on critical theory and postmodernism, which offer different possibilities to analyze and understand the relation between the hi-tech tectonics of the object, discursive image and the representation of architecture.

BUILDING THE IMAGE

„We were looking like the fanatics who wanted to change the helpless world.“

Miloje Popović, the first director of the SC (Popović, 2007, 54)

The public opinion about the building was divided, albeit the Sava center has won Borba award, the significant professional recognition in 1977. In the years after its construction, the Sava Center was conceived as a new modern institution, trying to define itself outside its political role as the main cultural center of New Belgrade. The international presence of Yugoslavia and the ambitions of the City of Belgrade to develop the city as an international metropolis, aimed at organizing international meetings, business and renting out space, recognized the importance of the Center as a venue for Yugoslavia’s self-promotion. Having in mind geopolitical position of Yugoslavia, and the aspiration to define itself as the center of the Non-Aligned Movement in the age of the Cold War, the Sava Center becomes a crucial project for the presentation of the states unpolarized politics. Some of the events which could give the broader picture on the political importance of the project are the 11 Congress of the League of Communists of Yugoslavia in 1983 (Figure 1a), Annual Meeting of the International Monetary Fund and the World Bank Group (1979), and the Non-Aligned Movement Meeting (1983). The Sava Center was conceived as a modern institution of advanced society, but also as a “political factory”, which without the support of the highest authorities and Josip Broz Tito, was difficult to realize (Figure 1b) (Popović, 2007).

In these significant goals, each of the functions found its occupation space within the primary setting of the object, transforming the interior space in accordance with ideological, economic and social changes and the space management agenda. In order to understand the nature of these changes, we must try to see the representation of this architecture from a higher degree of self-reflection, through interdisciplinarity and overlapping interpretations of the phenomenon of the perception of modernity in philosophy, sociology and culture (Vattimo, 1997).

SUBSUMED IDENTITIES

Political ideologies can act as a form of social frame, that provides social groups with a set of unifying values and beliefs. These beliefs reflect life experiences, interests and aspirations of social class, in the case of Yugoslavia the working class, and help to foster a sense of belonging and solidarity (Heywood, 2005). A unifying set of political ideas and values can develop naturally within a society. However, it can also be enforced from above in an attempt to manufacture obedience and thereby operates as a form of social control and manipulation, with the aim of creating the desired behavior or set of values. Observing the architecture both as the text (Barthes, 1991) and space of representation (Lefebvre, 1984), the relation between the political ideology of socialism in Yugoslavia and the transmission

of the narrative about modern society through architecture can be traced. Technological aesthetics of the visible structure and fragments could be observed as a form of stylistic narrative, which is used to portray the political aspiration for the non-alignment and openness of the societal utopia. It stems from the depiction of the progress in the late modernism, which based its contemporaneity on the technical means of production and the expression of the tectonic unconscious (Mertins, 2011). In that sense, the architect becomes a narrator whose spatial practice turns into a form of representational space, thus creating the sense of space through the narration on progress (Figure 2a). However, the narrator's only competence for telling the story is the fact that he has heard it himself (Lyotard, 1984). The current narratee gains potential access to the same authority by merely listening, acquiring and delivering the same knowledge. Secondly, the transmission of knowledge about the particular subject is quintessential for the formation of the customary knowledge, which follows distinctive, pragmatic rules: "know-how", "knowing how to speak", and "knowing how to hear" (Ibid). The collectivity that takes narrative as its essential form of competence does not need to remember its past, since the repetition and the recitation of these narratives assure their contemporaneity, consequently forming the strong social bond and assuring the future transmission of the same narrative through time. In the field of architectural representation, this could be observed on the level of ideological construction of inherent meaning, by creating the mythologization of the reality.

MOBILIZING THE IMAGE

„Architecture worthy of human beings thinks better of men than they actually are. “

Theodor Adorno (Functionality today, 1997)

The tension between what a building wants to be and the architect's idea of the buildings function challenges the architect's decisions regarding the design itself (Venturi, 1997). The design of the Sava Center building is dominated by semi-public spaces, which architects call "squares and streets", where the dehumanizing aesthetics of the "technical truths" of the architectural form is tempered by the use of natural materials, wood, leather, wool, and greenery (Šaletić, 1977). One of the goals is the dematerialization of the interior of the building and construction of the artificial environment within the object, which would be a place for meeting, conversation and contemplation (Figure 2a). The combination of natural materials with huge green and water areas was directed towards creating a city like leisure zone. A city within a city was also a concept for the design of the press-centre, comprised of modular cells equipped with the telecommunication equipment (Figure 2b). Although it was designed as a polyvalent space, whose flexibility influenced the structural solution and aesthetics of „the open architecture of our time“ (Maksimović, 1979), the object had been adopting and transforming ever since it was open.

According to the first director Miloje Popovic, at that time art and money were merged through donations and the help of state-owned companies and banks, thus building a sustainable system within the facility. In the first year, the building was closed for the public, and the entrance of the civilians was largely scrutinized and controlled. The inner landscape was a few years later transformed into Bazaar, a mini shopping mall, in which reputable social enterprises and firms such as Department Stores Belgrade, Prosveta, travel agency Putnik, but also British Airways, had their offices. The reconstruction of the internal landscape and the construction of commercial facilities instead were carried out under the supervision of architect Stojan Maksimović and interior architect

Šaletić. The main goal in the first years after the opening was to broaden the Centers offer by attracting cultural activities and different creative groups, such as filmmakers, painters, musicians, and the young. In line with that, the governing board had adopted several plans for the upcoming period, with an aim to continually produce another idea about the possible role of the Center in the enriching the cultural offer to the new society of the stable middle class.

FROM PURPOSE TO SENSE OF SPACE

Adorno states that what a language defines as necessary can later become superfluous, even terribly ornamental, as soon as it can no longer be legitimated in the second kind of language, which is commonly called “style” (Adorno, 1997). The discipline of architecture should be examined from the outside of its own limits, since that could suggest the loss of control regarding different contexts, such as cultural, historical, political, natural, economical, or in other words, the contexts which architecture cannot directly control (Grosz, 2001). However hard the practicing architects try to distance themselves from the aforementioned contexts, their relation to them persists and reflects them in nuanced and complex ways. In this dynamic notion of the purposeful architecture, the whole building could at a certain point become exclusively ornamental, or more precisely representational. The function of the object is independent of its purpose, while the purpose could be understood as any type of intention related to the construction of the desirable narrative. The notion of purposefulness is closely related to the social aspects, as purposeful forms as the rejection of style become a style by themselves. The ability to articulate space “purposefully” is linked to the creation of the „sense of space“ through architectonic imagination (Adorno, 1997). Technology within functionalist dialectics resemble the existing ideal in socialist utopias – the useful object is the highest achievement, „cleansed of profit motivation “ (Adorno, 1997).

Lefebvre calls for the comparable approach, which would analyze not things in space, but space itself, with a view to uncovering the social relationships embedded in it. The spaces themselves are specialized and they presuppose and imply a „logic of visualization “, which could be noticed in the design of the public and state building, whose main aim is to convey an impression of authority to each spectator (Lefebvre, 1984). The spectators can relate themselves to the set of images, signs and symbols, through the creation of the relation between the part and the whole. Lefebvre states that any determinate and demarcated space necessarily embraces some things and excludes others, being at the same time a „subject “ and an „object“.

After 1978 crucial part of the strategy for achieving the metropolitan image of the building, was the embellishment of the foyers with the art pieces. (Popović, 2007). This was directed at participants of international conferences and sponsored by working organizations and state banks. In 1979, in January, the first artwork “Veterans” of the famous Yugoslav artist Peđa Milosavljevic was solemnly installed in the main hall of the gallery. It was followed by the installation of dozens of sculptures, tapestries of the noteworthy Yugoslav artists (Figure 3a). In this process, we can follow the ideological line in which the representational model is changing, moving from the technology and truth-to-material logic to introducing decorative elements in the interior design, which transfer the message of cultural values and artistic achievements of the society at that specific moment.

The process of embellishment followed the setting of the “world clock” in the main

hall, which shows time in the scattered metropolises of the world. The clock is located between the dominant vertical installation elements - bunches, and info-desks, creating the impression of involvement and active tracking of world trends.

At the main entrance, the first thing the visitors are introduced with is the brass table containing the etching with the quotation of Tito's opening speech. It is followed by the Sava Center physical model, exhibited in the glass box, and ordered during the phase of the embellishment. Large photo-wallpapers with the resorts on the Adriatic coast were also placed within the foreign delegation units, but also the tapestry with the motifs of the National Liberation Struggle (Figure 3b). The tapestries by the prominent artists Ninela Pejović and Mirjana Morača, used as a cladding for the main conference hall, despite evident artistic expressiveness, were more frequently perceived as the elements of the interior design. It could be assumed that the works chosen by the architect Šaletić in the original interior design were too abstract to convey the ideological message clearly. Together with ambitions of the establishment, these embellishments and further transformations of the inside contest the original modernist premises of the authors. On the other hand, they are reflecting a rise in the postmodern culture of consumption and image-driven society, even within the self-managing socialism in Yugoslavia.

CONCLUSION

Postmodernism as an aesthetic context can be more precisely understood as "ultra-modernism", because it to a certain extent represents a critique of the "tradition" of modernism, as understood by Adorno. It is necessary not to consider historical consciousness as radically new, but as a difference within what constitutes a human relationship to the present. The development of the relationship between the discovered – semantic, and the basic – ontological, based on history as an objective track of events, with historical traditions, is destabilized through the idea of simultaneity of the event, which comes to the point of the idea of progress as a unique flow. In a world where there is a lack of a robust and homogeneous idea, which would have a particular role, the meanings are accumulated without order and rules, from a pure nostalgic tendency to fill the void. The loss of the functional and symbolic significance of the Sava Center, and the crisis in which it has been in the last 10 years, is actually the result of the loss of the symbolic importance of its representation model in the context of the neoliberal economy, based on the profit and feasibility of investments, in which culture equals the spectacle. The Sava Center's former role regarding expressing political and societal progress could be understood as the narrative whose transmission failed to continue once it had lost the connection with concepts and values that are considered to be preferable by the society. On the other hand, the loss of the central position in the representation of the state and the regime can be regarded as a vast potential for the future development of this architectural edifice. In general, once the building liberated itself from the shackles of the fixed meanings, the polyvalence of its form emerged, manifesting in various ways the multiplicity and complexity of the society and culture.

Miloš Kostić (1990) is a teaching assistant at the University of Belgrade – Faculty of Architecture, currently involved in the field of Contemporary architecture and architectural design. He is a Ph.D. student at the same University since 2014, with the focus of the research on the methodology of architectural design, tectonics, and cultural studies. Throughout his research, he inquires complexity and contradictions within different approaches to architectural detail and ornament in architectural theory and practice. Aside from academia, he has been actively involved in design practice since 2011 and has participated and been awarded in numerous national and international competitions and exhibitions.

Ana Zorić was born in Nova Varoš, Serbia, 1990. She graduated with Bachelor (2012), and Master degree (2014), in University of Belgrade – Faculty of Architecture, where she enrolled in PhD program the same year. She was selected as a Teaching assistant for the field: Contemporary architecture and architectural design at University of Belgrade - Faculty of Architecture 2016. As the author, she was a participant in several national and international exhibitions in the field of art, architecture, and urbanism. She won several awards at architectural competitions. She is also an active exhibitor in the field of fine arts. Thematic area of her scientific research covers the problems of the abandoned spaces of the city and their potentials in the context of reviving through activities and contents of recreation in architectural discourse. She has exhibited her scientific research at several international scientific meetings.

WATER IN ARCHITECTURE: IMAGINARY AQUATECTURE SPACE – HOUSES OF WATER

Abstract | This paper research possibilities of perceiving water as an inspiration and tool in research through architectural design. It is a process of shaping and durability in such architecture – that could be called Aquatecture. The Case study is historical Lower City of Belgrade Fortress (also historically known as Water town), as a place from which the City emerged and as the place to which the City should return by way of water. In one part of the river embankment, near the newly reconstructed Nebojša Tower, as a part of the multifunctional cultural city complex consisting of three Houses of water, the City Bath, Nebojša Tower with annex in the former waterfront rampart as a cultural center, and finally *City's Water Museum*, as the last fortification of the city, allows a final meeting of the River and City at the Estuary.

The goal of this imaginary aquatecture research and project is to reestablish the potential of such a historical site. By highlighting the Houses of Water as fragments of the City's infrastructural system, as a complex of aquatectural structure which promotes not only a model of living, but as a total utilitarian way of contemporary life in the city. This kind of contemporary life in the city is triggered by architecture which is inspired by water.

This imaginary and intuitive project, where the House of Water is observed as a future City Museum that would use its spatial form to create a frame for research of spatial structure, the content, form and influence of the water element in the space forming calling for awareness about the common wealth and possibility of the interpretation of the individual in relation to the real context, that kind of house could become one of more relevant places of the City's meeting points as a new city epicenter. Respectively, the Belgrade Fortress could become a new multi-functional city cultural complex that also contributes to the "hygiene" of Belgrade City.

The aim of this paper is to present the possible way of understanding water as a functional tool in the architectural design process. Ergo, water is a term, architectural and aesthetic term, which is explained through the architectural project.

INTRODUCTION: THE BELGRADE FORTRESS AS A NEW EPICENTER OF CULTURE – MULTIFUNCTIONAL CITY COMPLEX OF CULTURE

The spatial context of this research has been understood as a space of parallel paths of different dynamic characteristics of the City of Belgrade and its water, in the zone which is enclosed by the position of the Belgrade Fortress on the one side and by the Sava River at the estuary with the Danube, on the other side. The fragment of spatial reality on which the imaginary project is thought out in this research is defined as a space which embodies the course of history, that is the urban archeology of the water ways. The analysis of the existing state represented the starting point of the architectural design process which is directed by the understanding of the concrete situation of the spatial context on the site. The next step was the creative and intuitive process which should have resulted in a new programmed spatial revitalization of the site through forming of the City's epicenter of Culture. The main landmarks on the wider city site, buildings, and spatial areas such as the Lower Town of the Belgrade Fortress were the axis of the program spatial analysis with the aim to define individual themes and the immediate location. It is the immediate surroundings of the newly reconstructed Nebojša Tower with a river rampart which continues on to the embankment on which the railway runs. The new City epicenter is composed of three houses of water: City Baths, Water Museum and Nebojša Tower, which as new and revitalized buildings and spatial structures make the multifunctional Complex of Culture. Two of the three houses of water (City Baths and Water Museum) were formed as a part of the river rampart as the final fortification of the Lower - Water town of the Belgrade Fortress, at the estuary itself. In such a Complex it was important to think about the space allocated to the spectacle. The main critical analysis was based on the hypothesis that water can represent the contemporary definition, and methodological tool, and exclusive ambient spectacle – spatially inspiring. Thus, the research focused on the analysis and redefinition of the context of the location: spatially, historically, culturally and socially.

METHODOLOGY

The methodology of this research looks at the approaches to the problems of architectural design and the understanding of the contemporary experience of space which embodies water (McCarter and Pallasmaa 2012, 4-7). It connects the realisations of the research through the making of The Houses of Water as buildings – spatial structures of spectacle in contemporary culture in the framework of the contemporary spatial context of the Belgrade Fortress. The starting point of such a process of research represents a multitude of possibilities in defining space, which embodies the element of water – *Aquatecture* (Wylson 1986), that is *Spatial pictures* as the main frame for understanding such architecture. We call this architecture *Aquatecture*, which is followed by, and thus built by the phenomenon of the aesthetic principles of communication (Mako, 2009). Focusing on the definition of spatial experience in the architectural design process, three analytical methodological models are offered: Illumination (inspiration), project (drawing) and model (Miljković 2009, 41-43).

The Belgrade Fortress, through urban archeology, that is through carefully selected space for the project, has served as a polygon for researching the conditionality of visual-perceptive connections crucial not only for the public, but for private visualization of city space (DVT). With the aesthetically, logical analysis research was done on structural ties with epistemological layering of aesthetical topic of this paper – that is the House of water as a fragment of reality in the Lower (Water) Town of Belgrade Fortress.

The aim of this paper is to understand water, not only as an ornament in architectural space, but as the carrier of aesthetic meaning - experience (McCarter and Pallasmaa 2012, 145-147). Thus, water in such a context – design process is perceived as an element of shaping and continuity of space, matter that can offer new „ *fragile*“ perception of space, giving life to inspiration on the road to profound learning, all in the name of understanding and making of contemporary architectural space (Pallasmaa 2017, 57). This is why water has been chosen as the initial inspiration which leads towards forming *Spatial Images* as possible tools of operational, aesthetical and metaphysical games through the imaginary project as a methodological apparatus through which architects create. By creating a *Spatial images*, relying on Bachelard *Poetic images* we are enabling new illumination in space (Башилар 1969, 5-11). *Spatial image* that is new enough in its nuance to awaken the space with in itself, to create a place from space, to introduce a man with a watchful eye and full interest in the space that surrounds him. The being of a man, the being of space, and thus the being of the City will be condensed in such a place, a pure distribution of being that flows back to its center of creation of *Spatial images*, leading to the water as the main element of material imagination (Башилар 1998, 5) There is a desire to create such a space that is able to create new images. Images of space that will awaken, because every true architecture should be in the function of a perceptual awakening (Pallasmaa 2017, 53-54).

On the basis of the urban archeology of Belgrade's Fortress ground and its complex historical and cultural system, we tried to compile a set of logical contemporary solutions. Such projects for the Houses of Water would help the Fortress to regain its meaning which it had in the forming, founding and structuring of the City (Фуго 1998, 150-152). It is important to mention that space and time (lasting) of architecture could be inspired by water which in their framework lasts and shapes the contents of the spectacle of contemporary architectural spaces, making creative visions of architecture as a cultural practice (Šuvaković 2009, 171).

Methodological models: *Illumination (inspiration), project (drawing) and model*

During the design process, three methodological models are used: Illumination (inspiration), project (drawing) and model. For the illumination, or inspiration, the very location is used as a carrier of history flow, followed by water. Thus, the first watercolour drawings and diagrams of the future cultural complex were created, on the basis of which later projects were created for water houses (Figure 1 & 1a). The project was developed on the basis of the existing, reconstructed and revitalized condition in the immediate environment. First and foremost, following and respecting the context in which it is projected, and then in its architectural expression and style, following and supplementing the recently revitalized Nebojša Tower as a Cultural Center, where the former waterfront rampart is adapted into an annex of the Tower and serves as the lobby of the museum. If we look at the Nebojša Tower as the first house of water, in the continuation of the project development two more Water houses were created in the river rampart as the final fortification of the Lower Water town of the Belgrade Fortress, creating a multifunctional City Complex of Culture (Fig. 2). Finally, as the most important part of the design process, a model was set aside, on which the projected structures were again tested in the context of the Belgrade Fortress and its Lower Water Town (Miljković 2009, 41). On the model it is clearly authenticated that the newly designed structure will not in any way disturb the existing historical structures and structures on the Fortress, but on the contrary, in this way designed, the new

City Complex of Culture would allow the re-flourishing of this part of the City at the confluence itself (Fig. 3, 3a & 8).

INITIAL RESEARCH: HOUSES OF WATER IN THE MULTIFUNCTIONAL CITY COMPLEX OF CULTURE IN LOWER - WATER TOWN OF BELGRADE FORTRESS

The multifunctional City Complex of Culture in the Lower - Water Town of Belgrade Fortress consists of three main buildings - *Water houses*: Nebojša Tower, City Bath and City's Water Museum (Figure 4). The design of the Complex also includes the Water Institute with pumping stations and water facilities, as well as spatial accommodation capacity and several different ambient spaces and scenes for the outdoor, open-air spectacle (Figure 2).

Nebojša Tower: the first and only real House of Water

The beginning of the formation of the Complex, to which the project later proceeds as the New City Epicenter of Culture, resulted when in 2010, a team of architects from the Belgrade University of Architecture (Dejan Miljković, Branko Pavić and Jovan Mitrović) were commissioned for a revitalization of the Nebojša Tower into a historical museum. The former waterfront rampart is adapted to the annex of the Tower and serves as the lobby of the museum. An extension of the lobby, in the direction of the former Watergate No. 2, is turned into a multifunctional hall.

All sections of the exhibitions in the Tower are multimedial, interactive and multilingual: in Serbian, Greek and English. The entry section addresses the history of the Tower. The ground floor setup marks the prison period and slavery in general. Installed, hanging in the air, are portraits of political prisoners. The first floor is dedicated to Rigas Feraios, citing lyrics from his poems. The exhibition on the second floor is dedicated to the First Serbian Uprising. The final floor celebrates the development of Belgrade city after the liberation from the Ottomans where multimedia includes the reflection of water on the ceiling, from a centrally placed round dish (Figure 4).

Today only one part of the concrete annex works. It is the one that has a lobby with double door entrance and visitors services. This area is under a glass roof with a metal construction which has a green roof with grass on one part (Figure 5). The Tower still retains function of the museum. However, phase two which involves the covering of the whole annex that was made as a concrete trough in the waterfront rampart remains under the open sky. This multifunctional hall was never completed. That, never finished, and now open air multifunctional space is used for various artistic performances and architectural installations (Milenković 2004, 71-73). As such, it represents a place for the development of a unique spectacle in a house that indeed belongs to water. The Tower with its annex made of concrete is designed to be waterproof. After a decade, water has in many ways found its way into the open-air hall in the annex of Nebojša Tower. In this open-air hall, in 2011, a musical performance, *Ištar* by Ivan Brkljačić was performed (Figure 6). This performance could be classified as a Water Theatre. Similar types of spectacles, which could be called aquatic, in which water has a main spatial-ambiental role, illustrates clearly, the forming and unfolding of spectacles, in both the existing and newly planned structures. These newly designed structures are inspired by water, not only in the final processes of usage, but from the very beginning of their creation, they were predetermined to contain water. In this way they can create an

ambient spectacle in their spatial frames (Moore 1994, 201-204). .

The City Bath and the City Water Museum projects emerged as an extension of the material imagination and affirmation of water as tools in the process of architectural design research (Башлар 1969, 5). This kind of architectural research has the ultimate goal to form a special kind of ambience spectacle in which water and space coexist and create unforgettable spatial images in the eyes of the observer who has entered.

The City Bath: second house of water, the bridge between city and river, history and contemporarity

The project explores the conditions for the design of the City Bath in relation to its importance and position in the City. With a specific decision for the special treatment of the wall as a rampart, that is, a river embankment as the last rampart (in Lower Town) of the City, which has a City Bath as an extension of the flow. Also, the railroad tracks stretching through the embankment, create a point of departure in the city's bathhouse, thus creating an expanded flow of people in it (Figure 7).

The Bath is basically completely symmetrical and is reminiscent of an ancient excavation site (Figure 8). The concept for this House of Water is based on the keeping and tracking the flows generated by railroads, people, city walls, as well as the current water flows of the rivers itself. By creating a space that is in the immediate relation to the relationship inside towards inside, inside towards outside and outside towards inside. With this kind of spatial design, the City Bath would seem a programmatic framework for exploring the spatial structure, meaning and measure and content and form. The City's refers to the awareness of the general, the common, and allows the possibility of interpreting the individual in relation to the actual context, which would become one of the important places of City encounters (Abadić 2010, 15–46).

The City Bath as a fragment of structure or part of the City's infrastructure, in relation to the spatial framework of the Complex, examines the potential of the context for the improvement of contemporary life in the City. The Bath house can be interpreted from the aspect of individualization and the relief from City pressure. As well, the City Bath can be interpreted as a fragment of the structure or part of the City's infrastructure. In that process improvement of contemporary life in the City is examined as a support to the contemporary model of life and total utilitarianism on a daily basis in a way that draws public awareness of the general, and allows the possibility of interpreting the individual in relation to the actual context (Abadić 2010, 46).

At the level of the architectural plan (Figure 4), the analysis and characterization of the relationship between the private and the public, through universal and specific architectural elements, geometry, volume, surface, ambience, layers, continuity and elements of nature, water, air and light were carried out (Abadić 2010, 208). In the field of architectural intervention, work involved the creation of standards, personal in general, private in public, and research and realization from very small local interventions, to spatial in proportion to environment and historical context.

The City's Water Museum: the main building in the Multifunctional City Complex of Culture

During the research process, as the main object in the Culture Complex, the museum building was accentuated as the City's Water Museum. An object that completely follows in its spatial design the contiguous City Bath. Also, this building connects the City Bath (as a newly designed structure) with the already existing and reconstructed Nebojša Tower and the ramparts that revitalize in its continuation, forming a unique spatial structure of the Multifunctional City Complex of Culture.

The City Water Museum is a place where the city and the river are merged, the place where a man merges with the city and its rivers on the estuary. One type of syllogism from which follows that the city is equal to the river, that is, that the man is equal to water and that is, if the space is inspired and defined by water it can enable it. The City Water Museum is a place where water touches the City, and in it a man touches and experiences water in a special way (Juhani Pallasmaa 2017, 52). The museum's visitor experiences a *Spatial image* in his fullness of material imagination and ambient spectacle created by architecture that contains water.

The access to this building is constituted in such a way that visitors can easily reach to the context of the City, and a plateau has been created in front of the Museum, which continues into the atrium courtyard that surrounds it with all three houses of water. In the left part of the Museum, one enters a transition zone, a spatial mechanism in which the connection begins. These are spaces that can be described as a kind of locker room where people leave his clothes, and completely naked visit the Water Museum. The City Museum is designed in such a way that the visitor moves naked, and seamlessly crosses into the City Bath. Or, by visiting the areas of the Museum filled with water, one becomes an exhibit - a spatial artifact, a color that is lacking in the Spatial Image. In such a museum, a man is able to enter into a Spatial Image of water, that is, in the architecture that is exhibited in such a museum, the architectural space that is inspired and shaped by water. In that way, shaped and by a man perceived and formed architecture, can be called Aquitecture (Barker and Coutts 2016). At the Museum, a man enters the water, at that moment when a man enters the water at the City Water Museum, a spatial act takes place in which the City has merged with its water. Thus, the centuries-old function of this place is filled again, people, life that is, have returned to the place where the city is being built, the place where the City springs.

The place where the City springs

To make the inner space concrete and the outer spacious and shaped by the imagination of water, seem to be the original tasks, the original problems of research. The contrast between the concrete and the spatial is not clearly defined. Inside and outside will not react equally to the qualifications even if the water where that qualitative, as a measure of adhesion with space and place. Water inside and outside will be experience differently (Башић 1998, 5-24). Therefore, everything, even size is human valer, as the only measure that can connect these two spaces and flow with water in them By using a special, architectonic approach and structuring the space by fragmenting into large and very small, individual parts, the standards of the use of common space can be created, personal in common and private in public, defining a spatial spectacle in

contemporary culture (Abadić 2010, 45-46). In that way man will make the miniature of the city spacious in his own subjective and laconic manner - to experience water in architecture.

In this research it has been attempted to connect architectural images, dreams about space and dreams about water. Even if observation is very important, it is not a matter of isolated observation, but also about experiencing space in its immediacy (I see - I think - I do). The dedication to the whole Cultural complex with its three water houses in the Lower Town of the Belgrade Fortress (Башлар 1998, 19). Therefore, three methodological methods of architectural design research have to be based on the architectural plan, testing and characterization of relations, full and empty, private and public, universal and specific architectural elements of geometry, volume, surface, ambience, layers of continuity and elements of nature: water (in all three aggregate states), air and light (Figure 10).

Relying on *Spatial Images*, as the carriers of the creation of architectural action, they evoke dreams of space, but at the same time they must preserve the memory of previous spatial dreams. Even when the moment in which architecture goes beyond the threshold of the phrase, it was tried to emphasize the onirish path which leads to the architectonic creation of the space every time there was an indication of it. With additional reliance on mythological facts about the City, it leads, because their permanent functioning is recognized, (not) conscious action on people - the duration which shapes. It has been attempted to connect architectural images and material dreams about space, the substantiated dreams of water ((Башлар 1998, 28).

In this research Water is portrayed as a perfect being. It gets *Water Houses* into the heart of the City, can call it to itself and one can enter it. Perhaps more than any other element, water is a complete reality that shapes the world around us and life on earth. In spite of its diversity and ways of shaping, water nevertheless ensures unity and durability. Therefore, architecture needs water to point out the spatial illumination through the spatial unity of the elements, with which their joint permeation and duration are ensured. Without this unity of elements, material imagination is not satisfied, and formal imagination is not enough to connect the diverse lines of the city and the space in it (Башлар 1998, 24). The City, this creation of the people, is missing life because it is missing substance. The substance that flows through it, and the City is against it, does not hear it, does not see it, does not feel it. Whereas, the research carried out through the project demonstrates how water can be formed. It can be used as an operating tool in architecture by bringing life back to the City in which it is located. The City and its water, and with them the people, would continue to flow and last. Such a process would merge the City and the river into the House of Water in the Lower - Water City of the Belgrade Fortress, the place where it all begun, the place where the City springs.

CONCLUSION

The main intention of the paper is to present a conceptual architectural and urban solution that has its clearly recognizable research and application component. The elements of the thematic areas and program bases on which the project relies are clearly recognized. The Multipurpose City Epicenter allows the creation of content assemblies or self-contained multifunctional, hybrid and other entities that consider

typological characteristics of public content in the context of contemporary city access. The conducted research is illustrated with the artistic visions of the architect - the *Spatial images* that create and make everlasting connections between architecture and water. This process clarifies concrete proposals of architecture through the *Houses of Water*, which appear as a product of imagination. The acquired experiences from the research provide guidelines for further action in practice through three presented analytical methodological models of architectural design research. On this occasion the contemporary context of architectural action and theme of design is understood, and thus epistemological meaning of the duration and shaping of water space in the formation of new *Spatial Images*. In such a way formed architecture, inspired by water relations in the spatial correlation of full and empty space, described Houses of Water in the Lower Town of the Belgrade Fortress, are made. The interpretation of these houses as fragments of the structure or part of the city's infrastructure in relation to the established spatial, program and thematic framework of the research, returns the potential to the chosen context of the contemporary city. This makes the Belgrade Fortress the Epicenter of Culture, which significantly improves City life. Thus, water in such a design process is perceived as an element of shaping and continuity of space, matter that can offer a new fragile perception of space, giving life to inspiration on the path to profound learning, all in the name of understanding and making of contemporary architectural space. Also, if we interpret water as an element of material imagination in the contemporary design, that we recognise life is naturally, constantly surrounded by water. It has given birth to shape of life on earth, and continues to do so. Therefore, water is an aesthetic matter that can and must be used as an methodological operational tool, an element that is a basic necessity for our future shaping of architectural space.

Miloš Stojković, M. Arch., is a teaching assistant at the University of Belgrade – Faculty of Architecture, for a narrow scientific and artistic field: Architectural Design and Contemporary Architecture. He graduated at the Faculty of Architecture in Belgrade at the basic academic studies in 2014, and master academic studies in 2016. Presently, he is studying for his PhD - Doctor of Technical Science in Architecture and Urbanism at University of Belgrade - Faculty of Architecture. His scientific, professional and academic interests are related to the theme of water in architectural design and shaping of space, visual presentation, perception and use of water in the extended art media in the field of architectural design. He received the Award of the Union of Architects of Serbia, for the most successful student architectural project in 2016. He received this award specifically for his master project "*Belgrade Fortress as New City Epicenter - Multifunctional City Complex of Culture: City Museum of Water – House of Water*", which was exhibited at the 39th Salon of Architecture - *In Reality*, at the Museum of Applied Arts in Belgrade, in 2017. He regularly and very successfully participates in architectural competitions, workshops and scientific conferences, locally and abroad.

TEMPORALITY OF ARCHITECTURE AND THE ETHICAL TURN

Abstract | In his book *Aesthetics and its Discontents* Jacques Ranciere mentions architecture on a few occasions, however the position of architecture in relation to his conceptualization of the three regimes of art remains unclear. Even though art and architecture share similar dilemmas discussed by Ranciere, due to its function architecture is integrated in the societal field differently than art. In order to build, a certain purpose is ascribed to the environment and in turn a certain function to architecture. This is particularly relevant for the ethical question as opened by Ranciere in terms of the triad: an environment, a way of being and a principle of action. Namely, architecture (due to its temporality in relation to function) operates in relation to space differently than art and is in this way crucial for the environmental concerns of the future. This poses a challenge for the architectural discourse and demands a rereading of Ranciere's regimes of art in relation to architecture by elucidating its ethical aspect. First of all, the presentation will thus outline a new perspective on the question of the ethical turn through temporality of architecture. Secondly, rethinking architecture in the context of Ranciere's ethical question simultaneously opens an opportunity to rethink Theodor W. Adorno's take on architecture as developed in his only text on architecture: *Functionalism Today*. There, Adorno explains that in creating architecture an interaction takes place between purpose, space, and material so that architectural imagination fuses the three aspects. When architecture attempts to elevate the sense of space created in this process, it attempts to elevate it beyond the realm of purposefulness even though purpose is still immanent to it. Only if it succeeds in this synthesis, according to Adorno, architecture can reach greatness. The question of purposefulness (with its relation to material and space) can likewise be related to temporality of architecture, thus opening a new perspective on great architecture in light of Ranciere's ethical question. The presentation will show (with concrete interpretations of architectural works) how rethinking Ranciere's regimes of art can become operative in the context of architectural discourse challenged by contemporary environmental and societal changes. In doing so it will find crossings between Adorno's criterion for great architecture and Ranciere's ethical question.

Index terms | *architecture; art; aesthetics; ethics; politics; Ranciere; Adorno; temporality;*

INTRODUCTION: SENSE OF SPACE

In his only text about architecture, *Functionalism Today*, Adorno writes: [The work of an artist] manifests a crisis which demands that the expert [...] go beyond his craft in order to satisfy it."¹ To do this, the artist — as well as the architect — should account for the position of his work in society and for the social limits which he encounters on all sides. In this regard it becomes crucial to rethink city planning, reconstructions, where architectonic questions collide with social questions such as the existence or non-existence of a collective social subject. Second, Adorno stresses the importance of aesthetic reflection for architecture as a purposeful art. ² Nonetheless, the concept of purposefulness has become unclear. Therefore rethinking architecture in order to give valid answers related to its goals in society consequently becomes an urgent task.

Economic growth and building that accelerates it is today regarded as an objectivity.³ The means to achieve these goals are likewise understood as objective. However, there must be a kernel of these means (something else than the means themselves), namely something irrational. Adorno reminds us that capitalist society hides and rejects precisely this irrationality.⁴ Purposefulness in architecture shows itself as one of those concepts related to means that need to be rethought. In finding a way to do this, we can turn to Adorno's second point — in architecture there needs to be constant aesthetic reflection. Aesthetics is therefore a practical necessity for architecture that can retroactively become important also as an integral aspect of philosophy bringing new insight from architectural reflection.⁵

Adorno's stance that reads virtually as an instruction is a logical consequence of defining architecture in terms of purposeful art and for which Adorno introduces his own interpretation: architectural imagination fuses purpose and material to create space. For this reason we can talk about a sense of space (*Raumgefühl*) that is related to purpose, use. However, Adorno is clear — for great architecture to be, for architecture with a capital A, it is not enough for the architect to give space to purpose with material. For Architecture the sense of space is to be elevated beyond the realm of purposefulness even though it is still immanent in the purpose.⁶ Architecture for Adorno is not merely material plus purpose to create a space, Architecture means exceeding the question of purpose, which can be consequently felt in the sense of architectural space created.⁷

AESTHETIC EXPERIENCE AND ARCHITECTURE

In Aesthetic Theory aesthetic experience is described as immediacy accompanied with volition, concentrating consciousness. As such the analysis reconstructs personal time through its antithesis. Analysis terminates in beauty an unconscious perception and paradoxically it simultaneously points to it. It therefore subjectively re-describes the course that the artwork objectively describes within itself.⁸

Aesthetic reflection brings about the question of art and beauty that Adorno elucidates in relation to Kant's sublime and consequently opens the relationship of nature and natural beauty to the artworks. In his theory art and artificial arise in opposition to nature and each refer to the other: nature to the experience of a mediated and objectified world, the artwork to nature as the mediated agent of immediacy.⁹ Since the experience of nature is no longer accessible, Adorno challenges us to rethink natural beauty as something constantly changing and not objectified in relation to

artworks and therefore to architecture as well.

Aesthetic reflection of architecture reveals the following: on the one hand the consciousness concentrates on the experience of form that defines architectural space and on the other the thought is confronted with the views outwards, through the window. If this view is directed towards nature, the *temps duré*e and the experience of space is via architectural form in a specific relation to cyclical time of nature via program / content that defines the view and delimits the aesthetic experience.¹⁰

For the architectural space to be, a part of natural environment has to be sacrificed and as such is transformed into space with its function in the social domain. In this sense nature is not merely an image we experience looking out of the window. Nature is transformed as materiality to become space. It is therefore an object of action and temporality of architecture is consequently the key to define the relationship between nature and the built environment either in a positive or in a negative way, which brings about the question of ethics.

Ethics

Jacques Ranciere in his work *Aesthetics and its Discontents* defines ethics as “the kind of thinking in which an identity is established between an environment, a way of being and a principle of action.”¹¹ Architecture is affected with building and for building to be ethical it means that our way of being, a way in which we understand ourselves objectively in relation to the environment, “spatializes” via principles of action in such a way that there is a certain balance created between the three aspects.¹²

Ranciere opens the question of aesthetics from a perspective that situates the confusions of the aesthetic discourse in the same historical context as Adorno —in the context of philosophical idealism and Kant. Ranciere points out that with aesthetics the philosophers elaborated the regime of intelligibility within which its defining relations could be thought. They grasped and conceptualized the fracturing for the regime of identification in which the products of art were perceived and thought, the rupturing of the model of adequation between *poesis* and *aisthesis* established by the norms of *mimesis*. Under the name of aesthetic, they above all grasped and conceived a fundamental displacement: namely that the things of art would henceforth be identified less according to criteria of ways of doing, and more in terms of ways of sensible being.¹³

Ranciere and Adorno are akin in this formulation. However, Ranciere points to the consequences for the aesthetic experience being in a new form of life. He claims that a double suspension of aesthetic experience (of a cognitive power of understanding that determines sensible givens in accordance with its categories; and a correlative suspension of the power of sensibility that require an object of desire) simultaneously found a new art of living, a new form of “life-in-common.” It could do so because it defined that which comes within the province of art through its adherence to a sensorium different to that of domination.¹⁴ For Adorno, similarly, art beauty transcends domination.¹⁵ For Ranciere, however, the aesthetic autonomy is not the autonomy of artistic “making” celebrated by modernism, but an autonomy of a form of sensory experience that he defines as the gem of a new humanity, of a new form of individual and collective life.¹⁶

Regimes of Art and Architecture

To define the edifice of art, Ranciere introduces the three regimes of art, which have historically emerged in different contexts and continue to co-exist. For an artwork to belong to the *aesthetic regime of art*, the work draws its property of being an artwork from its belonging to a specific sensorium in which the form of sensory experience suspends the cognitive power of understanding (that determines sensible givens in accordance with its categories). It is accompanied by a correlative suspension of the power of sensibility that requires an object of desire. Ranciere also defines a *representative regime of arts*, in which a work of art is a “representation.” It is viewed through a grid of expressive conventions that determine the way in which a skill in giving form to raw material is brought to coincide with the artistic capacity of rendering the appropriate figures according to the appropriate forms of expression.¹⁷

He also defines an *ethical regime* of images, in which a work of art, for example a statue, is exclusively apprehended as an image of divinity. In this regime, there is properly speaking no art as such but instead images that are judged in terms of their intrinsic truth and of their impact on the ways of being of individuals and of the collectivity.¹⁸ When art, in its indeterminate singularity, was set in contrast to the list of fine, or liberal arts two centuries ago, aesthetics was born as a discourse. It opened way for a new gaze. In Ranciere’s words: “If aesthetic sentiment is to arise, it is not sufficient that pleasure is taken in seeing or hearing their work. For art to exist, what is required is a specific gaze and form of thought to identify it.”¹⁹

Does the framing of the regimes of art matter for architecture? Architecture was never regarded as a fine art precisely due to its function, purpose, relation to power and money etc. It was, nonetheless, affected by the aesthetic discourse. For architecture to be architecture in the 19th century, it was not enough to represent a skill, for architecture to be, there needed to be a thought and a gaze that identified it. Since architecture creates space with its form, it is impossible to think of mimesis in the same way as in fine arts. (Decoration is not at stake in this regard.) Architectural autonomy was consequently established in relation to architecture’s own rules, which were and are historically interpreted from a certain point in time onwards be it as language, space, style, typology etc. Autonomy therefore brings about different histories that are related, as in art, to different regimes of identifying architecture. These histories are composed of breaks, proximities and new beginnings.

It is possible to argue that, as in art, there is ethical, representative and aesthetic regime of architecture. On the one hand, in the ethic regime architecture is a product of a skill. On the other hand, the representative and the aesthetic regime demand a wider justification, a thought that correlates the product of a skill to a thought on architecture. In the representative regime this means relating it to its specific history through a network of similarities. The aesthetic regime, however, does not require affinity to its rules, but a specific sensory experience of architectural form. This form is connected to the inverse of the material, to the sense of space, discussed also by Adorno.

Turn

For Ranciere the relationship between aesthetics and politics is key. In his historical contextualization of aesthetic regime Ranciere points to the potentiality of “aesthetic revolution,” as he calls it, in the context of political engagement in the field of art. It inspired the artists of Arts and Crafts movement, the decorative arts celebrated as

“social art” in its time, engineers and architects of Werkbund and Bauhaus as well as Guy Debord later on. Malevich’s Black Square was not interesting because it was a form for its own sake, but as a gesture of an artist that juxtaposed Soviet construction to museum works.^{20 21} There is no aesthetics without politics for Ranciere and for this reason he goes back to tracing the history of aesthetic “confusion” to clarify another confusion that the critique of aesthetics fosters, the confusion that buries art’s operations along with political practices underneath the indistinctness of ethics.²²

In doing so, Ranciere defines the ethical turn in the field of art related to the question of the Nazi genocide, but again he contextualizes the discourse historically. The genocide lodged itself at the core of philosophical, aesthetic and political thinking around 1989 and as such overturned the potentiality of linked political and aesthetic radicality with a cut in historical time. The event which argumentation of the critical art refers to is a catastrophic event in the past, which cannot be changed. The discourse therefore could not avow political engagement over ethical concerns and subsequently continues to undermine the potentiality of the aesthetic regime of art.

CONCLUSION: TEMPORALITY OF ARCHITECTURE

The question of temporality of architecture and its relation to purpose is present in its aesthetic experience that fuses societal time and the cyclical time of nature to re-describe personal time. It has become clear that nature is being transformed into a devastated cultural landscape manifesting a catastrophe in the near future. With the programs that define architecture and its purpose this ancient craft has long been a part of the damaging process. However, if we redefine the discourse in light of a future event, ethics can open the doors to action.

For this reason architecture opens a way of rethinking art and artificial in relation to nature. Aesthetic Theory was published posthumously, in 1970 for the first time. Adorno could not talk about the turn of the 1989. However, the dilemmas of contemporary art and architecture urge us to rethink the field beyond formal considerations. Can Adorno’s insistence on aesthetic reflection bring about another turn and advance the event into the future?

Architectural work is a work of art with a specific relation to its use and its function. Aesthetic reflection shows that the experience of architectural space fuses three times: the cyclical time of nature, and societal time to re-describe personal time. Architecture, therefore, has a double function — in relation to nature and in relation to society. If we juxtapose the temporality of architecture to Ranciere’s conception of ethics, cyclical time of nature coincides with the environment and societal time with a way of being — a way in which a society builds an environment with programs for the future. The two environments are to be balanced via a principle of action.

The ethical question can in this way be integrated in Adorno’s take on Architecture. When architectural imagination fuses material with purpose, it fuses material not only with program, function, but also with the natural environment. For the practice of architecture to be ethical, it would need to balance societal time and cyclical time of nature in planning space. Furthermore, both questions would have to be exceeded when designing and building form.

The question of spatial planning was almost completely depoliticized in the Cold

War period and the consequences of post-89 are showing the effects. Formalisms that have emptied the architectural discourse do not offer any possibility of opening crucial dilemmas of the present. The question of architectural space therefore remains to be opened with Adorno's aesthetics. Taking Ranciere's regimes into account can elucidate architectural histories and future planning in unpredicted ways. In turn such a perspective might bring new insight into art. After all, space is, as beauty and nature, as violence and freedom, present in every single work of art.

- 5 Adorno, "Functionalism," 17.
- 6 Ibid, 13.
- 7 In this case, if we are confronted with great architecture, Architecture, we are confronted with the dilemmas of a work of art that has a specific relationship with its purpose through its materiality and function. The question of the artwork is discussed at length in Adorno's aesthetic theory, where he also defines what an aesthetic experience means and which is of key importance for architecture.
- 8 Adorno, *Aesthetic Theory*, 69.
- 9 Ibid, 62.
- 10 It is possible that the architectural work does not allow for such an experience. It could be closed off or it could overlook a devastated landscape. Nonetheless, it reminds us of the problematic relationship natural-artificial.
- 11 Jacques Ranciere, *Aesthetics and its Discontents*, trans. Steven Corcoran (Cambridge: Polity Press, 2009), 110.
- 12 Thinking about (at least) the environmental changes we are facing today, this is not the case. Does this imbalance concern architecture? If an architecture is imagined in relation to a beautiful view towards a landscape, this work is annulled if the landscape becomes devastated. It reminds us of Adorno's critique: cultural landscape that has expanded the notion of natural beauty in the time of romanticism is a ruin. This is the context of architecture that reveals itself through time and is a part of its spatial construction.

- 17 Ibid, 29-30.
- 18 Ibid, 28.
- 19 Ibid, 6.
- 20 Ibid, 39.
- 21 The autonomy of the aesthetic experience is the foundation for the idea of art to emerge as an autonomous reality and that in the next phase connects the practice of art to the question of the common. This is the constitution, at once material and symbolic, of a specific

space-time, of a suspension with respect to the ordinary forms of sensory experience. Art becomes political in its manifestation because of the distance it takes with respect to society's structures, social groups, their conflicts or identities, with the state of the world. As such it institutes a certain type of space and time in which it frames this time and peoples this space. Ibid, 23.

AESTHETICS OF A REIMAGING URBAN VOIDS AND FREESPACES OF MONTENEGRO

Abstract | Montenegro remains to this day an undiscovered destination with limitless “wild beauty - urban void” locations, blessed with illuminated Mediterranean skies, sea, mountains, home of artists and painters, enriched by jewels of untouched nature, and cultural-historical antiquity.

It is precisely these marginalized, forgotten, abandoned spaces that represent a great polygon of possibilities for expressing new identities of contemporary architecture and its increasingly human language. Through the co-ordinated creativity of art, we may renew these untapped, suppressed spaces into “Free-spaces” rooted into the deepest relations between man and nature. The creative “re-imagining”, “place-making” and resurrection of these spaces would be strengthened via new “Free-spaces” . Their aesthetics can be defined and seen through the imperative of the resilience of socio-ecological systems (SES Resilience) and the values of the places from which they are being realized.

The platform of this concept “treatment” and the freeing of existing, abandoned and marginalized territories (terrain vague) of Montenegro has two goals. The first is articulating unallocated spaces via existing and future road (traffic) structures (as well as its infrastructure), enhancing the possibility of discovery. The first goal is to take into account the dynamic interactions of such sites and their future potentials of transformability and adaptability as the basic components of the resilience taken as their developmental factor. The second goal of research is directed towards the inclusion of “unintentional natural landscapes” and “wasteless sites” with specially defined sources of natural energy sources (wind and sun, characteristic of MNE) where the socioecological value of the transformation system is demonstrated through the application of new aesthetic and functional values (interactive) of kinetic art practice. With this goal, the insight and design creates a completely new intangible architectural structure of archetypically defined unexpected values. It’s resilience will arise through the direct and indirect (real and virtual) effect of the participation of people and users in the role of actors and audiences in future scenic sites and energy-recognized locations. We as a community are crucially lacking in the development of a culture of universal and traditional values, the language of other artistic expressions and other thoughts that contemporary art and its practice offer and realizes. Therefore, the concept of this work has primarily focused on the projects of those “freespaces”, which will create new artistic incubators as spontaneous design pavilions inspired by a well-coordinated selection of projects for the stages of their manifestation. Their strength and energy must be directed towards nature and ecology, towards biological and biomorphic principles and synergy that produces a perceived reality.

Index terms | *Emerging resilience, urban voids, freespaces, terrain vague, wastelands, wasteless sites, unintentional natural landscape, interactive kinetic archisculpture...;*

Introduction

Research on public space, its settlement and longevity at the same, in the best possible conditions, are certainly some of the most important if not the earliest human creative manifestations. This is to some extent a reflex, which is bionically based on all levels of life that surrounds us. After all that man has created as civilized in the 21st century we have very much more to learn about designing and use of space and from some of our often invisible and quite seemingly unimportant associations. The scope of activities which contemporary man compared to other living creatures beings preoccupies himself with a space deeper and precisely in comparison to them is neither ecological nor functional. That somehow this contemporary man, unequivocally lags behind even an ordinary ant.

Nevertheless, the space of our evolutionary superiority, at least inexperienced, has certainly survived in culture and art practice as a proven feature of man's historical activity and overall positioning achievements of his deepest spiritual, mental and creative energies.

Taking into account the precisely stated circumstances of our development and the state of the general picture of the relation of civilization towards space and nature as its creator, I would like to point out the importance of our intensive dealing with the topics of *place-making* through the clearer visions of not only the local communities to which these areas relate but also to their adequate integration with the experiences of the entire civilization, applied technology, and the positive side of art, tolerance and culture, which always best combined and developed every space as well as the smiles of people in it.

Taking all of this into consideration and the potential of a small state such as Montenegro in the circumstances of transitional development, and through the possibilities of its almost completely dormant cultural and artistic potentials, I wanted to give this work some indications of certain *place-making* guidelines that corresponds with its official strategy of cultural tourism and implementation of its contents in public spaces not only of urban, but also of rural zones.

THEMES AND OBJECTIVES OF THIS RESEARCH

The theme of this project is "Reimagine Urban Voices and Natural Landscapes" through sharing values presents an animation of two completely different settings for the formation of active *free-spaces* zones on the ground of Montenegro. One involves the articulation of marginalized and abandoned, semi-open urban spaces located under the road infrastructure (with great potential), and the other is turned to reading and returning to those natural landscapes with the characteristics *Terrain Vague* and their chosen quotations to express the profound spiritual meditative value of the possibility of returning modern city man to original the attributes of nature and its symbols.

The first part of said solution is the concept of an applied and adaptive *mobile module of art structure*, which refers to any inert space created by placing elements of road structures above the ground.

The second part of said solution is a review of the essential values of intangible character that create the theme, like a story that has an artistic magical approach to the fertile soil of nature and symbols that have lived for centuries upon our lands. As such they offer initiation of new tourist possibilities by applying and animating these lands in a very high-quality and cost-effective manner.

Given micro-investment platforms and the capabilities of the communities and municipalities to which these solutions are pointed to, we have presented the possibilities of recycling certain types of construction and shipbuilding containers found readily. In addition to a strategically oriented ecological approach, we achieve the principle of *recycle* design.

Priority in developing this project is itself defined and fully adopts environmental standards and the mentioned *recycle design* through their monitoring of the bionic environmental principles develop the structure of biomorphic forms of compositions that they realize with their modular mosaics and specially designed collages of visual forms of presentation (Fig. 5). Another priority is the aspect of defining and applying the value of artistic practice. This is a result of a decades long research of the possibility of long-term activation of art in such and similar projects that have the goal of returning modern man, his half-connectedness with nature, need for communication, travel possibilities and new, more recent human forms of investing and shaping the real through the new values of the virtual.

PURPOSES AND EXPECTED VALUE OF THIS RESEARCH

The aim of this type of study through the theme of this project is to define future flows of theoretical or scientific research in existing urban public spaces and their urban voids in the context of creating new identity and (strategically important) spatial Art incubators when it comes to some particularly important places for uncovering the potentials of natural landscapes of Montenegro. They can be defined and localized by the activation of points that indicate the fields of their best aspects and energy. Those that can be effectively applied to the development of culture, the best civilization values, of developed European cultural environments. Achieving such *place-making* projects is possible through innovations and recycling of these within the innovative applications of these values and in upgrading Montenegrin authentic natural and cultural resources through renewable and environmentally verified strategies.

If **Freespace** (freely open space) by its unspoken nuance, describes the generosity of the human spirit and the primal feelings of humanity in the heart of the agenda of future architecture, focusing on the quality of accessibility and values that, as such, is realized by the public space itself, then we in Montenegro are on the right path with such spatial interventions humanizing and evolving the culturally and spiritually somewhat shortened opportunities for the development of our lands.

Freespace is of its own particular importance to Montenegrin Society, precisely because it celebrates the capacity of architecture in its continuous finding of additional and unexpected value of giving in each project - even within the most appropriate, defensive, exclusive or commercially restricted conditions. *Freespace* provides an opportunity to emphasize free natural gifts of light, heat and shadows: Through new

and innovative readings of sunlight and moonlight, natural air resources, gravity and the most diverse materials that man creates in contact with nature. I consider a particularly important clear ecological commitment regarding the development of self-sustainability of all potentially usable structures that can be implemented in the concepts that this research will pursue, both in the application of materials themselves and in their relation to the environment.

EXISTING SITUATION / THE CHALLENGES OF MONTENEGRO IN THE PERIOD OF URBAN VOIDS AND NATURAL LANDSCAPES

- **Lack of public space planning:** In the past informal planning and development of old cities, public spaces were a vital part of the public space, while today we live in the planning era of cities where the planning of public spaces is most often lacking as a priority.

- **Lack of participation and education of our public in the planning processes:** There is a noticeable lack of public participation in this area, as well as the lack of education of our urban society in terms of the importance and possibilities of these areas. That is why the key to CG is progress in this field through the development and building of a better common space of our cities, a clear focus on such issues of public space and the necessary answers that can engage our community in this important process. A process that should creatively become a new and innovative campaign dedicated to this topic through an active role and participation both professional public and the community as a whole.

- **Lack of quality public space design:** There is a huge gap between the contemporary needs of people as a local population and tourists when it comes to design values in our public spaces that have already been realized in most Montenegrin cities. It is notable that the design of these public spaces is mostly poor. Local needs are often ignored and planners and designers are engaged to designing public space are not selected by adequate competitions and results of them. As a result of several decades of weaker financing and superficial selection, we have the presence of mostly outdated approaches and interventions in the field of designing (thinking and designing) our public spaces.

If we qualitatively think about towns, then we always consider people. People as end users of public spaces need places that inspire and contribute to happiness, so our public spaces can and must bring a smile. We most often miss those public spaces in the era of technology in which our cities spread like fire, with their innumerable highways leading them and linking them to new urban areas.

1946

One of the proposals of this concept is the modular URBANA ART INSTALLATION called "Woken up dreams below the roads". It is designed as a multifunctional prefabricated housing structure consisting of 4 to 10 and more containers with accompanying contents and a unique design of space in a relationship to an environment in which it is identified by its special art program.

The displayed installations through the creative coordination of specially formed content (detailed consideration of the needs of the community to which they are related) can represent the development strategy of these spaces. With good and balanced planning and designing, you can get great art incubators that will in a short time give an unbreakable contribution to every urban community .. Their activity can

be integrated through the organization of various manifestations, open-air exhibitions and art schools, innovative courses, exhibitions and competitions in the most diverse art disciplines ...

Do we understand the presence of high-quality art practice as a cultural imperative and the best currency of the overall social development of a local community (how to integrate it in the general cultural values of the region, and consequently to better economic trends, as well as in terms of its constant tourist updating and the international market) we understand and fully accept the challenges that such creative centers of future even more free spaces can create and offer in order to have a humane and better life for every citizen of Montenegro, as well as for every guest or visitor.

This concept views **Place-making** not only as a philosophy, but also as the art of creating special public “places with the soul” that raises us and helps us to better connect with each other.

Freespace - Urban Voids and Natural Landscapes / Alchemy of abandoned spaces covered by road structure and overpasses as well as specially located natural landscapes of Montenegro

We consider ourselves as a creative provocation of almost countless useful spatial units that keep every abandoned space beneath the roads and road structures that are raised on the carriers, in the very heart of the highly developed urban communities, as well as in the marginalized landscapes of suburban and out-of-town space, we will feel a really unobtrusive field of potentially inactive space. As such, the resuscitations of such public spaces are primarily detected and recognized as potentially useful thanks to the aforementioned road and subsea structure. The pillars themselves that hold the road platform make one covered, to a certain extent secured and very important space that is mostly abandoned, completely avoided and most often does not use it. The lack of creative interpretation of these and such spaces is something that Montenegro can try through its experience practice to define and present this work precisely by activating the extraordinary potentials of its artistic practice. Namely, one of the important techno-ecological reasons that I consider especially important for such spatial potentials to be activated is transferring to ecological fuels instead of the existing fossils as well as the transition of the automotive industry to electric power. The disappearance of these main sources of pollution of the road regions and structures will make these areas extremely attractive in the near future, so that the economic side of investment in this concession will certainly pay off if it defines its developmental and modular applicability as well as constructive feasibility.

The starting position of the study of the potential of space below the roads

The space under the above-ground road structures and passages is one of the most important and best located spaces of unused public spaces of each city. It is often accessible and infrastructurally covered by the urban space of exceptional potential. It is protected from rain and sun. It is important to note that he is largely exempt from a large part of urban politics and planning documents of local self-government. His creative articulation creates an opulent play of opportunity through the proposal of new art communities, innovative hostels, art schools, galleries, ateliers, play areas, new movements, underground performances as well as shelters for community building, for renewing relationships with nature as well as for innovative manifestations and

celebrations. Now the clear indication of the transition of the automotive industry to electric power is also being realized, and the potential of permanent residential use of these spaces is realized.

The participation of this community in cooperation with local people, on the other hand, permanently helps improve the environment in the neighboring regions. Promoting local artists and people will help create more successful projects and beyond the areas where they are being realized.

“Only a hundred years ago we shape the public spaces, and now they can begin to shape us” (Author, 2012)

“The widespread practice of planning from above and from within must be replaced with new planning procedures from below and below inward, following the principle: first is the life and conditions of its realization, then the space and only at the end of the building. Instead of the reverse order in the planning process that gives priority to the first buildings, then spaces and (perhaps) only a little at the end of the theme of life that they work with such a human dimension that allows the buildings to be treated before life and space.” (Ghel, 2010)

– **Example Responsive / Adaptive - interactive urban constructions**) CG Solar Forest / MNE SOLAR FOREST

Such imagined *MNE Solar forests* with the park are also a parking place, a place to rest and an important road stop where electric cars can be recharged. They give the impression of evergreen foresters of unusual solar trees. The created photovoltaic forest with small landscaping has a multiple role. It serves as a source of clean renewable energy while providing shade to cars during charging. Every tree in this forest is equipped with a set of photovoltaic “sheets” mounted on its “branches”. The base of these trees is characterized by an energy statement for energy used to charge electric cars. “Leaf” rotates and monitors the position of the sun so that the maximum utilization and efficiency in interaction with the natural sources of energy to which this structure and its design are essentially related is achieved. In order to more fully maintain the self-sustainability of their embedded structures in natural forms, such urban installations should be activated in terms of modular wind turbine turbines and art installations that correspond to existing solar panels as their constituent elements

NONMATERIAL AND MATERIAL ACTIVATION OF FREE LANDSCAPING SPACES / NATURAL LANDSCAPES in CG

- **renewed rituals of cultural content**
 - **New parks and interactive urban compositions of the masons and bionic structures that invariably sublimate them.**

The green, anti-stressed and nature-endowed Montenegrin border zone of urban spaces is usually chaotic because they consist mainly of decades-old residuals of wrong access to them.

Other areas, as protection zones, are empty land that separates one zone of the building from the other, but also connects the enclaves and provides opportunities for a range of innovative urban actions. These interstitial spaces can act as an excellent potential for new urban restructuring. They can act as public spaces of special values

that today occupy the key components of the city, both in terms of both physical and social functions, which are now largely underutilised.

Space could be designed to give a sense of community ownership over it. It could be designed to reunite those areas of the city that were interrupted and separated by uncontrolled urban regeneration. Any such urban belt must not be a visual obstruction that effectively reduces the community and the like, we must remove the unwanted occurrences of the wrong treatment of those spaces. There are many examples of celebrity design and engineering, creating modern urban installations through the latest sculptural and sculptural practice by adding and bringing positivity to the overall sense of an urban site, instead of having to avoid it.

MATERIAL ASPECTS OF ACTION, synergy with renewable energy sources.

Development of enhanced ecological interactive installations and urban constructions as an interactive “responsive” mobile

Carefully prepared *Place-making* processes are indicated as necessary for the proper implementation of MNE *free-spaces* projects. Application of kinetic sculptural practice in designing interactive and sublime art fields and parks enriched by the active setting of future ecological and *architectural* installations / windmills.

The growing need for ecological and self-sustaining sources of energy through the natural winds of Montenegro that has greatly increased, led me to an attempt to consolidate the existing concepts of windmills and their technology with remarkable achievements of the contemporary kinetic sculptural practice of artist *Antony How*, His fascinating mechanisms and the smallest gale of wind could become not only visual and aesthetic sensation, but an excellent source of energy for future locations that could create such a bionically realized artistic vertical with exceptional functional supplements to meet the basic needs of electric power at a particular place where they intervened. This would provide innovative equipped *art gardens* such as urban constructions or pavilions that, in addition to the special music of the movement embodied by How in their kinetic installations, and the production of energy in the code for achieving complete energy efficiency and self-sustainability of the site where they are being realized.

Namely, in the first decades of the last century, we can find the beginnings of exploring such artistic practices in this domain of the possibility of exploiting wind energy. While some of the later

Here I give a section and analysis of the possibilities of the mentioned sculptural practice in the synergy of the artwork itself with the possibilities of exploiting one of the natural sources of energy in the concrete case of the **wind**. Namely, our intention is to establish the possibility of completely self-sustaining energy sources for newly created structures and installations of *free-spaces* - as *reimaginig urban voids* where large **environmental windmills** would be in the form of the best achievements of **contemporary kinetic sculpture practice**, as is the case in the works of Theo Jansen and Antony How.

I considered it important to put these parallels to show how this fragile and changing form of these first sculpture practices from the half of the past century is important for

understanding and thinking about some of the youngest and most effective realizations of contemporary kinetic and interactive architecture whose experiences can be of exceptional significance for *Free-space* and the possibility of developing its resilience that has already been discussed in the previous chapters of this paper.

Attachments (Fig. 12 and Fig. 13) show the connection at the level of solving kinetic mechanisms for the exploitation of natural sources of energy in the specific case of wind energy. Annex 12 is one of the early kinetic works by Nikolas Schofer and Nickolas Schoffer, while the attachment 13 of the author Ilhan Koman / Ilhan Koman shows (except for the photograph of the work itself) and the draft of the change of the shape of the rotor wings, as well as the deformation of the total forms of work in the state of activation of the properties of motion caused by the wind. These works are important because they point to one of the most current fields for the development of kinetic architecture, which is exactly ecology. That is why this period of the second half of the 20th century is important for researching examples of kinetic sculptural practice because it is the period of the beginning of technological improvement of procedures and scientific knowledge precisely in areas that correspond to the needs of today's advanced ecological strategies. By creative approach in their future integration into natural landscapes we can imagine them as future windmills in imaginary art gardens and contents that in different way make art practice active and technically ecologically creatively coordinated.

Eco design is certainly one of the binding directions for the development of our contemporary architecture and its ability to recycle free space, and therefore it is important to take a closer look at the experience of sculptural practice in this field, especially when it comes to authors who studied the problems of defining the form and achieving its most effective properties of kinetics precisely on natural sources of energy. (in the specific examples mentioned, this is wind energy) In order to better understand the role of the wind in the development of sculptural practice of this period, it is also important to mention the phenomenon of "Sky Sculpture" in this enclosure is the sculpture "Sail"

In some of the further studies by Ilhan Koman, there are also important studies of the design of the surfaces themselves for their further involvement as standalone or new individual units within the kinetic structures on which they actively work in the 1980s. It's about "Hyperform"⁵ sculptures from 1970.

All of the existing experience of artistic sculptural practice that has been identified in relation to realized works of art in the field of sky sculpture realization (from the first half of the past century) can now be easily sublimated and activated through the involvement of drones and their technology instead of the former lifting systems that are mainly was based on helium balloons.

NONMATERIAL CONTEXT / aspects: Transduction and reading of deep symbols of nature through active immaterial architecture of the site / Natural landscapes - Terrain Vague in MNE

By the transduction of the existing archetypal traces and the universal values of the moon, the stars and the sun in the Montenegrin Gnostic past (which dates back to the first half of the 4th century BC), we can also create such magical spaces that take place in the virtual reality of the scene of *liberated space* in relation to actors and observers

who identify and participate in the formation of such spatial performances and their new energies. The very act of art in its aesthetic continuum would give such places a newly established dimension of the uncovered secret that we are always returning to ..

On the foundation of activating such content, it is important to note that the community must be involved in it through the understanding of a recognizable strategy of cultural tourism (with a clear indication that Montenegro CULTURE becomes the main BREND identification) at all levels and all its public presentation models. A clear and recognizable campaign about the association of art circles, students, academic community, Montenegrin diaspora and competent cultural institutions can quickly create extremely flexible and applicable content that can be artfully divided by modern theater, architecture, music, dance and various other types of artistic activities in terms of the development of the mentioned space.

Therefore, any deeper analysis of the state of the challenges that the language of today's architecture must face in the new needs of the 21st century, returns again to the reinterpretation of the word *Francis Fukuyama* who considers that "The moment in which we exist is just one of those historical periods of turmoil and passage from one cultural and technological levels in the second, as a period of searching for a new style expression and determination of social reality conditioned by the technical achievements in which we live, representing exactly the period recognizable as the period of METAMORPHOSE".

Why is it important to understand these words so clear and visionary as the subject of this research. Precisely because metamorphosis is a key word that represents a focal point for our recognition and understanding of the phenomenon of contemporary interactive kinetic architecture, architecture, and the very interactive artistic practices as a whole.

In one of his research, Dr. D. O. Basic states that precisely metamorphoses are the key factors in managing personal identity issues in relation to ourselves, as well as in our overall picture of interpersonal relationships in space and time. Listening to Ovid's words as the main attributes in recognizing the ancient Ancient vision based on the understanding of metamorphosis: "*The soul never dies; it only changes shape*". We can recognize everything that essentially establishes strategically important ideas of the directions of development and the impact that the kinetic responsive architecture enriched by artistic practice can and should be established in our ecological and cultural mission of our survival.

With this well-thought-out practice, the future of modern architecture of public spaces can be seen within the framework of these artifacts of the prolonged constants of newly emerging *metamorphic ahiskulptoralities*.

Material elements in the context of thinking this concept - Reimagining Terrain Vogue:

PARKS as public and free spaces from passive green areas to the oasis for relaxation to important places of natural community gathering

As early as the 19th century, the first public parks were created on the territory of Europe so that people could escape from the mostly difficult and gloomy reality of urban

life. In the 21st century, the best parks accept their urban context with an innovative combination of greenery with the dynamic needs of the community. Until now, the elements of the creative use of natural elements in combination with carefully chosen works of art practice have shown the best and most successful combination that should now be given both the properties of ecological and recycle culture of understanding and achieving energy self-sustainability. It is possible with the use of solar technologies as well as well-designed use of kinetic sculpture practice, old and actualized learning, schools in nature, and more that identifies the needs and possibilities of users of the contemporary global community. We need to understand the needs of the newcomer simulacrum of the virtuality of the new era of technology that is already largely by younger generations (21st century) completely different perceptions in relation to us who belong to the middle or older age. They are as a generation at the threshold of adult life and quickly become active young people who want to stay in nature want to integrate with various innovative moments of interaction with video games, programs of new possibilities of new applications, pokemon motion guidelines and the like.

What is a program of concepts that could offer them something new and different .. First, we need to ensure the internet connection of these public spaces .. We need to understand the need for equality of all users of the mentioned spaces .. The values of their integration are just to present them technology as a means of not as a goal of life that the commercial side of the industry that produces it largely expands. That is why we need to understand the importance of the need for the safety of such public places, for good and unobtrusive video surveillance that would take the opportunity for any unpleasant and aggressive act when it comes to this content, especially on the territory of the Balkans. It is necessary to create a platform of different spatial orientation that will reduce the generation gap of needs and give equal status to everyone in a comfortable and modern way. Parks for excursions by *multicopters* (future vehicles that will work on combining technology of drones and motor dragons or helicopters) places for virtual sports events in which 3D optics are looking at reality selected by an application by one or more users..etc.

As part of the development and better understanding of the possibilities of this kind of active polygon of the future of public parks, I give as an annex and an overview of the first Montenegrin airplane that was made for the development of ecological tourism and the perception of the extraordinary potentials of our region, which is possible (in certain regions) only from the air. This is a unique spacecraft that is the work of the patron of the Montenegrin inventor mr Boris Markovic, and for now, as a prototype, it has been put into operation with several short trials.

1952 Conclusion

These solutions of free public places outweigh our local typical organization of architectural reflection of open spaces that burdens us and have been following us for many years. Their subject can touch our deepest feelings and open the gates of this space to all people of the world, present and future guests, as well as to future free generations that may still be able to hear us.

Therefore, with this conclusion, I would like to look at how the newly established impulses that this research continually establishes and the view of the future (which is obviously already knocking at the door) when it comes to the needs for more

advanced and liberated urban spaces (present urban voids to spatial potentials) and their responsive features defined by a well-coordinated and creative application of artistic practice, ecology, recycling designs, the latest technologies as well as all the more important bionic principles of designing them.

By developing Heidegger's thoughts on man's being and the time that he determines, we can quite certainly look at the language of architecture through the architectural works of the future as works of complex art, which is increasingly defined in its source as a field of activity through variability and fluidity as a dynamic and bionic quality of life.

The contemporary aesthetics of architectural thinking of free spaces must more than ever offer a harmony of realized experiences that keeps every successful architectural work or thought preserving and challenging during its existence ... That is why it is a complex process in which we can see what all and how much work or idea must carry in itself if we give him the temporal destination of existence through the reaction and the possibilities of his experiencing by the community to which he relates. Like a man, the being of an architectural work will establish himself by finding himself in the existing level of the nature of the environment that he always in a certain way assimilates or accentuates ...

In this never-ending game of possible relationships and the variability of the form of a successfully realized architectural language, a significant factor of our experience and understanding of the aesthetics of future *free spaces* because they are more and more like the users of such an artwork connected with the need for changeability as an increasingly necessary determining and source of its successful functional and visually applicable aesthetic development ...

It is precisely such a development that presupposes the paradigm of new possibilities of artistic practice that fosters the power of the language of contemporary architectural creativity in the level that brings it closer to either art or the function of man's (intuitive-irrational) existence in himself. Therefore, only in the truly great ideas of architecture comes the reconciliation of the final and the infinite when we speak of the notion of time: which greatly determines aesthetics and the sense of perceiving architecture as a comprehensive artwork such as that in its essence and is. The realized architecture as a work of art best illustrates the fullest perception of the world of a particular society in accordance with the elements of reality in which the conquered space is represented as such.

Relation to the physical, social, cultural and other realities of the place where and for which architectural design of space is planned is one of the important topics discussed on the future of the language of contemporary architecture of cities. Some of the most important research in the psychology of perception, transferred to the field of architectural needs as a profession, today can determine how the observed architectural space and the dynamics of its forms are recorded in human memory with the flow of time. This can certainly be further developed into one of the cognitive processes in which the future of the language of architecture will rely heavily on the field of architectural *responsive* kinetic practice of new and innovative applications of bionic design in accordance with new technologies.

Modern technology and the art that are available today should not be considered as an objective, but as a means to create the creative potential of the environment and public space, which will satisfy not only the basic, but also the cultural aesthetic needs common to all the human beings to which it relates. Despite the unlimited possibilities that are already being realized, technological potentials should be used in a way that preserves the basic values that nature has unselfishly left us to inherit.

Diversity and associativity between contemporary creativity and the one that is recognized in the past are signified as the similarity of experience and the particular feelings they produce, which the creators have guided in the past, and will be guided in the future in the future of every culture and tradition. Based on them, they will try to formulate some universal rules that will be able to freely relate to the physical and social context of the language of contemporary architecture.

Free urban landscapes as illuminated spaces can generate in their contents and projects this general spiritual experience through which people have passed and pass, regardless of where and from which culture they come from. Reflecting on the place of modern man and perceiving these universal rules, we must also recall Jun's view of the same when it comes to creativity and creativity; *"The one who speaks in images, who speaks with a thousand voices, he from an unrepeatable and transient procedure, saves and at the same time raises into the sphere of personal existence what he signifies, he elevates personal fate to the level of destiny of mankind, and thus liberates those good forces in all of us which gradually enabled mankind to save themselves from all the dangers and to overcome the longest night It is the secret of artistic activity"* (K.G.Jung)⁹

Can we conclude from this that the key word for the future of knowledge and the development of the language of the architecture of the future will be precisely *coordinated creativity* that is explained and established through the necessary improvement of the artistic and scientific component of the language of architecture in order for it to be of the highest quality in the service of a humane society and, and the man as the main participant in his proper development and survival. It is precisely coordinated creativity and raises the question of the importance of introducing and applying new concepts of the contemporary architecture language, which will best describe its developmental paradigms capable of learning and positioning coordinated creativity as the strategically established value of the future of architecture and art practice of the already existing new age.

The eclectic of freely and creatively solved forms thanks to the development of new technologies also gets its particularly applicable properties expressed in the merging and symbiosis of multivalent approaches with a new rhythm of contemporary sculpture practice, which in its functionally designed archiskulturality seems to become a recognizable elixir of the possibilities of the modern concept of good design and design.

Even today, most things are transforming into our eyes, they become something else, and therefore we must change. This very reflects on our behavior and experience. Sensations can not be easily censored or categorized. Changes in society and technology are changing and changing our boundaries of the picture of life. Within this, we must not forget that we are changing exactly what we are experiencing, and that is why we must constantly see that almost all the values of an architectural as well as artistic work

are transferred to the very important organizational and existential states of our being. The power of a multivalent (multifaceted) architectural the sense of the language of today's global culture in the possibilities of engaging the creative forces of future observers and users of its contemporary manuscript is an important and very important parameter that clearly indicates the advantages of transformable units of variable forms (in the processes of designing and sublimation of coordinated creativity).

If we experience science and technology only as a basis for the artistic aspect and the lyricism of the language of modern architecture, if our technique and technology do not become the goal, but successfully applied means of making more poetic things, technically-focused interactive kinetic archiskulptority can achieve completely new aesthetic and cultural values of future development factors of architectural structures of free spaces.

“The essential nature of the changeability of the form and, consequently, of the symbol of the movement, formed a global trend oriented towards the attempts to create and explain the architectural parts that (by their phenomenological factors, the kinetic properties of the established archicultural forms) indicate the increasing importance and potential of their inclusion in contemporary hyperproductive tissue cities. The artistic events themselves, which potentially abound in the aforementioned kinetic archives, continue to appear inaccessible. They can exist as batteries of conscious intuition by which we sigh and sublimate our inner experience. ”¹⁰

Let's hope that the time ahead of us will be worth valorizing and using their creative values. This time and space is undoubtedly offered by the most influential and largest cities in the world such as Paris, London, New York, Tokyo, Moscow, etc. Their development plans indicate that the historic core of cities will be best preserved in the language of traditional architecture that belongs to them, The new urban tissues of the future grow new.

It will be a confused valley without any flat surface that will carry the most diverse effects of the future, whose reality can not be comprehensively observed without the notion of architectural *metamorphism* that, by the power of its virtue, will read completely dynamically and kinetically the form of future architecture through the values and functions of its variability and symbolic semantic features of their meaning. Perhaps some vivid images of the future will overcome all our present fantasies, it may create such a strong and abundant content of the public space whose only place of solitude will be as a user, as part of virtual choices that will consume the simulacrum of reality in accordance with their desires. One of the possible scenarios of the future offers you to imagine the streets and free spaces in which you will be automatically logged and from each individual advertisement you will receive a marketing customized image of the product in accordance with your views, desires and preferences. The color, shape, sound and movement palette will only be visible to you in a way that best approximates your desires. Life in such urban spaces will become an application of the future that we may look through the frames of our tendencies, the reality of the environment surrounding someone else's eyes and commercially defined creative solutions.

Therefore, the progress in developing the language of contemporary architecture dedicated to the creation of new creative incubators of *public urban spaces and*

engaged landscapes should not be perceived in the expansion of its borders, but also in their best acquaintance. Today's and future generations of architects have an enormous array of possibilities for creating in articulation of the metamorphic variability of artistic practice of special importance for the development of these new urban and human quality public space architectures.

The so-formed spaces through some *successfully set artistic strategies and art projects*, the alchemy of the created creation of **free-spaces**, are already clearly recognized as artistic incubators of the new values of transformation of the environment in which they are realized.¹²

Therefore, the process of this and similar research, study and critical consideration of the unique architectural artistic expression and activation of urban *Free-space* sites is not and probably will not be completed. That's why this paper does not pretend to completely define the complex relations of artistic practice and contemporary architectural expression as is also practiced in this proposed concept of R.o.U.V. (reimaging of urban voids) Resilient by Urban voids. He primarily aims to point out the importance of properly studying artistic features as true and in practice proven guides by perceiving the true importance of healthy relationships of architecture, nature, artistic practice and contemporary man as their most important user.

Mr. Nikola Marković, PhD, as an artist, architect and designer, has been successfully creating for more than 30 years. He graduated in 1993 at the Faculty of Fine Arts in Cetinje and obtained his Masters in painting at the same faculty in 2006. As a freelance artist in since 1998, he has organized 23 solo exhibitions in the disciplines and techniques that he deals with in various fields of art practice. He enrolled the postgraduate studies, a direction of AUP, at the Faculty of Architecture in Belgrade. He passed the thesis as at 10. 9, 2012, thus obtaining the title of Master of Science in Architectural Urban Design. Since September 2013, as a associate in lecturing, he was engaged at the faculties of FDM and Polytechnic at the University of Donja Gorica in Podgorica. As at June 20, 2017, he successfully presented the Doctoral dissertation Innovations of contemporary architecture from artistic practice and kineticism to the Kinetic Archisculpture at the Architecture Faculty of the University in Belgrade (AUP Area). In addition to the above-mentioned projects and works in the field of professional development, he is the author of six monographic publications published by the Universities with which he was engaged as a lecturer and expert associate in lecturing. He is a member of the Association of Artists of Austria / BV, the Council of Court Experts of Montenegro, the Association of Architects CAM – MNE and the Commission for the Establishment and Valorization of Cultural Property of the 20th Century at the Ministry of Culture of Montenegro. For his work, he has won several international and domestic awards and recognitions both in the field of design and in the fields of architecture, interior design and contemporary art.

AESTHETICS OF SUSTAINABILITY: CAPSULE ARCHITECTURE IN THE CITY AND IN NATURE

Abstract | Architecture of minimum dwellings, like small houses, shelters or cabins, has been a hot topic, especially after the most recent global financial crisis. While these architectures may combine Buckminster Fuller's maxime of "doing more with less," the Australian Aboriginal reinterpretation phrased by Glenn Murcut as "touching the Earth lightly" or the functionalist rigor of Hannes Meyer's "function times economics," these structures may be extremely sophisticated architectural objects or low-tech, self built or improvised facilities with an inbuilt minimum environmental footprint.

When minimum dwellings are compact, well-equipped, connected to the network, structurally, functionally and visually recognized as one thing, temporary and mobile or transportable, they may be designated as capsule architecture. According to their interaction with the environment, their activity can be mapped. The idea to redefine the notions of home, individual, and community is supported by their characteristics of minimum or non-attachment to a place and the idea of seclusion, autonomy, being off the grid, etc., which may be enacted either in remote natural environments or in the urban or suburban conditions of the globalized world. These characteristics enable them to be appropriated in crisis areas and stimulate experiments in the fields of design and art, as well. Although seeking for disconnection from the immediate environment, these architectures enable or even enhance connectedness to the non-physical information network. Temporary by their nature, these small dwellings, shelters, redesigned container units, special technological structures, parasites and other manifestations of the capsules concept encompass the logic of technological facilities with a distinct architectural expression. At the same time, it is a manifestation of the rule of sustainable design, sustainable architecture and sustainability in general. In this context, the case of small dwellings shows its difference to other sustainable architecture approaches and aesthetics. It subverts the generally sustainable approaches with exposed importance of locality within the global forces, usually relying on context - location, local culture and environmental characteristics, etc. The aesthetic regime of temporary, changeable, a-contextual and autonomous architectural objects can be regarded as an aesthetics of otherness, which relates them to the legacy of the Modern movement's *existenzminimum* experiments, the New Brutalism, radical experiments of the 1960s and other avantgarde and neo-avantgarde practices of the 20th century, but firmly placed in the context of individualized, indeterminate, dispersed and ambiguous contemporaneity.

Index terms | *aesthetics of change; capsules; minimum dwellings; minimum footprint; otherness; aesthetics of sustainability;*

INTRODUCTION

A UN News online article from July 2018 entitled “Small and sustainable: ‘Tiny houses’ could be a solution to world’s housing problems” recapitulates the state of affairs in contemporary architectural efforts – how to provide decent and affordable housing that is as environmentally-friendly as possible. The house, 22 square meters in floorplan, was designed by UN Environment and the Center for Ecosystems in Architecture at Yale University in the United States, in collaboration with UN-Habitat.¹ Architecture of minimum dwellings, like small houses, shelters or cabins, has been a hot topic, especially after the most recent global financial crisis. While these architectures may combine Buckminster Fuller’s maxim of “doing more with less,” the Australian Aboriginal reinterpretation paraphrased by Glenn Murcutt as “touching the Earth lightly” or the functionalist rigor of Hannes Meyer’s “function times economics,” they may be extremely sophisticated architectural objects or low-tech, self-built or improvised facilities with an inbuilt minimum environmental footprint.

Although this discussion attempts to be relevant for contemporary conditions, we can find approaches and examples dealing with such environmental issues in the heroic utopian visions of future dwellings in the beginning of 20th Century that escalated with the revolutionary 1960s. Buckminster Fuller’s Dymaxion and other endeavors may be the most obvious examples, as well as the counter-cultural formations in the US, with the parallels in experimental practices in the UK, Japan and elsewhere. Most of the architectural experiments were premature, unlikely to be built even after the post-World War Two conditions, but thought about and designed in times when imagining a brighter future was an appreciated, if not an expected, endeavor.

In this paper I will argue that the legacy of visionary thinking behind the experimental architecture of the 1960s can be a valid ground to rethink contemporary responsible, responding sustainable architecture. For this purpose, I will discuss the topics related to minimum dwellings as an extreme version of small or tiny houses, namely the sustainability conditions inherent in pioneering and contemporary capsule architecture, which has, with its inception, become the “biggest” contemporary architectural monad, the minimum building block of architecture.² Exposing the questions of the aesthetics of durability, and the aesthetics of the envelope, the case of capsule architecture shows the potential for a wider social and political engagement of architecture.

MINIMUM DWELLINGS: THE CAPSULES

The extrapolation of the trend of minimizing the living space, the 1929 CIAM congress theme *existenzminimum* can result in a capsule architecture with its own typology. But this operation is not formal only. The conditions and consequences of the trend are becoming visible in it.

When minimum dwellings are compact, well-equipped, connected to the network, structurally, functionally and visually recognized as one thing, temporary and mobile or transportable, they may be designated as *capsules*.³ Although there have been many more capsules designed than actually built or produced, they inevitably serve as a precursor and a historical reference for the contemporary derivations. While pioneering examples focused more on their spatial, social and political role, i.e. the capsules of Archigram or the Japanese Metabolists, the contemporary ones have

acquired an environmental role as well. (Ecocapsule, LEAPhut, m-ch).

Capsule architectures bring a seed of otherness to the environment.⁴ Their mobility and uprooted-ness or non-attachment to a place may redefine the notion of dwelling and consequently the notion of home, individual and community. The otherness is supported also by the physical properties that enable seclusion and autonomy. Capsules are, therefore, potentially off the grid, and may be enacted either in remote natural environments or in the urban or suburban conditions of the globalized world. These characteristics enable the concept to be appropriated in crisis areas and stimulate experiments in the fields of design and art, as well. Although seeking for disconnection from the immediate environment, these architectures enable or even enhance connectedness to the non-physical information network. Temporary by their nature, these small dwellings, shelters, redesigned container units, special technological structures, parasites and other manifestations of the capsule concept encompass the logic of technological facilities with a distinct architectural expression. In capsule architecture, the temporality and change which usually falls out of the descriptions of traditional architecture, get a prominent role. This attribute defines capsule architecture through *mimesis*, in the sense of biomimicry, which is a widely-featured strategy for sustainable architecture, as well.⁵

AESTHETICS OF CHANGE

There is a legacy of understanding change in architecture, which was a theme proposed by Team 10 for the CIAM congress in Dubrovnik in 1956, and which was, in a more biological sense, implemented by the Japanese Metabolists in the 1960s. The term metabolism itself signifies the process of change in the span from formation to destruction and, in many cases, a new formation.

Kisho Kurokawa described his aesthetic approach as a desire for the natural, unadorned, plain, rustic and slightly sad expression depicted by notions of the “the aesthetics of Metabolism” and “the aesthetics of time.”⁶ These may be related to those of New Brutalism, and preserve relationships between architecture, society and nature which constantly changes with time. Change in Metabolist architecture is functional and representational. It can be seen in the proposed possibility of expansions, “organic” growth, flexibility in organization and the changeability of individual building elements, as well as larger structural entities. The aesthetic of change is well-described by Kisho Kurokawa, when observing the construction and deconstruction of his three-dimensional space-frame structure with capsule units at the Osaka ‘70 World Fair, named *Takara Beautillion*. As its assembly took only a few days, its “disassembly was similarly easy to perform; it was like the falling petals of a cherry blossom tree...,” which mirrors Buddhist aesthetics: “In Buddhism it is considered noble to fulfill one’s life and pass away beautifully, in accord with nature.”⁷ Constant change in Metabolist architecture is facilitated by replaceable components with various lifespans and durability, which has been part of the traditional Japanese wooden architecture, with the Ise shrine as an obvious reference.⁸ The ritual of building and demolition of Shintoist shrines has alternated on two enclosed sites every 20 years for centuries. The concept of perpetual change and cyclical time is installed in the concept and design of the shrine. The physical buildings are, therefore, not considered durable. In *Ise: Prototype of Japanese Architecture*, Noboru Kawazoe explains that the “intangible essence within the style” was actually the essence to be preserved and not the material substance of the buildings, while pointing out the significant difference between the Japanese

and Western notions of art: “The Japanese thought that life becomes eternal by being absorbed into the great stream of Nature. For them, it was not a case of ‘life is short, art eternal.’ They had only to look to the Ise Shrine—ever new, yet ever unchanging—to know that it is art, in truth, that is short and life that is eternal.”⁹

While the Metabolists were exposed to the metaphorical organic feature of changing structures, their Western contemporaries emphasized the aesthetics of change. The latter were seen in the “fathers of Pop” experiments and existentialist criticism by Independent Group, as well as in ironic or intentionally frivolous proposals of Archigram. With them, architecture became predominantly a promise of an *immediate future*.

AESTHETICS OF SUSTAINABILITY: POLITICS OF THE ENVELOPE

Next to organic operativity of capsule architecture, which does expose a specific aesthetics of sustainability, its “total beauty” could be tested. To illustrate it and as a checklist, let’s quickly relate the performance of capsule typology to Peter Buchanan’s well-known “ten shades of green architecture”¹⁰: while capsule architecture can respond to demands of “low energy/high performance,” “replenishable resources,” “recycling,” “health and happiness” and “total life cycle costing,” other categories, such as “embodied energy,” “long life loose fit,” “embedded in place” are out of its scope. The two remaining categories, namely “access and urban context” and “community and connections” are subject to testing beyond typological determination. The quick evaluation shows that capsule architecture can respond to five categories and possibly to two more, while it cannot respond to three of the totality of ten categories. This evidence makes it difficult to prove that capsule architecture is sustainable in the traditional sense. Nevertheless, the missing three categories can be challenged. Since capsule architecture is not architecture in the traditional sense, its characteristic power may overshadow these missing categories in favor of other virtues, which involve the political sphere. The political performance of architecture has been historically connected to the architectural plan, which organized the power structures and protocol, and to the architectural section, which organized the social strata and the relation to the ground, while the envelope has held a mere representational or symbolic function¹¹ with *visuality* (of the building) considered as “the location of its aesthetic interest.”¹²

But due to its size and compactness, a gaze can take in the capsule at once. The envelope conveys the message reflecting the content, therefore the envelope can be regarded the display of the aesthetic, as well as political, consideration. But in the case of the capsule, the envelope is a double-sided medium and should be analyzed as such.

According to Marshall McLuhan, housing functions as extension of our skin and heat control mechanisms and a medium of communication. While it provides protection and comfort to the body, it also shapes and rearranges the patterns of human association and community.¹³

To be more specific, the envelope of a capsule as an external medium separates exterior from interior and can be more precisely defined by its characteristics: the structure, that includes physical tightness and control mechanisms; the materiality and integrity, which makes a capsule a single-space element with either a frame or monocoque construction; and the derived representation. The form is defined by the type of the capsule and the agglomeration or siting properties.¹⁴ The envelope as an *archetype* of architecture mirrors a cave shelter from the distant past and can be traced as the most primordial architectural element in the tectonic theory by Gottfried

Semper - the creation of the envelope by weaving. With contemporary technology, the envelope is completed with perfected physical control mechanisms, which do not only protect the user against external influences. Highly functioning building envelopes are crucial for the edifice's sustainable performance, as well.¹⁵ But in many cases in contemporary architecture, the envelope becomes the sole technological response in architectural disguise. Such a position promotes "science and technology as the solutions that will repair ecological damage without interfering with consumerist lifestyles or worldviews."¹⁶

The specific architectural quality of the capsule is, in this case, emphasized by the double-sidedness of the envelope and its multiplied activity. What capsule architecture performs as architecture is distinct from just the parameters of sustainability. Namely, the characteristic of the capsule architecture refers to the internal part of its envelope, which enables comfort within. By means of an interface, the comfort is provided by the ergonomic character of furnishings, equipment facilitating the regulation of the influence flow from the outside, the transfer between inside and outside, and adjustments for the desired ambiance inside. It also enables a potential functional autonomy of the capsule.¹⁷

To quote Zaera-Polo from *The Politics of the Envelope*, "at a time when energy and security concerns have replaced an earlier focus on circulation and flow as the contents of architectural expression, the building envelope becomes a key political subject," which is reflected, for example, in Sloterdijk's *Sphären* trilogy.¹⁸

With its treatment of the envelope as a "double-sided surface", it enables it to go beyond superficial interactivity or environmental effectiveness and actually can provide the conditions of mediation between the interior and exterior, as well as their embodiment. With this understanding, the envelope is not solely an addition, passive or superficial, since the surface design is blended with the essence of architecture.¹⁹ To paraphrase Zaera-Polo, it has become "an image of engagement between the individual and the collective, and therefore a mechanism of political expression of contemporary societies."²⁰ According to the three models of building envelopes proposed by Lee and Holzheu:²¹ from the modernist "form follows function" through the Venturian "form accommodates function" to the biomimetic generative system responsive and adaptable to environmental or parametric conditions, i.e. "form is function," which the authors position within the politics of biomimetics, the pioneering capsule architecture has been a product of the late modernist period, but we can understand its operation in a rather contemporary – biomimetic way. The latter is especially clear also with the contemporary derivations of the concept.

CONCLUSION

The exposed aesthetics of time, and the aesthetics of the envelope show the potential of architecture for a wider social and political engagement.

Capsule architecture is, at the same time, a manifestation of the rule of sustainable design, sustainable architecture and sustainability in general, but shows its difference to other sustainable architecture approaches and aesthetics. It subverts some of the generally-sustainable approaches. The aesthetic regime of temporary, changeable, a-contextual and autonomous architectural objects can be regarded as an aesthetics of otherness that carries political connotations. These relate capsule architecture to the legacy of the Modern movement's *existenzminimum* experiments, the New Brutalism,

radical experiments of the 1960s and other avantgarde and neo-avantgarde practices of the 20th century, but firmly placed within the context of individualized, indeterminate, dispersed and ambiguous contemporaneity.

THE ESTHETICS OF THE ENCOUNTERS OF THE BUILT ENVIRONMENT AND THE ARCHITECTURE OF THE KASBAH OF ALGIERS

Abstract | Architecture experience is multisensory and aesthetic. The aim of this paper is to point out the visual-spatial properties related to the aesthetic experience of the Kasbah of Algiers. This work reports on a research that calls in the experience of 20 architecture students to restore the aesthetic qualities in the encounters of the Kasbah of Algiers, through a recalling task of the experience they had when walking in the Kasbah. This should allow identifying spatial properties underlying and affecting the aesthetic experience of the Kasbah of Algiers. Results show that the strongest registered aesthetic responses were encountered in the: gigantesque buildings, the terraces, the alleys and in the courtyards of the houses. These preferences can be attributed to visual-spatial properties(factors) of contrast such as: the play of scale, the play of light and shadow, the play of openness and closeness, the contrast between indoor and outdoor spaces; to the awe generated by the sea views and sceneries; beauty judgment generated by the homogeneity of scale and stylistic uniformity of the houses with a courtyard open to the sky, the symmetry and the uniformity of lateral spatial boundaries of the streets formed by building types featuring stylistic uniformity. The pop up and the change in configuration and intensity of these properties, rule the perception and the aesthetic experience of the Kasbah of Algiers.

Index terms | *aesthetics; aesthetic experience; architecture; built environment; Kasbah of Algiers; visual-spatial properties;*

INTRODUCTION

Vitruvius defines architecture as the harmonious combination of three principles: *Firmitas*, technical aspects; *Utilitas*, functional aspects; and *Venustas*, aesthetical aspects. Aesthetics and the sensory-emotional responses to aesthetics constitute currently a topic of growing interest in the field of scientific research, especially in the context of arts, architecture and urbanism.

According to Pallasmaa (2000; 2012), the built environment is experienced in a multi-sensory way that engages the body and the senses. When something is perceived, remembered or imagined, it becomes immediately and intrinsically linked and evaluated in relation to our body, our senses, our memories, our knowledge and experiences, our culture, our psychology and our personality (Arnold 1970). Hence fore, the aesthetics of a built environment is a part of its holistic sensory experience, and it can strongly affect man's perception and cognition in reaction to special features of this space.

This paper takes as a case study the Kasbah of Algiers, a world heritage medina of great architecture and aesthetic values. It reports on a pilot research project on the perceived aesthetic patterns or qualities of the city. The work aims to identify the built elements and the visual-spatial properties that underlie the aesthetic experience of the Kasbah of Algiers.

AESTHETICS AND ARCHITECTURE: A LITERATURE REVIEW

Aesthetics

Aesthetics is a generic term that is concerned but not confined to art. Everything in life has an aesthetic value. This value is of vital importance for human well-being (Porteous 2013). The word "aesthetic" derived from the Greek word "aesthesia", means perception through the senses. Therefore, aesthetics can be defined as the ability to perceive and feel objects and assign them positive or negative values (Aglioti et al. 2012).

An aesthetic response often involves emotional stimulations, which are associated, at least, with arousal; aesthetic emotions; and symbolism (Makheouf 2007). Therefore, aesthetics is often linked to notions of beauty (Porteous 2013) and sublime, which are in association with specific feelings such as pleasure, awe, joy, satisfaction ... Beauty and sublime are aesthetic emotions generated in response to an aesthetic evaluation of an object of aesthetic value such as architecture (Nadal and Martin, 2015).

Aesthetics is two kinds, intuitive and cognitive. The intuitive aesthetic is common and has at least four distinct components that transcend time and culture: the sense of pattern; appreciation of rhythm; recognition of balance; sensitivity to harmonic relationships (Makheouf 2007).

The aesthetic experience of the built environment

Aesthetic experience is part of the multisensory experience of the built environment (Cold 2001, p25). It implies that the visualization of an object induces in the beholder sensory, cognitive and affective responses (Aglioti 2012). Thus, our interactions with environmental stimulus to which we attribute positive or negative qualities of beauty or ugliness gives rise to an aesthetic experience that engages emotions and cognition. This complex neuropsychological state involves the activation of perceptual-

representational processes that cause sensations and feelings of pleasure or pain, attraction or repulsion, lust or fulfilment, as well as other cognitive processes (Pihko et al. 2011).

The spatial properties of a built or a natural environment refer to the unique aesthetic characteristics that can distinguish a scene from one city to another, from one neighbourhood to another, and from a building to another. Nasar (1994) proposes three types of physical characteristic variables that influence the aesthetic evaluation of a built environment: formal variables (complexity, order...); symbolic variables (style...); and schemata variables (typicality...).

In the last two decades, several research fields, including environmental psychology, neuroaesthetics and neuroarchitecture...are increasingly interested in the aesthetics of architecture and built environment. The aim is to understand the sensory and the aesthetic experience of man in the built environment, and its impact on well-being, mental health and behaviour. The findings show that many sensory-spatial properties can influence aesthetic experience, preferences and judgment (Ulrich 1983; Jacobsen and Beudt 2017):

Symmetry and complexity: symmetry and complexity are strong predictors of aesthetic judgment (Jacobsen and Höfel 2001). Symmetry is considered as a cross-cultural standard of aesthetic appreciation and one of the biologically based aspects of beauty. Studies on geometric shape's beauty confirmed the influence of symmetry and complexity on aesthetic judgment (Jakobson et al. 2006).

Golden Section (Golden ratio): One of the greatest contenders for a universal law of beauty is the golden section. Golden ratio is important for aesthetic appreciation through the proportions (Jacobsen and Beudt 2017).

Counters and forms: Another visual-spatial property that influences the aesthetic experience of the built environment is the amount of curvature of counters. Aesthetically, curvilinear counters are more attractive than linear counters (Vartanian et al. 2013). This preference given to curves is guided by emotional pleasure arousal, associated with increased activity in the anterior cingulate cortex, a brain region associated with reward and emotional processing of perceived objects. (Jacobsen and Beudt 2017).

Height, openness and proximity: Vartanian et al. (2015) neuroimaging studies investigating the effects of ceiling height and perceived enclosure on aesthetic judgments and architectural approach avoidance decisions show that ceiling high and open spaces are aesthetically considered more appealing.

Views and nature: Urban scenes that offer panoramic views, natural views, historical and cultural sites and recreational areas have been judged as the most attractive (Galindo and Hidalgo 2005). These scenes have a restorative effect that seems to be one of the criteria underlying environmental aesthetic preferences (Jacobsen and Beudt 2017).

Novelty and variety: are qualities enjoyed by man, necessary for psychological development and sensorial stimulation, indicated in the human choice for interesting environments. The quality of environmental variety is closely associated with the experience of surprise. The degree of surprise felt is a function of the rhythm of variety,

the range of change and the relative familiarity with the place. (Makheouf 2007).

THE AESTHETICS OF THE KASBAH OF ALGIERS

A literature review on aesthetics in architecture and built environment, is followed by a “walk along” survey task in the Kasbah, then a recall task through “commented iconographic map” restoring the sensory-aesthetic experience performed by 20 architecture students in the Kasbah of Algiers. The recall task aims to obtain data based on the characteristics of the perceived space such as colour, texture... that help grasping and understanding the influences of the visual-spatial properties of the Kasbah on its aesthetic experience. Lastly, a content analysis is conducted on the “walk along” content and the comments written on the maps for the recall task. The content analysis aims to identify the visual-spatial properties behind the aesthetic experience and the aesthetic preferences recorded in the Kasbah of Algiers.

Results and Discussion

The recall task and the spatial location on the map of the Kasbah of Algiers are carried out to allow the identification of spatial elements (buildings, streets, views ...) that shape the aesthetic experience of the Kasbah. The most aesthetically influential spatial components are:

- 1– The terraces of the houses and the view they offer;
- 2– The mosque of KETCHAOUA;
- 3– The palace courtyard Mustafa Pasha and Dar el-Souf;
- 4– The large streets;
- 5– The centenary house;
- 6– The narrow alleys;
- 7– Open spaces in search of the sea;
- 8– Fountains.

The content analysis allows the identification of the aesthetic visual-spatial properties of these built elements:

The gigantic buildings: The large scales generate feeling of sublime in the brain of the beholder. In these buildings, the richness of the indoor decoration generates a judgment of beauty in the face of the complexity of the geometric motifs of the decoration.

Panoramic views: The appreciation of the open panoramic view that offers the terraces on the great horizons of the Mediterranean Sea arouses some primal notions of something ethereal, which is strongly linked to “sublime”. Moreover, looking at nature has a restorative impact in the brain and the psychology of the viewer, which may strongly influence his aesthetic appreciation of the built environment of the Kasbah.

Meandering alleys: Due to their curvilinear shape, the alleyways of the Kasbah of Algiers have a great aesthetic appeal. Large and open lanes are considered more beautiful and memorable than the closed ones due to the openness/closeness effect

in the perception of the aesthetic value of the built environment.

The courtyard: the aesthetic experience arises from the richness and the complexity of the decoration of the courtyard, and from the openness to a nature element that is the sky, which have a restorative impact in the beholder. The courtyard is the central space in all houses of the Kasbah. There is no direct access from the door to the courtyard; one must pass by an intermediate closed and dark space “Skifa” in order to reach the courtyard. This spatial configuration allows a transition from low ceiling and dark space to the open and enlightened space, which generate a strong aesthetic response caused by fast emotional regulations in the brain.

CONCLUSION

This article has attempted to explore the aesthetic experience and preferences in the Kasbah of Algiers. The results show that this old city is varied in the possibilities of aesthetic experiences that it can offer, therefore, it is continually involved in a process of interpretation to make sense of the sensory impressions derived from the environmental experience by its users. In the Kasbah, the aesthetic experience follows the spatial patterns and moods of the encounters. The aesthetic patterns and properties of the Kasbah are multiple and manifest themselves distinctively or intermingled in the space.

This research brings a new perspective on the question of heritage safeguarding, which emerges from the desire to revitalize the spirit of this heritage and not only its physical skeleton. Thus, any action on this kind of urban fabrics will have to pay the necessary attention, so that there are no profound and significant alterations to the ambient and aesthetic character of these built environments, because the physical preservation alone is not enough to preserve the integrity and the “sense of place” of these encounters. We must push the reflections further and think of preserving the latent aspects of the patrimonial universes such as the aesthetic and sensory characteristics that constitute the spirit of these places.

Rezzoug Imane is an architect and a PHD candidate at Ecole Polytechnique d'Architecture et d'Urbanisme (EPAU). She received her degree in Architecture and heritage Studies from EPAU, 2016. Her master degree research focused on human's emotional response to architecture. She investigated user's sensory experience in the contemporary architecture, by conducting a sensory appraisal and a comparative analysis between the abstract conceived sensory experience by architect and the real lived sensory experience by users in contemporary buildings. As extension for her master research work, for her graduation architectural project, she worked on the integration of sensory and emotional design in heritage buildings, to create new adequate educational space for autistic children in Algiers. As a current PHD candidate, she is engaging in research that investigates the relationship between man and architecture. Her thesis will concern the relationship between neurocognitive multi-sensory experiences and their spatial and morphological corollaries in the Kasbah of Algiers.

Kenza Boussora is an architect and associate professor at Ecole Polytechnique d'Architecture et d'Urbanisme, EPAU where she earned her undergraduate degree in architecture and heritage studies. She completed her post-graduate studies at both Oxford Brookes University, UK, and Mohamed Khider University, Biskra, Algeria. She has taught Islamic architectural history with a particular focus on the North African Islamic architecture. Her main researches focus on architectural morphology and the relationship between architecture and mathematics. Recently, she is expanding scientific interest towards researches that investigate the relationship between architectural morphology, human's sensory experience and neuroscience. She conducted many research on Islamic architecture, regionalism and colonial architecture in North Africa and is the author of the book "Histoire de l'architecture en pays islamiques. Cas du Maghreb" 2004. She also has published two articles in the Nexus Network Journal: "The Use of the Golden Section in the Great Mosque of Kairouan" (vol. 6, no. 1 (2004), pp. 7-16) and "Formal style of Medersas buildings in North Africa" (vol. 17, no. 1 (2015)).

ARCHITECTURE AS PRACTICAL PHILOSOPHY: THE AESTHETICS OF CONTEMPORARY METROPOLIS

Abstract | The aim of this paper is to highlight the dynamics that are significantly determining a reformulation of the urban settings of contemporary cities / metropolises. The urban transformations induced by the recent cultural globalization drastically transformed the classical repertoire of urban typological archetypes (avenues, squares, public spaces, etc.) with which the modern and western notion of cities was defined. These types, constituted the spatial vocabulary of the social and community experience through which the urban context could be ordered and organized. We will begin the study with a brief examination of the notions of *City / Polis versus Civitas / Metropolis*, looking at the logics of their historical transformations and, in this light, we will examine the notion of architecture as a theoretical and practical discipline. Architecture, indeed, is above all, a perceptual event regarding *things, places, and built spaces* and it substantially responds to a visual and tactile code. As a receptive experience it can take place only in “public” and in forms of collective participation. Regarding the issue of the modern relation between *masses* and *art* is still very relevant Walter Benjamin’s analysis : «Architecture has always represented the prototype of a work of art the reception of which is consummated by a collective in a state of distraction. The law of its reception are most instructive.» We will proceed on analyzing theoretical and aesthetic parameters that are often not ascribable to the typical “western modernity” ones. Indeed, such urban *phenomenon* of contemporary transformation is predominantly taking place in Africa, Asia, Middle East, and South America. In this perspective, the proposed study will further focus on the analysis of the Emirate of Dubai which, due to its swirling urban development, represents, both an archetype and a paradigm for the urban configuration of the nowadays World /Global-Cities. The “always new” and evidently “artificial” city of Dubai, is still capable to portray its own urban style and tell its own story although one could use the notion of “generic” as in Rem Koolhaas’ definition. A term that is, indeed , quite appropriate to the contemporary way of producing urban spaces according to the fetishistic logic of the “integrated spectacle”, as described by Guy Debord. The case study of Dubai allows to bring to surface, urban strengths and dynamics that, initiated by the contemporary process of globalization, contribute to form a planetarian “sensitivity” and “taste”. By circumscribing our analysis to the material dimension of the city / metropolis, this paper aims to contribute to a reflection on the current processes of construction and production of contemporary aesthetic perceptions.

Index terms | *Urbanism; Global Cities; Architecture; Dubai; Capitalism; Middle East;*

Introduction.

We live in an era that reached a peak in the urbanization of the world never seen before: the way of thinking, building, and living in today's cities, assume an unavoidable relevance in understanding the contemporary global scenario.

«The question of what kind of city we want cannot be divorced from that of what kind of social ties, relationship to nature, lifestyles, technologies and aesthetic values we desire. The right to the city is far more than the individual liberty to access urban resources: it is a right to change ourselves by changing the city. It is, moreover, a common rather than an individual right since this transformation inevitably depends upon the exercise of a collective power to reshape the processes of urbanization. The freedom to make and remake our cities and ourselves is, I want to argue, one of the most precious yet most neglected of our human rights» (Harvey 2008).

This contemporary scenario is not always homogeneous nor unitary. At the international level, its characters, show more than one parallelism with the vertical/hierarchical rearrangement of urban spaces and places formed by social relationships within the perimeter defined by capitalist valorization. The model of "globalized cities" seems to develop showing characteristics in partial uniformity with the planetary setting. This situation requires a critical reflection on some aesthetic models that seem to tend to become dominant concerning the architectural-urban configuration of the city/metropolis, whose stake is inevitably meant to be political.

Aesthetic Experiences.

The city is a privileged, often exclusive, place for the constitutive expressive dimension of our power of being "generic" (Marx 1968, 107-150). *The human being is a potential being* who, as such, creates his habitat, primarily through the transformation of *sensible matter* (see: Virno, 2002; Ciccarelli, 2018). Every expansion and limitation of this potentiality becomes the matter of a specific aesthetics policy which includes certain economic-social relations. Assuming a specific apportionment/distribution of the "sensible" matter – being the visible (and the invisible) of spaces, times, and activities thus establishing the communal experience -, aesthetics are combined with politics.

The *politics of the sensible* (or «sensible politics») establishes ownership of spaces and times of social labor. A certain aesthetic "*partage*" arises - since ancient Greece - at the source of the political order:

«Aristotle states that a citizen is someone who has a part in the act of governing and being governed. However, another form of distribution precedes this act of partaking in government: the distribution that determines those who have a part in the community of citizens. [...] Plato states that artisans cannot be put in charge of the shared or common elements of the community because they *do not have the time* to devote themselves to anything other than their work. They cannot be *somewhere else because work will not wait.* » (Ranci re 2016, 12).

The ever-changing capitalist production will shape the perimeter of conflicts between multiple powers, as well as their specific spatial "form."

Architecture and ideology.

In principle, one could say that Architecture is *a world conceived in its materiality* defined by buildings, cities, territories, and landscapes. Therefore, as practice-oriented knowledge, architecture takes charge of showing the world as *constructed or designable – a world/Kósmos*. Indeed, the «visual, tactile, and functional evidence» is the most noticeable characteristics of architecture. It assumes the unquestionable primacy in the common and everyday spatial experience of societies and communities: «Architecture is above all a material fact, » that is, «*things and places, built spaces*, substantially “tactile”. » (see: Assennato 2011, 15-16; Benjamin 2000, 45). Its intrinsic ideological value, precisely because of its eminently perceptual *artificial essence*, should, therefore, first, be verified.

Manfredo Tafuri has admirably shown how theories, techniques, and practices of architecture have historically taken shape within the continuous “impersonal” reproduction of *capitalist relations*. *Architectural ideology*, referred to building techniques, to the relationship between forms and volumes in urban morphology, and to design theories, is formed within the transformations of the *relation of production*. It seeks the constituent elements of its own “materiality”: in the symbolic codes of production and in the organization and capitalist exploitation of *living labor* (see: Tafuri 1976; 2007).

Arranging/Ordering: City and Metropolis.

«Philosophers have thought of the city, they have brought to language and concept urban life» bringing it back under the dominion of the *logos*. *Logos* means, above all, the *reason* that aims at reflecting an order (*Kósmos*). *Logos* is thus, a legislative and authorizing reason deployed on nature (*Physis*) for the creation of the *human world*. This concept leads to an unavoidable *practical* and *political* ordination: «To the organization of the city itself can be linked the primordial whole of urban form and its content, of philosophical form and its meaning: a privileged centre, the core of a political space, the seat of the *logos* governed by the *logos* before the citizens are “equal”, the regions and distributions of space having a rationality justified before the *logos* (for it and by it) » [see: Lefebvre, 1968]. The noun *Kósmos* and the adjective *kósmios* (“dignified,” “honorable,” “decorous”) shows an evident similarity with the verb *kósméo* (“putting order,” “adorning,” from which “cosmetics”) (see: Dal Lago, Giordano 2014). Is, therefore, the ancient *polis* the “original” place for the conjugation between *art and power, aesthetics, and politics* in the name of an order, (and a *partage*.) of the *production of the sensible*?

Polis and Metropolis.

Giorgio Agamben clearly distinguishes the only apparently homogeneous notions of *City* and *Metropolis*. In ancient Greece, *metropolis*, when compared to the “city/*polis*, meant a *political* and, at the same time, *spatial relationship*. «The citizens of a *polis* who left to found a colony were curiously called *en apoikia*: distancing/drifted away from home and from the city, which then took on, in relation to the colony, the character of Mother City, Metropolis» (Agamben 2007).

The notion of *Metropolis* then, call for a *spatial, social, and political relationship* characterized by the fundamental characteristics of *mobility* and *dynamism*. It «has a strong connotation of maximum *dislocation* and spatial and political *dis-homogeneity*,

as that which defines the relationship between the state, or the city, and colonies. And this raises a series of doubts about the current idea of the metropolis as an urban, continuum and relatively homogeneous fabric. » (*ib.*- emphasis added).

In the XVIII century, the paradigm of power as the prerogative of the sovereign authority, transformed into the paradigm of modern *bio-power*: «So I would say that the metropolis is the *dispositif* or group of *dispositifs* that replaces the city when power becomes the government of the living and of things. [The] government always has this schema of a general economy, with collateral effects on the particulars, on the subjects» (*ib.*)

With the imposition of a «metropolitan spatialization» a *de-politicizing tendency* is put into action, reaching the extreme point in which *private* and *public* short-circuit in absolute indifference (see: *ib.*). The bio-political paradigm of governmental power must be conceived as a predominantly economic form of governance of men and things, which determines a neutralization of urban space inhabited by public subjects, or *citizens*.

Metropolis and Civitas.

According to Massimo Cacciari, unlike the Greek model of the *polis*, the Roman *civitas* politics is entirely independent of a *natural ethic*. (Cacciari, 2009)

The *polis* was the place of *ethos* and *ethnos*, since it provided a home to “people,” housing a *lineage* (*génos*), thus, sinking its roots into belonging to a tradition, to a language, and to other characteristics that defined its uniqueness and unity. The inhabitants of the *polis* were so-called *polites*, because they developed their politics around the city *agorà*, through direct participation in the governance of the common *ethos* (see: *ib.*). Indeed, Plato and Aristotle were concerned about the *polis* not expanding or growing larger than specific territorial dimensions.

In the classical Latin world, the city turned out to be the - “artificial” and not “original” or “natural” - product of *cives* (*citizens*). Apart from any original ethnic or religious determination, the Roman *civitas* was precisely the *product of people belonging to different cultures and traditions*, very different from each other, who established, by reuniting together, that they were subject to the same laws. Undeniably, the founding myth of Rome provides testimony of this. The Roman *cives* were somewhat bound together by a scope, a purpose, and by a *common sentiment* (*Concordia*) that expressed itself through the power of the law, rather than being tied to an *indigenous* origin.

The Roman *Urbs /Civitas*, opposite to the “localized” *polis*, is dynamic (*Roma mobilis*). It permanently tends towards an *imperium sine fine*. Rome is *Urbs* who claims to become world, imposing “*Concordia*” by obedience to the “law,” or rather, by transforming *Orbis* into *Urbs*. For this reason, the *civitas* is always “*augenscens*,” it continuously “grows,” reaching everyone, as everyone can potentially become Roman *cives*, being welcomed in the Roman *Asylum*. The *civitas* continually tends to overcome its “furrow” and therefore to extend its *limes*, i.e., exceeding the present static situation defined by the city boundaries. (see: *ib.*)

The model of the “*civitas mobilis augenscens*” radically reconfigure the problematic *relationship* existing between the identity-homogeneity of the *polis* and

the *detrterritorialized-difference* of its colonies which, as Agamben mentions, was the specific quality of the Greek *metropolis*.

According to Cacciari, in the “baroque” age, the city was required to be simultaneously - and *contradictorily* - a place to satisfy human needs of *otium* (dwelling) and a functional machine for the *negotium* (commercial, artisanal, and banking activities which began to be incorporated into the city walls starting from the Middle Ages). Subsequently, the irruption of the combined *industry* and *market* will lead to the creation of the *Großstadt* and then, again, to an indistinct urban realm: This is how the *modern metropolis* emerged. The metropolis progressively reduces social relations to fetishistic-mercantile ones: production, exchange, and consumption of goods and values assuming and maintaining the *production /market* nucleus as expansive propulsion (see: *ib.*).

Modern Metropolis: from State to market as a new “Kósmos”.

In the Paris of the XIX century, Walter Benjamin identified the genealogy of a new form of metropolitan life. He delineated the relationship between the capitalist mode of production and symbolic forms. During the Second Empire of Napoleon III a dual alternative was manifested to the strong state model: the *market* or the *Commune*. After 1848, Baron Haussmann, the “*artist démolisseur*” started an “urban revolution”(see: Benjamin 1995).

The “*haussmanization*” expressed a new urban *space-time* regime desired by the Bonapartist power:

«It corresponded to the tendency which was noticeable again and again during the 19th century, to ennoble technical exigencies with artistic aims. [...] Haussmann’s efficiency fitted in well with the idealism of Louis Napoleon. The latter encouraged finance capitalism. Paris experienced a great speculative boom. [...] To the phantasmagoria of space, to which the *flâneur* was addicted, there corresponded the phantasmagoria of time, to which the gambler dedicated himself. Gambling transformed time into a narcotic. [...] Meanwhile, as far as the Parisians were concerned, [Haussman] alienated their city from them. They no longer felt at home in it. They began to become conscious of the inhuman character of the great city. [...] The real aim of Haussmann’s works was the securing of the city against civil war» (Benjamin 1995, 157-158; see also: Harvey 2008 and Lefebvre 2014).

The concise experience of the *Commune* (1871), temporarily put the *haussmannian “embillessemet stratégique”* in crisis. The insurgents attacked and knocked down “the column of Vendôme,” and the monuments of “*phallic-video-geometric*” power (see: Debord 2004; Lefebvre 2014) in order to affirm an alternative way of living in the city.

After the bloody repression of the *Communards*, the new metropolitan form will reach a new stage of development. In the *Ville Lumière*, the *artwork* will begin to lose the “aura” that marked its distance from the masses. To distinguish itself, in the new historical-social conditions, it will have to find its value of exposure, of a predominantly mercantile representation. In the age of its “technical reproducibility,” art finds its medium in the market, just as politics undergoes a distorted aesthetics establishing a new relationship with a massified “public”. According to Benjamin: «Architecture has always represented the prototype of a work of art the reception of

which is consummated by a collective in a state of distraction» (Benjamin 2000, 45; also see: Simmel 2000).

The new *Kósmos/Order* of modernity to which the agent individuals will later have to adapt will be the “spontaneous” (but imprescriptible) established through the rules of the *market* (Hayek 2000, 18 and 48 ff.).

Post-city and Post-metropolis.

In the nowadays *post-metropolis* or *city-territory*, the urban space is more and more indefinite, homogeneous, and indifferent. It is real physical parametrization without historical-narrative “identity.” In the metropolitan industrial cities, there were still points of reference as factories or other buildings around which productive activities orbited. In the contemporary post-industrial cities, buildings seem constructed without any coherent logic and any apparent planning. The speed of the changes that the current post-industrial production system requires imposes ultra-flexible upgrading capabilities, making permanent and long-lasting urban plans almost impossible (see: Cacciari 2009).

Rem Koolhaas describes as *Generic Cities*: «post-cities under construction on the site of the former city» where «there is no form, only proliferation» and that is subject to a «fascism without a dictator» that «pretends to unite but divides. Create communities starting not from shared interests or free association, but same statistics and certain demographic data, an opportunistic plot of vested interests.» (Koolhaas 2006, 37, 69, 80, 85).

In this *abstract space*, on which a territory appears to be “*sine fine*,” post-metropolises can thus arise everywhere by exploiting «the now global *tabula rasa* condition.» (*ib.*, 24)

At a planetary level the late capitalism, de-territorializing finance, informatics, mercantile, and migratory flows, deprives the ex -“first world” of the geographical, political, and cultural privilege it has enjoyed for centuries. Koolhaas observes that «globalization transforms [urban] language into *Junkspace*.». In the *Generic City* «new notions of metropolitan identity, the history of the city, and public space, are de-structured by a demonstration of the manner in which the metropolis become fractal, anomic, enormous and multinational. » (Negri 2007).

Conclusion: Study-Case Dubai.

After his sensational debut in the world proscenium, Dubai willingly participates in the frenetic “race for height,” happily assimilating the contemporary “global culture.” Risen and grown at incredible speed on the “natural” deserted *tabula rasa* without encountering any hindrance or constraint of any kind arising from an absent - to be preserved - urban fabric, Dubai has imposed its relevancy on the world. Not unlike other global cities, the Emirate displays (in Guy Debord’s sense) the *spectacular* image of its cityscape, which is “decorated” by iconic landmarks and spaces. Dubai exalts a celestial top-down/vertical axis of development. The wide range of gated communities, luxury hotels, skyscrapers (among the highest in the world), huge shopping malls, and a mild tax regime, very favorable to *corporations*, are the real “oil” of an essentially devoted to consumerism-shopping metropolis.

J.-M. Huriot demolishes the dominant rhetoric that cloaks, captiously

justifying it, the global competition to build “higher and higher” towers:

«They symbolize power. [...] They convey a clear, strong message of success, wealth, development and a dominant position on the global political or economic stage». The “race for height” is a preponderant element in the configuration of metropolitan urban areas of the new millennium. They satisfy needs for “densification”, and centralization of functional urban streams and at the same time, they maximize land value.» (Huriot 2012)

Dubai’s urban language mostly emerges from an orientalist approach which displays the simulacrum of an idealistic Middle East formal aesthetic. Subsequently, globalization provides the missing formal and typological characters through the replication of specific types that characterize the uniqueness of “old” euro-western cities: *A shopping for iconicity*.

The competition toward the “highest,” saw in the construction of the Burj Khalifa tower designed by Adrian Smith a milestone for the urban identity of Dubai. Smith says: «Right now we’re seeing in China and Dubai, and in other places, scenarios where the developer is building and looking at the entire vision, which is much larger than the tower itself. They will realistically make money on everything else except the tower, which they’ll probably break even on in 10 years, because eventually these buildings do make money.» (Smith 2013)

Through the design of towers, *architectural form* can now enjoy its contingent aesthetic *ecstasy*. As a significant example, one could mention the under construction Dubai Creek tower, (aka Calatrava’s tower). It (symbolically) flaunts only or mainly on the height, with no relation to its volume, which is almost absent. One goal, however, is clear: to increase the land value of the surrounding buildable areas, as well as to attract investments. With almost no functions added, other than the voyeuristic observational program on the urban “spectacle” of Dubai, the tower exhausts its mission as building, and it becomes a pure capitalist architectural device. It saves money on its construction due to its “light” functional program but at the same time maximizes real estate profits on buildings in the adjacent lots. Would it be the aesthetical typology for the towers of the future?

A STUDY ON BIOLOGICAL CONCEPT IN ARCHITECTURAL THOUGHTS: COMPARISON OF «DER RAUM ALS MEMBRAN» (1926) AND «METABOLISM» (1959)

Abstract | This study analyzes the biological influence on the field of architecture in the 20th century, by focusing on two particular biological architectural thoughts; “Der Raum als Membran” (Space as Membrane) by Siegfried Ebeling in 1926 and “Metabolism” by Japanese architects in 1959.

First, I peruse “Der Raum als Membran” which is an essay written by Siegfried Ebeling, who was a German architect which studied at Bauhaus. He saw architecture or space as a biological membrane like skin or cell, and he proposed a theory of “biological architecture”. In his theory, there is an influence of the concept “Umwelt” which advocated in 1909 by Jakob von Uexküll who was a biologist of the same period. Ebeling not only introduced a biological metaphor with the flexibility of a membrane, but also incorporated a biological concept like “Umwelt”, to plan an environment. And he thought architecture is breathing.

Second, I investigate a manifesto and a group of Japanese architects by the name “Metabolism”. It was presented by Kawasoe Noboru, Kikutake Kiyonori, Kurokawa Kisho, Otaka Masato and Maki Fumihiko in 1959. “Metabolism” is a term of biology and includes the meaning of “the replacement of old cells by new cells” or “growth”. They selected the word because they believed “design and technology should be a denotation of human vitality”. They thought buildings and urban designs as an existence having metabolism which is a basic function of living things, and proposed variable and proliferate architectures having dynamic time span.

By comparison of these biological architectural thoughts, I point out three main similarities; 1) the expansion of biological concept to architecture, 2) “cell” as a metaphor and 3) dynamic buildings or urban design. Although they had different historical, geological, social, political and cultural backgrounds, both of them tried new architectural ideas at their times.

Recently, the Earth runs into Anthropocene in the geological classification, and human-beings face biological and ecological problems more and more. Many artists and designers create works and activities by means of biological theory and bio-technology, called “Bio art” or “Bio design”. This occurs because of the rapid development of life science, like genetics and bioengineering, and the awareness of bioethics and ecological problems. To reconsider the biological architectural thoughts in the 20th century provides us clues to think about artistic practices we have today.

Index terms | *Anthropocene; Architectural Thought; Biological Architecture; Bio Design; Membrane; Metabolism; Umwelt;*

Introduction

In this paper, I focus on two specific biological architectural thoughts, *Der Raum als Membran (space as a membrane)* (1926) by Siegfried Ebeling and *Metabolism* (1960) by Japanese architects. I analyze the biological effects in the field of architecture in the 20th century. *1

One aspect of 20th century art is the connection between art and engineering as a requirement and possibility from the social and technical background. For example, the Futurism artist focused on objects with speed and power incorporating advanced technologies at the time, such as cars and weapons. And even with the Constructivism, the structural model introduces rational mathematical theory, and the form influenced mass-produced products as modern industries. Then, the point of actively using of new architectural materials at that time, such as glass and metal, storied the century of engineering and mechanization. However, in the last twenty years of research, the movement to revalidate the context of such modern art has been intensified, and develop the study on the relationship between modernity and art as a *biological era*. *2 Especially, Oliver A.I. Botar proposed a clue to reconsider modern art as *Biocentrism* which is the philosophical biocentric movement that appeared with the term *Biozentrik* using in German-speaking region and influenced many cultural situation at the fin de siècle. *3

Preceding studies on the contact point of creation and biology are underway in the field of architecture as well. As a result of recent research, an anthology named *Biology in Art and Architecture* was published, and attempted to historically consider the influence of biology in a wide framework such as architectural history/ architectural practice and art history/ art practice. *4

Biological Architecture by Siegfried Ebeling: Interaction between Man and Environment

First, I analyze *biological architecture* thought brought up by Siegfried Eberling [1894-1963] from a work focusing on his Bauhaus dissertation *Der Raum als Membrane* (1926). [Fig.1] Ebeling, born in Rätzlingen, Germany in 1894, studied philosophy and theology at Heidelberg University, then dispatched to the World War II, and then studied theology and art history at the University of Jena and Leipzig. After that, He worked at the factory of Junkers, then studied at Bauhaus Weimar in 1924-1925. In the Bauhaus, he received design education at studios of Wassily Kandinsky [1866-1944] and Marcel Breuer [1902-1981]. *5 He is exactly the architect who lived in the era of Biocentrism.

For the beginning, I describe the basic concept of his *biological architecture*.

In order to have a standard with which we can measure existing or future-facing architecture, it is useful to look at the original situation of house building as the basic form of architecture. In the midst of a fantastically changeable world of things and life, a house is a relatively rigid multicellular cavity body, the underside of which is rigidly or loosely connected to the multiply reinforced ground. With its remaining surface, it attaches to a thinner medium, which is periodically intermittently irradiated with light of different quality. The tension of the cavity resulting from both pairs of forces enters into a legal correlation with psychologically and physiologically determined living beings. The degree of harmonic balance between the 3 components determines

the character and quality of the architecture. *6

Architecture in his argumes assumed *house* or *room*, and the house is a multicellular body and is considered to be tightly or loosely connected to the ground. And considering the impact of climatology and the environment on the mind while giving examples of space using glass and solar energy, it is necessary to consider the equipment that captures the energy related to the human ecology in the outside world, that is, man thinks the house itself as an energy source, he suggested. *7

Quoting words written by Friedrich Wilhelm Nietzsche [1844-1900], the consideration of the 1st chapter, in which a very philosophical argument, seems like vitalism theory. Indeed, the architectural plan of Ebeling had never been built. It is pointed that a realized case reflected the Ebeling's idea at that time was only the German Pavilion of International Exposition Barcelona [Fig.2] designed by Ludwig Mies van der Rohe [1886-1969] in 1929. *8

However, in his thesis, Ebeling pointed out that the background to the concept of *biological architecture* was based on "partly practical and partial sociological considerations". And he mentioned also challenges for the realization (in chapter 3), the idea was conceived as feasible.

Such and other partly practical, partly sociological considerations finally lead to the conception of the circle of thought of "biological architecture", in which essential time seems to be ripe for the methodical attempt, the three-dimensional roughly physical determined space of a three-dimensional biologically determined membrane between our bodies as plasma-labile substance and the latent given, but not yet biostructural detected fine forces of the spheres to match. *9

Ebeling had already thought about the architecture as a membrane in 1924, when he was a student of Bauhaus Weimar. *10 [Fig.3a and 3b]

In other words, by creating new structural relationships (using new technical processes), the room, which today is still massively porous, will become a membrane between our body as a nucleus and the plasma energies of the big world. *11

For Ebeling, the human body in the house or room is the nucleus, and it was a membrane for circulation with the plasma energy to the outside world. In the 1926 dissertation, Ebeling described the importance of Raoul Heinrich Francé's book, *Die technische Leistungen der Pflanze* (1919), one of the proponents of biocentrism. *12

Concerning the theory of Francés, Moholy-Nagy László [1895-1946] who was a Bauhaus's meister, has quoted his book in Bauhaus Bücher titled *von Material zu Architektur* (1928). Moholy-Nagy taught in Bauhaus from 1923 to 1928, when Ebeling studied there at the same time. Moreover, in the previous study, it is pointed out that Ebeling influenced also the concept of *Umwelt* proposed by 1909 by Jakob von Uexküll who was a biologist. *13 Uexküll's theory regards environment as the world where each creature finds meanings, not as the world where around living organisms as it is given. This ecological point of view is recognized that the assumption of Ebeling was influenced it, in terms of circulation through the outside world and the living thing which is the nucleus in the house.

Under these concepts, he concluded concrete tasks of sunshine and light supply and

the system of thermal efficiency and air circulation as a subject in his discussion. In this way, the biological idea of Ebeling can be realized by using materials such as new glass and metal as a building material based on the ecology of a human being, while having the concept of nature and life on the cosmic scale. The idea of creating an interaction between environmental control and physiology on the human body was raised.

Metabolism: the Idea of Movable City

Second, what I attempt to compare is the thought of Metabolism, which is one way of *biological architecture* presented in the era when modernism began to end. *14 It was 1960 that Metabolism appeared in the form of publication [Fig.4], but its fetus had started before 1959. It was the year after the dismantling of CIAM, it seems that it was a turning point of the (modern) architectural theory.

Four architects (Kikutake Kiyonori [1928-2011], Kurokawa Kisho [1934-2007], Otaka Masato [1923-2010] and Maki Fumihiko [1928-]), two designers (Awazu Kiyoshi [1929-2009] and Ekuan Kenji [1929-2015]) and one critic/ editor (Kawazoe Noboru [1926-2015]) are the member of Metabolism group, which organized for the World Design Conference Tokyo in 1960, that is an international conference held for the first time in Japan. *15

Kawazoe named the characteristic group name *Metabolism*, which represent directly vital and biological activity.

Kawazoe Noboru: the term of “metabolism” is “shinchin-taischa” in Japanese. This is the word I got from Engels saying in the *Dialectics of Nature* (1883); “the fundamental existence style of life is metabolism”. When I searched the good translation of metabolism, Mr.Kikutake consulted the Japanese-English dictionary and found that “metabolism”. *16

Although Otaka had the leadership as the oldest, it was pointed out that Kawazoe, Kikutake and Kurokawa actively lead the group activity as promoting it. *17 As a circumstances of the foundation of group, the linguistic expression of the philosophical outline of Metabolism was largely due to Kawazoe’s words. The preface of the booklet was written by Kawazoe just before publication.

“Metabolism” is the name of the group, in which each member proposes future designs of our coming world through his concrete designs and illustrations. We regard human society as a vital process— a continuous development from atom to nebula. The reason why we use such a biological world, the metabolism, is that, we believe, design and technology should be a denotation of human vitality.

We are not going to accept the metabolism as a natural historical process, but we are trying to encourage active metabolic development of our society though our proposals.

This volume mainly consists of the designs for our future cities proposed only by architects. From the next issue, however, the people in other fields such as designers, artists, engineers, scientists, and politicians, will participate in it, and already some of them are preparing for the next one.

In future, more will come to join “Metabolism” and some will go; that means a

metabolic process will also take place in its membership. *18

As stated above, the important point is that they regard the society as a sustainable development having vital process, and that it captures the design and technology as the extension of human life. Kurokawa pointed out that the above was important in Metabolism in 1977.

First, it reflects our feelings that human society must be regarded as one part of a continuous natural entity that includes all animals and plants. Secondly, it expresses our belief that technology is an extension of humanity This belief contrasts with the Western belief that modernization is a repetition of a conflict between technology and humanity. *19

In fact, excepted the preface and Kawazoe's essay, there was no use of the word *metabolism*. Consistent is the concept that becomes the core of *metabolism*. That means *adaptation to change*. It was the presentation of the dynamic way of architecture which was considered to be basically fixed. The idea of Kikutake's *movable* is remarkable. While Kikutake's discussion concretely did not use the word *metabolism*, in the illustration titled "Order of Metabolism in the City", it caused an image of cell division and supplemented as follows;

As the city grows, it divides into two parts like a cell division.

There are (a), (b) and (c) on how to divide.

It depends on whether the production is the main part of how to divide, or whether the residence becomes the main part.

4/16 *20 [Fig.5]

And showing the case of the "Sky-house" which had already been completed and announced in 1958, it was described as "the three movable things" as follows;

Human life	Move-net
Family life	Movable house
Urban life	Mova-block *21

Move-net divided according to the function of living space, Movable house which can be replaced according to family style and life stage, and Mova-block which expanded the way of thinking to cities are dynamic adaptation of buildings due to life cycle or city change, that is, metabolism.

Then, the longest development of the concept of Metabolism was Kisho Kurokawa who participated in metabolism at the youngest age of 26 years old. Kurokawa developed this idea throughout his life and eventually ties it to the idea of *symbiosis*.

From metabolism to metamorphosis, and symbiosis, the flow of thought for the last 33 years may seem to be inconsistent at first glance, but in fact, the principle of the machine is revolutionized and replaced with the principle of life It is penetrated by this

way of thinking.

That was the start of the metabolism movement in 1960. *22

On the other hand, Kurokawa told also about his architecture which used biological term later as follow;

I never understood my architecture as biologicistic or biological. Sure, both metabolism and symbiosis are biological terms, but in my architecture it is more a matter of the whole principle of life underling them.

Metabolism and Symbiosis as architecture terms really did arise with me in connection with such social questions, incidentally "Symbiosis" earlier than "Metabolism". However, Metabolism was the first to become known as a catchword for my architecture in the 1960's. In the process it was most often linked with the then developing High-Tech because of the idea of interchangeability of components, that simply replaced old with new. However, with me recycling or ecological thinking was in the foreground from the beginning, something that has become current today thanks to the general interest in global environmental problem. *23

In this way, Metabolism is not an architectural group with a firm idea, but rather in the mind to disseminate Japanese design to the world and to develop new architecture theory, forward to the reality such as population growth and high technology society. It was a construction concept that showed a gradual similarity that young generation architects were thinking to face the contemporary problem of the living environment of human beings.

Comparison of Two Biological Architecture Thought in the 20th century

As mentioned above, by comparison of these biological architectural thoughts, I point out three main similarities; 1) the expansion of biological concept to architecture, 2) *cell* as a metaphor and 3) dynamic buildings or urban design.

1) The expansion of biological concept to architecture.

Regarding this point, biology is assumed as a concept that is opposite to physical, but it is not a bio-morphism or a bio-mimicry method that imitates the form or function of a specific organism, but architecture(s) or city itself can be considered as a *biological architecture* which has been considered as a kind of integration with a life process, a human life process.

2) *Cell* as a metaphor.

The term of cell (Zelle) was used directly in Ebeling's architectural thought. On the other hand, regarding Metabolism, as a biological and vital image linked to metabolism, in the image of the "order of metabolism of the city" in Kikutake's ocean city plan, and in the poetical text of Kawazoe as "my dream 50 years hence". The description of the cell can be confirmed in a sentence of "Now I am a cell of bacteria which is constantly propagating itself." [Fig.6] *24

3) Dynamic buildings or urban design.

In this regard, Ebeling assumed a dynamic system that controlled the environment

mainly based on (sun-)light and air conditioning as a house building. Meanwhile, Metabolism regarded even larger social and urban frameworks themselves as dynamic subjects.

In addition, another common point is that the both of them, the thought of Ebeling's biological architecture and the proposal of Metabolism, were the concept of architecture toward *the future*. In that respect, there were not many examples which the concept was directly realized. On the other hand, as a big difference, while the thought of Metabolism purely concerned the *metabolic process* of living organisms and drew an engineering approach with its metabolic process as the core in the time axis of urbanization. In contrast, Ebeling proposed the idea of the utilization of natural energy more specifically. It showed the living environment in the broad sense of the meaning *biology* (including environmental studies and hygiene studies).

In conclusion

It has long been pointed out that the earth has entered a geologically new generation called *Anthropocene*. Human beings are increasingly frustrated by biological or environmental problems. In recent years, many artists and designers have created works and activities called *bio art* and *bio design* using biological theory and biotechnology. This is a remarkable problem as it is presently in the branch point to reconsider our living environment. By seeing the demands of contemporary, it is possible to reconsider the architectural thought of Ebeling and Metabolism as a predecessor of bio design. Ebeling's biological architecture was devised in a time when biology as academia was established, and it was devised in a society where industrialization is progressing more and more after World War II. Ebeling devised a building plan as a utopian futuristic membrane that came from working in Bauhaus and Junkers factory and by using the new industrial materials he encounters for architectural materials. Regarding Metabolism, it was a time when the Japanese society gradually achieved post World War II reconstruction, and the relationship between human life and nature was considered during entering the period of rapid economic growth. *25 The movable building and city concepts for the growing population were possible by relying on the development of technology. It was foreseeing that the change of the times became intense and that the city itself needs to have a function to metabolize like a living thing. [Fig.7] Both of these biological architectural thoughts were evolved at the turning point in global trends at each era. Therefore, in term of creative inspiration coming from the encounter of different study fields, these are cases to be investigated in this era.

AESTHETICS OF DENSITY HOUSING

Abstract | The aim of this paper is to propose a new *reading* of the chaotic appearance of density housing, through drawing as a critical tool of the architecture of the contemporary city. The analysis of the aesthetics of density housing starts from a single recorded photography of the city's fragment. Most of the drawing experiments consist of mapping fragments of the Modern city of New Belgrade that has been overexposed to the uncontrolled flux of spatial transformations over the last few decades. Unplanned spatial conversions resulted with widely varying dissimilar elements of citizens' individual interventions within the original buildings. The second part of this experimental process puts the object of research in a correlation with selected ongoing artistic photography practices that interpret the complex housing dynamics in which we live today, such as Michael Wolf (*Architecture Of Density, 2014*), Andreas Gursky (*Tokyo, 2017, Paris, Montparnasse, 1993*) and Yuya Takeda (*Apartment Complex G-2, D-1, 16, F-3*), etc. After intersecting selected artistic cases with the urban structure of the disrupted Modern architecture of New Belgrade that was rapidly *modified*, results of research show the remarkable density and diversity of human lifestyles that can be perceived as a new kind of active habitat. Shifts between individual and family atmospheres, of each dynamic void of the unnumbered apartments create *indoor landscapes*. Congested buildings of New Belgrade, architecturally composed as a combination of rigidly repeating closed, static physical structures and pure horizontal *indoor landscapes*, trigger the architect to simultaneously consider different spatial situations. By layering the layered, the proposed drawing methodology encodes the relationship between invisible/visible, present/absent building transformations over time and uncovers the aesthetics of density housing.

Index terms | *architecture, density, housing, aesthetics, transformation, indoor landscapes, New Belgrade;*

LEARNING FROM OPEN BLOCK ILLUSION

Post-modern and post-social transformations have changed unique urban qualities of Modern city of New Belgrade and put the city in front of new spatial collisions.¹ Individual inhabitants' interventions on the collective housing of the Central Zone of New Belgrade have reached the level of autonomous spatial transformations. Living space expresses everyday life of citizens: their balconies are their extra rooms, they are visible to the public, they are filled with all waste furniture, etc. Rarely are those balconies small green areas, just as the windows profiles are rarely original. All those buildings have their own facade cuts, added roof rooms or balcony spaces, different colours of facade, and so on. The struggle for each square meter has increasingly broken down the architectural concept and established its own regime over how a certain space is being used. While all those micro-space attacks are upgrading day by day, at the same time macro-space is developing its discontinuity. As the most important part of the plan of the Modern city, the Central Zone of New Belgrade has always been in the focus of economic interests. New Belgrade as a Modern city was based on the concept of open blocks and the idea that the city can always spread out. Instead of reconceptualising the plan, political transitions with their new investors see the opportunities of the big green areas of open blocks as an empty space for commercial buildings. Intersections of those micro and macro spatial transformations combine social needs, political power and confront the architects with multiple spatial diversities. Block 30 as one of the blocks of the Central Zone has its own specific configuration. Prefabricated elements of the block 30 buildings are still clean enough and readable in spite of each individual life of balcony and flat windows. There is pureness of a rhythm. Observer can perceive illusion of this modern rationalism at the facades that have made new frontal line at the block 30. Open block is not open anymore; one of the sides of the block has a line of the commercial buildings. Cross visual points for all those new buildings are facades with reflective glass. They are like big mirrors of the everyday life of the collective Modern housing; they have become *another space*². The image of density Modern housing of New Belgrade turns into a new form of life when we see it on the mirror facade. Each orthogonal line becomes a curve, and each window space has new fluid atmosphere. Everything that was rigid mutates to a numerous of distorted images. Is it possible that those spatial overturns have new aesthetics quality?

BOUNDARY OF ARCHITECTURAL IMAGE

“The mirror is, after all, a utopia, since it is a placeless place. In the mirror, I see myself there where I am not, in an unreal, virtual space that opens up behind the surface; I am over there, there where I am not, a sort of shadow that gives my own visibility to myself, that enables me to see myself there where I am absent: such is the utopia of the mirror. But it is also a heterotopia in so far as the mirror does exist in reality, where it exerts a sort of counteraction on the position that I occupy. From the standpoint of the mirror I discover my absence from the place where I am since I see myself over there.”³

The object of research establishes a correlation between ongoing artistic practices that interpret the world in which we live today, and provide us with *another view* of the *reading* of extreme density housing. Selected examples such as *Michael Wolf (Architecture Of Density, The Transparent City, 2014)*, *Andreas Gursky (Tokyo, 2017, Paris, Montparnasse, 1993)* and *Yuya Takeda (Apartment Complex G-2, D-1, 16, F-3)*,

describe the contemporary moment as close as possible, as well as the congested atmosphere of modern people's lives within in. At the same time, they represent a document of extreme development and complex urban dynamics.

What do Gursky, Wolf and Takeda's observations imply for the field of architecture? A closer look to selected photography artworks reveals architecture extracted from its own context. Although these visualisations do not show people, the boundary of an architectural image of reality is broken by perception of an artwork. On the one hand, the repetition of facades maintains order, rhythm, but on the other hand, while the act of viewing is prolonged, the feeling of density prevails. Does communication exist at all, among these multiplicities?⁴ If not, what are the instruments of architecture that will achieve it? In his artwork, *The Transparent City*, Wolf's photographs represent Chicago, that has, like many urban centers throughout the world, undergone, or is still going through, a surge of new construction, that generates a new layer of architectural experimentation onto the buildings from the past eras. The author has chosen to photograph the central downtown of the city, thus pointing out to the most drastic changes in urban environment. Through all these visualizations, that bring urban structure as close to us as possible, it seems like everything that belongs to the static structure of architecture has become secondary. While occupying space, constant fluctuations of images in front of our eyes provoke us to the point when we are unable to absorb one picture, because the other has already happened. Despite the fact that the photographer is especially focused on the issue of voyeurism within the contemporary urban landscape, complexity and contradictions that are happening here have revealed lack of life identity. Numerous apartments blur individuality, and density transforms the typical aesthetics of housing. Metropolises like Chicago, Hong Kong, Paris, Tokyo, day in and day out, face the observer with its vertical reflection through skyscraper facades, which is far easier to perceive than the actual morphology of the city. At the same time, implications of the illusion of a fragment of the city is beginning to be more *readable* in the parts of the city such as New Belgrade than in the current built environment. Ephemerality, constructed by reflection, transparency, gradually takes a new form - towards *another* architecture. What is the relationship between these abstract elements and the objective reality?

DOZENS AND DOZENS OF WINDOWS: AESTHETIC QUALITY OF EVERYDAYNESS

"Should a window suddenly light up, or on contrary go dark, the solitary dreamer might ask himself -in vain- if it concerns a scene of illness or of a love, if it is the moment [geste] of a child who gets up early or of an insomiac. Never does a head, a face appear in the dozens and dozens of windows."⁵

Is it a window boundary between *indoor landscape*⁶ and cityscape or "the window offers views that are more than spectacles; mentally prolonged spaces?"⁷

Everydayness is a multitude of moments which breaks stability; it is the opposite that challenges perception and our aesthetic experience.⁸ Different aspects of bodily movements create illusion as a new spatial image. Each of these individual images forms a space around itself, thus producing a scale of different impressions that trigger reactions of our mind and body. Window expresses the scale, the rhythm and the atmosphere.⁹ Atmospheres of human activities that are housed within a rigid network of the built environment, are being discovered through the airy volumes. Simultaneous observation of the layered spatial volumes begins from the study of relations from inside to outside. The degree of openness is achieved through *transparency*¹⁰ of window, and

therefore, the impression of urbanity as well. But the question is, which tool provides us with a possibility to map those life screens? Is there any architectural, analytical and technical method which is able to follow the speed of everydayness? The agency of air voids of the density housing have unpredictable impact on the future design processes, which are still not well discovered. The failure of this sensitive life layers is full of diversities. They are the potential for architectural thinking and observing process; moreover, they hold responses in terms of design.

MAPPING DENSITY: INTERSECTING ATMOSPHERES

The exhibition *Travelling the World. Art from Germany. Artworks from the ifa Collection, 1949 to the Present*¹¹ that happened from January to March at Museum of Contemporary Art Belgrade presented a few Gursky's photography artworks. One of the selected works was *Genoa, 1991*. On the photography, the car roofs were full of different boxes, bicycles, some old materials, etc. Analysis of each detail of this work could be compared to a photography of the current situation of New Belgrade density collective housing. Car roofs are purely aesthetic visualization of New Belgrade's balconies, extensions, or even facade treatment. Each balcony is an individual plot, and just like a roof of a car, it is full of unexpected life details, incompatible elements... Atmospheres from Gursky, Wolf and Takeda's photography artworks bring the specific scientific layer of research to our drawing process. Despite the fact that chosen life situations from Gursky, Wolf and Takeda's works are extreme, they provide spatial depth of each delirious fragment of reality. The fragment of reality gives us the possibility of perceiving the essential characteristics of the process that we are pursuing. Documenting this phenomenon, with the idea of indicating how modern life takes place in a contemporary city, and highlights what might become a conceptual foundation for future architectural actions. Through all these visualizations, that bring urban structure as close to us as possible, it seems like everything that belongs to the static structure of architecture has become secondary. What is the relationship between these abstract artworks elements and the objective reality?

This paper proposes drawing as a critical tool that was developed during PhD research which explores the dynamic processes of density housing (Figures 1-7). "In order to comprehend differences, we use the material to expose the immaterial and their relation to the unbuilt. The study of spatial conflicts that are not directly visible through drawing stimulates new points of view and new analysis and finally yields new information. Therefore immateriality depends upon materiality and is based on the intuitive abilities of the observer and a certain level of knowledge and understanding of the phenomenon. Under these circumstances, we can reach the point of mapping transformations of the urban fabric where we can establish a common language in the drawing. In order to create a poetic diagram for dynamic mapping, we search for answers in the relationship between the hand-drawing as the first critical tool and the computer as the second one. This relationship between the intuitive trace of a hand and the mechanized processes of digital tools provides our drawn methodology with comprehensive tools to encode any transformation using these techniques".¹²

CONCLUSION

Mapping density through drawings has blurred the boundary between inside and outside of urban structures. The proposed drawing method intersects static and dynamic parts of the buildings. Density has pushed drawing as a critical tool to the

limit; when the architecture and the life of object become one. At that moment, we do not draw any more the designed quality of buildings; yet we draw the moment when system collapses, the *glitch*.¹³ Despite the fact that drawings represent the flash of the moment of density housing transformations, they create a new architectural trace. Aesthetic qualities of congested buildings of New Belgrade are hidden behind the everydayness. Drawing could not be so precise such as some mechanical tool, but could bring unexpected simultaneously spatial relationships and advance our future design processes.

AESTHETIC IDEAS IN THE CRITIQUE OF THE POWER OF JUDGEMENT

Abstract | In his *Critique of the Power Judgement*, Kant defines an aesthetic idea as “that representation of the imagination that occasions much thinking though without it being possible for any determinate thought, i.e., *concept*, to be adequate to it, which, consequently, no language fully attains or can make intelligible,” concurrently claiming that all beauty is in its expression. However, in architecture, the expression of aesthetic ideas is limited by the primacy of the appropriateness of the object for its use (its voluntary end). In this paper we will discuss how this limitation affects aesthetic ideas and whether it gives us reason for aesthetic ideas in architecture to have specific status. We take into consideration its dual representational function, because in addition to representing aesthetic purposiveness, as other works of art do, works of architecture should also represent the kind of intended structure). (1) We will address this issue by concentrating on the question of which relation stands between the voluntary end of an architectural work and the relevant aesthetic idea (and if, as Paul Guyer claims, the beauty of an architectural work could be understood as the harmonious play of its function with its form). (2) The second question we present regards the role of content of aesthetic idea in architecture and which specific content (again referring to Guyer’s claim that adherent beauty could be understood as harmonious play of content with its form). (3) In the final part of the paper, we discuss how a representation of the function of an architectural work could be compatible with aesthetic freedom and how the aesthetic idea could be bound to the architectural concept.

Index terms | *Aesthetic ideas, Architecture, Concept, Kant, Harmonious play, Function*

Aesthetic idea is one of the most important concepts in Kant's Critique of the Power of Judgment. Although he introduced it in his discussion of faculties of genius and fine arts, it seems that aesthetic ideas actually explain all kinds of beauty, including even natural beauty.¹ We must be careful when trying to understand what Kant meant under the term aesthetic idea. In §49, he gives the definition:

by an **aesthetic idea**, however, I mean that representation of the imagination that occasions much thinking though without it being possible for any determinate thought, i.e., **concept**, to be adequate to it, which, consequently, no language fully attains or can make intelligible.²

Even the name itself is partially controversial, particularly why they are *ideas*. Ideas are, according to Kant a special kind of concept (*Begriff*) of reason to which no intuition could ever be adequate, thus going beyond the possibility of experience.³ Aesthetic ideas are in some way the opposite (counterpart) to intellectual ideas, an intuition to which no concept could be adequate – and even their *genus* is not the same. Most importantly, aesthetic ideas are not concepts (*Begriff*) at all. They are “representations of the imagination”, and that means forms of intuition, not concepts. It is important to note that they do not represent their object mediately through the general mark common to many things, but are rather singular representations which immediately refer to their objects.⁴

Nevertheless, aesthetic ideas have acquired their name due their similarity and possible relation with ideas of reason. Like ideas of reason, aesthetic ideas “strive towards something lying beyond bounds of experience”.⁵ Of course, in different modes: ideas of reason are concepts which go beyond limitations of space and time, intuition and categories of understanding; aesthetic ideas are intuitions which go beyond limitations of empirical concepts. The former are intellectual representations beyond bounds of experience, the latter are sensibility beyond bounds of (determinable) experience. That is exactly what makes possible the most important use of aesthetic ideas, to represent ideas of reason – because they sensibly represent something beyond bounds of experience.

Despite aesthetic ideas not being concepts themselves, Kant addresses them as always connected to concepts (this will probably not be the case for free natural beauty as an expression of aesthetic ideas, although Kant does not address this specifically). This relation could be understood in two ways. In §17, after Kant introduces the possibility of adherent beauty and when he explains the ideal of beauty, he also introduces the term “aesthetic normal idea”.⁶ To be clear, aesthetic normal idea is not quite the same thing as aesthetic ideas, but probably could be a good way to understand it. It is defined as: “an individual intuition (of the imagination) that represents the standard for judging it as a thing belonging to a particular species of animal”.⁷ Aesthetic normal idea, thus, represents (*in concreto*, in intuition) an ideal proportion of an object as it should be, its concept *in abstracto* (e.g. average dimension, relevant characteristics etc.), which immediately serves as a condition for ideal representation of some object. On the contrary, the aesthetic ideas does not represent *in concreto* the concept of that object but goes beyond the bounds of experience and “occasions much thinking though without it being possible for any determinate thought, i.e., **concept**, to be adequate to it”. However, they are specifically related to concepts. Here is what Kant

claims when he explains how aesthetic ideas are constituted:

Now if we add to a concept a representation of the imagination that belongs to its presentation, but which by itself stimulates so much thinking that it can never be grasped in a determinate concept, hence which aesthetically enlarges the concept itself in an unbounded way [...] that is, at the instigation of a representation it gives more to think about than can be grasped and made distinct in it (although it does, to be sure, belong to the concept of the object).⁸

This quotation immediately shows that aesthetic ideas are not floating without reference to a concept; rather, they “aesthetically enlarge[s] the concept itself in an unbound way”. Kant is even more explicit on which connection in question should be noticed:

Those forms which do not constitute the presentation of a given concept itself, but, as supplementary representations of the imagination, express only the implications connected with it and its affinity with others [...]⁹

Those, previously mentioned forms, “which express only the implications connected with it and its affinity with others”, Kant calls aesthetic attributes, giving in turn an example how concepts could be aesthetically represented through implications connected with it:

Thus Jupiter’s eagle, with the lightning in its claws, is an attribute of the powerful king of heaven, as is the peacock of the splendid queen of heaven. They do not, like **logical attributes**, represent what lies in our concepts of the sublimity and majesty of creation, but something else, which gives the imagination cause to spread itself over a multitude of related representations, which let one think more than one can express in a concept determined by words.¹⁰

The rich content implied in relation with the concept here constitutes aesthetic representation which goes beyond the boundaries of experience. However, that it represents aesthetically means that it is related to feeling, not to cognition of relation between, say, an eagle and heaven. It is the interplay between the given content and form in which it is given that arouses the play of our cognitive faculties (which are in some way free, because they exceed the boundaries of determinate concepts).¹¹

To summarize: we have to consider a few important characteristics of aesthetic ideas:

- (1) Aesthetic ideas are not concepts (*Begriff*): they do not represent an object mediately through a mark common to many things, but they are singular representations that should immediately refer to their objects (whatever those may be)
- (2) Aesthetic ideas are related to concepts, because they aesthetically enlarge the concept itself in an unbounded way
- (3) They represent aesthetically, not through logical attributes, but through

interplay of the content and the form

AESTHETIC IDEAS AND ARCHITECTURE

Kant mentions architecture (*Baukunst*) only in a few places in *Critique of the Power of Judgement*. The most important is §51. where he defines it as:

The **plastic** arts, as the first kind of beautiful pictorial arts, include **sculpture** and **architecture**. The **first** is that which presents corporeal concepts of things as they **could exist in nature** (although, as a beautiful art, with regard to aesthetic purposiveness); the **second** is the art of presenting, with this intention but yet at the same time in an aesthetically purposive way, concepts of things that are possible **only through art**, and whose form has as its determining ground not nature but a voluntary end. In the latter a certain **use** of the artistic object is the main thing, to which, as a condition, the aesthetic ideas are restricted. In the former the mere **expression** of aesthetic ideas is the chief aim.¹²

As all fine arts, architecture also should express aesthetic ideas. However, already at the first step we find a difference. (1) While sculpture represents things as they might exist in nature, architecture represents “concepts of things that are possible only through art”. Not only does Kant recognize (which some of his predecessors did not) that architecture should not imitate nature, he also explicitly address that architecture is more connected to things created by man (for man). However, even more important is Kant’s further claim, that concepts of things should be represented – it is not only that architecture should not imitate nature, but it should also present a concept of its artificial objects as they should be. (2) This becomes clearer still in the second important characteristic, according to which the form of architectural objects has its determining ground in “a voluntary end” – in a function or use chosen for this object. It is important to note that this form object is not just dependent on its use; the claim is that the form of the object is the consequence (*Folge*) that follows from a voluntary end as its ground. (3) This thesis is even more radicalized in the next sentence where, in contradistinction to practically all other fine arts, expression of aesthetic ideas is not the main thing, but its use – moreover, aesthetic ideas are restricted to it.

Thus, in architecture, according to Kant, we have to take several things in consideration: a *concept (Begriff)* of a purpose of a building related to the function of that object, the voluntary end, which is the ground of the *particular form* of this object and an *aesthetic idea* that enlarges the concept in an unbound way. Note, however, that aesthetic ideas do not represent the concept logically, but only aesthetically through the harmonious play of its rich content and corresponding form. Because the relevant concept, to which aesthetic ideas are restricted, is nothing other than the concept of the relevant function of the object, we could possibly conclude that aesthetic ideas enable the harmonious play of object form with (the concept of) its function.

THE ARCHITECTURAL CONCEPT AND MATERIALITY

Aesthetic ideas in Kant’s philosophy are in some ways similar to the architectural concept (concept as it is used in architecture). (1) As well as aesthetic ideas, the architectural concept is not a concept (*Begriff*) in a logical sense at all: it does not represent an object through a mark which is common for many thing, but it is a singular representation which immediately refers to its object (whatever it may be). (2) In addition to aesthetic

ideas, the architectural concept should (at least in its materialization) be somehow related to the concept object (its function). At the same time, however, it should not be reducible to the concept, but enlarge it in an unbounded way by providing it with so much thinking that it cannot be grasped in a determinate concept. (3) The medium through which architectural concepts are represented should also be aesthetic and not (only) logical.

Let us linger on the third point. It could be argued that Kant does not take seriously into consideration the importance of materialization of objects in architecture. It is indeed not so strange a claim, due to Kant explicitly arguing that what matters in beauty is not the material side, but a drawing, an outline.¹³ However, not only does architecture, like all other fine arts, need materialization in order to express its aesthetic ideas, but in architecture its function (which according to Kant has priority) depends on the material aspects of the object and its sustainability. It is precisely because of this that aesthetic ideas, as well as architectural concepts, cannot be expressed directly (through the presence of relevant material content) in architectural work. In addition to the restriction of aesthetic ideas to the concept of the voluntary end of the object, their material expression is also restricted by the material aspect relevant to that use and sustainability of the object.

Materialization of the object can always represent a limiting of architectural concepts through the its very object. It thus opens up the question of perception in architecture, as well as the problem of sufficient adaptation or integration of the aesthetic idea into the object so as to allow the right understanding of the conceptual content. We can take the “object-medium” as the theoretical analogy to Eisenman’s interpretation of presence and absence of the object. According to Eisenman, the object has an immediate aesthetics and function represented in its presence.¹⁴ Architecture that is *here* and *now* is never finished or completed in its presence. Comprising the object of architecture is also its absence, which does not deny its function or beauty, but does displace perception. Overcoming immediate sensory or visual images (or that which we see as beautiful) is for Eisenman possible through “dislocating text”. It is true that the object of architecture is not exhausted in its materialization and phenomenological projection. It is above all a *concept object-medium*, a medium that creates other meta-situations or meta-contexts. At the same time, by incarnating an *idea in form* (as the intention of the architectural concept referring to the physical phenomenon) in the next instance, the object adopts the conceptualization of physical reality. This process shows how material sensation and intelligibility in architecture are always intertwined, transformable and intentional one towards the other. It is impossible to strip the architectural object of its conceptualization in the context that occurs through the aesthetic experience, even when the physical form contains the explicit code that suggests a way of seeing/looking. To have an idea about any object, that is, anything physically present, regardless whether its presence embodies an artistic or architectural object, for Eisenman is only one conceptual standpoint; nevertheless, anything that has physical presence possesses equally an aesthetic or sensory aspect.¹⁵ There is always the possibility of also thinking aesthetically on a conceptual level, just as conceptual content is always followed by the possibility of aesthetic interpretation. In this same way, Eisenman explains the aesthetic in conceptual art: that the idea of the object incarnates what could be called the aesthetic intention, and that regardless whether the object exists or not, intention that refers to the physical phenomenon

always remains.

In Kant we find that beauty is the expression of aesthetic ideas. If this is true, then beauty of the architectural concept (whatever it may in itself be), if it is to be, must be reflected in its appearance. In architecture, appearance can also be the presentation of absence, and what is more, the presentation of absence is not an absence of presentation. In that sense, the beauty of architectural objects (and) the “presentation” of architectural concepts assume that the presentation or materialization of the object also present some “absence,” both in relation to the conceptual use of the object and its materiality. The purpose of the other object of architecture is to deploy the aesthetics of the material object of architecture to present “the first object of architecture” – its architectural concept.

CINEMA AND ARCHITECTURE: MODERN PERCEPTION

Abstract | In the first part of the paper we take Walter Benjamin's essay on cinema as a reference to think about his prognostic values. By the time he wrote this article his critique of capitalistic mode of production showed the direction towards which capitalism was progressing: in the direction of an increasing intensity in exploitation of the proletariat, but also in the direction of its own abolition. We are interested in these prognoses that affirm the transformation of art and its function, and call our attention to the loss of transcendence and the decay of aura of the work of art. At the same time they show possibilities that affirm the continuity of art with a different role and the dislocation of the aura. The form of art that is suitable to this reflection is cinema, and the parallel drawn by the philosopher between cinema and architecture. Our intention is to think about this parallel and the urban interventions.as artistic forms of aesthetic modernity: that is, as products of this modernity that at the same time indicate the way the world is given to us and understood by us. And also to look for reflections on the cinema and the theater indications of how to surpass the corporal determinations that are imposed on us – drawing upon Brecht and Godard - and investigate the effects of the intense urbanization in cities like São Paul (Brazil) in our way of perceiving. Do such theories help us overcome the chaos of modern urbanism?

CINEMA AND ARCHITECTURE: MODERN PERCEPTION

In his essay on artwork, Benjamin compares Marx's prognostics derived from his analysis of commodity in the Capital with his own prognostics deriving from his analysis of art. Marx presented his analysis in a way which showed what could be expected of capitalism in the future¹. At that time his critique of the capitalistic mode of production showed the direction in which capitalism was progressing: in the direction of an increasing intensity in the exploitation of the proletariat, but also in the direction of its own abolition.

For Benjamin, the moment in which he writes the essay is suitable for new prognosis. Unlike Marx's analysis, whose prognoses have taken half century to be observed, Benjamin's are referred to as the "tendencies of development of art"² which can be immediately observed.

Our focus are the prognostics that affirm the transformation of art and its function, and call our attention to the loss of transcendence and the decline of aura in the work of art. At the same time they show possibilities that affirm the continuity of art with a different role and the dislocation of the aura.

Every form of mature art is at a point of intersection of three developmental lines³ the action of technique on the form of art; 2) the realisation by the new form of art of the effects that traditional forms of art tried to produce in the past; 3) the utilisation by the new forms of art of the changes in the structure of perception⁴.

For Benjamin the reception of contemporary art occurs in a scattered and collective way. This is due to the profound changes in human perception, an indispensable condition when we think about contemporary art. Cinema and architecture are the two forms of art whose reception is distinguished by these two traits because cinematographic and architectural works conform to the format of an art produced to be received by the masses, which has a "new attitude toward the work of art"⁵. This form of distracted reception was first discredited when compared to that of the specialist⁶. This form of perception is related to how the mass appropriates the work of art so as to bring it close. The oldest and clearest example of this form of reception is architecture. "Architecture has always offered the prototype of an artwork that is received in a state of distraction and through the collective"⁷.

Architecture is a form of art that finds its sense in this mode of reception. There is a paradox in this mode of reception of art because the sense of its existence is a collective reception: it is involved by the mass but it also gives form to the mass reception. This change of emphasis in the mode of reception interferes in the mode of contemplation. If, previously, the optical reception related to this last mode, it is now determined⁸ by habit, or tactile mode of reception. The reason why this happens is, for Benjamin, that: "the tasks which face the human apparatus of perception at historical turning points cannot be performed solely by optical means, that is, by way of contemplation"⁹. We will never develop the habits we need to survive in the modern city through contemplation or mental activity. The body apprehends these tasks more quickly, just as Baudelaire's Apache learns how to situate himself in the big city as if it were a forest.

First consequence: This new form of reception of art realises a task that is necessary to humanity. Architecture has an important role because this form of art is essential in understanding the relationship of the masses to art¹⁰. Second consequence: the form of reception of art by the mass is imposed on the individual, even if this one tries to avoid the task. The individual's resistance is overcome by the strength of the masses, which does not necessarily follow the right direction owing to this resistance. There is a task to be fulfilled; there is a strength that pushes it to its realisation. The result will

depend on the consideration of this demand. If it is not considered, this movement will follow the direction imposed by the nature of the strength. "Art will tackle the most difficult and most important tasks wherever it is able to mobilize the masses. It does so currently in film"¹¹.

Architecture can help us understand what Benjamin means. To understand architecture nowadays it is necessary to believe in it as we believe in other arts. We must observe its injunctions and discover how it is applied. In architecture, tactility and habit of tactile reception have primacy over visual mode of reception and contemplation in a more radical way, as in sculpture. We need another kind of aesthetic act¹². The habitual viewer who looks is less attentive, as if the existence of architecture was evident and did not deserve a determined act of attention. He transforms himself into a customer or into someone who strolls. As Benjamin said, the architectural monument is perceived in a state of distraction.

a) For Hegel's affirmation architecture coincides with the symbolic form of art¹³, in which the Idea still looks for its authentic artistic expression. It is still abstract and undetermined, does not have the adequate phenomenon in itself, is opposed to natural external things and to human facts¹⁴. Its objectivity and particularity expresses its own abstractions of which it is not aware. When these abstractions are objects of knowledge, architecture will necessarily take another form and have another function, different from that which it had at the moment it emerged, and immediately after. The beginning of architecture occurred when man searched for a place to inhabit - a cave or a tree trunk. This trunk or cave could not be considered as a product of an artistic intention because they did not express an objective *per se*¹⁵. When houses and temples were built we still had the satisfaction of a necessity that was out of art's field, and this "satisfaction [of a necessity] in conformity to an end has nothing to do with fine art"¹⁶. It is not yet art; it can only be art if we add to this conformity to an end the "impetus for form and artistic beauty"¹⁷. This double aspect in architecture, satisfaction of a need and satisfaction of a need with beauty, reveals a division that cannot be in its origin, and that already reveals to Hegel where to look for the "origin of art": in the works that do not bring its meaning through another purpose or need, but through themselves¹⁸.

Autonomous or inorganic architecture builds configurations that exist for themselves, but they are still attached to a corporeal form which is inadequate for beauty and to the free appearance of the spirit. That is why it cannot remain in this point of departure, but searches to express the exterior nature as a cover (wrap) configured by the spirit through art. This means that the progress of art is to be found in the possibility to emphasize the difference between means and ends. End would already be contained in both moments: in the building of temples and palaces, or individual sculpture. This difference between means and ends detected in architecture by Hegel has already been criticized by Benjamin in his essay *Critique of Violence*, in which he focusses his analysis on questions concerning law and right. For Benjamin the aesthetic act is full of meaning: to build a house is already the expression of something. Its meaning does not come later. Meaning for Hegel is established afterwards with rational reflection, but for Benjamin it comes together with the action.

If architecture remains a means to accomplish ends that are alien to it, in his exposition of the history of architecture, Hegel traces in parallel and unconsciously, a history of the forgetfulness of the body and material life. This is what Benjamin looks forward to bringing to the centre of his reflection.

Benjamin replaces the discussion on matter and body when in his essay he treats art as a matter of perception, of aisthesis (like the Greek). Architecture is, in this sense, the art that makes it possible to lead reflection to this point, because it is, since the

beginning “a work of art that is received in a state of distraction”¹⁹. This collective reception is the corporal reception of the mass that walks through the constructions of the big cities. History of architecture makes it easier to understand the historical relation between the masses and the work of art, or, we can say that architecture is the art that makes it possible to bring the relation of the mass with art to the centre of the reflection on modern and contemporaneous art. And this relationship brings to the centre of this reflection not contemplation of art through optical means, but perception through tactile means. It is the rise of a new technique, the film, which puts the reception of art through tactile means at the centre of aesthetic problems. Film cannot be received through contemplation, and cinema appears to respond to a necessity of human apparatus of perception: we need to learn how to perceive with our tactile organs because this perception will lead us out of the labyrinth created by traditional patterns of reflection.

b) Film shows that “tactile dominance prevails in the optical universe itself”²⁰. No matter how much modern analysis of society has insisted on the fact that vision prevails over other senses, Benjamin, on the other hand, insists that the visual stimulus is dominated by the tactile, which means that visual stimulus follows a programme already established by habit. Film not only shows that, but also makes possible its abolition. The violent tensions of our time can be perceived because in film the tactile dominant prevails over the optical one; Film offers the possibility to disorganise this prevalence, not to reestablish the optical, but in the name of a better comprehension of the phenomena of perception. If film shows that “tactile dominance prevails in the optical universe itself”²¹, we can also confirm that if tactile reception is accomplished through habit, habit determines optical reception²².

Optical reception is determined by the way buildings organise the use of space. Benjamin has in mind at this point the utilisation by fascism of the growing massification²³. This means to transform political life in images in which the mass appears as playing the leading role but in fact they are images in which the masses play the role of the mass.

The apprehension that optical component is determined by the tactile is an important knowledge in the game of politics, which is efficiently conducted by Nazis. It is important for Benjamin to take seriously the social function of film: the “initiation of humanity into this harmonious play(...) between natural forces and mankind”²⁴ and act so that the mass is offered an opportunity to perceive both: 1) the tactile determination over the optical and 2) the possibilities that optical dominance offers to tactile experimentation. The masses’ tactile reception can teach us much about the reception of works of art. Those to which we dedicate concentrated attention are the works of art that we contemplate from acquired habits²⁵.

“By its use of close-ups, by its accentuation of hidden details in familiar objects, and by its exploration of commonplace milieux through the ingenious guidance of the camera; on the other hand, it manages to assure us of a vast and unsuspected field of action [Spielraum]”²⁶.

The explosion of the “prison-world” is possible because man is alienated by the representation of his image. This alienation, however, has a productive use: it produces estrangement; man fails to recognise his own image projected on the screen. We can now examine what we see without knowing. The film exhibits on the screen elements of a collective dream. These images are a kind of elixir for the “the dangerous tensions which technology and its consequences have engendered in the masses at large-tendencies”²⁷; mechanisation itself created that which can make masses immune to its dangers. Film is a product of the innervations of collective elements that search for the satisfaction of a desire for a better life. These innervations create, at the same time, the technique which immunises the masses against its harmful effects. In Benjamin’s view

there is a need to laugh at what we create, and that is not catharsis.

For Benjamin these two features of film will be useful to man in order for him to free himself from the demands imposed by capitalist society: 1) film makes us perceive the restrictions that determine our existence²⁸; 2) and film assures us of an immense and unexpected field of action. The recording of our actions allows us to realise that they are the result of a detailed and involuntary montage, and to see our world as a constructed scenario. The camera penetrates deep into the web of reality and reveals what takes place in the interstice of this “optical unconscious” (thus making us aware of what determines our view, in the same way that unconscious impulses determine our actions). So Benjamin’s aisthesis is, at the same time, close to and far from Greek insofar as, on the one hand, he affirms that there is something beyond the reach of vision, but this something is not invisible, but perceptible.

Unlike architecture in its different moments, film in modernity accounts for the intense existential dangers of the modern man and for the tensions of our time. Is it still so today?

AESTHETIC DIMENSION OF STREET EXPERIENCE

Abstract | Together with the rise of new digital era, cities have been increasingly organized for commercial advertising, private consumption and impersonal driving, losing its function of human participation and planned retention in public space. Theoretical framework of the research is based on environmental aesthetics, focusing on the analyses of architectural and built environment. The main objective is to analyze the link between aesthetics environment and direct users' experience of the street. The second aim of this paper is to define main elements of aesthetic dimension of experiencing the street. Used methodologies are based on content analysis, expert observation and case study of Kneza Miloša street in Belgrade.

Kneza Miloša street is very rich with its' architectural and cultural heritage, since it locates many important administrative buildings, 10 embassies, numerous cultural monuments, mixed architectural styles and epochs residential and commercial zones, bombed and devastated buildings, parks, historical sites, sacred spaces, construction sites and abandoned lots, and many more. Regardless, it somehow does not possess the strong ability to keep users' attention on the built environment. The aim of this paper is to analyse and categorise aesthetic dimension of experiencing the street, embedded in the built environment and street plan. For the purpose of this paper three categories of aesthetic experience of street will be presented – *micro, meso and macro level*. Each category is followed with theoretical background, as well as with examples which can be found through experiencing Kneza Miloša street in different scales.

Index terms | *Architecture; Environmental aesthetics; Everyday experience; Kneza Miloša street; Belgrade;*

EVERYDAY SPACES

The streets, as places where everyday actions mostly take place, can seem as pervasive context for assessing the effect that spatiality has on the aesthetic experience. Everyday experiences are often observed as not worthy of introspection since they consist of mental states that are not sufficiently explicit or understood, let alone of philosophical interest. Everyday experiences are considered inevitable and too familiar for researchers, and for practical reasons of their multidisciplinary complexity, the phenomena are often accepted as such.

A framework for the study is developed out of the literature in the field of environmental aesthetics. Paper will observe the relationship between primarily build environment elements and the way that auto culture tends to change our contact with surroundings. By focusing on contemporary issues, especially those resulting from the emergence of a new digital age, it is hoped that we can come to better understanding of our cities, circadian activities and everyday experience in the areas we inhabit.

AESTHETIC EXPERIENCE

Aesthetic is the area of philosophy connected with the appreciation of things, and the manner how they affect our senses. Aesthetic judgment is formed as immediate sensory and cognitive appraisal, formed through subjective experience, together with the evaluation of meanings and values. It is familiar that word aesthetics originates from Greek word *aisthētikos* which means perception, relating to understanding by our senses. According to Oxford Dictionary aesthetic is defined as something concerned with beauty or appreciation of beauty, or designed to give pleasure through grace.

According to Cuthbert, an aesthetically pleasing experience is one that provides pleasurable sensory experiences, a pleasing perceptual structure and pleasurable symbolic associations. Therefore the author defines three levels of aesthetic experience: sensory perception, cognition and meaning (Cuthbert, 2006). Another way to evaluate everyday aesthetic experience is through gestalt psychology, which helps us understand the human need to form ordered patterns from visual stimuli. Different formal characteristics of the built environment can be enhanced through gestalt psychology such as: coherence of overall building shape, models developed in building facades, compositional elements, etc.

STREET AS AESTHETICAL OBJECT

The Oxford Dictionary defines streets as the roads or public areas of a city or town. The word has an ancient origin in English word *stræt*, of West Germanic origin from late Latin *strata*, meaning the paved way. On the other hand, urbanists have much broader definition while defining the street. According to GDCI street is the basic unit of urban space through which people experience the city. The street is often misconceived as the two-dimensional surface, while in fact, it is multidimensional spaces consisting of many covers and structures.

One of the highly debated subjects among aestheticians is that our aesthetics recognition is not limited strictly to art, but intuitively guided toward the world in general. Carlson believes that social settings are neither self-contained aesthetics objects nor uniquely made for aesthetics consumption (Carlson, 1999). Hence the physical environment

cannot only be understood as an abstract aesthetic phenomenon, but it is of high importance to evaluate experiences from its everyday users. The environmental aesthetics defines the street experience most often strongly connected to physical activity and movement, especially walking (Dovey 2001, Lehtinen 2015, Macauley 2007).

Formal characteristics of the aesthetical object, in this case focusing on the street as an aesthetic object, emerge only as elements of communication with ideas. Understanding ideas that build a style vary with their perception at different times. Therefore, as Mako stated, it is only possible to experience and evaluate the aesthetic object through the multiplicity of its meanings (Mako, 2009). Since movement through the urban environment is generally the most basic and direct mode of apprehending and connecting ourselves to surroundings, different forms of motion will be in the main focus of this research.

AESTHETIC DIMENSION OF STREET EXPERIENCE

-CASE STUDY OF KNEZA MILOŠA STREET-

Kneza Miloša Street is a street in the center of Belgrade, the capital of Serbia. It was the central city's korzo (promenade), but as the tram was introduced to the street, among the first in Belgrade, korzo lost its function. Today is one of the major traffic arteries in the city, as well as the location of some of the most important national institutions with the most significant number of embassies in Belgrade. It extends with the overall length of 1.87 km (1.16 mi) of a straight line course in a south-western direction. Street geographically, from its beginning to its end goes straight downhill, giving a panoramic view down the entire path. Within the framework of a single street change of different construction cycles and architectural styles such as: eclecticism, secession, academism, modern, post-war and contemporary architecture, are visible.

For the purpose of this paper, three categories of the aesthetic experience of the street will be presented – micro, meso and macro level. Each group is followed by a theoretical background, as well as by examples from the built environment, all from the case study of Kneza Miloša street.

1. Micro level

In order to aesthetically appraise physical environment on the micro level, the key is to bring relative slowness that elicits attention to detail in the surroundings, as well as a sense of relatedness to elements, objects, and monuments. Micro-level of the aesthetic dimension of street experience can be defined as an experience through stillness or slow walk down the street. Likewise, experience on the micro level is separated from meso and macro level, since it refers to the small distance from which each element is observed.

Details in quality and characteristics of the sidewalk, the content of the stores' windows, colours, wall materials and textures, upper floor façades, doorways, rooftops, windows, etc., are all means to keep passerby's attention on the built environment. Perception is also directed towards surfaces, which can be generated by variations in colours, as well as in textured patterns. Colour is of particular interest as it can stimulate aesthetic pleasure at the subconscious, as well as cognitive levels of perception. When it comes to elements of urban equipment, arrangement and repetition of rows of trees and

parking lots, clusters of benches, columns, planters and flower boxes, fences and even cracks in the pavement, may contain that interesting detail which would be able to attract and keep at least short period of someone's perception.

If we analyse scale of detail within the observed street, we can mention Dimitrije Leko's building *Ministry of Social Policy and Public Health*, whose monumentality and representativeness is created through a row of tall and strong colonnades. Other example is *Ministry of Forestry and Mining and the Ministry of Agriculture and Waterworks* building, built according to the design of architects Dragiša Brašovan and Nikola Nestorović to the first floor, and completed three years after by Nikola Krasnov. Its dynamic feature of the façades is realised through a rhythmic series of windows, projecting cornice and balustrades, rich façade plastic and emphasised corner parts with luxurious domes. We can mention as well the building for Dr Vita Romita, which due to its characteristic features such as shape, outer walls in raw stone and small windows on the ground floor, became known as the *Doctor's Tower*. Examples are numerous, but these were selected only as a representation of the proposed criteria.¹

Other elements that are perceived from smaller distances, even though not being the elements of built structure, such as storefronts and shop windows, signaling and the countless number of advertisements, are just some of the elements noticed within Kneza Miloša street. These elements are defined as an integral part of the user experience of the street, with an example of the intersection of Kneza Miloša street with the Kralja Milana street where was once famous restaurant *London*, and as of 2017, it is a location of a supermarket called *Idea London*.

2. Meso level

According to Aota Mami in her paper "A Theory of Aesthetic Experience in the Human Environment" when we aesthetically appreciate an environment we think about an aesthetic value of a larger region. However, since our perception is limited, we are not able to experience the whole region at once (Aota, 2016). The same process of fractioning can be used for defining the experience of a single street. Urban matrix emerging movement, also creates networking attractions, since attractive activities, such as retail, follow the patterns of movement that the network has already created.

The pedestrian movement through the street is essentially an initiator of experience. Aesthetical experience of a street on meso level is defined primarily through pedestrian movement. For the purpose of assessing elements of aesthetical street experience, slow vehicle movement is categorized within the same category with pedestrian movement. Meso level is also defined as observing an element from the medium distance.

Kneza Miloša street can be divided into three separate entities, which form the unity of a street. The first part of Kneza Miloša street begins at the intersection with Bulevar kralja Aleksandra (King Aleksandar Boulevard), on the left and crosses the intersections with Andrićev venac (Andrić's wreath) on the right and Krunska on the left, ending with one of the city's main streets, Kralja Milana street. The next, second important intersection is with Kraljica Natalija's street on the right, and Masarikova on the left, intersecting Admirala Geprata street on the right and ending with intersections Nemanjina street. Third compositional section crosses the streets of Birčaninova, Vojvode Milenka, Miloša

¹ Selected buildings are listed as Cultural properties of Belgrade as *cultural monuments of great value*. More information can be found at: <http://beogradskonasledje.rs/>.

Pocerca, Višegradska, and Durmitorska, and it ends with Mostar Interchange.

Moving down the street should arise a mindful and creative internalization of the enveloping environment. Therefore, some of the elements that are perceived on meso level also include arrangement, repetitions, similarities, exception, comparison, continuity, rows, and clusters of elements, which appear and alternate within the course of the street.

According to proposed categorization, spatially dominant buildings are perceived primarily on meso level, as well as open areas, nodes, crossroads and meeting places. Within the street, *New Generalštab complex*, projected by Nikola Dobrović and built between 1957 and 65, as of his most representative works, destroyed in the several attacks in NATO bombing, can be distinguished with its noticeable withdrawal from the regulation line.

Meso level experience of a street is oriented in accordance with our interests or patterns of behavior, and therefore, even though not being elements of built structure, *networking attractions, ground floor activity, cleanliness, and state or condition of a street*, are some elements also worth mentioning. Open areas and parks, such as *Pioneers Park* and *Archaeological Site Pionirski Park*, as well as *Finansijski Park (Financial Park)* as one of the oldest in Belgrade, renamed to the *Park Gavriilo Princip*, are some of the major impressions that are registered by a large number of pedestrians within Kneza Miloša street.

3. Macro level

Macro level of aesthetical street experience is primarily defined through vehicle movement, and/or large distance from the observed element. Macro level is connected to the street experience of the street as unity, and as an entity of urban matrix. Bill Hiller states that the movement created by an urban network is essential to the city, to the extent that it is probably the ultimate grader of the city's identity. The issue of the movement, in its subtlety and network dependence, can no longer be separated from the creation of urban space (Hiller, 2008). In movement through the urban environment, there is a continuous stream of "information" parading past and through us, most of it more culturally encoded (Macauley, 2007).

The architecture of the terrain, urban matrix, street silhouette, street regulation, street geometry, and street angularity are some of the important elements which define the macro street experience. Kneza Miloša street terrain, which goes straight downhill for the entire curse of almost 2 km, is one of the most impressive visual elements on the macro level of experiencing the street. Also, very important elements are urban landmarks, some of them being: Building of the Finance Ministry, Old Generalštab, New Generalštab, Building of Ministry of Foreign Affairs, Beograđanka, Embassies, Church of the Ascension, Pioneers Park and many more. During rapid movement, attention is also aimed at horizontal composition, vertical composition, color, and material landmarks. One other very important element is the direction of view, including different types of openings and visual connectivity elements. Very recognizable is the visual opening on the intersection of Kneza Miloša street and Nemanjina street. Proposed elements are important factors for orientation in the city, as well as for the creation of the city's

identity.

Figure 1. Elements of the aesthetic street experience

CONCLUSION

In the present moment, it can be said that the surrounding is often perceived as scenery or postcard-like picture. Reason for that can be found in arising new era, which is primarily visually oriented, but at the same time, these lead towards the declining length of the periods of attention that we are able to devote to an occurrence. As long as irrelevant information is multiplied, the process is leading towards the collapse of what we mean by communication between an individual and his environment. Opposite to *techno nomad*, described in the previous sentence, Charles Baudelaire and Walter Benjamin introduced the term *flâneur*. The term refers to another kind of aesthetic walker, a spectator who discovers the city as a kind of gallery or museum. "Flânerie is a way of reading the street, in which people's faces, displays, shop windows, café terraces, cars, tracks, and trees turn into an entire series of equivalent letters, which together form words, sentences, and pages of a book that is always new." On the other hand, everyday spaces are an important factor in providing the setting for necessary repetitive familiarity, since, with too many elements changing continuously, every day would become stressful, overwhelming, and unexpected in a highly debilitating way.

As Eisenman states in his text "Six points", if architecture is one form of media, then its form is not powerful. In order to overcome the dominance of other media, architecture has to turn to the creation of increasingly spectacular appearance forms (Eisenman, 1972). But at the same time, the built environment is not just a combination of materials, volumes, colors, and heights; Kevin Lynch also states the importance of the ways of use, flows, perceptions, spiritual connections, and systems of representation. The significance of all mentioned is not fixed as the elements of the built environment are, but it changes over time, in different cultures and in different social groups (Lynch, 1960).

Even though often neglected both by designers and researchers, proposed elements presented in Figure 1 are some of the primary sources of differentiation of streets. Case study research demonstrates only part of elements of the cultural and built heritage of Kneza Miloša street. In order to grasp more fully the diverse aspects of experiencing the street, one has to choose between easy consumption and *the more satisfying one*. Categories proposed in paper point to some of the possibilities, measures, and instruments, commonly known, but important to be remembered from the point of designers of the built environment, as well as from the point of the user of space, in order not to seize easier street experience, but a more pleasurable one.

ARCHITECTURE AS A TOOL FOR AESTHETIC AND POLITICAL THOUGHT

Abstract | Despite the usual approach of architecture in terms of conception, design and construction of the built environment in our paper we will argue that architecture can be used as a tool for aesthetic and political thought. To this end we will rely on definitions of architecture emphasizing either its aspects of principle (arché) and construction either its relational character. On these regards, architecture will be used as a means for conceptualizing and thinking issues at the intersection of the two pivotal notions of political theory, that is, equality and justice.

Our main hypothesis will be that in the contemporary aesthetic regime the thought of aesthetics is indissoluble from that of politics endorsing in that way the main aspects of the relevant contributions of Jacques Rancière. In our analysis, on a first level, we will show the affinity between the political and aesthetic thought and on a second level we will elaborate aspects of architecture such as scale, type, form, diagram, history and hierarchy in order to show the functioning of architecture as a tool of thought. To this end we will provide a solid scheme and definitions of thought drawing from contemporary philosophy.

By establishing analogies between the process of thought and the processes of architecture we will try eventually to show that architecture can be used in an inverted manner so as to shed light on matters of aesthetic and political theory and practice.

Index terms | *Aesthetics; Architecture; Diagram; Jacques Rancière; Political theory; Relation; Thought;*

The relationship of architecture with politics and ethics is approached for the first time by Plato and Aristotle. Plato, although very critical towards art, believes that architecture is a form of art that promotes the social good. In his turn, Aristotle highlights two key competences that he considers architecture and design should be based on: *poiesis* (Greek: making, manufacturing, producing) and *praxis* (Greek: acting, behavior). *Poiesis* is more related to the knowledge needed for the production of art while *praxis* is associated with another category, that of *phronesis*: “a directive, true behavior based on reason in the field of what is good and bad for the man” (Birkhäuser, 2007: 22). Aristotle makes this distinction in order to demonstrate that the architect’s ability is founded on proper behavior and this is why the architect knows what is best to be done even when the technique fails (*Nichomachean Ethics* VI, 1141b 20). Thus, according to Aristotle, architecture is “a supreme art of direction” (Gadamer, 1998: 12).

In Immanuel Kant’s thought, architecture holds a crucial role, different in many respects regarding Plato and Aristotle. Kant employs terms of classical architectural theory in his first writings, while in his first and third *Critique* he introduces the term “architectonic of reason”. The basic idea behind the “architectonic” is the connections between one or more individual elements and their relations to a whole. In the *Critique of Pure Reason* he emphasizes the importance of architectural terms for thinking. Kant uses a series of architectural metaphors so as to define the limits of judgment and knowledge. The architecture will also be used by Kant for the description of the structure of arguments. In his attempt to organize and, above all, map the boundaries of thought, Kant approaches thinking in structural and morphological terms while at the same time he switches between architectural and territorial language in a way that we will again meet in the German philosopher Martin Heidegger.

In fact, in Heidegger, architecture is dealt more in terms of space and thinking with the ultimate goal to arrive at an understanding of the fundamental structure of dwelling. In this regard, building secures dwelling by the permanence of construction. In Heidegger we have the quest for the essence of good life. Art provides man with a measure so that he could approach the essence of dwelling which is equivalent to the essence of good life. In turn, French philosopher Jacques Derrida, in conversation with Plato, Kant and Heidegger, finds a reason in architecture so as to consider the question of the foundations of thought, that is, to “question the premises that ensures a foundation” (Derrida, 2015: 27). Derrida approaches architecture and the very essence of being an architect through philosophy. He states, in particular, that, “the architect is the one who is closest to the principle of *arkhe* (Greek: rule, principle, law) beginning and commandment in a way that between the figure of the philosopher and that of the architect there are affinities which have at stake the questions of sovereignty and political decision” (Derrida, 2015: 12). More generally, Derrida’s thinking on architecture revolves around the political in terms of the question of *Polis* and that of urban form. From this point of view, he will raise the question of a thought that is determined by architecture or, more specifically, the question of an architectural thought: “rather we ask the question of a thought that would be specific to architecture, an architectural thought [...] That’s why I do not wish to accomplish this gesture that would consist of taking architecture for something, a technique to which one resorts and which would be foreign to the thought and thus more able to be represented in space, to constitute the model of a rhetoric [...] I would rather raise a question that aims at architecture as a possibility of thinking” (Derrida, 2015: 28).

In his major work *Sources of the Self*, Canadian philosopher Charles Taylor also draws on the terminology of architecture in order to approach questions of self-consciousness and identity, in dialogue with Aristotle and Heidegger. He employs concepts such as “framework”, “moral space” and “moral topography” (Taylor, 1989: 111) in order to address the problem of disorientation and uncertainty in relation to the position in which one stands. Taylor poses the question: “What induces us to talk about moral orientation in terms of the question, who is we?” (Taylor, 1989: 28). But to find an answer to this question we have to assume a space within which one should find his way and orientation. Taylor suggests that an understanding of our predicament in terms “of finding or losing orientation in moral space is to take the space that our frameworks seek to define as ontologically basic”. Going back to Aristotle, we could import in Taylor’s thought the architectural dimension by linking the ability to orient oneself to a moral space with an understanding of architecture as a “supreme art of direction”. In addition, when Taylor identifies moral space as a space of questions, this means that by answering these questions we end up with the provision of “a horizon in which we know where we stand, and what meanings things have for us” (Taylor, 1989: 29).

More generally, by examining the ways in which architecture is interrelated with the field of philosophy, we could say that there are two major tendencies: On the one hand, a philosophical approach to architecture based on the etymology of the terms “architecture”, “architect” and others from the vocabulary of architectural theory. Architecture means that there is an *arkhe*, a principle that defines hierarchies of things, what is important and what is not, what precedes, what should be the order of things and who will decide and where he will draw the respecting knowledge. On the other hand, philosophy crosses the architectural field in terms of space and in relation to this, thinking of space, attempt to demarcate, to find a position and an orientation within it. In both tendencies, there is an ethical dimension intertwined with a political one since the ethical space is also a political one, that is, there is always an interplay between the part and the whole, the individual and its broader frame of reference. To shed light on this, it is important to recognize the aesthetic dimension at play and its co-articulation with the ethical and the political. Following the contributions of Michel Foucault, Gilles Deleuze and especially Jacques Rancière, the political can be read in terms of its ability to establish and redistribute divisions of the sensible that is hierarchies of what can be seen, said or heard (Rancière, 2000, 2004, 2010). It is exactly the architectural dimension of these hierarchies that specifies ways of seeing and the respective positions. Architectural thought can therefore be perceived as a tool for understanding the structure of ethico-political aesthetic spaces in order to provide an orientation or re-orientation, or to designate a position as a valid point of view for a situation or a problem (Latour, 1986, 1990, 2011).

From these reflections on the aesthetic dimension it is becoming evident that there is a primacy of visibility over the other regimes of senses. That is, there is a privileged nexus of connections between thought, visibility and architecture. We might talk of *architectures of thought* (Piotrowski, 2011) as well as of architectures of visibility in order to point towards processes such as visualization and visual (and / or spatial) reasoning, thinking and explanation. Our consideration of architecture as a tool indicates that there are problems or issues to be solved. This aspect of problem-solving will lead us to the domain of design, inherent to that of architecture. The consideration of design justifies our denotation of architecture as a tool of thought. The reason for

that is that both tool and design as well architecture of course, can provide rigorous solutions in terms of form. Designing means shaping, but also means making decisions. According to Otl Aicher, “Design is a process of intellectual ordering, clarifications of connections, defining dependencies, creating weightings and requires the designer a special ability to see and fix analogies, connections and fields of references” (Aicher, 1991: 101). According to Christian Gänshirt Birkhäuser, the definition of design can be approached through three terms: “seeing, thinking, doing” (Birkhäuser, 2007).

Our decision to designate architecture as a tool of thought is based on the hypothesis that the process of form-finding and structuring of a problem is a crucial step in negotiating the problem at hand. Tools, by their nature, are highly formalized and this aspect inevitably activates a process of form-finding in order for the tool to be effectively used. Birkhäuser will resort to the etymology of the corresponding German word *Werkzeuge*, according to which the tool is an object that “creates works” (Birkhäuser, 2007: 7). For Vilèm Flusser, tools do not only shape our concrete actions, but also our thinking: “We change our behavior, and thus our thinking, feeling and wanting” (Flusser, 2014: 222). Tools provide a particular shape but at the same time, tools should demonstrate flexibility. This demand, evident or not, could be better understood by considering the nature of the design problems inherent in the architectural design process. In fact, the demand for flexibility along with a demand for structuring and finding a form for the issue or problem at hand could be understood by the *indeterminacy* that characterizes the design process (Goldschmidt, 1997). The design problems are known as “ill-structured” or “wicked problems”, that is, “problems that are characterized by incomplete, contradictory and rapidly changing information or demands” (Rittel, H. & Webber, M. 1973; Wrigley, C., & Straker, K., 2017; Goldschmidt, 2017). In this context, a point of intersection between architecture and design is the diagram which can be perceived both as a tool and a notion. As a diagram we mean, a representation of “causal or temporal relationships between parts of entities and phenomena” (Dogan, F. & Nersessian, N., 2002: 353). A central hypothesis of our research proposal is that the notions of architecture, design and diagram are highly interconnected. In addition, given the fact that our focus will be on political and ethical questions, we are confronted with a novel constellation of elements that necessitates specific research actions which will be presented in the following section.

Given our approach to architecture we have legitimate reasons to speak of a critical reversal. Contrary to conventional approaches to architecture that focus on its material expression, architecture can also be considered as a way of thinking that can be systematized and take the form of a tool of thought.

2022

One of the key challenges of our research proposal is to approach the domains of politics and ethics in relation to architecture. The relationship between politics and architecture could be considered as twofold. On the one hand, there is the question: What is political in architecture. On the other hand and by means of reversion, another question: How architectural thinking can approach political questions and issues. Our focus will be mainly on the second question which in turn leads us to two different set of questions: What exactly is architectural thinking and how does it differ from other types of thinking? What are these other types of thinking and what is to be considered as the added value or contribution of architectural thinking? The second set addresses the question of content and form with regard to those ethical and political issues that could be the object of an architectural thought. It also addresses the question of the

subject of architectural thinking: what are the assumptions or hypotheses according to which a subject (individual, group, institution or organization) can resort to architectural thinking in order to deal with moral and political problems? Through such questions emerges a further objective of our research: the necessity to update the concepts of politics and ethics through their mediation by the process of architectural thinking.

The consideration of architecture as a tool for thought imposes a second constraint alongside the requirement to focus on ethical and political issues. Tools serve a specific purpose and in this respect it is important to delimit that field of issues and problems for which architecture is appropriate as a tool of thought. However, in order to delimit the field, a new set of questions will have to be answered, such as: On what grounds architecture as a tool of thought is more effective in comparison to other tools of thought? What are these other thought tools that have been devised and continue to be used today to address ethical and political issues? Is there any potential for collaboration and complementarity among the various tools of thoughts? What exactly are the issues in which architecture as a tool of thought could have the greater contribution in the problem-solving process? On a second level, it is necessary to consider the very concept of thinking and especially in an integrated way that would unify architecture, design and the concept of diagram. Given the fact that a critical factor of optimal use of these tools is the experience of the user, it will be important with respect to the pragmatic value of our research, to search for ways in which architecture as a tool of thought will not be based solely on user experience, but instead on a method that could serve as a satisfactory approach to the problem at hand regardless of the user's experience.

Finally, another field of inquiry should be the use of architecture as a tool for ethical and political thinking with respect to the architectural aspect that already exists in ethical and political questions. In this context we could also consider not only conceptual approaches of architecture but also cases of built architecture. In this respect, it is crucial to focus on the concept of space and the ways in which architecture and design can define and re-define visibilities and ways of seeing. Always in relation to political and ethical issues we will try to answer or at least approach the following questions: How can the visibility and overall perception of an area be improved? How are blind spots produced and can these be mapped through architectural thinking and orientation in space? How can be attained the position that offers the proper or optimal visibility to a space that we consider to be of ethical and political importance?

Thomas Symeonidis graduated with the highest distinction from the National School of Architecture in Paris (Val-de-Seine). He holds a Master of Engineering from Aristotle University of Thessaloniki. He pursued postgraduate studies in Economics and Political Sciences at the LSE and in Architecture and Design at the National Technical University of Athens (NTUA) where he completed his Ph.D (Philosophy, Aesthetics). He has been post-doctoral fellow at the Athens Fine School of Art exploring the interrelation between ethics, politics and aesthetics. He is a lecturer in undergraduate and post-graduate courses in the School of Architecture at NTUA and in the School of Applied and Fine Art at the University of Western Macedonia. He has translated in Greek Jacques Rancière's *Malaise dans l'esthétique* (Aesthetics and its discontent). From 2010 he lives between Athens and Paris where he is conducting independent research for his research and writing projects.

THE TRUTH ABOUT BEING TOWARDS DEATH AS A BASIC DIMENSION OF ARCHITECTURAL BEAUTY

Abstract | Martin Heidegger's reflections on art, beauty and architecture fit into his holistic conception of transgressing/overcoming metaphysics as a form of discourse that promotes European culture, and at the same time responsible for the depersonalization and desacralisation of the modern world. Metaphysics - in his founding act, taking place in Plato's philosophy and updated in the philosophy of art to Nietzsche - separates art from philosophy, refusing the first legitimate (independent of discursive knowledge) access to the truth, and thus separating truth from beauty (and good) and them - in a cognitive and ethical sense - depreciating. Art - and architecture plays a special role here - is, in Heidegger's perspective, the original, pre-metaphysical expression of man's establishment (dwelling) in the world, the unveiling of the world as an existential space in which life is realized in belonging to the truth of being. This means above all the affirmation of being towards death and the resulting concern for authentic existence, as well as the measure that defines the position of man in the world as existing "on earth" and "under heaven." As a result, to refuse the ability to present the truth to art, the basic trait of the condition of modern man is "homelessness". Meanwhile, in the beauty of architecture the opposing experience is made present, integrating in the existential space a natural, architectural, social, cultural and aesthetic space. Architecture is presented in its essence, which reveals beauty in a special way, as "an expression of the structure of its world, as a real *imago mundi*". Architecture therefore encodes in itself the fundamental order of human life - it determines the position of man in the world, organizes the way of life in both a horizontal and vertical plan - expressed in the triad of Truth, Good and Beauty. The article focuses on the analysis of two aspects of the Heideggerian conception of architecture. First, its onto-logical function - it is, along with poetry, the primal sphere of revealing beauty, structuring space ("arranging places"), and thus human existence, coding the truth and being in truth (goodness). Secondly, the normative-transformative function introduces man to the transformation of his position among the whole of being, reintegrates it with nature and sacrum - along with absorption in dwelling his own mortality man gets rid of his own image as a sovereign Lord of existence, and assimilates the pattern of Son and Shepherd of being.

Index terms | *being towards death; beauty; dwelling; the normative-transformative function of architecture; the onto-logical function of architecture; truth of being;*

Martin Heidegger's philosophy matches the Apollonian message, namely: *Know thyself!* This call instructs people to be themselves, to maintain an appropriate measure, and to accept mortal status which differentiates human from divine. It is also an appeal for wisdom which arises from the proper reference to entirety of beings, which materialises via metaphysics. For a man the way to oneself, meaning the way to the truth about oneself and existing in truth – learning about oneself is a life process, a coordinated movement in the architectural and existential space – is the longest and the most difficult one. It is the way towards death as well as the way to oneself involving dying and suffering, plus acquisition and affirmation of the limits of the human condition.

The death and hermeneutics of Da-sein

The way to self-discovery and becoming oneself is recreated in the topos of Ulysses' journey through which he experiences extreme alterity and lostness, but also recognizes his own identity and the importance of home¹. Because *Da-sein* is on its path to oneself², it "is always somehow directed and underway. Standing and remaining are only boundary instances of this directed being "underway.""³ At the same time, the condition of the contemporary man is defined by *homelessness*, the loss of the feeling of being at home in the world and "the forgetfulness of Being", by the metaphysics closing itself off from truth of Being which leads to spatial and axiological disorientation. He does not know who he is, not even who he should be, nor if he should be.⁴

According to Heidegger, one's relationship with Being – thus going into the holistic sense – is made present in the form of the experience of the extreme possibility – the non-existence (death), meaning something that is simultaneously the most of one's own and the most alien to one, something unclear in its nature, and yet illuminating human being's essence.

"It is death that touches mortals in their essence and so places them on the way to the other side of life and so into the entirety of the pure attraction. This is how death gathers into the entirety of what has already been placed, into the *positum* of the whole attraction."⁵

The meeting with the truth of death occurs in anxiety which reveals the finitude of life and death of existing in untruth. Death separates man from *being-in-the-world*, from the sphere of meaning. Anxiety delivers from beings which as such cannot provide him support and, by confronting (him) with the experience of nothingness, it initiates a conscious relationship with Being as authoritative for the sense of existence. It opens the horizon of the holistic sense and man's appropriate attitude to the world, thus allowing the discovery of his *place* in the world by initially experiencing the loss of the world, the slipping away of beings⁶, the total loss of sense.

In anxiety the experience of loneliness is the one that is prefigured, not the sheer end of existence but its lack of sense which derives from nonauthentic life that is separate from Being. Anxiety serves its reductional role, it unearths meaning by appealing human being for a relationship with Being, and, by extension, for being in truth. Therefore, in anxiety emerges the fear of total annihilation by death, the fear of making life worthless, irreparable – because of living it with no consideration of Being, by pursuing the manipulation of beings – and separated from other people. Without this

meaning that gives life, man withers – he produces, works, earns, consumes, yet his life is filled with a void which consequently brings a desire to fill it with *even more* beings. Hence, in fear Being calls man to itself and at the same time reveals itself to him in its otherness, i.e. as nothingness. The experience of death takes him out of his world and opens to him the horizon of life that is conscious, fulfilling, and the realisation of the message of Being. Said experience then directs him towards the world and transforms him into being towards conscious and responsible life.

“Thinking [about death – T. D.] builds upon the house of being, the house in which the jointure of being in its destinal unfolding, enjoins the essence of human being in each case to dwell in the truth of being. This dwelling is the essence of “being-in-the-world.”⁷

Therefore Being calls man to give oneself over, to become a ‘good shepherd’ the same way it did by giving him free reign over itself in its entirety. The basic measure of Being is non-being towards oneself, retreating, and existing for human being by bestowing gifts on him. And so, Being is embodied in total annihilation, in the absence of perfection, and in resorting to turning on one’s own⁸. The querns of annihilation not only crush that what is scant, and by extension that what is not closed in on itself, not separated, and not entirely fitting in the sphere of beings. Death possesses the power to eliminate beings, but sacrificial love is beyond its reach.

Metaphysics and beauty

According to Heidegger, man is metaphysical because the framing of being in their entirety orientates him in the world making the world understandable. Hence, he goes beyond beings “to recover them as such and as a whole for our grasp”⁹. In metaphysics – which only in philosophy achieves its distinct form – the sense of the completeness of beings revealed together with man’s place in the world and his attitude to it. Therefore, metaphysics – by forfeiting the sense of beings as such and at the same time referring it to the perfect being (ideas, God, absolute spirit, will to power) – is the most elementary method of orientating man in the world that gives sense to his way of life. Without metaphysics, at least in this sense, which does forget truth of Being and which continuously reaches into its ground, human being becomes disoriented spatially and lost spiritually – *homeless*, crippled by the loss of meaning¹⁰ as the decay of filiation in Being¹¹.

So, if metaphysics is not defined as a science but as an “fundamental occurrence in our Dasein”¹² that additionally goes beyond the philosophy itself including all holistically oriented symbolic activity together with art. Art is metaphysical and meta-metaphysical at the same time, it includes the entirety of being and orientates it in Being, going beyond beings and bound to it will to power. Being that is emerging from art – as something that is different to whole beings – determines the correct man’s orientation in the world, reveals and joins *axis mundi* and *axis personae*, space and time of man’s life. Without being rooted in Being and as such in beauty, the tree of metaphysics withers¹³.

Heidegger defines beauty as the means of unfolding the sense of whole existence – truth¹⁴, yet warns that it cannot be understood in the narrow metaphysical sense and reduced to a relationship with beings neither in the form of an idea nor in the form of will to power: “Truth is the truth of beings. Beauty does not occur alongside this truth. It appears when truth sets itself into the work. This appearing (as this being of

truth in the work and as the work) is beauty.”¹⁵ According to Heidegger, what makes human being different from other beings is the way of perceiving oneself. Man sees himself in unconcealment of Being, is seen in the view of Being¹⁶, and at the same time acquires and protects this view. That is why beauty as *kalos* constitutes the measure of whole beings, in its reference to Being¹⁷. Not only does it tune human being, but also tunes him with Being, it moves him to a proper position relative to beings. In beauty the world becomes a harmonious unity because it relates to the fundamental measure establishing proper positions and relations of space, society, discourse. Beauty forms inextricable bond with being as the way of revealing its truth¹⁸, and is its most complete form as it fills beings with sense that is whole. Beauty predisposes man to thinking, living, and growing in truth of Being, to the sacrifice that is “that human essence expending itself (...) for preservation of the truth of being for beings.”¹⁹ It leads to the formation of the relationship between man and Being²⁰.

Bridge, river, and demigod. Beauty as a correlation with being

The essence of human mortality – which metaphysics aims to obscure – can only be realised in a specific architectural structure. It sets (orientates) the path towards death, which opens man to his own mortality and teaches him the daily rhythm of activities, while giving him the ability to expropriate himself from the aspiration to be for himself and to offer himself to others, and thus to transcend beings towards Being and to make its truth present: “Only man dies-and indeed continually, so long as he stays on this earth, so long as he dwells”²¹. The term “so long as” indicates that the architectural (dis)order can also expropriate man from dying, pledge it, reduce death to the end of life (an irrational tearing away from the world) as an existence oriented towards having power over the world. Heidegger points out that man lives “beautifully”²², “poetically dwells man on this earth”²³ exclusively as mortal, i.e. in openness to the presence of Being, in the ability to give oneself to Being. Note that this term originally refers to the Rhine and the demigods, and the ontic-functional status of these thought and poetic figures taken from Hölderlin’s poetry expresses the drive to growth²⁴. Rivers make the land fertile, and a demigod (Heracles, Dionysus, Christ) creates unity between the divine and the human world, all his existence is for man, and he suffers and dies for him. Their correlation to Being does not lie in being superman (figure 1) but on abandoning possessing things. This is when human nothingness opens towards the nothingness of fullness of Being (figure 2).

Death realises passing away as a passage and making man understandable for another people. For Heidegger, the architectural form expressing the significance of the road, including the last road, is the bridge, which is also a complete symbolic form – a work of art in the sense presented above, harmoniously binding form, function, and meaning. The bridge connects the banks of the river, leaving the river underneath. It defines a vertical axis and two visible and differently oriented horizontal axes: “underneath” that which is natural and resistant to man, inaccessible and the road which runs “above”. And the sky opens above the bridge:

“Now in a high arch, now in a low, the bridge vaults over glen and stream-whether mortals keep in mind this vaulting of the bridge’s course or forget that they, always themselves on their way to the last bridge, are actually striving to surmount all that is common and unsound in them in order to bring themselves before the haleness of the divinities. The bridge *gathers*, as a passage that crosses, before the divinities-whether we explicitly think of, and visibly *give thanks for*, their presence, as in the figure of the saint of the bridge, or whether that divine presence is obstructed or even pushed

wholly aside”²⁵.

The bridge is the centre that creates meaning, a place that gives unity and direction to the zones on opposite sides of the river, not only directs the roads towards each other, but also gives them meaning as paths to something and through something and of someone to someone. It allows spatial and interpersonal relationships to form a unity, being together and for themselves. Therefore, the bridge allows the river, unlike the dam that holds it back, to be a river, to flow and to keep its course.

The meaning of bridge is formed by combinations of horizontal axes (path and river) and vertical axis determined by saint figure (figure 3). Bridge orientates man on the earth and under the sky at the same time in relation to the four corners of the world. Axes form the shape of a cross, directions form a rectangle and a circle connecting the world, divinity, and human being. This shape, the fourfold includes a saint, a poet, and a demigod – the crucified son of heavenly father (figure 4) – the figures of man’s guides in the world’s night with their own suffering and sacrifice, following the sacrifice of Being, opening man’s heart, funding his correlation with Being. River refers human being to archetype of path – and its orientation towards the East, towards God approaching through darkness and loneliness.

To live – if we treat the bridge as a symbol of the way of life – is to connect, to focus, to protect, to allow being and growth, to be between the horizontal and the vertical, to be among people, but also for people, to expect and meet. The spatial form of the bridge shapes its symbolic meaning, which concentrates the essence of the path on which one can stop, but cannot stay:

“Always and ever differently the bridge escorts the lingering and hastening ways of men to and from, so that they may get to other banks and in the end, as mortals, to the other side”²⁶.

One crosses the bridge, the path remains, even if the person who moves on it leaves. However, the bridge is not an insignificant “in-between”, connecting the two banks of the river, disappearing in their closeness to each other: it reveals the essence of the passage and the road as a combination of two zones, *sacrum* and *profanum*. It creates its own zone of safety and freedom from the river element²⁷.

Conclusion

The beauty of bridge presents a topology of Being²⁸, spatializes the entire semantic constellation in ontological and normative-transformative aspects. It presents itself as a figure of being towards death, as the death of egoism, as the acceptance of Being’s call to existing – similarly to a demigod – for other people. The way of life is filled with suffering, purification of human heart from the will of being for oneself. Hence, the way of life, as a way in truth of being towards death, presents itself as *via crucis*, as a way of continuous transformation in the face of death by the light of beauty as love of Being.

THE EXPERIMENTAL “RAYMOND RENOVATION PROJECT” AT NANZAN UNIVERSITY

Abstract | By analyzing the vision and execution process of the “Raymond Renovation Project” (2017-2012) of Nanzan University in Nagoya, this study aims to explore the possible means and meanings of the sustainable use and development of the architecture of the Modern Movement in contemporary society. The Nagoya campus of Nanzan University (1964) is a representative work of the modernist architect Antonin Raymond (1888-1976). The greatest distinguishing feature of the university’s architectural design lies in its utilisation of landscape to inform the structure and arrangement of the buildings. Nanzan University was awarded a prize by the Architectural Institute of Japan in 1964 for its creation of a brand new spatial order in the university campus by unifying architectural design with the landscape and connecting functional buildings. In 2014, due to the integration of campus and the reorganisation of Faculties, the university embarked upon a programme of large scale campus construction, including the “Raymond Renovation Project” which started in 2017. The guiding principle of the project is the succession of Raymond’s policy “based on nature”. The project aims to improve both students’ educational and living environments. The Office of the President manages the project, in cooperation with Facilities Management Divisions, while Nihon Sekkei and Obayashi Corporation undertake the construction work. Construction of the gymnasium, administrative building, main gate parking area, G30 hall and classroom buildings F, G, H and J was completed by October 2018. All of these buildings are based on Raymond’s original work from the 1960s. For the renovation, Nihon Sekkei decided to retain the original exterior as much as possible, while installing thermal and seismic insulation and barrier free access equipment. By analyzing Raymond’s architectural work and philosophy carefully, Nihon Sekkei aims to improve and diversify students’ lives. However, the plan and progress of the Renovation Project are less well known among students and staff. Although the project has made satisfactory progress, the sharing of its achievement in- and outside of campus has just begun. Renovating the university led to consideration of its membership and *raison d’être* as an intellectual community in the face of deteriorating infrastructure and contemporary needs for education and social diversity, whilst simultaneously sustaining the historical value of buildings. Hence, the renovation project by Nanzan University can be seen as an important experiment to broaden the scope of the aesthetics of architecture in the 21st century.

Index terms | Antonin Raymond; modern architecture; Nanzan University; “Raymond Renovation Project”; renovation of buildings;

INTRODUCTION

By analysing the vision and the execution process of the “Raymond Renovation Project” (2017-2021) [fig. 1] of Nanzan University in Nagoya, Japan, this study aims to explore the possibility of creating new aesthetics of architecture through the legacy of the architecture of the Modern Movement in the 20th century.

The Czech-American architect Antonin Raymond (1888-1976), who was active in Japan for 43 years (except during wartime), contributed greatly to the development of modern architecture in Japan. Raymond first came to Japan in 1919 as an assistant to Frank Lloyd Wright (1867-1959) when he planned the Imperial Hotel (1921) in Tokyo. In 1921, Raymond became independent and remained in Japan, opening his own architecture bureau in Tokyo. Thereafter, he completed diverse modern architectural projects in Japan, which were at the same time a response to the international modernist movement.

The Nagoya campus of Nanzan University is a representative work by Antonin Raymond completed in 1964. The modernist style campus was awarded a prize by the Architectural Institute of Japan in 1965 for its exceptional spatial order. Whereas other university buildings in Japan planned by Raymond have been demolished because of deterioration, Nanzan University embarked upon a programme of large-scale campus renovation called the “Raymond Renovation Project” (2017-2021). However, most staff and students remain unaware of the architectural value of the university buildings and the renovation project. It is therefore necessary to consider the meaning and significance of the legacy of university buildings toward the 21st century.

After looking into the characteristics of the original campus architecture, I will focus on the project’s background, execution process and future tasks. As a conclusion, I will address the idea that this renovation project reveals to us possibilities of modern architecture to create contemporary utilization values and new architectural aesthetics in the 21st century.

CHARACTERISTICS OF RAYMOND’S ARCHITECTURE OF NANZAN UNIVERSITY

History of the Nagoya Campus

Nanzan University was founded in 1949 under the new post-war university system, originally consisting of a single faculty with four departments (1). In the 1950s, as the number of faculties and departments increased, a plan was made to relocate to the site of the present day campus. The plan was finalized in June 1961 and Raymond visited the new site in August. The construction plan was announced in March 1962 and the works started in August of the same year. In 1964 the first campus buildings – such as the university hall (demolished in 2009), the main administration building, faculty building 1, the library and buildings F, G, G30 and H – were completed. Subsequently, the gymnasium, indoor pool, clubhouses and buildings K and M were completed between 1967 and 1973.

Characteristics of the Buildings

While it is often the case that universities are built over a long period of time, Nanzan University is unique among Raymond’s Japanese projects in being an example in which he undertook the back-to-back planning and construction of the complex. Raymond, alongside his wife Noemi, also designed frescos, relief works and furniture. Nanzan University, which was built when he was between the ages of 74 and 76, and which was based on Raymond’s five points of architecture: 1) simple, 2) direct, 3) honest, 4) economical and 5) natural and human scale, became one of his most representative

works.

The buildings are frame structure and have an economical and functional layout. Their structure is natural and human-scaled. The reinforced concrete buildings have a common external appearance with simple exposed concrete and red clay-coloured walls [fig. 2]. Noemi suggested this colour should match the ground colour of the campus area. Water-based paints tint the wall which supports the base surface of the concrete wall (2). Brise-soleil and louvers fulfil both the practical function of regulating the inflow of wind and sunlight, as well as the decorative function of providing a visual rhythmic pattern of vertical and horizontal lines. Exposed concrete pillars and beams on the inside play a structural as well as an ornamental role [fig. 3]. Sunlight passing through windows and glass doors accentuates the texture of the simple materials. Such utilization of structure is characteristic in Raymond's works after the 1950s. He himself wrote that he used ornamental effects from structure as a base of spatial design in the plan of Nanzan University (3).

Utilization of Landscape

The greatest distinguishing feature of the university's architectural design lies in its utilization of landscape to inform the structure and arrangement of the buildings. University campuses are customarily situated on flat land because they contain a number of large-sized buildings. However, Nanzan University was erected on an undulating site. In his plan of Nagoya campus, Raymond's architectural thought of "natural" was practiced under the principles of conserving both vegetation and landscape as far as was practicable. Raymond emphasized asymmetry and dynamism of structure, stressing that "the very nature of the ground dictated 'asymmetry' and a variety of levels, fitting the ground and seemingly growing out of it like the vegetation, attached to the ground by roots" (4). The ground was barely disturbed for the construction. Slopes in the G30 hall, and auditorium of building G, utilize the natural hills. The ground around the library remained almost pristine. The Architectural Institute of Japan awarded a prize to Nanzan University in 1965 for its creation of a brand new spatial order in the university campus by unifying architectural design with the landscape and connecting functional buildings.

CHANGES IN THE 2000S

Expansion of the Campus

Anticipating the future establishment of new faculties and a rise in student numbers, Nanzan University continued to add new structures after the completion of the last buildings planned by Raymond in 1973. Building N, faculty building 2 and cafeteria 2 were completed in 1975, and the following buildings were built between the 1980s and 2000s:

1982: Buildings E and L

1986: Gymnasium

1990: Building J

2000: Building D

2004: Building A

2007: Buildings B and C

Because buildings A, B and C were built on a new area, the university campus expanded

one street further beyond the main street. The addition and use of these three buildings changed the traffic flow of the campus, as Raymond had set its centre line alongside the main street. In addition, the university recommends use of the Yamatedori gate near these buildings as a main entrance, which resulted in a change of scenery on the east side of the campus in the 2000s.

Formulation of the Grand Design in 2007

In 2007, according to the 2005 Basic Policy of the Chairman of Nanzan School Corporation, Nanzan University formulated its Grand Design for the next 20 years, which influenced the later campus plan. The final report of the Grand Design foresaw changes to the campus in its medium to long-term plan. The medium to long-term plan is divided into three periods: first is a foundation period (2007-2013), followed by a development period (2014-2020), and finally a perfection period (2021-2027). The first period contains consideration for campus maintenance, and the second period contains its execution. As a part of reform ideas to broaden an educational target of university, there were two important suggestions regarding campus renovation. Firstly, the two existing campuses should be unified in Nagoya in the future. Secondly, campus maintenance is necessary in order to realize universal systems such as barrier-free entry and maintenance of the parking area.

The campus changed significantly in the 2000s. A new flow line was caused also by changes in traffic environment as well. The two nearest underground stations opened in 2003 and 2004.

PROGRESS OF THE “RAYMOND RENOVATION PROJECT” (2017-2021)

Outline of the Project

In 2014, 50 years from its establishment, the university embarked upon a programme of large-scale campus construction. It was a project aimed at campus renewal and campus integration. The two-part process (construction and renovation) was divided into four periods. In the first two periods, building S (2015), Cafeteria Lien (2017) and building Q (2017) were built. Integration was completed when the Faculty of Science and Technology moved to building S, and the Faculty of Policy Studies to building Q. The latter two periods of repair works started in June 2017 and were named the “Raymond Renovation Project” in November of the same year.

The guiding principle of the project is the continuation of Raymond’s creed of architecture “based on nature”. The university emphasizes Raymond’s name on pamphlets and billboards, noting that the principle underlying the project is to “inherit architect Mr Antonin Raymond’s architectural creed ‘based on nature’”. The project aims to improve both students’ educational and living environments.

The Office of the President manages the project in cooperation with Facilities Management Division. The former takes care of publicity work, gathering donations and mediating the university’s ideas to the design and construction teams. The latter takes care of the construction site and facilities and coordinates the various tasks involved. Nihon Sekkei and Obayashi Corporation, who undertook the construction of building Q, again won the competition for basic design and actual engineering.

Renovated Sites

Construction of the gymnasium, administrative building, the main gate parking area, buildings F, G, G30 and H, clubhouse 1 and an artificial grass sports ground was completed by February 2019. All of these works except clubhouse 1 are based on Raymond’s original work. Buildings F, G and H, in the centre of the campus, have a

connecting corridor. There is also a second level connecting corridor between buildings G and G30, which crosses the main street. For renovation of these central buildings of the campus, in the sense of geographical and historical position, Nihon Sekkei decided to retain the original exterior as much as possible, while installing thermal and seismic insulation and barrier-free access equipment. Original window glasses and frames are conserved as an industrial legacy, for they are made with materials that are no longer produced. Furthermore, security was improved through electric locks and streetlights. Increases were made to the number of automatic doors and elevators, thus facilitating barrier-free access within the campus.

The renovation of the continuous entrance to buildings F, G and H is especially remarkable. Its most significant characteristic is a seamless continuity between the buildings' interiors and exteriors. One side of the corridor has glass walls that accentuate a sense of unity with the main street outside, allowing the movement of light, the view and the flow lines to form a natural continuity. Fresco works by Raymond on the ground floor of buildings F, G, H and G30 were moved and now have new lighting that draws the eye from the main street. Wooden benches designed by Noemi remain in the entrance area, complemented by new chairs [fig. 4]. The buildings were restored with the aim of strengthening their interaction with the main street.

Nihon Sekkei's Contribution

The progress of the project shows that Nihon Sekkei analyzed both Raymond's architectural style and philosophy carefully. In material from the explanatory meeting for the renovation project at Nanzan University in December 2016, the university states the following:

Even after the integration of the campus, we continue to pass down architect Antonin Raymond's architectural concepts to harmonize with nature by unifying external design and conserving vegetation, and we plan further renovation construction for present campus (5).

This formulation implies that the university understands the meaning of "based on nature" in the sense of sustaining green campus surroundings. Nevertheless, Raymond's consideration during the planning stage was the use of natural landscape alongside his five points of architecture. Furthermore, Raymond carefully designed common spaces in the university hall and library at human scale. Nihon Sekkei appear to have done a thorough study of Raymond's architectural philosophy in order to utilise the points of design unification and harmony with nature in the campus plan, as displayed in, for example, transparency of in- and outside buildings and creation of communicative personal spaces.

PRESENT MISSIONS

Unawareness of the Legacy

Nanzan University is now introducing the renovation project on its official website, pamphlets and billboards, for both university members and the local community. The university is proud of the project and they also wish their students to be proud of the academic years they spend surrounded by Raymond's architecture (6).

However, it is difficult to find evidence that the university regarded Raymond's architecture as their heritage before 2017. Shimizu Kensetsu undertook the task of construction at the campus after 1975 ending in 2015 with the completion of building S. The use of exposed concrete and red walls, louvers at windows and utilization of hills was modelled after Raymond's style. However, the human scale does not appear

in Shimizu's later work. The surface finish is not as delicate as the originals. The Gymnastic Centre also looks markedly different from the others, and there was no wide controversy when University Hall, which bore the most significant features of Raymond's style, was demolished in 2009.

The university's pamphlet about the project indicates that buildings after 1975 follow Raymond's concept of unified external design. In other material, from an explanatory meeting for the construction in 2013, it was stated that the grand principle was to "pass down the 'based on nature' : plan and management by Antonin Raymond" (7). Although the university may have been aware of Raymond in 2013, in reality, the importance of his architecture was almost forgotten as time passed by.

Dissemination of the Project

Nanzan Archives of the Nanzan School Corporation and a few professors had continued steady activity to archive the related materials and had published or exhibited them to the public. It was after Nihon Sekkei joined the construction project that the university's principle to inherit Raymond's concept was actually executed. Although the project has made satisfactory progress, the dissemination of its achievements both on and off campus has just begun.

CONCLUSION

The architectural value of modern buildings by Antonin Raymond in the Nagoya campus of Nanzan University was almost forgotten until the "Raymond Renovation Project" started in 2017. Parallel to the execution process of the project, the university assumed the leading role in the re-evaluation and practical use of Raymond's buildings. There remain significant discrepancies in degrees of interest toward the renovation and the heritage of the university. Renovating the university led to consideration of its membership and *raison d'être* as an intellectual community in the face of deteriorating infrastructure and contemporary needs for education and social diversity, whilst simultaneously sustaining the historical value of buildings. Hence, the renovation project by Nanzan University can be seen as an important experiment to broaden the scope of the aesthetics of architecture in the 21st century.

Tomoko Kakuyama is a lecturer at Nanzan University in Nagoya, Japan. She specializes in the design history of Central Europe, mainly of Austria, in the 19th and 20th centuries. She is also interested in the inheritance of cultural resources. She conducted research in Cracow as a junior fellow of the Thesaurus Poloniae Programme (2011), and in Vienna as an Austrian governmental scholarship student (2007-2009). Her recent papers include: “The Acceptance of Ornament in Modern Design: Kineticism and the Vienna Workshop in the 1920s” (Back to the Future. The Future in the Past. Conference Proceedings Book of ICDHS10th+1, 2018), “Avant-garde of the ‘Vienna Kineticism’ in the Interwar Austria: Originality and Resonance with International Modernism Movements” (Design History, vol.16).

WHAT IS AN ARTIST'S STUDIO IF NOT A LIVING ROOM IN A HOUSE?

Abstract | The paper pursues the moment in which a living room becomes an artist's studio and vice versa, simultaneously setting the two spaces apart and tying them together within the confines of a house. It does so with reference to Jacques Derrida's thinking on *the truth in painting* actualised by the painter's *stroke* that brings a motif to the surface of a canvas in a visual representation of something lying behind. Derrida considers four categories as *outlines* that *circle* the pursued truth, that which *is* painting, like containers limiting the work by drawing an outer edge. The paper draws a fifth that literally outlines the work in the sense of the walls of the studio that demarcate the space. This line that the studio draws around the work is preceded by the artist's stroke, and until the moment of this gesture, the space of the work is simply a room in a house with another designation. The moment in which the artist strikes, the room splits in two, or doubles, and the paper argues that like the trait defining the work of art, the stroke opens the space of the studio when the artist cuts through and reaches beyond the surface of the canvas ground in order to draw the work out. The artist thereby broaches a space that was always already part of the living environment from which it emerges and to which it might, again, return. The artist Lucio Fontana has performed the cutting of the canvas in his *Tagli* series from the late 1950s, and the implications of Fontana's gesture is explored in regards to the space that is opened by the action. The artist's interest in the void that the slashing of the canvas produces provokes an exploration in regards to the quality, or trait, of this space that is drawn by the knife when the artist cuts. A cut that also resonates with the artist/architect Gordon Matta-Clark's building cuts from the 1970s, especially the work *Splitting* which cuts a dwelling house in two halves. If the artistic gesture, as such, can be seen to claim its own space while also producing a new, then the paper pursues the possibility that this other space might give clues to the accommodation of a contemporary dwelling otherwise rendered obsolete in the twenty-first century.

Index terms | *Artist's studio; cutting; Derrida; dwelling; Fontana; Matta-Clark; void;*

WHAT IS AN ARTIST'S STUDIO IF NOT A LIVING ROOM IN A HOUSE?

The artist's studio as a catalyst and locus for the modern/contemporary living space is brought forward as a proposition with a twofold objective. On the one hand, it suggests that artistic practice engages with the space in which it takes place in ways that accommodate everyday life. On the other, that contemporary living requires the engagement of creative practices in order to take place in a given space – be such performed by the artist, dweller, or both. If the first proposition implies that artistic practice can make space for everyday occupations within its own domain, it also suggests that art and dwelling might coexist in a shared space. From the perspective of the dwelling, it seems that the artistic gesture might facilitate an opening in the fabric of the living environment required for this space to more fully accommodate contemporary life.

Central to all claims is the idea that to make oneself at home in a turbulent historical moment – short on stability and grounding – one needs to take possession of a given space in radical ways. If such would appear at odds with conventional dwelling practices, then the artistic gesture might be particularly well suited to facilitate the required critical agency. This is not simply to suggest that the creativity of artists facilitates alternative lifestyles and novel spatial arrangements with the potential to inspire dwellers in how they arrange their private domain. It is not to claim that the artist holds the key to the future household and the architect is soon to be rendered obsolete. Rather, the proposition involves a consideration of the kind of engagement that artistic practices employ, the possibility of the artistic gesture and the opportunity for the contemporary living space otherwise succumbing to standardised schemas. The nature of this commitment is the focus of the present enquiry.¹

To appeal to art and aesthetic experience in an attempt to counter a perceived crisis in terms of how we find ourselves at home in the twenty-first century employs what could be considered an alienating force. The idea of an adverse relationship between the seemingly critical, autonomous agency of art and a framework for dwelling that aims to domesticate goes back to the early avant-garde.² What lies behind is the notion of the domesticating force as a challenge to the autonomy of art and vice versa to the extent that the two domains are considered incompatible. The loft space is in light of this an interesting example of co-existence between art and dwelling involving a live/work arrangement that exceeds the notion of incompatibility. If the artist's studio is marked by a tendency to become a lived-in environment in any case, the loft space appears to surpass its precedents in a number of ways.³ Firstly, the loft, as it emerged on Lower Manhattan, New York City, in the mid-twentieth century, is a re-constructed space to the extent that former industrial interiors had to be made inhabitable for both dwelling and art practice before one could settle in. If this material resistance would seem to mark a limit within the live/work economy – like the slash setting the two occupations apart – then this fine line between art and dwelling would require negotiation at all times unless walls were erected.

Considering the extent to which the loft space has since been commercialised, one might ask what it is about the loft that speaks to a wider population so that the artist's studio in this sense has become a dwelling typology among others. Is it the aura of the studio, the artistic gesture, or the work of art itself? The industrial heritage, gentrified neighbourhood, or simply the large undifferentiated open loft space? Is it that the loft invites a certain kind of participation that requires inventive appropriation in the sense

of direct engagement in order to become a functional living space? Is it the lack of definition and differentiation experienced as gaps in the fabric of the domestic setting that must be countered and overcome to prevent all sense of meaning and comfort from being drawn out through these openings? Or is it the manifestation of a lurking alienation that mobilises the power of the occupants to take charge of the semantic void central to their living environment as efforts prerequisite for dwelling in our time?

When the artist strikes, a space opens up in the work and beyond. Not simply because the artist cuts through material to construct a space like an architect builds a house. Nor as a result of re-making the studio space in the work or representing it as an image. Rather, it is the way in which the artistic gesture sets its material apart from the surroundings that opens a gap between what was and what will become another surrounding space. If the work of art inevitably must set itself apart from the space in which it takes form, it inflicts some level of otherness on this surrounding space without which it would itself not otherwise stand out as something else. The convoluted difference between work and space marks a possibility, and the moment in which a given space becomes an artist's studio and vice versa can be pursued – simultaneously setting the two spaces apart and tying them together in one gesture.

Jacques Derrida, in *The Truth in Painting*, raises the question of what *in painting* means – “The idiomatic trait or style (that which is singular, proper, inimitable) in the domain of painting.”⁴ Derrida is interested in the question of what art is and can do and counts four possible truth-aspects to which one could add a fifth although this possibly breaks the *pas-partout* with which Derrida frames his enquiry. Derrida counts, “the thing itself,” in the form of the painted canvas;⁵ “the truth faithfully represented, trait for trait, in its portrait ... its double,” the motif;⁶ “the picturality [sic],” painting as a medium in contrast to for example literature, music or architecture;⁷ and “that which is true on that art which is called pictural [sic],” the value of painting as the purveyor of truth.⁸ The fifth aspect, which might appear within the central void of the *pas-partout* frame, is the painter's brushstroke.

Derrida writes about the stroke of the brush, “A trait never appears, never itself, never for a first time. It begins by retrac(t)ing [*se retirer*].”⁹ So, the stroke is like a *drawing*, a withdrawal into itself, at the same time giving and taking place. The trait that defines the work of art is so because it has already appeared once, is already a recognisable feature. It appears in a double movement of withdrawal and repetition and is like the stroke of the artist's brush *in painting*, the repeated movement that brings the motif forth as something always already existing. Through this gesture of retracing the ground, the artist's stroke opens a space and this space could be the studio. Derrida continues, “I follow here the logical succession of what I long ago called ... the *broaching* [*entame*] of the origin: that which opens, with a trace, without initiating anything.”¹⁰ When the artist cuts through and reaches beyond the surface of the ground in order to draw the work out, s/he is broaching a space that was always already there and a work, the outline of which was always already drawn. By extension, a studio space always already part of the living space from which it emerges and to which it might, again, return. The artist's repeated effort to broach and inhabit this space for art and living is an attempt to retrace something familiar – a familiar trace, or space. There might be neither beginning nor end to this repeated inhabitation of the space drawn by the artist from one work to the next.

In 1974, American artist/architect Gordon Matta-Clark cuts a dwelling house straight

through. While the cut does not address the artist's own house or studio, the motivation to cut an abandoned shoebox house comes from extensive participation in the re-building of loft spaces. When returning to New York City in the late 1960s as a newly graduated architect, Matta-Clark becomes instrumental in the reconfiguration of lofts for live/work purposes. As he later explains, it is this work that leads to the ambitious building cuts which will mark the artistic practice.¹¹ The cut is breaking the house gently, if decisively, in the sense of an analytical as well as critical separation of material that complicates what it makes visible. Matta-Clark says in passing, "I wanted to alter the whole space to its very roots."¹² Breaking and entering the house is then a straightforward aspiration and operation on one level if a rather complex undertaking on another. What begins as the penetration of a surface will soon have deeper implications when the cut uncovers a much larger complexity. From the point of view of the artist/architect, the edge of the section drawn by the chainsaw reveals a history of the building's making, its life and use, secrets and aspirations, the future that it has been denied. A historical and material complexity is embedded in the fabric of the building's layers exposed by the cut, and the life of the house resides within the gaps and voids that are revealed. "A cut is very analytical. It's the probe! The essential probe," Matta-Clark claims.¹³

For the artist/architect, the action of cutting involves a number of operations – opening, incision, removal, division, forming – all equally destructive/constructive in nature. While the form of a given material might be disfigured by the cut, another form is simultaneously created, even if a kind of *non-form*. The cutting tool, which is a requirement, is per se violent in its capacity to give form regardless of the force with which it is operated. The implement that is the knife violates the material by the sheer force of its sharp edge.

When the artist Lucio Fontana performs the cutting of the canvas in his *Tagli*-series [Cuts] from the late 1950s onwards, the surface of the picture plane is broken in one decisive gesture. The motivation behind this move is a complex journey from interwar experimentation with the situated artwork to post-war spatial manifestos and installations. Yet, in one instant Fontana's cut re-defines his artistic practice, and it does so with a striking purity of intention and outcome. The canvas slashed by the Stanley knife is preceded by the *Buchi*-series [Holes] from 1949 where paper and canvas are punctuated using the opposite end of the paintbrush as a tool. While the artist explicitly addresses the two-dimensional surface, these un-framed works of cuts and holes reverberate in their disclosure of unknown spaces beyond the picture plane. In regards to the *Tagli*, this is a space within the work, like another dimension – an immaterial "nothingness of creation" disclosed by the "formless gesture" of the cut, as Fontana explains.¹⁴

The interest in space and the relational work marks the artist's time when returning to Europe after World War II. Fontana joins the Milanese Movimento Spaziale [The Spatialists] preoccupied with the notion of a televised post-war space age, and the dissolution of the two-dimensional ground can in this light be seen as opening an infinite space within the work. It is the experience of an expansion of the pictorial space so that an immanent infinite darkness opens beyond. At once accessible and then not quite – perhaps an invitation to draw something out. If Fontana envisages the material slits as entries into deeper dimensions of the work then this expansion also involves deeper layers of the life-world within which the work is created.¹⁵ Which is to say deeper layers of the artist's studio. Fontana's spatial contextualisation of the work,

which goes *through* the work rather than *out* from it, possibly opens a space beyond the studio itself. A thought that invites reflection on the possibility of the gesture in regards to the life-world at large within which both studio, work and the space beyond expand.

When Fontana opens a gap in the fabric of the painting, he first draws an outline of this opening with a knife on canvas. It is a drawing that penetrates its medium and thereby draws itself into another dimension of the painting as well as the space which frames it – the space which it comes to frame. The contour of the cut, this silhouette that the gap outlines complicates conventional painting’s figure-ground relation. “Cut-as-contour begins to turn the surface inside out,” as Mansoor has described it.¹⁶ Fontana’s drawing is a movement that draws something out by means of a gesture that forces its way in. It is, as such, a two-fold inscription not only drawing a line and lining the edge of this drawing while revealing an endless space hidden in the fabric of the canvas ground. Not only disclosing in the sense of opening something closed, but framing a passage from one space to another which works both ways. If this passage suddenly emerges as the result of one precise cut, then the skill of cutting belongs to the artist who executes, and as such practices, the cut again and again. He does so to the point of an almost mechanically repeated execution from one work to the next over the span of a decade from the first initiation in 1958 to his death ten years later.

In 1966, the artist organises the cut canvasses in a spatial configuration which invites visitors to the 33rd Venice Biennale to experience six white *Tagli* placed in an oval-shaped, white spatial environment. The 1:1 installation format is further explored two years later in Documenta 4 where the experience of one cut surface is staged as an event within a spatial maze. When eventually scaling the work for bodily experience, the implications of the cut definitively extend beyond the picture plane to involve the wider environment – to create this environment. A space opens up, which at the same time appears to be an occupation by space itself in the formless shape of infinite darkness visible through the slit canvas. A particular kind of probe then, revealing an expansion of a space seemingly already there. A space spaced out by the un-grounding of the canvas that the cut implies. A space to return to as a possibility for the new living space cut from an artist’s studio like a loft.

1 The paper is based on my doctoral study, *Splitting and Doubling: Spaces for Contemporary Living in Works by Gordon Matta-Clark, Kurt Schwitters and Gregor Schneider* from Kent School of Architecture, University of Kent, Canterbury, UK, 2014.

2 While the practitioners of Art Nouveau embrace modern technology despite its anti-domestic inflictions, avant-garde artists and architects of the late nineteenth/early twentieth centuries are concerned with the domestication of art that at the same time takes place. The avant-garde – identified by having already ventured as far as possible away from home with the shared aim of encountering the new – protests against the domestication of art as interior decoration. See Christopher Reed, ed., ‘Introduction’, in *Not at Home: The Suppression of Domesticity in Modern Art and Architecture* (New York: Thames and Hudson, 1996).

3 As Katy Siegel points out, the pragmatism of the live/work space is perhaps an attempt to streamline artistic production. Yet, a certain live/work balance has always marked the artist’s studio, even when this space was not directly connected to the dwelling domain. The notion of dwelling has always been an aspect of the artist’s workplace because the artist’s work routine follows a different time schedule than the average worker’s. While there is no nine-to-five

routine, the flexibility of a one-space solution is practical – neither walls nor commute prevent the artist from working when s/he is inspired to create. SUPERSTITION, MYTH, AND THE SLIPPERY HOLD OF MEMORY

Abstract | How are we to make sense of a world in constant flux? Perhaps this was most eloquently addressed in “Do The Senses Make Sense?” by John Ray Jr. PhD (1952), suggesting that *reality* is up for grabs.

The author of *Superstition, Myth, and the Slippery Hold of Memory* was raised by his grandparents, refugees from Eastern Europe, who escaped the blood-letting of World-War One. The author was raised in an underworld of mobsters, which many refugees must endure for survival, yet sought refuge in a fantasy world of art, higher education, and eventually architecture.

A formal academic education at the University of Miami (BFA, 1974), Washington University, St. Louis (MFA, 1976), and The Cooper Union (B.Arch, 1987) provided the tools for a creative architectural career. Yet how is one to address the concerns of building on a barrier island already overburdened?

Superstition, Myth, and the Slippery Hold of Memory is a discourse that explores the various options through a technique of visual and verbal collage. It is a dialogue that questions memory, identity, history, and reality through the lens of a practicing architect who has been battling in the trenches to save his city.

Index terms | *Reality, memory, academia, mobsters, exile, architecture, collage, identity;*

Introduction

Superstition, Myth, and The Slippery Hold of Memory appears to be the first publication written by the ambiguous and cryptic Wallace Kinbote. The greater part of the work was apparently composed in a “wretched” apartment, identified as the Reality Apartments located in Miami’s South Beach neighborhood during a particularly vigorous period of sustained inspiration in his life. It is known that his daily consumption of rye whiskey reached an alarming rate, and he rarely slept due to narcosis and hypersensitive hearing. Kinbote would spend the night walking about his dingy abode, pencil in hand, composing his master-works. The Project was completed on a warm rainy night and posted on the dark web. As Kinbote was on the run and in exile, he was too deeply immersed in other labors to discern the dull thud it made. Praises, as far as this writer can recall, rang out only in this author’s Peer Review infused into Kinbote’s completed work.

The title, *Superstition, Myth, and The Slippery Hold of Memory*, is meant as an attempt to suggest an outline broken by refraction, a kaleidoscopic distortion in the mirror of being, a wrong turn taken by life in a malefic world. The title is popularly deemed to be a drawback for a solemn reader looking for general ideas of human interest in a memoir and may be led incorrectly to look for them in this work. Few things are more tedious than a discussion of general ideas inflicted by author or reader upon a written work of unknowable sagacity.

The purpose of this introduction is not to demonstrate that *Superstition, Myth, and The Slippery Hold of Memory* belongs or does not belong to ‘serious literature’, a euphemism for hollow enlightenment. This writer has no interest, and is manifestly indifferent to what might be called the literature of social comment, politics, economics, and so on. To introduce politics into the reading of this work by paying particular attention to formulations of history and cultural temporality within those contexts is certain to operate against intention. Similarly, the influence of our epoch on Kinbote’s book is as negligible as the influence of his book on our epoch. There can be distinguished, no doubt, certain reflections in the glass directly linked by the tenured patronage that we all know and have brushed against in the course of our own lives.

The story in *Superstition, Myth, and The Slippery Hold of Memory* is not about life and death in a disquieting world; and the characters, all of them, are merely delusive preposterous mirages and illusions during their brief spell of being, but harmlessly fading away when dismissed from the cast. Kinbote directs the reader toward the more overtly formal features, the stylistic distortions, like intertextual allusion and recurrent patterns intimating the presence of an alternative world. The main themes are the beating of infatuated hearts and the torture an agonizing tenderness is subjected to – the theme of dim-witted cacology which thwarts its own purpose, and Kinbote’s blessed madness when he perceives the simple *reality* of things and knows, but cannot express in the words of his world, that he and everyone else exist merely as the author’s chimeric whims.

Methodology

Current literary studies require that innovative works be analyzed and introduced for their further scientific study. Such studies include archival documents, articles

contributed through international media, as well as their journals and correspondence. The customary and routine study of architectural, historical, and geographical literary processes and research is incapable of providing an opportunity to show how circumstances promoted and formed *Superstition, Myth, and The Slippery Hold of Memory*.

Philology¹ defines the literary collection as a book that contains literary works of one or more authors. It is generally agreed that the collection is a reliably flexible form that contains works of various literary genres selected to meet the needs of a reader. This literary product has two main varieties: author's collections that include literary works of one author; and, multi-author collections that include literary works of various authors chosen by the compiler. While an author's intention in a collection is reflected in para-textual elements the multi-author collection does not always have such fixed components. It is important to discern and analyze the relations between text and para-text² to determine the dynamics of the relationship between authors. Due to the nuanced nature of the book, no recognized Philological approach can begin to explain the dynamics of the relationship between the authors or the demiurgic structure of *Superstition, Myth, and The Slippery Hold of Memory*.

Based on this writer's intimate knowledge of the characters described in *Superstition, Myth, and The Slippery Hold of Memory* the methodology employed in this work explores and challenges various perspectives in order to approach a holistic understanding of its processes and its literary life. The most promising is the approach according to which pragmatic linguistics and ethnographies are scrutinized within logically oppositional universes of discourse. Indeed, in the case of Kinbote's dynamic work, the most profound research is required and must be conducted when limited to variant discordant contexts.

This writer maintains a supreme clarity of this analytic project, especially when not following any logical sequence, but preparing instead this or that passage and filling in the gaps at any point in the process and in no special order. It is true that the entirety of *Superstition, Myth, and The Slippery Hold of Memory*, before it was even produced, seemed to already exist in this writer's disposition in some other, now transparent, now dimming, dimension. This writer's greatest experience in composing is when not cognizant of how or why an image or structural move or exact formulation of phrase has just come to fruition. It is sometimes rather amusing to find one's readers trying to elucidate in a matter-of-fact way these wild workings of a not very efficient mind³.

The design of this intensive methodology is fixed in this writer's jurisdiction and every character is subject to the course imagined for him. In that private world, this writer alone is responsible for its stability and authenticity, and whether produced as consummately and faithfully as imagined, which may reveal dismal blurrings and blanks, is quite another matter.

Discussion of Results

Imagination is a form of memory. An image depends on the power of association, and association is supplied and prompted by memory. A vivid individual recollection pays a compliment not to our capacity of retention but to a mysterious foresight in having stored up this or that element which creative imagination may want to use when

combining it with later recollections and inventions. In this sense, both memory and imagination create a new reality across time.⁴

Consider the much-discussed painting, *The Treachery of Images* (“*Ceci n’est pas une pipe*”; “This is not a pipe”), by the French surrealist painter, René Magritte (1898-1967). Magritte problematizes the way that we attribute significance to images, as well as the complicated relationship between the verbal and the visual. The painting challenges the “correspondence” or natural theory of the image, the idea that an image stands unambiguously for (or in relation to) the object which it represents (or *re*-presents) or that the image can have a stable semantic or spatial relationship with the verbal sign.

Magritte highlights for our consideration the idea that an image of a pipe is not the same thing as the pipe itself. It is a representation of a pipe, once removed from its referent, the object to which it refers. He also forces us to consider our own reaction to the painting by suggesting that our compulsion to call the image a pipe reveals our predisposition to confuse the image with the thing it represents. The lesson is a didactic one in spite of its challenge. We see the sign (the image of the pipe) as the signified in a process much like the tendency to see the word as the unambiguous sign of a thing.

Whatever the pictorial turn is, then, it should be clear that it is a rediscovery of the picture as a complex interplay between visibility, discourse and figurality. It is the realization that spectatorship (the look, the gaze, the glance, the practices of observation and visual pleasure) may be as deep a problem as various forms of reading (decoding, interpretation, etc.) and that visual experience or “visual literacy” might not be fully explicable on the model of textuality.

The visual and rhetorical turns in modern thought track down the implications of what at first seems to be just a witty observation. However, when you consider these implications, you realize that if the relationship between the word and its referent is ambiguous and that it is more or less fixed by context (as in the case of Kinbote’s textuality and imagery), then there are enormous consequences for our understanding of truth, meaning, and reality. No longer is it possible to believe naively in the idea that our words or images can render a fixed reality even though trusting such a belief is necessary at every turn, step, or glance. Furthermore, we also realize that the words and images we use to represent the world and our experience are assertions of a perspective that say, essentially, “think of the world in these terms (rather than *those*),” or “see the world in these images (not *those*).” That is, *any* expression in words or images makes assertions that reflect the perspective and attitude of the one who names, and influences the interpretation of the hearer, the reader, or the spectator. When you consider as well that the process moves in both directions (seeing itself as the expression or assertion of power), you have the invitation to consider the visual and the textual as inextricably linked in the parallel acts of believing, interpreting, persuading, and identifying, each in its own right worthy of a closer look.

In the course of its development the study of social phenomena was guided in the choice of its methods by the nature of the problems it had to face. It gradually developed a technique appropriate to those problems without much reflection on the character of the methods or on their relation to that of other disciplines of knowledge. The term “science” had not yet assumed the special narrow meaning it has today, nor was there any distinction made which attributed to it any special dignity.⁵

The persistent efforts of modern science to impose scientific conclusions in order to

obtain objective, strictly controlled results, are unconcerned with the conscious or reflected action, actions where a person can be said to choose between various courses open to him or her. The external stimulus which may be said to cause or occasion such actions can of course also be defined in purely physical terms. But if we tried to do so for the purposes of explaining the meanderings of the human action demonstrated in *Superstition, Myth, and The Slippery Hold of Memory*, we would confine ourselves to less than we already know about the situation.

The belief that science, and only science, can describe Kinbote's world as it is, independent of perspective with a concomitant elimination of the psychological and spiritual dimensions of experience is a matter of putting too high a value on natural science in comparison with other branches of learning or culture.⁶

This writer's critique of pure instrumental rational science argues that the world is better suited to understand literary and creative expression as accessible experiences that can be articulated in a formal language and that generates an intersubjectivity of mutual understanding in each case.⁷

Superstition, Myth, and The Slippery Hold of Memory is a collection of characters, memories, and dreamscapes which jarringly manhandle form and content and reaches an uncomfortable pitch. These alienating stylistic devices which some reviewers consider to be bizarre, puzzling and difficult, and which most readers have little hope of understanding or experiencing, constitute a running threat to a reader's engagement. Its function suggests how the pervasive effects of mass culture have required a violent challenge to reality and the demands of the reader: to question the authority with which popular culture lays claim to represent the world – a farcical authority which is founded on false premises. We can see then, that Kinbote manifests a cultural dichotomy by which academic and literary texts and styles are appropriated and directly opposed to the culture from which they are borrowed. The connections to the culture are to be found in its fundamental nature, its unceasing drive to recruit readers to its own ready-made version of reality.

Participation in popular culture itself stands under the same sign as intimidation. Enthusiasm for it not merely betrays an unconscious eagerness to read the commands from above but already reveals the fear of disobedience - this anxiety is the ultimate lesson of every authoritarian era. It is the uncritical acceptance of discourses offered for consumption which marks the contact point between the consumers of popular mass culture and those citizens who make totalitarianism possible through their submission. This acquisition of passive consent and inhabitation of mental territory is precisely how Kinbote's aesthetics depict a form of resistance against these forces, as writers must preserve the inherent complexity of thought and language at a time when all communication is debased by the techniques of popular culture.

Kinbote's deployment of a unique blending of formal features can be associated with impulses which display innovation and aesthetic autonomy, which include the construction of several competing temporal realms, parodies of popular issues, and abrupt shifts in the ambiguous narrative voice which introduce awareness of spatial dimensions in the narrative. Perhaps the most important element is the introduction of conflict into an otherwise unchallenged architectural discourse, principally due to the fundamental link asserted between meaning and form, in the integration of

heterogeneous or opposed elements within the literary work through ambiguity, irony and paradox. In other words, the conflict is regarded as inherent to literature of value, as a means of resisting an entropic decrease in imaginative and creative activity, and that the act of reading constitutes the transformation of these disparate elements into a unified form.

In much the same way that Kinbote demonstrates, Peyre⁸ found the acceptance of popular culture to be a threat to creativity, and saw its ideals as a kind of “levelling down.” For Peyre, the connection was clear between a lack of conflict and intellectual indolence. He noted, “Theoretical freedom of thought becomes too little conducive to boldness of thought,” leading to “passive resistance to thinking” and a “lack of adventure in initiating new ideas.”

Kinbote’s collection of thoughts and images is of a certain interest due to its cohesive goals, as evidenced by its seemingly incongruous commentaries, references and anecdotes interspersed throughout the work. Some of Kinbote’s literary tendencies were particularly popular among Russian and Siberian publishers during and after the First World War. However, the content of Kinbote’s collection also failed to meet any current publishers’ expectations: Numerous publishers assumed that most of the prose and visual imagery were either unimaginative, improperly referenced and far from literary standards. Kinbote’s *possible* use of pseudonyms and cryptonyms instead of real names, may imply to some scholars that the work should be classified as an amateur publishing initiative intended for limited circulation. This is the likely reason that *Superstition, Myth, and The Slippery Hold of Memory* was posted on the dark-web, and is not listed in any well-known literary indices. This also points to the unknown run of many thousands of downloaded and privately published copies in world-wide circulation.

Kinbote writes with urbanity, with humor and with high drama. Yet there are no melodramatics. He takes us inside his mind, which is a fascinating mind by the way. Its twists and turnings are not always easy to follow, but its processes are believable, and its musings have the ring of authenticity and inevitability. Here is a civilized man, thinking civilized thoughts; but he is faced with forces from the abyss.

The launch of Kinbote’s compelling project on the dark-web was never advertised except in the dubious *Journal of Toxic Masculinity* and *The Siberian Times*, the digital illustrated news/literary/historical website. *The Siberian Times’* publisher developed a unique marketing strategy by recruiting its own correspondents in some major Siberian cities (Irkutsk, Chita, Omsk, Krasnoyarsk, Onhava) offering lotteries and coupons for the readers. Much attention is given in the dark-web editions of this periodical to the literary section where readers can find reviews and access to works of such authors as Kinbote and other refugees.

Historically, many social and cultural processes are determined by the participation of the studentship. Such has been the case with Wallace Kinbote. With its provocative title it resembles futuristic publications of the early 20th century. The Preface sounds as outrageous as speeches of revolutionary Dadaists, but the reader may find here new motifs of fatigue, satiety and strained eroticism, demonstrating that the author is more opposed to the dominions than to a new revolutionary era.

During a rare public appearance promoting his project in his native Novaya Zemlya, Kinbote addressed the local students and academic community. Speaking in his local dialect in December 2017, Kinbote was recorded to say:

“You, engineers, doctors and lawyers, architects and students, you, people of different professions, stupefied by routine, slow, boring ruminants! I am inviting you to the delight of my spiritual work – to Thoughts, Words, Colors, Gestures, Sounds! Look here, savages! Open your swollen eyes – oh, it is so stuffy, so very stuffy with you! As I tremble with rage, fling the windows open. I want to shave this gloom of your ignorance completely from the vast and frozen plains. Cheer up!”⁹

There are interpretations that see Kinbote’s Novaya Zemlya speech as espousing a calamitous realism, as positing the independent existence of a surreal state of affairs. That this realism is achieved via a linguistic turn should be recognized by all (or most) interpreters, but this linguistic perspective does no damage to the basic realism that is experienced in *Superstition, Myth, and The Slippery Hold of Memory*.

Such realism is also taken to be manifested in the essential bi-polarity of dueling authors. Likewise, a straightforward reading of their relationship suggests more linguistically oriented interpretations yet gives conceptual priority to the symbolism. When *reality* is matched with conceptual symbolism, it is the act of comparison which determines the shape of *reality* (and not the other way round).¹⁰ In any case, the issue of the *reality* described in *Superstition, Myth, and The Slippery Hold of Memory* is addressed by its very existence and any question of the limits of language and the more particular question of what there is (or is not) beyond language have moved on to questioning the very presence of Kinbote within the book and the status of his existence. Kinbote writes like a poet to a poet. This reviewer went through periods of anguish and [re] search, not to astonish the reader, not to walk on the high wire, but because this writer was exploding. *Superstition, Myth, and The Slippery Hold of Memory* was discovered, still full of sand, just dug out from under the rubble. It emerged naturally of its own necessity, by its own force. It burned, it pressed heavily, it hurts. It had to be let out.

I know that I am only at the beginning. There is so much to take in so that Kinbote’s world will gain form, take shape. Kinbote understands the birds, how they feel when the time to migrate comes. They know it, it’s a craving, it’s an instinct. He walks with his eyes on the horizon, like a somnambulist, like a bird that was left behind. It’s painful. Lonely. And miserable.

It would be erroneous to claim that the human mind is capable of grasping the relationship between multiple realities in the presence of each other. It is, as it were, from the fortuitous juxtaposition of the terms that a particular light has sprung, the light of the images, to which we are infinitely sensitive. The value of the image depends upon the beauty of the spark obtained, a function of the difference of potential. According to Breton, we are obliged to admit that the images are the products of the activity, reason’s role being limited to taking note of, and appreciating, the luminous phenomenon.¹¹

Kinbote is writing, writing himself to death, by himself. Comparisons. Parallels. Sometimes it feels like he is two. And never knows what is happening. He keeps pulling into himself, always, in every possible way, and then this writer thinks: When am I going to digest it all?

You don't have to possess it all, it's enough to sniff at it. You can't have everything. But sometimes it's good enough just to glimpse it. Either you uproot it completely, or you let it be. Like a tree.

Kinbote's *reality* cannot be possessed by the reader, the esteemed visitor, but only by the writer.¹²

Conclusions

Kinbote's riveting brand of rich synthetic English contains some outlandish ingredient, some dreadful additional pungency that might account for his unrelieved personal turmoil.

Kinbote is not accessible for comment, apparently arrested. For his own safety, I am told. Let us hope so. Well, no matter. Perhaps it was his mere obstinacy, as when a ripe man clings to myth and tradition with as much passion as young people show when dismantling it.

There are rumors floating about from a presumable informer, for which this writer must temper himself and sink his voice low, indicating that Kinbote, whose identity was not certain, was caught while attempting to escape his 'captivity' in exile and was executed on the spot. After a rigorous interview by this writer, the informant admitted that Kinbote may have been restrained, brought back and imprisoned.

If you hear otherwise, you hear wrongly, because we are not talking of that, but of the sad case of history encroaching upon us, a picture which has a few nice shadows.

This is not the first time that an obscure and unlovable, but marvelously obstinate man has gnawed his way into the public imagination. But to those who would watch these events and would like to protect them, Kinbote offers no clues for the simple reason that he had no reason to exist when toppling over the brink of the present into the void he eventually filled.

Perhaps Kinbote is the victim of sentimental delusions, a thinker, a dreamer, (or even a dream). I note with regret that my delicacy is nothing less than his helpless shadow, now an afterthought.

His words and images are conundrums. I must confess my admiration for Kinbote; I esteem him as I do my own self, because he is able to find perfect felicity in his specialized knowledge and is the only real man among us poor fossils, in his eternal bliss, among the swooning galaxies, those mirrors of infinite space, where mythology stretches strong circus nets, where Kinbote breaks his neck, instead of rebounding and hopping down onto the ground to take that short run with a half pirouette in the middle and displaying the extreme simplicity of heaven in the acrobat's gripping gesture, the open hands that start the heavy shower of applause, while he walks backward disappearing behind the curtain.

Addendum

Far more serious [in Breton's opinion], whatever reservations may be allowed concerning responsibility in general and the legal considerations which determine an individual's degree of responsibility, however difficult it may be to accept the

principle of any kind of responsibility, how the punishable offenses will be judged. Will the accused counterfeiter be acquitted, or will he merely be given the benefit of the doubt because of extenuating circumstances? We could soon see a trial of this sort: the accused has published a book which is an outrage. Several of his most respected and honorable colleagues have lodged a complaint against him, and he is also charged with slander and libel. The accused may waste no time in agreeing with the accusers, his only defense is claiming that he does not consider himself to be the author of his book, said book being no more and no less than an agglomeration which precludes any question of merit or lack of merit on the part of the person who authors it; further, that all he has done is copy a document without offering any opinion thereon, and that he is at least as foreign to the accused text as is the presiding judge himself. What is true for the publication of a book will also hold true for a whole host of other acts of art.

Kinbote's world, such as I conceive of it, asserts his complete eccentricity clearly enough so that there can be no question at the trial of the real world, as evidence for the defense. It could, on the contrary, only serve to justify the complete state of distraction which he has achieved.

THE POETRY OF ARCHITECTURE AND CHINESE LANDSCAPE PAINTINGS

Abstract | The poetry lies in an “aesthetic sense” when one places oneself in a certain environment. The “aesthetic sense” is a kind of feeling results from pure bodily sensations and emotions. “Aesthetic sense” has for a long time being the highest pursuit for Chinese literati in artistic creations. This sense needs to be gained through the body’s immediate perceptions rather than understood through linguistic concepts. Once the “aesthetic sense” is gained by the body, the poetry will emerge.

This article starts with the concept of “somaesthetics” and the concerns of the bodily senses in traditional Chinese culture, this is followed by the discussion of the techniques associated with bodily concerns, by which the painters and the designer approach “aesthetic sense” in landscape paintings and architectural design. Four particularities of the essence of landscape paintings are discussed in the article. They are techniques to achieve “aesthetic sense”. Those techniques are associated with the idea of somaesthetics – the focus on the immediate bodily perceptions and understandings. The designer translated those techniques into an architectural project, Xiangshan campus, China Academy of Art, so that the design particularities of Xiangshan campus becomes an architectural counterpart of landscape paintings. Each technique is illustrated from landscape paintings to Xiangshan campus design, as to make a close connection between landscape paintings and architectural design, and offer a plural explanation of the way to approach “aesthetic sense”.

Therefore, besides demonstrating the idea of somaesthetics in Chinese landscape paintings, the purpose of the article lies more in revealing how the particularities of Xiangshan campus, as illuminated by Chinese landscape paintings, offers a new, expanded, and more nuanced understanding of the poetry of architecture.

Index terms | “Aesthetic sense”; Chinese landscape paintings; design of Xiangshan campus; poetry of architecture; somaesthetics;

INTRODUCTION

The sense of poetry happens at a moment when one puts oneself in a certain environment. It is a kind of feeling results from bodily sensations and emotions. The article starts with the concept of somaesthetics and the concerns of the bodily senses in traditional Chinese culture, this is followed by the discussion of the techniques by which the painters and designers approach the sense of poetry in landscape paintings and the design of Xiangshan Campus, and thus attempting to offer an alternative, expanded, and more nuanced understanding of the poetry in architecture.

SOMAESTHETICS

Richard Shusterman introduces the term “somaesthetics”; proposed from a philosophical perspective, this term is described as referring to “how we experience and use the living body (or soma) as a site of sensory appreciation (aesthetics) and creative self-fashioning”. The term “soma” indicates a sentient body, actively producing feelings, emotions and sensations, while the term “aesthetics” gives “soma” a conscious sense of bodily perception.¹ Shusterman puts considerable emphasis on the cultivation of the body as the central tool of self-cultivation, in order to have better “perception, action, virtue and happiness”.²

It is interesting to find out the deep affinity between Shusterman’s pragmatic aesthetics and traditional Chinese philosophies. In *Pragmatist Aesthetics: Living Beauty, Rethinking Art*, Richard Shusterman claims that his concept is encouraged by Chinese philosophy and other ancient Asian thoughts.³ One of the grounds that pragmatic aesthetics shares with classical Chinese philosophy is a focus on embodied experience and understanding.⁴ Chinese people tend to believe in something that can be felt, immediately experienced, intuitively understood, more than in abstract theories, so do pragmatic aesthetics.

Chinese philosophy mostly does not have a definite body–mind dualism, and it sees bodily senses as lenses through which to look at the world and to shape mind. The concept of body-mind integration has influence on traditional paintings. Some scholars found that the body in Chinese traditional art is “invisible”.⁵ The invisibility of body refers to the lack of representation of the body’s own intrinsic physical attributions. The body is literally “invisible” in Chinese traditional arts, but the body is connected to consciousness and a larger body of humanity in a more implicit and subtle way. This article does not attempt to look at the visual image of the physical body in paintings and architectural spaces. It rather sees the body as a subject, which always attempts to reflect the landscape scenes with corresponding bodily feelings, instead of an object that needs to be seen and analysed by others. In this sense, the body as an object is “visible”, whereas the body as a subject is “invisible”. The subjective body is actively seeking its *being* from its perceptions, emotions and immediate bodily understandings. Landscape paintings rarely present one’s physical encounter but a more generalised idea of one’s *being* in landscapes, and one’s body is merely a humble entity of the whole natural landscape, that is why human figures depicted in landscape paintings are often inconspicuous.⁶

Chinese men of letters created a term *yijing*, a kind of poetic sense results from pure bodily sensations and emotions when one places oneself in an artistic or natural environment. The sense of poetry has for a long time being the highest pursuit for Chinese men of letters in artistic creation, including painting and gardening. The

sense of poetry is hardly described in language; it must be experienced in body as a consequence of exposure to certain images (or artistic works) when one is in a suitably contemplative state of mind. The sense of poetry is similar to what Peter Zumthor refers to with the term “atmosphere”. When Zumthor tries to describe the quality in architecture, he refers to those buildings with beautiful and sensuous presence which are able to move him. The thing that moves him is atmosphere.⁷

Wang Shu is an architect who brings to his work a literate mindset, seeking traditional aesthetics for contemporary architectural practice. One project, Xiangshan Campus, China Academy of Art, is wang’s representative work. Xiangshan campus is located in the city fringe of Hangzhou, a southeast city of China. A small mountain (50 metres high) Xiang stands at the centre of the campus site, surrounded by two streams flowing from west to east passing through the foot of the mountain. The concept of Xiangshan campus is about designing the sense of poetry. As illuminated by landscape paintings, the design of Xiangshan campus is seen as an architectural interpretation of landscape paintings, aiming to provide a new understanding of the poetry of architecture.

THE SENSE OF POETRY FROM LANDSCAPE PAINTINGS TO ARCHITECTURAL DESIGN

This section discusses four particularities of the essence of landscape paintings. They are approaches for the sense of poetry. Those techniques are associated with the idea of somaesthetics – the focus on the immediate bodily perceptions and understandings. The designer translated those techniques into architectural design, so that the design particularities of Xiangshan campus becomes an architectural counterpart of landscape paintings.

Following the Nature

The nature means the inherent feature and the original state of an object. The object goes in a way as the nature takes it. This philosophical idea is embodied in Chinese landscape painting. The landscape painting requires a sort of natural state of creation – the one is painting with one’s purposeless and unrestrained mind, away from any conscious concerns, prejudices and bias, and one’s body should be in a relaxed situation, so that one’s painting could go with the body’s sensuous and emotional intention, and that is considered natural. In such a way, the body’s immediate perceptions and sensuous and emotional intention, and that is considered natural. In such a way, the body’s immediate perceptions and emotions could be brought into the aesthetic sense of the painting.

The design of Xiangshan Campus was initiated in a similar way as landscape painting. The “freestyle” layout of the masterplan seems as if it is irrationally designed, as the graphs in masterplan drawing are randomly formed (figure 1). This is because the masterplan did not come from a modernism’s thinking, compared with the planning of other university campuses that usually started with the configuration of functional blocks.

Following the nature also implies that the objects in a landscape painting look as if they are naturally generated. Though the painting is artificially made, the sense of naturalness could emerge when one encounters a landscape painting, and this is where the sense of poetry resides. Guo Xi⁸ states in *Lin Quan Gao Zhi – Shan Shui Xun*⁹ that the reason why landscape paintings are popular among Chinese literati is that it helps

them to fulfil the instinctive wills of staying closely with natural landscapes.¹⁰

In line with the law of painting, the design of Xiangshan Campus tried to achieve the sense of naturalness. Wang Shu's lecture at Harvard University came up with a term "landscape architectural system". It is a system of design philosophy that encourages learning from natural landscapes and requires artificial constructions to be integrated with natural landscapes. Wang explained the idea of landscape architectural systems by showing the harmonious co-existence of artificial dwellings and natural landscapes in several paintings (figure 2).¹¹

The design of the buildings attempted to be harmonious with natural landscapes. Huge openings facing the mountain are designed for the buildings, as well as particular construction materials that try to be consistent with the colour of the landscapes. Each of courtyards north to the mountain is distinctive in their orientations to mountain that provides different natural views. The flat site that has been transformed into a typical southeast hilly terrain and the horizontal eaves repetitively appearing on the façades help reinforce the horizontal tendency of the buildings are attempting to relieve the sense of the huge mass of individual buildings (figure 3). Moreover, between the mountain and the buildings, there originally lies a large area of fields, including farmlands and fishponds (figure 4). All those original resources were retained intact, attempting to create an idyllic countryside image that is a pursuit of Chinese men of letters in the past.

Tactility

The awareness of tactility takes a considerable part in Chinese traditional philosophy. This kind of philosophy sets off for ultimate interpretations by means of the body's tactile sense, instead of visual sense only. Some postmodern thinkers have had parallel thoughts. Maurice Merleau-Ponty asserts that the body opens to the world and is the first motivation of its extension rather than an enclosed entity.¹² The body's openness to the world essentially relies on the tactile sense, and it is because of the body's tactility, the world could be seen as the extension of the body.

Landscape painting sees tactile sense as the most important technique in achieving aesthetics. During the process of painting, there is a dynamical and sensitive interaction between the drawing paper and fingers. The painter's immediate emotions can be transmitted to the finger's acting force, the way of holding the brush and the process of making strokes, and the form of a stroke reflects the painter's tactile feelings during the moment of drawing, so that the painting can be seen as the extension of the painter's body. The viewers of a painting could experience some sorts of immediate emotions. There is a similar relation between the designer, the architecture and the visitor. Architecture could be seen as an extension of the designer's feelings. Designer's emotions can be transmitted to architecture through the configuration of spatial forms, materials and tectonic methods, and thus those would arouse the visitor's sensuous perceptions as one encounters architectural spaces

The body prefers to have intimate contact with natural matters. Natural materials, such as wood and rock, are more likely to arouse the body's tactile feelings. Natural materials are frequently used in the design of Xiangshan Campus. Cedar wood boards cover the courtyard-side façades, from bottom to top, of the courtyard buildings (figure 5). Other natural materials, such as bamboo, a particular plant the southeast part of

China abounds in, has been widely used in the buildings over the campus.

The materials with historical sense and handmade sense are also used to induce the body's tactile feelings. Hooks and bolts for the doors and windows are all forged by a local blacksmith. The designer also adopted the techniques of free stone masonry and rammed earth technology in the project. The lower exterior walls in some buildings are constructed with stone masonry, based on one of the construction techniques used in local tea gardens. Another regional technique applied in the design is about a way of construction of walls that used to be popular in the east of China: the wall was traditionally constructed by a group of mixed materials, including mud, wood, bricks, porcelain, tiles and rocks. In Xiangshan Campus, the designer used abandoned materials collected from demolished buildings and assembled them in a way that expresses their new value in the university buildings (figure 6).

"General images" rather than imitation of details

One of the principles for the creation of landscape paintings, stated by Guo Xi, is that drawing has to focus on the general tendency of the landscape, and manifest its overall aesthetic sense rather than taking too much effort in polishing details.¹³ The image in a painting is a fluid, indeterminate and amorphous imagery that reflects the painter's general understandings. The purpose of painting is for the sake of aesthetic sense that comes from the body's grasp of the "general image" of the object, instead of rigid imitation. The achievement of that requires the painter to recognise the whole "from the angle of totality" and to paint "what he knows" rather than "what he sees from one place".¹⁴ The landscape painting is made through the re-composition of landscape images that come from the painter's memory, imagination and renovation of natural forms.¹⁵

In the design of Xiangshan Campus, Wang has produced three prototype of building forms. Each one represents one type of landscape-architecture relation.¹⁶ "Mountain house" takes references from the cliff temple (figure 7). "Water house" represents the form of weaving water and the intimate engagement of the body and the water (figure 8). "Courtyard" can be most easily adapted to a built urban environment. Wang's prototypes are not simply created by imitation, but by creating an analogous atmosphere or a tendency to correspond to the actual landscapes.

In addition, some architectural forms in the campus seems as if they are borrowed from the lines and strokes in landscape paintings. Wang has abstracted the beauty of the line from landscape paintings and practised applying this sense of beauty in architectural form. These lines run throughout the buildings, from curved roofs, to framed façades, to the zigzagging passages.

Rambling spaces

A rambling space means a space that largely enables the body's freedom and results in a higher chance of body's movement. The freedom of the body depends on the body's initiatives to explore the space, to seek the possibility of the flow of the body, and to adapt the body's intention to particular conditions.

Guo Xi provides four criteria for landscape paintings: walkable, viewable, tourable, and liveable.¹⁷ Walkable means the spaces presented in paintings could offer the body

comfortable spaces to walk through; watchable requires beautiful views, which the body could see at different distance; tourable refers to a rambling body that seeks aesthetics from the varied sceneries with the body's movement; liveable suggests that some spaces in the painting is suitable to live in. Therefore, in Guo Xi's idea, landscape painting should offer an embodied visual effect that the viewer's body should be *in* the painting, instead of *seeing* the painting.

It is demonstrated in *Lin Quan Gao Zhi* that there are "three kinds of distances" of mountains. Looking up to the top of a mountain from the bottom, the mountain is like towering towards the sky, that is the "high distance"; looking deep to the back of a mountain from the front, the mountain seems to be far-reaching, that is the "deep distance"; and looking towards a mountain at a distance from a near stand, the mountain is remote and in the eye level, that is the "level distance".¹⁸ Guo Xi's "three kinds of distances" do not literally mean to offer three viewpoints and the corresponding views of the mountain. The "three kinds of distances" articulates the association between the varying images and the change of the body's viewpoints.

"Early Spring" is Guo's representative work reflecting his requirements for landscape painting – walkable, watchable, tourable and liveable. Various views, at different distances, assembled in one painting: remote peaks, lower rocks, dwellings, waterfalls, river banks and so on (figure 9). One could imagine one's body wandering around the landscapes and viewing those places at different distances.

All of those ideas are translated in the design of Xiangshan campus. There are basically two types of viewpoints concerned in the design: viewing from outside and viewing from inside. Viewing from outside is about viewing the buildings from positions outside, in the mountains or other places at a far distance, whereas viewing from inside is about seeing the views closely inside the buildings (or gardens) at a near distance.¹⁹ One place could be a good position from which to view others and also a place to be viewed from elsewhere.

The path is one of the key elements in traditional gardening. Walking along an elaborately designed path in a small garden, a sense of a large-scale space will be generated as a result of the constant shifting of varied views. In the campus, the possibilities for rambling have been attained by creating a number of long passages running around buildings, interior spaces, roofs, courtyards and the waterside (figure 10). In addition, there are seemingly random and irregular holes of different sizes deliberately designed into some buildings, aiming to borrow views from the appointed landscape. A series of pictures will be presented successively with the movement of the body while walking along a path. These pictures along the path make a whole piece of journey, similar to a panoramic painting made up of many small scenes.

CONCLUSIONS

Chinese culture largely accords with Richard Shusterman's "somaesthetics", which asserts that beauty is not absolutely constructed through intellectual thinking, but through bodily experience. This kind of beauty is known as a sense of poetry that has been pursued for a long time in Chinese art history. Wang Shu has sought to create a kind of poetry in architecture, by learning the criteria from Chinese landscape paintings. Wang imagined certain kinds of feelings and experience in the spaces he was designing and, based on such imagination, he designed physical spaces aiming to make these

feelings happen in the people who engage with the spaces.

Architecture is not about an abstract concept or a physical object that transcends bodily perceptions and actual experience; it is rather a place where the poetry happens as well as a place where people experience the poetry with the body's senses.

URBAN WILDNESS IN THE ERA OF ECOLOGICAL CIVILIZATION

Abstract | Nowadays, the development of urbanization is confronted with many problems. In the context of building the ecological civilization, The wilderness philosophy has become an important part of the ecological civilization thought with the deep concerning thoughts for the destruction of human's homeland and the deep introspection on the current production and life style. The cities as a symbol of human civilization and progress are becoming people's main living environment and carrying people's imagination of a better life. In this beautiful imagination, the wilderness is the most authentic ecological nature, which is supposed to be an indispensable aesthetic object and aesthetic experience in people's city life. Therefore, we advocate a kind of aesthetics in the ecological civilization, that is the wilderness aesthetics. The wilderness as the best object of cognition and experience in people's city life, its value and the beauty of wilderness should be revalued, and it is the great beauty of the ecological civilization.

Index terms | *Ecological Civilization; The development of urbanization; Wilderness; Human's homeland; Aesthetic object and aesthetic experience;*

Ecological civilization, as an academic term in China, has become the consensus of the Chinese people. In the era of ecological civilization, wilderness consciousness has gradually gained attention. Focusing on today's Chinese cities, is there a real sense of "wilderness"? Is the wilderness landscapes valued during the process of urbanization? Does the urban aesthetic accommodate wilderness?

As a great creation of civilization, the city has gradually become the main living environment for people. From the urbanization construction to the urbanization construction, to the rural revitalization project, the development of cities, towns and villages is becoming more and more serious with strong aggression and destruction to the ecological nature and the wilderness. However, the spiritual nostalgia for the wilderness carried by people's cultural genes has never faded. The development of urban civilization will inevitably require the nourishment and protection of the wilderness. However, it seems to be a contradiction between the pursuit of urbanization and the accommodation of the wilderness. How to make urban development and wilderness gradually merge with each other, how does urban aesthetics accommodate the wilderness, and how to construct an aesthetic view of urban wilderness in the era of ecological civilization? These philosophical reflections have become real problems in front of urban research scholars and even urban builders.

The city embraces the wilderness

Human beings were born in the wilderness.

The academic formulation of "wilderness" originated in the West, With the development of the country, the destruction of the original ecology became more and more serious, and the awakening of environmental protection in the late 19th century, the consciousness of wilderness protection gradually sprouted. The pioneer scholars began to write relevant thoughts: Thoreau's Walden Lake, Leopold's Sand Country Yearbook aroused the rebuilding of the relationship between human and nature, Nash's Wilderness and American Spirit expounded the American wilderness. Ralston systematically published Philosophy Towards Wilderness. The wilderness protection in this period has prominent scientific and ethical characteristics, reflecting a "dream to coexistence of civilization and wilderness", and emphasizing the non-intervention of human beings in the wilderness.

However, there is no absolutely no man-made wilderness. At present, there is almost no absolute sense of "primitive nature" or "pure nature" on the earth, and the real sense of wilderness rarely exists in cities.

In the era of ecological civilization, people try to coexist with nature in harmony and demarcation. As a result, wilderness is gradually re-integrated into urban life and becomes a new spiritual sustenance. At the same time, people gradually regard it as a kind of precious resource, that is, clear water and green mountains are as good as mountains of gold and silver. The "wilderness" in the city that I want to emphasize is not pure nature. From the perspective of urban design, it can be understood as a "wilderness landscape". This kind of wilderness, as the object of people's affection in the city, has the characteristics of ornamental, interactive and recreational. That can let the landscape develop freely in the form of wilderness, instead of a fixed image brought by traditional planting, it develops an ecological circle with relatively stable genes through natural screening and transformation. There is no constructed landscapes, only the relatively stable genes, and naturally.

The works of Patricia Johnson, a famous contemporary American landscape designer and ecological artist, incorporate the original wilderness into environmental design, combining the natural changes of the wilderness with design, and creating a wilderness

landscape that evolves with time. These landscape works transcend the traditional sense of natural culture, showing how to create a vibrant natural space in the city combined with the original wilderness, and make it a part of the daily activities of citizens. It is not difficult to see that the reason why wilderness gives people strength is that it follows the laws of nature and its nature is closer to the nature of human beings, which is called “Tao follows nature” advocated by Lao Tzu.

The Realistic Demand for the Re-enchantment of the Wilderness

The practice of wilderness landscape shows that wilderness can release more powerful vitality in city. Contemporary scholars of urban studies have begun to pay more attention to wilderness in urban environment.

In fact, the ecological civilization advocated today is a deep reflection on the relationship between human and nature, aiming to make people focus on ecology and wilderness. The outstanding characteristics of ecological civilization is attaching importance to ecology and emphasizing the beauty of original ecology, such as snow mountains, rainforest, oceans and other large areas of original ecology as well as small pieces of original ecology hidden in cities or villages that have not been destroyed by civilization. This is the “wilderness”. As Rolston’s research, wilderness reconstructs the relationship between human, city and nature. As the fertile soil of human life and the foundation of civilization, nature, in Rolston’s view, nature is “the matrix of life incubation and the place where human beings are born”¹, while wilderness is “the source of the connection between human beings and the natural”² and “the source of values”.

The affirmation of wilderness value is supported of cultural background. In the context of ancient Chinese culture, “wilderness” can be regarded as a view of nature. Ancient literati often regarded the wilderness as a kind of nature in their works, which is not only physical nature, but also a kind of nature in the spiritual world. Chinese Ancient cultural traditions advocated the harmony between human and nature. Even in landscape culture, the emphasis on wilderness can be traced back thousands of years.”

Tracing back to ancient Chinese culture, wilderness appeared frequently in ancient Chinese literary creation. As the external manifestation of the internal spirit of Chinese culture, wilderness constructs a wilderness world in traditional culture. Combing the development process of ancient Chinese cities, in the course of independent aesthetic appreciation of natural and taking wilderness as the object of esteem, it shows two aesthetic meanings, one is “seeking interest” and the other is “expressing feelings”.

Seeking Interest in the wilderness. Back to the Warring States Period, Chuang Tzu yearned for the “world of Supreme virtue”, which was actually the period of seeking interest and wilderness at the beginning of civilization. At that time, all things lived close to each other, retaining the original wilderness charm of their natural state, and presented a wilderness landscape. The development advocated the natural nature of things and affirmed the original natural state of nature.

Enjoy the wilderness. From the records of ancient Chinese literary works, as pure nature, that wilderness is not only a silent natural object or passive natural environment, but also carries rich spiritual symbols and emotional connotations. In literary creation, literati like to use the image of wilderness interest. Through the image of wilderness,

2 Holmes Rolston III, *Philosophy Goes Wild* [M], Liu Er, Ye Ping, Changchun: Jilin People's Publishing House, 2000, p. 4.

they seek interest in the wilderness and place more emphasis on the wilderness.

In ecological civilization, the acceleration of urbanization has led to the lack of “homeland feeling” of Chinese living in cities. It is difficult to find spiritual homeland. As the home of soul and spirit, wilderness can be called a medium and a carrier. The return of wilderness consciousness has become an urgent need in urban living life.

Therefore, the preservation and protection of wilderness landscape in cities has become an important mission of contemporary urban construction. Professor Chen Wangheng summarized the realistic need of this wilderness consciousness from the philosophical as “wilderness re-enchantment”³. In the era of ecological civilization, wilderness philosophy has become an important part of the contemporary ecological civilization with its deep sense of distress for the destruction of human survival home and deep reflection on the current production and life style. As early as last century, American environmental ethicists have issued a warning: “The protection of wilderness provides the only or the last chance to live in harmony with nature.”⁴

Contemporary Inevitability of Wilderness Aesthetics

Cities are closely related to wilderness. From the perspective of industrial civilization, cities and wilderness seem to be incompatible two independent existences. So, from the perspective of ecological civilization, how should they intervene in each other and coexist in harmony? It is not easy for cities to accommodate wilderness, but even more difficult for cities to accommodate wilderness aesthetically. With the acceleration of urbanization, more than half of the population live in cities. Cities have become the main living environment of Chinese people. “Let cities integrate into nature, and let residents see mountains and water.” This was mentioned by President Xi Jinping. Living in the city carries people’s yearning for a better life. The idea of “Better City, Better Life” clarifies that the city is not a machine for people to live, but a container for people’s emotions. In urban life, “Happy Living” as the highest pursuit of environmental construction, the inclusion of wilderness in cities is indispensable. It can also be understood that wilderness is a reflection brought about by the rapid urbanization process.

Today’s urban construction is a complex and comprehensive project. Professor Chen Wangheng emphasizes the principle of “aesthetic dominance”. Therefore, in the urban aesthetic life of the ecological civilization, we advocate an aesthetic view, that is, the wilderness aesthetics. As the most authentic ecological nature, the wilderness has become the object of cognition and experience in people’s city life. Of course, aesthetics will inevitably be obtained and we can find the meaning of life better. Professor Chen Wangheng advocates the delimitation and harmony between ecology and civilization, and emphasizes the construction of a new aesthetic concept, that is, the aesthetic concept of delimitation and harmony. “This aesthetic concept requires the coexistence of the original wilderness and modern civilization. In their respective regions, the wilderness and civilization do not contradict each other and are self-contained. This kind of harmony is not the sympathetic harmony of “I am in you” and “I am in you” emphasized in Chinese traditional culture, but the harmony of demarcation.”

This wilderness aesthetic emphasizing enlarging individuals in nature, sharing the same rhythm of life and the same emotion of life with mountains and rivers, to establish the

beauty of harmonious parallel development between wilderness and civilization.

Wilderness aesthetics has survived in Chinese cultural tradition from ancient times to present. The shock of wilderness is like the spray of blood from ancient times in the wilderness, which is an aesthetic feeling that can not feel in urban civilization.

In addition to the theoretical level, wilderness practice has been gradually promoted in China. Around the twentieth century, wilderness outdoor sports began to be popular in the United States, and the public's leisure interest gradually turned to wilderness, which continues to today. Nowadays, from the perspective of ecological civilization, the acceptance of wilderness practice becomes more and more urgent.

In the era of ecological civilization, to realize the sustainable development, we need pay more attention to wilderness and accept wilderness from the theoretical level, realize the return of wilderness at the level of urban planning and construction, and advocate more wilderness practice activities. Wilderness aesthetics rebuilds the real connection between urban residents and nature. Its significance is not only in strengthening the vitality of the city today, but also remind people cherishing the wilderness as a place of human interest, a place to enjoy, spiritual home, and re-enchantment the wilderness. Wilderness aesthetics is the great beauty of the era of ecological civilization. Cities in the era of ecological civilization sometimes have strong calls and acceptance of wilderness.

OPENING PREFABRICATION TO PARTICIPATION: INSTITUTE FOR TESTING MATERIALS SERBIA (IMS)

Abstract | The paper departs from pair of photographs (FIG.1.2) indicating common living space in newly built Experimental blocks 1 and 2 in New Belgrade. On the wall there is a memo to the youth working actions that ten years ago put foundations for the city. Throughout the window one could see new housing built by testing application of IMS prefabricated system designed by Branko Žeželj. In the further narrative, the paper traces role of the Institute for Testing Materials Serbia (IMS) in regard to the aesthetics of prefabrication. IMS was formed soon after Yugoslavian break with USSR in 1948 marking country's shift toward rapid industrialization. In this process use of manual building techniques was in the stage of transition toward application of equipment mainly imported through contracts on war reparation. As argued by Cornelius Castoriadis in his article on Yugoslavian bureaucracy from 1950, it was by abroad equipment once installed and further kept in good repair, replaced, and expanded that industrialization of Yugoslavia assured dependence from a qualitative point of view from the West. After retirement from ETH Zurich, one of the most prominent engineers of the generation Mirko Roš will return to his country of origin to constitute a new institution. With import of Swiss equipment the institute will gain its initial organization. In this process prefabrication itself became the object of ultimate expertise involving variety of actors. Deliberately designed as an 'open prefabricated system', IMS enabled primary construction to be completed in situ by manual techniques both as to work compatibility with secondary systems from variety of industrial catalogs. Envisioned to adjust to the different qualifications of construction labor with extreme savings in concrete and steel and being the first to introduce prefabrication at the actual construction site, the IMS system soon become one of the leading Yugoslav export products. From its initial application in New Belgrade, the IMS final product – a flexible flat – generated more than 60 000 housing units in Yugoslavia. Moreover, it domesticized within the European, African, Asian and South American market with incomes big enough to assure autonomy to the house of its origin. Tracing the development of institute from its constitution and import of machinery toward technical characteristics of the system and its application in housing in Yugoslavia and abroad (Cuba) the paper will try to point to the possibility of experimentally lead prefabrication as one of potential legacies of socialist aesthetics in architecture.

OPENING PREFABRICATION TO PARTICIPATION: The Institute for Testing Materials from Yugoslavia to Cuba

In April 1949, the recently retired ETH professor Mirko Gottfried Roš received a photo album depicting the achievements of The Five Year Plan in building the country from the Ministry of Construction of Yugoslavia. It was as a gesture of gratitude for his visit to Belgrade, the city of his birth, where Roš travelled, invited by the same Ministry.¹ The reason for the visit was the offer from the government and the Serbian Academy of Sciences to create a new institution for guiding industrialization and testing materials according to his knowledge and experience.² This was more than rich, as Roš obtained 11 honorary doctorates throughout Europe and set the foundation and developed the Swiss Federal Laboratories for Material Testing at ETH. In 1952, the new institution took the role that the prewar institutes had in government, gathering these within one center. In the letter addressed to the government Roš referred to the new institute as one for testing industrial materials and buildings and being independently funded, apart from initial expenditure covered by the state. Apart from loans for machinery and the salaries of employees, these included furniture for departments to equip '7 cabinets for researchers taking into consideration their scientific work, personal relations and the visits of groups of scientists from abroad'.³ These corresponded to departments of Stone, Concrete, Geomechanics, Wood, Metals, Physics and Chemistry, and the Development of Machines. Roš worked on the research program, the people engaged, specifications of the equipment with the positions of machines and the distribution of spaces. He oversaw the import of machinery from Switzerland produced by Alfred J. Amsler, writing: 'Initially we have one loan to obtain machines and apparatuses from Switzerland for scientific research and the practical testing of materials with the value of 1 000 000 CHF...the first half of the loan is adopted. The rest is needed for the fruitful work of the Institute. The machines are specified, prices without increase and with special discount of 10 %'.⁴ Although initially part of the Academy of Sciences, the Institute was separated by decision of the government from 1953 and placed under the supervision of an Executive Committee.⁵ It was then renamed the Institute for Testing Materials of the Republic of Serbia (IMS) and Roš's deputy and the Chair of the Department of Concrete, the young, up-and-coming Branko Žeželj, took Roš's position as Principle.⁶ This initiated a long phase of the Institute's development based on original patents in prestressed concrete, initially applied to Experimental housing in New Belgrade.

In 1962, the Belgrade photographer Branko Turin depicted motifs from newly inhabited

experimental housing in New Belgrade. Sitting in a local restaurant, a man looks throughout a large window towards the center of the housing area, playground and school. Dressed in a suit, he is surrounded by marble columns and wooden walls with memorial picture devoted to the youth working actions in building the city [fig. 2a, b].⁷ Built as a trial solution for solving the housing crisis in Yugoslavia, Experimental housing was a testing ground for both a way of living and a way of making. The most peculiar feature of the new settlement was the introduction of the IMS prefabricated system and the substitution of working actions by machinery equipment.⁸ Yet, despite all the difficulties, this new way of prefabrication actually took a lot from practices of youth actions. This primarily meant trial work on the construction site with the involvement of a variety of semi-specialized actors in the process of building.

Recalling the difficulties in construction Žeželj mentioned that the soil was unexplored and sometimes impassable, and that there was a lack of electricity, phones and basic materials such as cement and gravel. As the city was planned for the very unstable floodplains at the confluence of the Danube and the Sava, every kilo of weight within the construction was important [fig. 3]. Moreover, there was a lack of mechanization in the construction process, with only a few, weak cranes. With transport from the factory being expensive, it was decided that floor slabs will be produced at the construction site.⁹

An applied system was envisioned as a homogenous and rather simple solution made out of a pillar and a slab in a square of 4.2 x 4.2 m [fig. 4a, b]. Yet due to the joint between the slab and column regulated by the steel pre-stressed wires, the system acquires a high level of flexibility.¹⁰ The floor slabs, as the most original part of the system, are made out of internal ribs sandwiched between concrete slabs. The ribs are followed by cables which by introduced force create the prestressment of the concrete through each floor. The lower slab is made of two layers of plaster with a net in between and it represents the final solution for the ceiling. Due to the absence of a beam and the integration of the ceiling, the structure forms a very clean base for further work. The creation of the slabs was simple, too, as instead of steel molds, they were made using cardboard. Using paper for molding the ribs and upper slab was prioritized due to economics and simplicity of assemblage as it enabled both ribs and slab to be made as one.¹¹ The solution fitted the goal, with slabs weighing 3t on 17 m² which was 30 % less compared to known systems and actually enabled building on sand.¹²

The floor slabs were weaved to each other in a horizontal continuum by intersecting cables running through the ribs. The introduced force was adjusted to each building and delivered *in situ* as the final touch. This was done using equipment produced in Yugoslavia as part of IMS technology.¹³ The intention was clear from the very foundation of the Institute under Roš as two main themes during 1949 and 1950 were prestressed concrete and work on steel armatures and presses. The phase ended up with prototypes of press for straining cables made out of six \times 5 wires with armatures.¹⁴ The joint would become most famous solution of IMS technology bringing to Žeželj international recognition and to the Institute an initial product for export: metal systems for reinforcement.¹⁵ The solution brought relief in the housing sector until the end of the 1960s, the majority of building in New Belgrade was designed and performed by IMS system. As shown in a 1960 album by the Department of Concrete at IMS, weaving the structure in Experimental housing was performed by a mixed community of builders, from laymen and semi-skilled workers to engineers [fig. 5]. With minimal equipment this process of making although named the first phase toward industrialization was more correspondent to *crafting of industry* in trial by actors seeking a place in society by building it.¹⁶

From the perspective of city planning, Experimental housing was based on the General Urban Plan for New Belgrade as a city of 200 000 inhabitants adopted in 1958 by the People's Committee of Belgrade [fig. 6]. The plan came from the Urban Planning Institute Belgrade by a group of architects around Branko Petričić, known for his collaboration with Le Corbusier on *Plan de Paris 37* related to the thesis from *Ville Radieuse*.¹⁷ More than any other, the plan reinforced the idea of greenery surrounding freestanding objects that almost took a secondary role in the overall *imago* of social life. The city was envisioned as a sum of centers of neighborhoods of 5000 to 10000 inhabitants accompanied by schools, kindergartens, markets, playgrounds, health centers and culture. The adaptation of the plan was followed by its testing sample of Experimental Blocks 1 and 2 that became the biggest housing construction site in the country, a 'laboratory of experimental work whose findings from 1955 until 1960 were of major significance for the development of the construction sector'.¹⁸ Attempting to meet the extremely high rates of demographic increase, the Experimental housing was envisioned as two parcels totalling 3640 flats on 35 ha, for 12 425 inhabitants and represented the first local communities in New Belgrade. Embedded areas in the middle of the block for communal activities were surrounded by 5 types of buildings with 8 to 13 floors and 10 types of apartments.¹⁹ That the experimenting regarding planning followed the experimental work of the IMS was affirmed by Petričić, who

19 Petričić, "The First Urban Realization. New Belgrade 1955-1975," 230.

wrote that in order to fit the IMS vision, defined spans, heights and module were needed. Petričić worked on span, recalling that ‘after competition we adopted one of 4.2 x 4.2 m and next to the new urban vision, we got an original structural system. Seemingly crucial to this were the extremely difficult field conditions’.²⁰ Construction informed the plan in the other direction as next to Petričić, an architect employed at IMS Dušan Milenković worked on designing the first buildings built in 1957/1958 prior to the adaptation of the plan.²¹ The plan simultaneously adopted resulted in mock-ups in order to build most housing from 1960 until 1963.

For the IMS, apart from testing the new way for construction, working on experimental housing meant new visions for the production of flats at construction sites. There would be organized precast plants for production at sites capable of producing 500 hundred flats per year. Production was mobile and as soon as it finished work at one site it moved to a new area. In order to set up production, the Institute initiated cooperation with interested firms for building and installations, craft workshops and the Yugoslavian sector for construction of machines.²² In this sense, the involvement of the IMS in solving the housing problem mediated by the plan of the Urban Planning Institute, informed its future, adding the production of flats as part of its experimental offer.

In June 1966, the Cuban Vice-minister of Housing, Alberto Arrinda Pinero, wrote to the ambassador in Yugoslavia, José Luis Pérez, that ‘our Ministry wishes to experiment as soon as we have sufficient technical data with the system of Prestressed Concrete developed by Professor Branko Žeželj’. The information requested included the plans for four to five story buildings, details on the construction of floor slabs, the form of prestressing through the columns, the kind of material for the joints and views on possible alternative material to be used. Additionally, the Ministry would ask for ‘6 more copies of the excellent brochure of this system published in 1966 by the IMS’ and photographs.²³

The ambassador visited the New Belgrade construction site in September 1966 in order to compare options for similar construction in Cuba. According to his talk Cuba faced a huge program of housing construction and Fidel Castro personally had an interest in applying the IMS system for this purpose.²⁴ In December, a Cuban delegation visited New Belgrade followed by another group aiming to agree work on experimental building in Cuba according to the IMS system.²⁵ Formed of Amor Serjo, Adolfo Gonzales, Leonardo Ruiz and the architect Basilo Piesecki, the group worked at the IMS on an experimental project followed by the three-month practice of six Cuban technicians at the Institute. In return, Žeželj travelled to Cuba to give lectures, describe the system and suggest building location in Havana.²⁶ Meanwhile, material travelled back and forth, including

pieces of steel wire for prestressment arriving at the IMS for final approval for the adequate application of the system in Cuba [fig. 7].²⁷ The phase resulted in a contract between the IMS and the Cuban Ministry on the application of the IMS system and the export of equipment for the production of experimental buildings.²⁸

From the Cuban perspective, faced with intensive housing construction, the Institute for Housing within the Cuban Ministry of Construction underwent significant research into prefabricated systems worldwide. Groups of researchers studied the systems in order to select a group of ten. Delegations were sent to various countries in order to learn about the technology, do field trips and discuss projects. The process ended with the selection of 6 prefabricated systems: 3 with large-scale panels, 2 with movable moulds and one skeletal system from the IMS. These were further compared based on projects for experimental buildings assigned to each to offer data on the possible involvement of workers and materials. From 1968 to 1969, experimental buildings were built based on detailed projects created to drive practical decisions.²⁹ From 1971, the Cuban administration accepted the IMS system being seen as the best in competition with other system for prefabrication.³⁰ Subsequently the IMS and the Cuban Ministry started an intensive collaboration with over 20 years of field construction. In 1974-1979 alone, three precast plants for the annual production of 4500 flats were delivered from Yugoslavia to Cuba together with equipment, documentation and technical assistance.³¹ Known as PVYC: *Plantas de Vivienda Yugoslavia-Cuba* and located in Havana, Cienfuegos and Santiago de Cuba, these produced flats on site, using micro-brigades made up of 33 initially unskilled builders [fig. 8, 9].³²

The IMS work at the Experimental housing travelled a long way, adopting the heritage of unspecialized work in the post-war period. Starting from solely the experience of making, the IMS recognized the trade value that makers and society were striving for in the process of constructing the city as a place of inhabitation. Thus, work on Experimental housing involved the further development of the Institute as a producer of flats *in situ*. This practice evolved in the special X Department of Buildings founded in 1957, tasked with achieving unique solutions using experimental prefabrication, afterwards know as one of the most original contributions of the IMS.³³ All of paths the IMS took from New Belgrade were gathered as a *transfer of technology* by which the Institute exported precast parts for making housing in Italy, Austria, Hungary, Cuba, Ethiopia, Angola, Egypt, the USSR and China. These were based on the involvement and education of local people and materials, aiming at an open system within the experimental testing of materials.

EXPANDING A DEBATE ABOUT SHRINKING POST-SOCIALIST CITIES TOWARDS AESTHETICS: URBAN SHRINKAGE, INSPIRATION, AND CREATIVITY

Abstract | Shrinking cities are becoming a new 'reality' in contemporary urban development thanks to numerous scientific contributions about this globally widespread phenomenon. However, it is not widely known that the term "Shrinking cities" was initially promoted through the same-name international project that culturally dealt with shrinking cities. This project, led by Eastern-German cultural experts, revealed internationally the essence and frequency of urban shrinkage. Interestingly, the approach used in this project has been important to clarify that urban shrinkage is not a negative process *per se*. Even more, the project contributed to define the multi-dimensional and productive character of this phenomenon. The further research and projects on shrinking cities were less devoted to its cultural and aesthetical side. They were mostly oriented towards the main causes and consequences of urban shrinkage, discussed within the discourses of economy, geography, demography, political science, and ecology. Nevertheless, the inspirational, artistic and creational aspect of urban shrinkage has not been lost. With the recent formation of the concept of shrinking cities, a new attention has been given to potential ways to overcome urban shrinkage. New conceptual proposals and attempts have also used culture, art, and creativity again, but in different format. They have tried to connect the previously acquired scientific knowledge with creative industries and applied arts, where they are seen not just as a creative moment, idea or artistic inspiration, but as a comprehensive, and usable "healing" approach to reinvigorate shrinking cities. The aim of this paper is to present ongoing efforts towards the link between urban shrinkage, inspiration, and creativity. It is done by comparing them with the position of this link from the beginnings of the concept of shrinking cities in the early 2000s. Therefore, it is a contribution to the development of the historic perspective of the aesthetical and artistic side of this concept, which certainly needs a more prominent role in the future urban development.

Index terms | *Creativity; Inspiration; Post-socialist Europe; Urban aesthetics; Urban shrinkage;*

INTRODUCTION: POST-SOCIALIST SHRINKING CITIES THROUGH CULTURE, CREATIVITY AND AESTHETICS

Shrinking cities has recently emerged as a new “reality” in global urban development (Rink et al, 2012). It should be clarified at beginnings that urban shrinkage as a development process has existed parallel with urban growth since the first cities. Then, the process of modern urban shrinkage has also been noticed 60-70 years ago, in the case of early-industrialised cities in the USA (Kaufman, 2011). However, the frequency and widespread of shrinking cities, as well as the appearance of the case of extreme urban shrinkage, have cemented the position of this phenomenon as important in contemporary urbanisation at global level (Richardson & Woon Nam, 2014; Pallagst, Wiechmann & Martinez-Fernandez, 2014).

Urban shrinkage is especially evident in Europe, where 40% of cities are losing population (Rink et al, 2012). However, this percentage differs greatly across the continent. In the eastern half of Europe, which consists of the former socialist countries, urban shrinkage is by far the prevalent type of urbanisation today (Turok & Mykhnenko, 2005). In Romania and Bulgaria, more than 90% of all cities are shrinking; the other post-socialist countries have the lower percentage of shrinking cities, but all of them have more cities in this group than in the group of growing cities (Restrepo Cadavid, Cineas, Quintero & Zhukova, 2017). Serbian cities are also pretty threatened by urban shrinkage; approximately 85% cities has had demographic decline and economic underperformance by the last national population census in 2011 (Djukić, Antić & Vujičić, 2017). The presented figures illustrate that shrinking cities and the ways of their future development are of special interest in post-socialist Europe.

Shrinking process is a multi-dimensional and complex phenomenon (Hospers, 2014). It reflects through different aspects and many times it is challenging to position these aspects between causes and consequences. However, from the early beginnings of research, urban shrinkage has been mainly described as a process of population loss in an urban area due to the problems of its economic restructuring (Rieniets, 2009). Thus, demographic and economic aspects figure as the most prominent ones. The other ones with minor role are numerous: social, political, administrative, ecological, physical, financial and fiscal shrinkage, etc. (Großmann, Haase & Rink, 2008).

Interestingly, the internationalisation and the main promotion of both the term and concept of shrinking cities in the middle 2000s was carried through the same-name project (“Shrinking Cities / Schrumpfende Städte”) that was basically settled in art, creativity, culture and aesthetics from post-socialist space in Eastern German cities. Since that, this initial, “artistic” approach in the phenomenon of urban shrinkage has been retreated to the other afore mentioned aspects, better linked with scientific investigations and quantitative outputs. Nevertheless, this approach has not been lost. Even more, it seems that artistic approach is passing through a renaissance period now, after the consolidation of the concept of shrinking cities in the early 2010s.

The aim of this paper is to present ongoing efforts towards the link between urban shrinkage, art, inspiration, and creativity. Its contribution is to determine the current aesthetical and artistic side of this concept. This is of special interest, because art, culture and creativity have become important global factors to fuel socio-economic development (Aber & Yahagi, 2014). Therefore, the aesthetical and artistic side of shrinking cities certainly needs a more prominent role in the future urban redevelopment

and demographic regeneration of shrinking cities.

METHODOLOGY

This research is shaped as a review paper. The key content of the paper is related to the newer knowledge regarding relations between urban shrinkage, art, culture, inspiration, and creativity. To acquire it, the initial artistic development of the concept shrinking cities (and the same term) from the early and middle 2000s had to be explained. This is done by combining primary and secondary resources and by adding comments and conclusions.

INITIAL RESEARCH OF SHRINKING CITIES THROUGH ART AND AESTHETICS

It was already highlighted that both the term and concept of shrinking cities were initially promoted through the same-name international project – “Shrinking Cities / Schrumpfende Städte” (2002-2008) – that artistically and culturally dealt with urban shrinkage. This project was led by Philip Oswalt and the other Eastern-German cultural experts and it was financed by the Federal Cultural Foundation of Federal Republic of Germany. However, the project involved many international experts in art and research and included different cities as research case studies. The main case studies were four urban areas: Detroit (USA), Manchester/Liverpool (Britain), Ivanovo (Russia), and Halle/Leipzig (Germany). In line with this character, the project revealed internationally the essence and frequency of urban shrinkage at different levels: in Eastern Germany, in Europe, and globally. Hence, the project played a critical role to mobilise cultural and scientific community from different disciplines to explore the phenomenon (Laursen, 2009). The project manager, Philip Oswalt, clearly revealed the intention in the introduction of the project, saying: “Shrinking cities are a cultural challenge to us. In the Shrinking Cities project, architects, academics and artists investigate recent developments ... and make suggestions” (Oswalt, n.d.)

At the first glance, it is unexpected to understand that a cultural project handles such project with easily noticeable functional and physical repercussions, typical for the fields of urban planning (Laursen, 2009). Nevertheless, several artistic actions (Fig. 1 & 2) conducted within the “Shrinking Cities” Project triggered general opinion relating shrinking cities. In essence, the project tried to give the positive answer that shrinking cities with their identity, uniqueness and mental milieu were an ‘excellent polygon’ for new artistic expression in architecture, film, photography, music, literature and the other forms of fine and applied arts. This approach was used in the whole project, where every investigated shrinking city (or ‘polygon’) got a specific ‘artistic dossier’ (SCP, n.d.).

The outputs of the project were praised even at its final stages. The most important ones were several mobile artistic performances, created by the project members, which were eventually exhibited in shrinking cities in Germany and in the USA. These events did not presented just the consequences of urban shrinkage (mainly negative), but they also aspired to show the positive, creative dimension of this phenomenon (Hollander, Pallagst, Schwarz & Popper, 2009). Apart of these, major events, many small cultural actions were conducted. For example, a series of documentary movies about urban shrinkage were realised, such as “Requiem for Detroit?” (2010), “Sometimes City” (2011), “The Pruitt-Iggo Myth” (2011), and “Detropia” (2012) (Luescher & Shetty,

2013).

At the end, the impact of the project has been much more significant than the enlisted outputs. The artistic and culture-based actions carried through “Shrinking Cities” Project have changed the way people perceive urban shrinkage and shrinking cities as its physical reflection. P. Oswalt (2006) scrutinised this change in the project; to show people that shrinking cities are not a paradox in urban development, but its new normality and that they need to be familiarised with it (SCP, n.d.). Finally, people became familiar with both the term and concept of shrinking cities.

THE RECENT RESEARCH OF SHRINKING CITIES AND AESTHETICS

Today, after the consolidation of the concept of shrinking cities, this approach through art, creativity and culture is usually settled in the broad social aspect of the concept, but this picture is more complicated (Antonić, 2018). Although the fields of art, culture, and creativity have never been excluded from the main research discourse of shrinking cities, it seems to this topic has been recently reinvigorated due to a new climate in general urban development. These sectors have been traditionally appreciated by scholars due to their traditional influence on social wellbeing, but also as useful and innovative tools for economic regeneration recently (Aber & Yahagi, 2014). There are two main directions that are observable in the current discussions about the role of art and culture in shrinking cities and their desirable reurbanisation.

Generally, inherited ‘classical’ culture is considered as a significant factor for reurbanisation. This is underlined as a very useful approach for the cities with strong cultural background, such as Dresden, Jena or Potsdam in Eastern Germany (Wiechmann, 2009). The example of Dresden (Fig. 3) is well-documented. The city successfully implemented the strategy adopted immediately after the fall of socialism in the early 1990s. This strategy was based on the comprehensive physical renewal of ruined old city ambient as an extended tourist offer for the numerous visitors of classical cultural and artistic splendour in many city museums and galleries. The use of huge resources from federal government for this aim has been criticised by public, especially during the years of urban shrinkage in the 1990s and the 2000s (Wiechmann, 2009). This approach has had a partial impact on the best examples in Eastern Europe, e.g. world-heritage cities in post-socialist countries. For illustration, the afore mentioned Dresden, as well as St Petersburg in Russia or Tallinn in Estonia, have witnessed reurbanisation process since the start of 2010s, Sibiu in Romania (Fig. 4) has slowed its shrinkage towards reurbanisation, but Pecs in Hungary has continued to shrink fast despite it was even European capital of culture few years ago.

2086

Another problem in the previous approach is that many cities do not possess so valuable cultural legacy to be a ‘fuel’ for their regeneration and reurbanisation. However, the things that all shrinking cities possess are creativity and local tradition that can be utilised for these aspirations. This is even evident for those cities with profound industrial past, rarely linked with culture and art (Bontje, 2016). J. Aber (2009) emphasises this interconnection between creativity and local tradition. It should be done through cultural industries, one of major attainments of a shrinking post-industrial city and globalisation. For example, many American shrinking cities have recently based their development agenda on the encouraging of creativity and the formation of local creative clusters (Audirac, 2009). The point is that this vision can be achieved only with comprehensive local development of higher education and tertiary economic sector; this is, for example, an outcome of the research of the City

of Liepaja in post-socialist Latvia (Egliņš-Eglītis & Lūsēna-Ezera, 2016). Accordingly, development policies that encompass both urban regeneration and wide support for creative industries and clusters or make links and customisations between these two sectors are seen as a key element to enable reurbanisation and urban redevelopment (Oliveira & Paulino, 2017).

CONCLUSIONS

The main intention of the paper is to present the newest directions in the research of shrinking cities that bridge this wide topic with the fields of art, inspiration, and creativity. The basis for this research is the same-name research cultural project, “Shrinking cities”, which has left an immense impact on the entire concept; it consolidated the name of both the term and concept of shrinking cities globally. Moreover, the cultural events and research-scientific contributions realised within the project changed the deeply embedded opinion that shrinking cities cannot be considered as ‘exempts’ of contemporary urban processes and that they also have or, more precisely, must have a development perspective.

The acquired findings relating the newest data about the links between shrinking cities and the fields of art, inspiration, and creativity present a quite new situation. After establishment of both term and concept, the general interest about this topic has been reoriented towards the future of shrinking cities, i.e. possible solutions for them. Two presented approaches are diametrically different, but both have art, inspiration, and creativity in their essence. It is also obvious that they target two different types of shrinking cities, in line with their historic and cultural legacy. However, this dichotomy is more profound.

- The first type of cities, with rich and unique heritage and culture, face simpler procedure because the focus is on already obtained on artistic and cultural treasure and they can easily start with the second phase – their promotion and sustainable use. Thus, they can achieve the redevelopment and eventual reurbanisation in short-term periods, like in the explained case of Dresden.
- In the other side, the second type of shrinking cities without rich and unique heritage and culture had to first rediscover which kind of heritage and culture they can promote and utilise and, then, how they can be linked with general urban development. This is certainly more time-consuming. Such cities are also prevalent and they usually cannot use just the tools from art and creativity to redevelop themselves. Finally, the showcases of this type are still rare, which put a bigger challenge for the development agenda of such shrinking cities.

At the end, regardless of the type, shrinking cities need the better integration and/or customisation of their development policies, to allow a ‘synergy effect’ and rational approaches in this process. This is particularly important because, as it was explained in the introduction, shrinking cities have limited demographic and economic resources, which cause a lot of constrains for their future.

Branislav Antičić, Ph.D., is a teaching assistant at the University of Belgrade – Faculty of Architecture, Serbia. His scientific, professional and academic interests in general are urbanism and spatial planning, with a special focus on the planning of medium-size and small communities and urban dimension of housing. He has published several articles in high-ranking scientific journals and monographs on these topics. Moreover, he is an active participant at international conferences and scientific meetings, where he made more than 50 scientific contributions. He also participates in one national scientific project regarding the improvements and systematisation of housing in Serbia and in one international INTERREG project about the urban branding of cultural heritage along the Danube. As a coordinator or member in working team, he has also been involved in more than 35 works relating to urban and spatial planning and urban design, of whose several have been awarded.

Aleksandra Djukić, Ph.D., is an associate professor at the Faculty of Architecture, University of Belgrade. Her field of professional activities and research is directed on urban design and planning, urban morphology, urban renewal and heritage. She has published 4 monographs, 180 articles and chapters in international and national scientific journals, books, proceedings. She has participated in numerous national and international research projects and workshops. She was a keynote speaker at three international conferences and she gave lectures at Universities in Granada, Graz, and Bari. In practice, she has done more than 50 urban plans and designs, 10 realized buildings and 5 studies in urban renewal and planning (for UNDP, Ministry, Local government). She has received many awards for competitions, in urban practice, for research project and two rewards for the best paper at International congresses. She is a vice president of Serbian Town Planner Association and a representative in ECTP-CEU.

Eva Vaništa Lazarević, Ph.D., is a Full Professor of Urbanism at the Faculty of Architecture of Belgrade, and has over 25 years of experience in teaching urban design, regeneration and planning and as a practitioner architect. She was engaged as Head of Department for Urbanism, Member of City Council Commission for Urbanism of Belgrade and a Councillor for Architecture and Urbanism at Ministry for Urbanism, Planning and Environment of Serbia. Founder and responsible for design and project management of “Atelier Eva Vanista Lazarevic” Design Bureau, she has created design solutions for a variety of projects in Serbia and abroad. She is also the author of over 30 scientific papers concerning urban design and two books, both awarded, and a participant of many scientific and academic conferences and professional meetings.

TODAY'S AESTHETIC EXPERIENCE BASED OD YUGOSLAV AESTHETICS

Abstract | Over seventy years long history of Yugoslavia, and even more older idea about unification of the South Slavs left behind them historical facts, abundance of artworks and some love-hate relationships. The way we perceive Yugoslavia today depends on many things, including our year of birth. Had we chance to experience Yugoslavia in its live days or we were not even born. Second thing about experiencing Yugoslavia is how we perceive nationality in it. Was there Serbian/Croatian/Macedonian art within Yugoslav borders or it was Yugoslav art/architecture/cinematography etc. *How we remember is how we define ourselves.*

A primary interest of this paper is to stimulate and provoke our thoughts and feelings, to expand our Yugoslavia-based knowledge in terms of wondering is there Yugoslav aesthetics. In the second section of this paper, the main goal is to identify emotions behind post-Yugoslavia experience. People who were born in the last decade of the existence of a state called Yugoslavia nowadays still recognize the Guzzini lamps with nostalgia for that time, and even though they had no opportunity to create at that time they can now feel their internal/unique value. In the end, this work aims to re-examine the potential of today's young creators who can draw energy from their heritage.

Index terms | *aesthetic; experience; Yugoslavia; design; influence; creative process;*

INTRODUCTION

The Common State of South Slavs nations lasted just over seventy years. The idea of unification was based on the possibility that different nationalities can work and develop together within one homogenous group. Belonging to a particular community is related to the matter of the identity,² in this case to the primary, Yugoslavian one, towards the Serbian, Croatian, Slovenian, and later Montenegrinian and Macedonian. The idea and development of Yugoslav idea can not be considered only in the formal framework of the state's duration, as the establishment of the Yugoslav identity can not be viewed outside of the ideologies,³ which at different times and using of different cultural structures⁴ formed and maintained the continuity of the development of the idea of a common state of a unified, national identity- the Yugoslav one.

Issues concerning collective, national and cultural identity help us to understand more deeply their overlaps and sources, depending on the context. By cultivating and developing individual (or all) forms of human culture, one forms and achieves a cultural identity, while culture is determined by the principles of the nation.⁵

The concept of collective identity comes to new generations through time and through the feeling of belonging to the same.⁶ That heritage, that cultural uniqueness of one nation is closely connected with its established national identity.⁷ This was the Yugoslav idea. The parallel development of national identities vis-à-vis the Yugoslav one is enabled by the establishment of the Yugoslav identity as the first one, and thus their relation is defined as hierarchical.⁸ Therefore, the degree of development of Yugoslav culture, art and heritage must be observed being aware that it did not perceive its peak as a homogeneous entirety. The potential of the Yugoslav idea did not survive its zenith.

Question - what is ours and what is yours is still in the air, even after more than 20 years after the breakup of Yugoslavia. The events that preceded the break-up, as well as those after it, are being dealt by the historians, and today they are viewed as a Yugoslavia timeline. What's left inside the borders after removing them? We know what and how it happened, now we searching for the way how we should remember that?

Nostalgia today defines our memories of Yugoslavia. It comes along with certain dose of melancholia how it was and could be together with some unsolved questions. Nostalgia that is not only related to the former Yugoslavia citizens, but also to people born in the last decade of its existence. Their (Yugoslavia) point of view could be rather defined as fantasy than real involvement.

Search for an aesthetics outside West

In search of the answers to aesthetic questions, often (if not always), we come across publications written in the West. It poses a question whether aesthetics is really a Western endeavour?⁹

Prefix *Yugoslav* in term of Yugoslav aesthetic can be perceived in two possible ways. First one refers to Yugoslav idea of South Slavs unification which has never reached its fully potential as national identities prevailed over the Yugoslav one. That point of view turns the idea of unification (one home for all), into utopia. Ernst Bloch's critical theory of Utopia sees Utopia as a process rather than a destination, so if we perceive the idea

of Yugoslavia as utopia, it actually gives us space not to answer to all questions that has bothered Yugoslavia breakup.

The second one can relate to the real events set up in Yugoslavia for the purpose of glorifying the country and its people, such as Yugoslavia's Youth Relay (using baton as an object of aesthetics). The first one refers to a long process of forming Yugoslavia as a country, where the result of a process has no influence on its perception. The second one refers to the fact that many things can not be perceived outside of Yugoslav context.

The present paper aims to focus on these things, where an object presents harmony and togetherness with the country of its origin.

Obtaining experience

A phenomenon of an aesthetic experience is being discussed through various disciplines, including philosophy and sociology, to understand it man need to move *beyond the acknowledgement of aesthetic in formal works of art*.¹⁰ Understanding what an aesthetic experience is implies also questioning aesthetic appreciation. Beside that, the important thing is to investigate/research what an aesthetic experience makes different. If we ask what an object of appreciation can be, than we implicatemananother question: What makes something to be considered as art?

Theories made about aesthetic experience implicate processing stages which are involved within. Researches usually refer to it as a process, and according to that they develop a model for understanding.

One of it is a model proposed by Leder (Leder and collaborators) in which aesthetic experiences involve five stages: *perception, explicit classification, implicit classification, cognitive mastering and evaluation*; model differentiates between aesthetic emotion and aesthetic judgments as two types of output.¹¹

From this point of view, an object of aesthetic appreciation can be defined as something that prompts valuable (aesthetic) emotion in us. During the process of evaluation whether something is an aesthetic matter of subjective or objective we must consider that aesthetic is contextual so our judgments (and experiences) are directly in relationship to historically situated experiences.

If art is the only way we are exposed to aesthetic experience, than we have already defined what can and what can not come to an aesthetic experience. As experience, an individual, yet strongly in correlation with personal sense of aesthetic taste and intuitions about art can't be controlled or compared, aesthetic experience can't be strictly positive (right) or negative (wrong) and vice versa.

Resulting in an aesthetic emotion is followed by a cognitive process of a perceiver challenged to absorb and identify the artwork together through affective states.¹² A process which contains fascination and evaluation, and the result of which is an emotion was also discussed by Marković, as characteristics of an aesthetic experience (Marković 2012;): 1) *fascination with an aesthetic object* 2) *appraisal of the symbolic reality of an object* 3) *strong feeling of unity with the object of aesthetic fascination and aesthetic appraisal* (aesthetic emotion).¹³

The present paper focuses to give an insight to the question how we aesthetically experience our past in the present days, examining whether there is a Yugoslav aesthetic.

Context of Yugoslavia

Yugoslavia, 1955. Niko Kralj designs chair 4455, *chair to work like a charm in every ambience*.¹⁴

One example of environment where the chair found its place was a hospital in Jasenice, Slovenia. There, the chairs were used in halls and waiting rooms. 60 years later the hospital was renovated and the chairs were removed from a newly designed interior. In 2009, the reconstruction of a Modern Art Gallery in Ljubljana was finished and the chair 4455 again found its place.¹⁵ For about 5 years, these chairs were simultaneously used in two different objects, in both as a mean of use. In the Modern Art Gallery the chair has a deeper sense, while in the hospital it has the same purpose as it had had for many years before. Time changes our point of view, but it doesn't always give to its value. What can be a reason for that? A great design by Niko Kralj, for sure. Yugoslav or Slovenian? It doesn't matter, because that design is a mid-century modern style. As we see things nowadays, we may take for granted that high quality designer chairs were located in waiting rooms, public spaces, offices etc. It's the proof that we have grown up in the modern world. A standard and a quality are inspiring us. The tradition of good design being at its disposal. Standard, again, inspired by *our* history of design.

Fascination with a good local design, through our personal experience to a new perception of the same thing in a new context, followed by emotions. From an architect's point of view, it can be said that the identity of a certain space can be preserved by fragments of the past.

Yugoslavia, 1979. At the JNA Stadium, the president Tito receives a relay baton on his birthday. Twenty days worn by thousands of young people throughout Yugoslavia, the baton made by Milena Braniselj, was the last one Tito received, as he died in May the following year. What makes that baton more special from more than 2200 others batons that are being kept in Museum of Yugoslavia¹⁶? We can focus on local relay batons, the first one and the last one, as well on the entire manifestation, (which from 1965 was considered as an evening performance with light show and the fireworks).¹⁷

Excitement of watching it was an indicator of aesthetic experience. Relay race was seen as a symbol of togetherness, positive emotions as indicators for good.

Does an (aesthetic) emotion come first before (aesthetic) judgment?

Cannes, 1980. Milena Dravić is wearing a dress made of silk from Prizren (*Prizren silk*) and designed by Aleksandar Joksimović. She said: *I had our jewellery and everything on me was ours, nothing foreign*.¹⁸ She won the Cannes Best Supporting Actress Award for Special Treatment. Watching those photos today, where everything is domestic: Makavejev, Milena, Prizren silk and jewellery – makes that we can not lack a sense of proud and dignity, as well as the feeling of identity and national belonging. Creation of this unique identity will make a new material designed for some new dresses and new scenarios.

Still sorting thoughts

How we see something, and how we make it valuable depends on things that are within us, but also on the ones that created space in which we were born. The past and the present space intertwine, sporadically taking a dominant position. Beside our need to understand, as humans and as creatives can be to seek for new questions, new positions from where we can understand our (possible) paths. Perception, deep feelings, and a sense of profound significance¹⁹ could be our parameters on that road.

Belgrade, 2018. Serbian graphic designer Bratislav Milenković illustrates for the Museum of Yugoslavia. He names his illustration *Renewal begins now (Obnova počinje sada)* and based on graphic designs created in Yugoslavia until 1990, believing that *with reconstruction of ourselves we can get to better and new perspectives.*²⁰

IS THERE AN EASTERN CHRISTIAN AESTHETICS?

Abstract | The Eastern Europe is considered not geographically or historically, but in terms of the Orthodox Christianity. In that regard, the originality of an Eastern European aesthetics and gnoseology refers to the energetic theology of icon having no counterpart in other domains. Discussing its manifestations, the authors' interest concerns Russian avant-garde painting from the XX century. The focus is on suprematism of Kazimir Malevich whose action is characterized by the concept of non-objectivity that has become a synonym for the avant-garde movement. It is the artist whose sensibility and artistic philosophy is designed primarily through an immediate experience, excitement and reflexion of painting. Non-objective aesthetics of suprematism in the first place emerged to be a basic nature of the art and then raised to a universal substance of ontology and cosmology. Passing from the black through the colored finally to the white phase, the paintings of Malevich wield a significant relation to Byzantine iconography in respect of its theory and theologico-aesthetical substrate. The suprematistic icons, fulfilled by a specific sensibility and extraordinary energies, discern presence of the fairy faith and an unbearable spark in artist's eyes looking into the future. The Russian avant-garde has remarkably stepped out from the frame of modernism coming near to a postmodern view. Contrary to the modernistic attitudes, it does not favor a strong demarcation between the old and the new art considering such classifications meaningless— which stems from a certain perception of past and future, tradition and history, originality and nation in artistic creativity. In addition to challenge the modern conception of linear time, one suggests an assumption that creativity is already contained in the tradition which indicates a comeback to the origin. Such a paradigm implies continuity, inheritance and restoration of artistic experience making a struggle against the individualism, which comes from a conviction concerning cosmological significance of art. It corresponds to iconographic style that is a common creation whose key tag is absence of the individual subjectivity. Malevich claimed that socialistic community was the last instance of modernism whereby the next step required abandoning the objective art in favor of non-objectivity. His statement that it could not be realized in socialism, but only in suprematism, was prophesying a post-modern culture which should arise afterwards. Its emergence implements a contemporary interpretation of the Eastern European and the Eastern Christian aesthetics.

Index terms | *iconography; Russian avant-garde; suprematism; non-objectivity; postmodern culture;*

INTRODUCTION

As well as Europe, the Eastern Europe is a concept defined in various manners. The definition sometimes includes the Siberian Russia, the Balkan Peninsula and even the Middle East covering countries from Turkey to Afghanistan, Pakistan and India. It is therefore extremely flexible and dependent on the issue discussed.

The paper considers aesthetics of the Eastern Europe assuming an integrity of the region, whereby the integration factor is regarded to be the Orthodox Christianity. Discussing its manifestations, the authors' interest concerns the Russian avant-garde. A striking cognation of the avant-garde art to the Orthodox iconography indicates a continuity of the Eastern European aesthetics (Pellegrinaggio, 2018).

There is no reliable response to the question of when the Russian avant-garde started.

The authors agree a view that the turning point was emergence of suprematism in 1915, which coincided to crucial events of science and politics. In that regard, the suprematist manifest of Kazimir Malevich presenting a program of non-objective art is considered to be the avant-garde mainstream (Раткин, 1978). The same year, it was published the general relativity theory which turned out significant for elucidation of the Eastern European aesthetics. But there was also much more than that. Like most of avant-gardists, Malevich considered the social revolution in 1917 to be hinted by the artistic one, since both movements were organically imminent. He sought to explain that the avant-garde implemented within an artistic area the ideas which had been proclaimed by socialism and revolution (Мијушковић, 1998).

Malevich actually cognized that a relation to art was disclosing the same nature of totalitarian ideologies unifying utilitarianism and tendency towards the objective satisfaction. In that respect, the revolution was not only a triumph of the proletariat, but at least as much a triumph of the capitaliust class. In short, it is a triumph of the objective realism. One concludes that socialism did not eliminate such a system, but only developed it further and – because its nature could not exceed the objective limits – it was at best the last stage on a way to non-objectivity. He finally realized that his program was unattainable to socialism, but only to suprematism that should occur afterwards (Malewitch, 1962). Did he indicate a postmodern era that coincided to a transition of the Russian socialism? – it is the issue offering a contemporary interpretation of the Eastern European aesthetics.

RUSSIAN AVANT-GARDE AND ICONOGRAPHY

Non-objective Cosmology

The Russian avant-garde began to manifest resolutely through the primitivist movement that started about 1908. The concepts of French cubism and Italian futurism concurrently penetrated Russia, which turned to be crucial for the avant-garde design (Мијушковић, 1980).

The primitivist movement sensibly relied upon the traditions of folk art, Byzantine iconography and children drafts, insisting on spontaneity and immediacy which were originally related to the East. For Russian avant-gardists, it was a substantially national phenomenon considering the East and Russia had been inseparably linked since the Tatarian invasion (Турбецкој, 2012) – but also as much before. The modern forms of art evolved from the Byzantine ones, which had been taken from the Armenio-Gregorian art. In that manner, the Eastern European aesthetics completed a full cycle, elucidating primordial significance of the artist impression (Шевченко, 1913).¹ A basic line of the impression is a substantial dynamics that makes forms not to remain in an objectivity state, but to pattern the creation. Regarding that, futurist and cubist conceptions fell in

Russia on the fertile ground which had already cognized a dynamical substance of art.

In 1912, Filonov stated that cubofuturism had come to a dead end due to mechanicism in its fundamentals. It came to a geometric representation of volumes and dynamics in space and time, but beyond its reach there was a substantial dynamics generating life (Kovtun, 1992). Whilst in the futurist experience dynamics is always regarded to concern an object, suprematism postulates a non-objective dynamics – a dynamics as such regardless of mechanical laws that apply to the spatial phenomena, but not to a painting surface (Мијушковић, 1998). On the other hand, cubism is a conception that everything one could perceive is defined by cross-sections between planes and surfaces (Andersen, 1974). In that respect, cubofuturism – that had been a specifically Russian synthesis – corresponded the objective geometry of a spatio-temporal continuum.

Substantial Geometry

Suprematism started from the last futurist exhibition of Moscow in 1915. There was exhibited the *Black Square Painted before the White Background* which, according to Milner's (1996) interpretation, has signified an origin of the geometrical system. Malevich divided the canvas into arshins and vershoks, which were the obsolete Russian units of measurement. As there are 16 vershoks in an arshin, the canvas could be divided into 2, 4, 8 and 16 parts – which is usually disregarded concerning the *Black Square*, since in centimeters or inches all measures become arbitrary. One is fascinated by the fact that the rhythmic relations within the painting were also present among his paintings. They were exhibited on two walls and the *Black Square* was hung at the top corner connecting them all. It was icon not only due to the place, but also to the significance and in that respect the suprematist paintings are geometrical figures that communicate to each other as well as to the observer.

Removing referential relations from the plastic and the conceptual structure, however, such art does not imply neither personality of the observer, nor any circumstances of the perception – since there is no human space making a personality existent (Мијушковић, 1998). The observer is present neither in the center of a painting, nor outside it, nor in the third place – but it is figured by a dynamical substance which the icon performs. In that respect, Russian avant-garde restored the iconographic paradigm in order to escape a representational art. The substantial moments of iconography, which should be discussed concerning that, are: perspective, colors and geometry.

Perspective is a fundamental fact of the iconography. Unlike the modern concept that became a dominant mode of representation during the Western Renaissance, the iconographic perspective corresponds to a dynamical substance of painting. The binocular vision, which is a blend of two images from different viewpoints, gives some interesting results of the matter. In that manner, one obtains a cubofuturistic description of the spatio-temporal continuum implying a perspective depth related to the time domain (Antonova, 2010). What lacks however to realize the substantial geometry of icon is non-objectivity, since the iconography does not represent reality but the original creation.

The color flow has initially been encountered in the icons through application of the light reflex to the clothes by paints flowing to the background of the image (Шевченко, 1913). The colors are not regarded to be just decorative element, but a subtle symbolism of transcendence (Sendler, 1995). According to Malevich, painting is a sense for the color which is a constructive principle of creation. The color flows and the original unity turns into the painted energies arising the artistic sense (Малевич, 1993).² In the colored phase of suprematism until 1917, non-objective painting was constituted on canvas by means of colors resting on a strong contrast between black and white. Thereafter the color scale has disappeared in white and the architectural suprematism

has proclaimed a basic element to be the form (Маљевић, 2010). The suprematist whiteness corresponds to a substance of painting, in the same manner it appears in the Orthodox iconography regarding the white areas on the robes of angels and saints.

By disappearance of the color scale, Malevich considered transfiguring it into white that makes all colors to be one. There is a million of colors at rest and the single one in time (Малевић, 1993). In that respect, scaling designates the time domain of iconography which is related to the perspective depth. The substantial geometry corresponds to self-similarity of fractals which are dynamical patterns of non-objective energies (Milovanović & Tomić, 2016). The fractal design turns to be an important topic in elucidation of suprematist art (Тарасенко, 2007).

Fractal Architecture

Non-objective architecture of Malevich is based upon the existence of a dynamical substance that had overcome any weight (Nakov, 1977). In that respect, it coincides to the relativistic cosmology whereat gravity has been incorporated in a geometrical structure of the theory. However, a link between the general relativity and the fractal geometry is not an elucidated issue – which is necessary for elaborating his conception that is defined to be the ability to create a construction not dependent on relations between forms and colors, but founded upon weight, speed and expansion. The complex systems physics using geometrical hierarchy to express dynamics in a concise manner is the appropriate framework for such an activity (Prigogine, 1980).³ In that relation, one realizes his remark on complexity which concerns a strict law generating life (Малевић, 1989). According to energetical aesthetics of suprematism, the system is a weight distribution method since in the system there is no weight. It denies a static nature of matter due to the substantial dynamics, which makes Malevich responsible for a complete revolution in architectural design (Nakov, 1977).

The postmodern architecture rendered by fractal forms is primarily based upon contemporary science (Jencks, 2002). The three-dimensional sphere, which is a basic model of the general relativity, appears likewise in the traditional cosmology being a vision of afterlife (Lipscomb 2014).⁴ Since it is partially presentable in terms of fractal geometry, one is not surprised that self-similar patterns occur not only in the Orthodox iconography – but also in the sacral architecture which is a realization of the Eastern European aesthetics. Fractals are present as much in the Hindu temple that is a cosmological model of increasing complexity. An evolving cosmos which is dynamical and self-similar is not typified merely by scaling, but there is the complexity increase concerning geometrical elements (Trivedi, 1993).⁵

Postmodern Era

The Russian avant-garde has remarkably stepped out from the frame of modernism, coming near to a postmodern view. Contrary to the modernistic attitudes, it does not favor a strong demarkation between the old and the novel art considering such classifications meaningless – which stems from a specific perception of past and future, tradition and history, originality and nation in artistic creativity. In addition to challenge the modern conception of linear time, one suggests an assumption that creativity is already contained in the tradition which indicates a comeback to the origin. Such a paradigm implies continuity, inheritance and restauration of artistic experience that makes a struggle against the individualism, which comes from a conviction concerning cosmological significance of art. It corresponds to iconographic style that is a common creation whose key tag is absence of the individual subjectivity (Мијушковић, 1998).

The upcoming era that should appear having ended modernism was announced by Berdyaev, who suggested a rather significant character of the Eastern Europe for

its establishment (Берђајев, 1989).⁶ He considered in Russia there had been no individualism which was modernism characterized by. The Russian intelligence was principally presenting a model of community and organic culture, opposed to the modernistic concept of universalist and cosmopolitan one (Берђајев, 1987). Relating that, the avant-garde art did not demand to represent but to transfigure the world – which coincides both to the social and to the scientific revolution. Avant-gardism differed from traditionalism only because it considered the modernistic destruction could not be resisted by traditional methods (Groys, 1992).⁷

In that respect, a continuity of the Eastern European aesthetics has been observed in socialism and post-socialism as well. When German army came to Moscow during the Second World War, the Holy Godmother of Kazan was flown by plain three times over the city.⁸ A collapse of the Nazi army was relating to such a ritual procession performed in the air. The post-modern era has arisen novel tendencies of iconolatry (Никољскаја, 2013),⁹ which make suprematism a prototype of the restoration that is taking place.

CONCLUSION

The paper is focused onto suprematism of Kazimir Malevich, which was a mainstream of the Russian avant-garde. He was the artist whose sensibility and philosophy was designed primarily through an immediate experience, excitement and reflexion of painting. Non-objective aesthetics of suprematism in the first place emerged to be a basic nature of art and then raised to a universal substance of ontology and cosmology. Elaborating a substantial geometry of icon, he came to the postmodern architecture rendered by fractal forms. In that respect, the Eastern European aesthetics is substantiated by occurrence of a postmodern era that was announced by Russian artists and philosophers.

(Endnotes)

- 1 If Cézanne, Gauguin and Rousseau played an important role in the Russian art, it was because they had tended towards the Eastern traditions and forms.
- 2 The painting process is defined by Malevich through an intuitive calculus constituting the color theory of suprematism. Social phenomena are also expressed in the various color scales and the culture which is based upon. Paints are the most dilute in the rural areas and the most dense in the cities. The final point is a metropolis where the coloration has overcome and colors dispersed in the white light. Such a hierarchy is the social generalization concerning the three stages of suprematism – the black, the colored and the white one.
- 3 The complex systems are defined by increasing complexity in the temporal domain, which corresponds to a perspective depth of iconography. The use of geometry to express dynamics is coincident to the basic concepts of general relativity.
- 4 The *Divine Comedy* by Dante Alighieri is a model of the traditional cosmology that includes an Empyrean which is the abode of God. Dante regarded the Empyrean to be a mirror image of the Aristotle cosmos, gluing their boundaries in order to make the three-dimensional sphere.
- 5 The geometrical elements of circle, triangle and square are assigned special symbolics to typify the basic energies. They are combined in increasingly complex figures to present particular qualities embodied in some aspects of creation.
- 6 The Eastern Europe is experiencing the end of modernism even though it did not experience modernism itself, which is contemporaneity and originality of its history. The Russian philosophy of history has always been apocalyptic, as well as the Russian revolution that has also come to an apocalyptic issue.
- 7 The socialist realism is usually considered to be an antithesis of the avant-garde. However, Stalinism satisfied the fundamental demand that art should cease representing life and begin transfiguring it through an aesthetico-political project.
- 8 October 22th of the Orthodox ecclesial calendar (which is November 4th of the Gregorian one) is the feast day of the Kazan Godmother Icon, due to the deliverance of Moscow from Poles in 1612. Since 2005, it has likewise been celebrated in Russia as the *National Unity Day*, replacing the *Day of Great October Socialist Revolution* and also the post-socialist *Day of Reconciliation and Agreement*, both of which were held on October 25th (November 7th).
- 9 Contemporary relations have extended the domains of some icons. The Holy Godmother of the Burning Bush is recognized to be a firefighter protector, Saint Matthew the Apostle has

become a patron of the tax officers and bankers. Saint Elijah the Prophet is a protector of the airborne army, Holy Great Martyr Catherine is one of the rocket army presumably because the first multiple rocket launcher had a nickname *Katyusha* after the popular wartime song by Mikhail Isakovsky.

Miloš Milovanović, born on September 13, 1980, Šabac, Serbia. THE IMPORTANCE OF ROMAN INGARDEN'S ONTOLOGICAL AND STRUCTURAL INVESTIGATIONS OF THE LITERARY WORK OF ART FOR THE LATER READER-CENTERED THEORIES OF LITERATURE

Abstract | During 1970s there happens a significant paradigm change in the theories of textual interpretation. This is the change of focus from the formal structure of the literary work, to the experience of reader. The formalist paradigm of understanding literary text as a closed semantic system is relocated by the understanding of literary work as a co-creative product of the author and the reader. The emphasis on *intentio operis* is replaced by an emphasis on *intentio lectoris*. The relation between the literary work and the reader has been handled by various theoretical approaches such as hermeneutics, the aesthetic of reception, reader-response criticism, theory of aesthetic response, semiotic theories of interpretation, to name but a few. What they have in common is an interest in the relation between the literary work and the reader in the act of reading. The phenomenon of reading has been handled by the best part of these approaches as an interaction between the text and the reader. According to this position, the meaning of the text is co-created by the creative acts of the reader in the act of reading. Hence, the work takes its last shape through the reading act. All these theoretical approaches accept the openness of the work to the creative acts of the reader. In other words, they presuppose that the literary artwork structurally and ontologically involves an openness that permits the reader to be involved in the creation of its meaning. However, very few of them questioned the ontological background of this presupposition. My aim in this paper is to show that these theories owe very much to Roman Ingarden's ontological and phenomenological investigations of literature. I will try to reveal that it is Ingarden's understanding of "ontological incompleteness" that allows us to postulate the reader as the active co-creator of the literary work of art. In order to achieve this aim, I will briefly lay out his understanding of "schematism," "intrinsic incompleteness," and his distinction between the "artistic" and the "aesthetic" object. Second I will focus on how these notions allow us to understand the literary work of art as an open structure that permits the reader to participate actively in the production of its meaning. Third I will show how his works influence later thinkers such as Wolfgang Iser (and other members of Constanz School) and Paul Ricoeur. Overall my aim will be to show the contribution of Roman Ingarden's (as an East European philosopher) aesthetic theory for the later theories on the aesthetical reception of literary work of art.

Index terms | *Hermeneutics; Paul Ricoeur; phenomenology; reader response criticism; Reception aesthetics; Roman Ingarden; Wolfgang Iser.*

Roman Ingarden, the least well-known pupil of Edmund Husserl from the Gottingen period, wrote two important books on philosophy of literature. In these books, Ingarden mainly asks how literary works of art are cognized by the reader. In order to answer this question, he carefully investigates the ontological and structural properties of the literary artwork. In this paper my aim is to re-focus on these investigations and show that Ingarden's work not only lays the philosophical foundations for later reader-centred theories of literature, it also shows the importance of the reader in forming the meaning of the work many years before the blossom of reader-response theories.

For Ingarden there are two crucial questions that should be answered before discussing the proper methodology of literary studies: "(1) How is the object of cognition – the literary work of art – structured? And (2) What is the procedure which will lead to knowledge of the literary work; that is, how does the cognition of the work of art come about and to what can it lead?" (INGARDEN 1973B, 4). Ingarden tries to answer the first question in *The Literary Work of Art* (1931) and devotes his second book, *The Cognition of the Literary Work of Art* (1937), to the second. These two works are complementary, since Ingarden believes that there is a strong correlation between the object of cognition and the way it is cognized: "The epistemological investigations which have been carried out by phenomenologists since Husserl's *Logical Investigations* show that between the mode of cognition and the object of cognition there is a special correlation; there is perhaps even an adaptation of the cognition to its object" (INGARDEN 1973B, 8). Hence, as complementary works, the first book investigates the noematic side of literature, while the second focuses on the noetic side. Through his noematic investigations, Ingarden shows us that literary artworks are schematized objects, that is they are ontologically incomplete, and accordingly they need the active contribution of the reader in order to be concretized.

Ingarden starts his investigations by showing that literary works of art are purely intentional objects and because intentional objects are not fully determined like real objects, the literary work of art contains various points of indeterminacy that need the co-operative acts of the reader in order to be filled in. Thus, for Ingarden the work has a schematic structure. In some works, (e.g. the modern novel) this schematic structure may be more visible and profound, but all literary works essentially have a schematic structure due to the intentional nature of the portrayed objects of the work.

The schematic structure is not an accidental, but a necessary and essential characteristic of the literary work which has its roots in its structural limitedness and intentional nature. A literary work, as we know, is composed of finite semantic units of different degree; words, sentences, paragraphs, chapters etc. The objects and state of affairs in a literary work of art, which are determined by infinite and ever-changing properties, are presented as meaning correlates of these semantic units. It is the essential disproportion between the things portrayed and the semantic means of representation in the work that results in the schematic structure of the work: "It is impossible to establish clearly and exhaustively the infinite multiplicity of determinacies of the individual objects portrayed in the work with a finite number of words or sentences" (INGARDEN 1973B, 51). Hence, the literary work suffers from an incompleteness, but this incomplete structure gives the reader a freedom to concretize the work in various possible ways, it is a productive incompleteness.

In a letter written as a reply to John Fizer, Ingarden states that "pure intentional objects projected from language means or from conscious acts have necessarily areas of indeterminateness in their content" (Ingarden and Fizer 1970, 543). As a result, the incompleteness of literary work is not an epistemological, but an ontological incompleteness. The same situation is also applicable to derived intentional objects. That is to say, the objects portrayed in a literary work are also incomplete in an

ontological sense.

Barry Smith explains the distinction between epistemological and ontological incompleteness with the help of the term “access” (Smith 1979, 379). He states that we have direct access to contemporary human beings through various kinds of physical contact. To no-longer-existing human beings, on the other hand, we have weaker access. We can access them only through memories, newspaper reports, historical documents, memoirs, etc. And because our knowledge of them depends on a finite quantity of such informative means, it is Inngarden 1973ays incomplete. This incompleteness is epistemological in nature: “if we know only that Henry Nth lost an arm in the Battle of X, but not which arm, then we do not suppose that after the battle Henry himself was ontologically structured in such a way that the missing arm was indeterminately neither right nor left” (Smith 1979, 380). When it comes to fictional characters, we have incomplete access to them as well. We can access them through the determinations given by means of the semantic units of the literary work. Due to the schematic structure of the work, our knowledge of the characters in a literary work of art is incomplete. This incompleteness, in contrast to the incompleteness of our knowledge of historical characters, is an intrinsic incompleteness. It is an incompleteness suffered by the characters themselves as intentional objects. In other words, the problematic character of our access to literary objects does not originate from any epistemological incompleteness that may arise due to inadequacies in a particular reading; rather it comes up as a result of the ontological character of the work in its intentionality.

In this sense, real objects cannot be ontologically incomplete. It is clear that when we perceive real objects, our perception is partial and one-sided, hence there is Inngarden 1973ays a possibility of further perceptions of different determinations of the same object, or, as we saw in the discussion about our access to historical characters, a possibility of further supplementary information. Hence if we can talk about an incompleteness of real objects it can only be an epistemological incompleteness. “Fictional objects on the other hand,” says Barry Smith, “are such that from the very start we can exclude the possibility of supplementary information, information which would be additional to that which is to be found in (or, within certain limits, *read into*) the texts themselves” (Smith 1979, 381). Thus, the incompleteness of fictional objects is an ontological incompleteness that is intrinsic to those objects.

Laying out the structural and ontological bases of the schematic structure of the literary work of art in this way, we can focus on the role of the reader in apprehending the work as a schematic structure. As a schematic structure containing “points of indeterminacy,” the work calls for the reader to apprehend its portrayed world in its most complete form possible, and hence to remove at least some of the places of indeterminacy. The process of filling in the gaps and removing the points of indeterminacy is what Inngarden calls the “concretization of the work.” As a result of this, the same work is open to various concretizations, which are equally admissible. In virtue of the concretization process, the reader, in the act of reading, is not limited to the role of a passive perceiver but is an active co-creator of the finished product. In addition, the possibility of various concretizations allows the reader a certain degree of freedom in the sense that she is not obliged to realize the work in a pre-determined way.

Concretization is a process that occurs during the act of reading, when the reader involuntarily “fills out” various places of indeterminacy with her own initiative and imagination by using the elements she has chosen among many possible and permissible ones. As mentioned, there may be differences among the concretizations of the same work by different readers, or even by the same reader in different readings. Although these possible concretizations are constrained by the linguistic strata of the work, we can talk about various possible concretizations within these limits. We can talk about two main sources of difference in concretization; the capacity of the reader and the

partial nature of cognition. The capacity of the reader is not independent from the state or attitude in which she finds herself at the moment of the reading act. Hence concretizational attitudes may show differences in different epochs of the literary history. At this point, says Ingarden, we can talk about “the ‘life’ of one and the same work in various epochs as a historical process in which the continuity of being and the identity of the work are maintained despite all changes” (INGARDEN 1973B, 55). The reader, in her concretizing act, activates these potentialities and determines the indeterminacies only partially. “It is impossible, even with the best intentions, to remove all places of indeterminacy” (INGARDEN 1973B, 241). Hence, every concretization is in the end schematic to a degree and this situation supports the possibility of different concretizations of the same work too. In every reading of the same work, we may talk about different degrees of concretization of diverse indeterminacies and the actualization of diverse potentialities in the work. This diversity of the possible concretizations leads to various aesthetic objects as the products of the concretization process.

One may ask at this point how the identity of the work is maintained in Ingarden’s theory if the concretization of the work is so dependent on the subjective acts of the reader? The answer lies in Ingarden’s differentiation between the literary work of art itself (which I shall call the “artistic object”) from the concretized work that Ingarden calls the “aesthetic object.” This differentiation has its source in the three interrelated ways of approaching the literary artwork. Ingarden again and again stresses that the appropriate attitude for the reader to take in cognizing a literary work is the aesthetic attitude, which means that she should concretize the literary work of art in an aesthetic manner. However, it is obvious that aesthetic cognition is not the only way of cognizing the literary work of art. We may talk about a variety of other ways. A literary historian can read a literary work of art in order to approach some clues about the life of the author, a philologist can focus on the phonetic or semantic stratum of the work in order to discover its linguistic structure, and an ordinary reader may read a literary piece only to kill time or amuse herself. We may talk about many other possible ways of approaching a literary work of art. Ingarden leaves many of these possible ways out of the scope of his work, saying that these ways of cognizing a literary work of art are inappropriate to the essential function of the work, which is to constitute an aesthetic object. Other functions that can be attributed to a literary work – such as giving information about the period in which the plot takes place or imposing a political view – can only be regarded as secondary functions, and these functions cannot be of interest to literary studies but only to other areas like psychology, sociology, or cultural studies. Ingarden mainly examines two kind of cognitive attitudes that differ according to the intention with which the reading activity is carried out. The first is the “aesthetic” attitude, in which the purpose of the reading act is “bringing the work through a reading to the actualization of an aesthetic concretization in order to enjoy it aesthetically in this concretization and to contemplate it” (INGARDEN 1973B, 170). The second is “the purely cognitive ‘investigative attitude,’” which aims at an objective knowledge of the work itself or its aesthetically concretized form. The investigative attitude can be carried out in two ways: through a pre-aesthetic attitude and through a reflective-aesthetic attitude. The pre-aesthetic way of reading investigates the work in its schematic formation (the work itself/artistic object) while the reflective-aesthetic investigation of the work takes the concretized work actualized in aesthetic experience (aesthetic object) as its research object.

Differentiating three types of literary cognition allows Ingarden to separate the artistic object and the aesthetic object as the outcomes of two different acts. The artistic object is constructed through a pre-aesthetic reconstruction, while the aesthetic object is the product of an aesthetic concretization. This differentiation helps Ingarden to postulate artistic and aesthetic values as different entities. In addition, such a differentiation helps

Ingarden to constitute the literary work of art as an intersubjective object. We have seen that literary artworks can be concretized in various ways and the way they are concretized is determined by the competence of the reader or her decisions. Hence, we can say that every particular concretization is to a certain degree subjective. It is a product of a peculiar experience of a specific reading of a specific subject. However, both the pre-aesthetic and reflective-aesthetic cognitions and the interpretations that appear at the end of these cognitions are intersubjective and in that sense, make literary study possible. As Eugene H. Falk tells us, according to Ingarden, “[t]he *purpose* of literary criticism must be the aesthetic concretization of individual works of art. The *task* of criticism must be an account of an aesthetic concretization and an artistic and aesthetic evaluation based on that concretization” (Falk 1981, 204). Such a process is possible only by realizing the differences between these three kinds of interrelated cognitions. While the pre-aesthetic attitude determines the value potentialities and points of indeterminacies in the work, the reflective-aesthetic attitude is mainly concerned with the aesthetic value of various individual concretizations. By means of the investigative attitude we can also examine the validity of these concretizations, either by contrasting the aesthetic object with the artistic object or by contrasting it with other aesthetic objects concretized from the same work through different readings. As Rene Wellek explains, “the problem of falsifying concretizations is regulated by literary criticism which has the task of reconstructing a work in its context, to see to it that it is interpreted correctly” (Wellek 1973, 63). What is important here is the fact that such a distinction between these types of cognition is only possible in virtue of the schematic structure of the work. We can talk about the artistic object differing from the aesthetic object only if we can assume that we can approach the work without filling in the points of indeterminacy and actualizing the potentialities in the work.

In conclusion, by defining the literary work of art as a schematized object which requires the reader’s conscious acts in order to be concretized, many years before the blossoming of reader-oriented theories, Ingarden showed us the indisputable role of the reader in the formation of the literary work of art. In Gerald Prince’s words, “as early as 1931, he studied the ways in which readers (adequately) realize or concretize a work of art, the ways in which they transform a text or mere series of sentences into an esthetic object by filling gaps or places of indeterminacy in that text” (Prince, paragraph 6). Thanks to the intentional nature of the objects portrayed in the work and the schematized structure of the strata of the work of art, the reader becomes a co-creator of the aesthetic object as the final product of the aesthetic cognition of the literary work of art.
